• **policy** – The execution policy to use for the scheduling of the iterations.
• **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
• **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
• **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
• **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`
• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_difference` algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. The `set_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate f.

Equivalent elements are treated individually, that is, if some element is found m times in [first1, last1) and n times in [first2, last2), it will be copied to dest exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (sequenced_policy) or in a single new thread spawned from the current thread (for sequenced_task_policy).

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most 2*(N1 + N2 - 1) comparisons, where N1 is the length of the first sequence and N2 is the length of the second sequence.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_difference` requires *Pred* to meet the requirements of `CopyConstructible`. This defaults to `std::less<>

• **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`

• **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **rng1** – Refers to the first sequence of elements the algorithm will be applied to.

• **rng2** – Refers to the second sequence of elements the algorithm will be applied to.

• **dest** – Refers to the beginning of the destination range.

• **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_difference` algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. Where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>`. The `set_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_difference_result<Iter1, Iter3> set_difference(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Iter3 dest, Pred &op = Pred(), Proj1 &proj1 = Proj1(), Proj2 &proj2 = Proj2())
```

Constructs a sorted range beginning at `dest` consisting of all elements present in the range `[first1, last1)` and not present in the range `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

Equivalent elements are treated individually, that is, if some element is found `m` times in `[first1, last1)` and `n` times in `[first2, last2)`, it will be copied to `dest` exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most `2*(N1 + N2 - 1)` comparisons, where `N1` is the length of the first sequence and `N2` is the length of the second sequence.

**Template Parameters**
• **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
• **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
• **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
• **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_difference` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`.
• **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`.
• **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`.

**Parameters**

• **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
• **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
• **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
• **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`.
• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns**
The `set_difference` algorithm returns `ranges::set_difference_result<Iter1, Iter3>`. The `set_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.
Constructs a sorted range beginning at dest consisting of all elements present in the range \([\text{first1}, \text{last1})\) and not present in the range \([\text{first2}, \text{last2})\). This algorithm expects both input ranges to be sorted with the given binary predicate \(f\).

Equivalent elements are treated individually, that is, if some element is found \(m\) times in \([\text{first1}, \text{last1})\) and \(n\) times in \([\text{first2}, \text{last2})\), it will be copied to dest exactly \(\text{std::max}(m-n, 0)\) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most \(2^*(N1 + N2 - 1)\) comparisons, where \(N1\) is the length of the first sequence and \(N2\) is the length of the second sequence.

**Template Parameters**
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_difference` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal.

The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_difference` algorithm returns `ranges::set_difference_result<Iter1, Iter3>`, where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>` The `set_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

Functions

template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>

hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<Iter1, Iter2, Iter3>>::type set_intersection(
ExPolicy &&policy,
Iter1 first1, Sent1 last1,
Iter2 first2, Sent2 last2,
Iter3 dest,
Pred &&op = Pred(),
Proj1 &&proj1 = Proj1(),
Proj2 &&proj2 = Proj2())

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate \( f \).

If some element is found \( m \) times in [first1, last1) and \( n \) times in [first2, last2), the first \( \text{std::min}(m, n) \) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (\textit{sequenced\_policy}) or in a single new thread.
spawned from the current thread (for \textit{sequenced\_task\_policy}).

The application of function objects in parallel algorithm invoked with an execution policy object of type \textit{parallel\_policy} or \textit{parallel\_task\_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

\begin{description}
\item[Note:] Complexity: At most $2*(N1+N2-1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.
\end{description}

\section*{Template Parameters}
\begin{itemize}
\item \textbf{ExPolicy} – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
\item \textbf{Iter1} – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
\item \textbf{Sent1} – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
\item \textbf{Iter2} – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
\item \textbf{Sent2} – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
\item \textbf{Iter3} – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
\item \textbf{Pred} – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of \textit{set\_intersection} requires \textbf{Pred} to meet the requirements of \textit{CopyConstructible}. This defaults to \textit{std::less<}.\textbf{Proj1} – The type of an optional projection function applied to the first sequence. This defaults to \textit{hpx::identity}.
\item \textbf{Proj2} – The type of an optional projection function applied to the second sequence. This defaults to \textit{hpx::identity}.
\end{itemize}

\section*{Parameters}
\begin{itemize}
\item \textbf{policy} – The execution policy to use for the scheduling of the iterations.
\item \textbf{first1} – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
\item \textbf{last1} – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
\item \textbf{first2} – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
\item \textbf{last2} – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
\item \textbf{dest} – Refers to the beginning of the destination range.
\item \textbf{op} – The binary predicate which returns true if the elements should be treated as equal.
\end{itemize}

The signature of the predicate function should be equivalent to the following:

\begin{verbatim}
bool pred(const Type1 &a, const Type1 &b);
\end{verbatim}

The signature does not need to have \texttt{const \&}, but the function must not modify the objects passed to it. The type \textit{Type1} must be such that objects of type \textit{InIter} can be dereferenced and then implicitly converted to \textit{Type1}.

\begin{itemize}
\item \textbf{proj1} – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate \textit{op} is invoked.
\item \textbf{proj2} – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate \textit{op}
is invoked.

**Returns** The `set_intersection` algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise.

The `set_intersection` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
//template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
//hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>>, Iter3>
//set_intersection(ExPolicy&& policy, Rng1&& rng1, Rng2&& rng2, Iter3 dest, Pred&& op = Pred(), Proj1&& proj1 = Proj1(), Proj2&& proj2 = Proj2())
```

Constructs a sorted range beginning at `dest` consisting of all elements present in both sorted ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found `m` times in `[first1, last1)` and `n` times in `[first2, last2)`, the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (`sequenced_policy`) or in a single new thread spawned from the current thread (for `sequenced_task_policy`).

The application of function objects in parallel algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most `2*(N1 + N2 - 1)` comparisons, where `N1` is the length of the first sequence and `N2` is the length of the second sequence.

**Template Parameters**
• **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

• **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

• **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

• **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

• **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of set_intersection requires Pred to meet the requirements of CopyConstructible. This defaults to std::less<>

• **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to hpx::identity

• **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to hpx::identity

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal.

The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type Type1 must be such that objects of type InIter can be dereferenced and then implicitly converted to Type1

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate op is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate op is invoked.

**Returns**
The set_intersection algorithm returns a hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns ranges::set_intersection_result<Iter1, Iter2, Iter3> otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The set_intersection algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_intersection_result<Iter1, Iter2, Iter3> set_intersection(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate f.
If some element is found \( m \) times in \([\text{first}1, \text{last}1)\) and \( n \) times in \([\text{first}2, \text{last}2)\), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot be overlapping with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most \( 2*(N1 + N2 - 1) \) comparisons, where \( N1 \) is the length of the first sequence and \( N2 \) is the length of the second sequence.

**Template Parameters**
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_intersection` requires `Pred` to meet the requirements of CopyConstructible. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_intersection` algorithm returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>`. The `set_intersection` algorithm returns the output iterator to the element in the destination range, one past the last element copied.
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_intersection_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, Iter3> set_intersection(Rng1 &&rng1, Rng2 &&rng2, Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate \( f \).

If some element is found \( m \) times in [first1, last1) and \( n \) times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most \( 2^*(N_1 + N_2 - 1) \) comparisons, where \( N_1 \) is the length of the first sequence and \( N_2 \) is the length of the second sequence.

**Template Parameters**
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of **set_intersection** requires **Pred** to meet the requirements of CopyConstructible. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to hpx::identity
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to hpx::identity

**Parameters**
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal.
The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_intersection` algorithm returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>`, where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>`. The `set_intersection` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### hpx/parallel/container_algorithms/set_symmetric_difference.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx

namespace ranges

Functions
```

```cpp
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at dest. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate \( f \).

If some element is found \( m \) times in [first1, last1) and \( n \) times in [first2, last2), it will be copied to dest exactly std::abs(m-n) times. If \( m>n \), then the last \( m-n \) of those elements are copied from [first1,last1), otherwise the last \( n-m \) elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (sequenced_policy) or in a single new thread spawned from the current thread (for sequenced_task_policy).

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most \( 2^*(N1 + N2 - 1) \) comparisons, where \( N1 \) is the length of the first sequence and \( N2 \) is the length of the second sequence.

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
• **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
• **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
• **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
• **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_symmetric_difference` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>
• **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity
• **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not have to have const &, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns**
The `set_symmetric_difference` algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at dest. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate $f$.

If some element is found $m$ times in [first1, last1) and $n$ times in [first2, last2), it will be copied to dest exactly std::abs($m-n$) times. If $m>n$, then the last $m-n$ of those elements are copied from [first1, last1), otherwise the last $n-m$ elements are copied from [first2, last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (sequenced_policy) or in a single new thread spawned from the current thread (for sequenced_task_policy).

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most $2^*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
• **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

• **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_symmetric_difference` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>

• **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`

• **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_symmetric_difference` algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<
typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
        typename Pred = hpx::parallel::detail::less,
        typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_symmetric_difference_result<Iter1, Iter2, Iter3> set_symmetric_difference(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Constructs a sorted range beginning at `dest` consisting of all elements present in either of the sorted ranges `[first1, last1)` and `[first2, last2)`, but not in both of them are copied to the range beginning at `dest`. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found `m` times in `[first1, last1)` and `n` times in `[first2, last2)`, it will be copied to `dest`
exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most 2*(N1 + N2 - 1) comparisons, where N1 is the length of the first sequence and N2 is the length of the second sequence.

**Template Parameters**
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of set_symmetric_difference requires *Pred* to meet the requirements of CopyConstructible. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

**Returns** The `set_symmetric_difference` algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. The `set_symmetric_difference` algorithm returns the output iterator to the element in the
destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_symmetric_difference_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, Iter3> set_sym
```

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at dest. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate f.

If some element is found m times in [first1, last1) and n times in [first2, last2), it will be copied to dest exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most 2*(N1 + N2 - 1) comparisons, where N1 is the length of the first sequence and N2 is the length of the second sequence.

**Template Parameters**
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of set_symmetric_difference requires Pred to meet the requirements of CopyConstructible. This defaults to std::less<
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to hpx::identity
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to hpx::identity

**Parameters**
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
• **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const & , but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_symmetric_difference` algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>` The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

**Functions**

```cpp
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
hpx::parallel::util::detail::algorithm_result<ExPolicy, setunion_result<Iter1, Iter2, Iter3>>::type setunion(ExPolicy &&policy, Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate \( f \).

If some element is found \( m \) times in [first1, last1) and \( n \) times in [first2, last2), then all \( m \) elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(\( n - m \), 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (sequenced_policy) or in a single new thread spawned from the current thread (for sequenced_task_policy).

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most \( 2^*(N1 + N2 - 1) \) comparisons, where \( N1 \) is the length of the first sequence and \( N2 \) is the length of the second sequence.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
• **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
• **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
• **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of set_union requires Pred to meet the requirements of Copy-Constructible. This defaults to std::less<>
• **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to hpx::identity
• **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to hpx::identity

**Parameters**
• **policy** – The execution policy to use for the scheduling of the iterations.
• **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
• **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
• **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
• **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type Type1 must be such that objects of type InIter can be dereferenced and then implicitly converted to Type1
• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate op is invoked.
• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate op is invoked.

**Returns** The set_union algorithm returns a hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns ranges::set_union_result<Iter1, Iter2, Iter3> otherwise. The set_union algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\). This algorithm expects both input ranges to be sorted with the given binary predicate \(f\).

If some element is found \(m\) times in \([\text{first1}, \text{last1})\) and \(n\) times in \([\text{first2}, \text{last2})\), then all \(m\) elements will be copied from \([\text{first1}, \text{last1})\) to dest, preserving order, and then exactly std::max(\(n-m, 0\)) elements will be copied from \([\text{first2}, \text{last2})\) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (sequenced_policy) or in a single new thread spawned from the current thread (for sequenced_task_policy).

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most \(2^{*}(N1 + N2 - 1)\) comparisons, where \(N1\) is the length of the first sequence and \(N2\) is the length of the second sequence.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_union` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`

• **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`

• **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **rng1** – Refers to the first sequence of elements the algorithm will be applied to.

• **rng2** – Refers to the second sequence of elements the algorithm will be applied to.

• **dest** – Refers to the beginning of the destination range.

• **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_union` algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. Where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>`. The `set_union` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_union_result<Iter1, Iter2, Iter3> tag_fallback_invoke(set_union_t, Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Constructs a sorted range beginning at `dest` consisting of all elements present in one or both sorted ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found `m` times in `[first1, last1)` and `n` times in `[first2, last2)`, then all `m` elements will be copied from `[first1, last1)` to `dest`, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from `[first2, last2)` to `dest`, also preserving order.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most `2*(N1 + N2 - 1)` comparisons, where `N1` is the length of the first sequence and `N2` is the length of the second sequence.
Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.

- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_union` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>

- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`

- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.

- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```cpp
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

Returns

The `set_union` algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. The `set_union` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less,
          typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
set_union_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, Iter3> set_union(Rng1 &&rng1, Rng2 &&rng2, Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate \( f \).

If some element is found \( m \) times in [first1, last1) and \( n \) times in [first2, last2), then all \( m \) elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most \( 2^*(N_1 + N_2 - 1) \) comparisons, where \( N_1 \) is the length of the first sequence and \( N_2 \) is the length of the second sequence.

**Template Parameters**
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_union` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal.
  The signature of the predicate function should be equivalent to the following:

2.8. API reference 835
bool pred(const Type1 &a, const Type1 &b);

The signature does not need to have const &, but the function must not modify the objects passed to it. The type Type1 must be such that objects of type InIter can be dereferenced and then implicitly converted to Type1

- proj1 – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate op is invoked.
- proj2 – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate op is invoked.

Returns The set_union algorithm returns ranges::set_union_result<Iter1, Iter2, Iter3>.

where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The set_union algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx/parallel/container_algorithms/shift_left.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges

Functions

template<typename FwdIter, typename Sent, typename Size>
FwdIter shift_left(FwdIter first, Sent last, Size n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first)
- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel shift_left algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced FwdIter must meet the requirements of MoveAssignable.

Template Parameters
- FwdIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- Sent – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- Size – The type of the argument specifying the number of positions to shift by.

Parameters
- first – Refers to the beginning of the sequence of elements the algorithm will be applied to.
• **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
• **n** – Refers to the number of positions to shift.

**Returns**  The *shift_left* algorithm returns *FwdIter*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> shift_left(ExPolicy &&policy, FwdIter first, Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first - n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most (last - first) - n assignments.

**Note:** The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

**Returns**  The *shift_left* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename Rng, typename Size>
hpx::traits::range_iterator_t<Rng> shift_left(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first - n), moves the element originally at position first + n + i to position first + i.
The assignment operations in the parallel `shift_left` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

**Template Parameters**
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

**Returns** The `shift_left` algorithm returns `hpx::traits::range_iterator_t<Rng>`.

The assignment operations in the parallel `shift_left` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignment operations in the parallel `shift_left` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.
Parameters
• **policy** – The execution policy to use for the scheduling of the iterations.
• **rng** – Refers to the range in which the elements will be shifted.
• **n** – Refers to the number of positions to shift.

Returns The `shift_left` algorithm returns a `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `hpx::traits::range_iterator_t<Rng>` otherwise. The `shift_left` algorithm returns an iterator to the end of the resulting range.

**hpx/parallel/container_algorithms/shift_right.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

**Functions**

```cpp
template<typename FwdIter, typename Sent, typename Size>
FwdIter shift_right(FwdIter first, Sent last, Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first + n + i`.

The assignment operations in the parallel `shift_right` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: At most `(last - first) - n` assignments.

**Note:** The type of dereferenced `FwdIter` must meet the requirements of `MoveAssignable`.

**Template Parameters**
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

**Returns** The `shift_right` algorithm returns `FwdIter`. The `shift_right` algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
```

2.8. API reference
**hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> shift_right(ExPolicy &&policy, FwdIter first, Sent last, Size n)**

Shifts the elements in the range \([\text{first}, \text{last})\) by \(n\) positions towards the end of the range. For every integer \(i\) in \([0, \text{last} - \text{first} - n)\), moves the element originally at position \(\text{first} + i\) to position \(\text{first} + n + i\).

The assignment operations in the parallel \(shift\_right\) algorithm invoked with an execution policy object of type `sequenced\_policy` execute in sequential order in the calling thread.

The assignment operations in the parallel \(shift\_right\) algorithm invoked with an execution policy object of type `parallel\_policy` or `parallel\_task\_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most \((\text{last} - \text{first}) - n\) assignments.

**Note:** The type of dereferenced `FwdIter` must meet the requirements of `MoveAssignable`.

**Template Parameters**

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- `Size` – The type of the argument specifying the number of positions to shift by.

**Parameters**

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `n` – Refers to the number of positions to shift.

**Returns** The `shift\_right` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced\_task\_policy` or `parallel\_task\_policy` and returns `FwdIter` otherwise. The `shift\_right` algorithm returns an iterator to the end of the resulting range.

**template<typename Rng, typename Size>**

**hpx::traits::range_iterator_t<Rng> shift_right(Rng &&rng, Size n)**

Shifts the elements in the range \([\text{first}, \text{last})\) by \(n\) positions towards the end of the range. For every integer \(i\) in \([0, \text{last} - \text{first} - n)\), moves the element originally at position \(\text{first} + i\) to position \(\text{first} + n + i\).

The assignment operations in the parallel `shift\_right` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: At most \((\text{last} - \text{first}) - n\) assignments.
Note: The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

### Template Parameters
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

### Parameters
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

### Returns
The `shift_right` algorithm returns `hpx::traits::range_iterator_t<Rng>`. The `shift_right` algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> shift_right(
    ExPolicy &&policy,
    Rng &&rng,
    Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first + n + i`.

The assignment operations in the parallel `shift_right` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignment operations in the parallel `shift_right` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most `(last - first) - n` assignments.

**Note:** The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

### Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

**Returns**
The `shift_right` algorithm returns a `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and re-
turns `hpx::traits::range_iterator_t<Rng>` otherwise. The `shift_right` algorithm returns an iterator to the end of the resulting range.

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`

```cpp
namespace ranges

Functions

```cpp
template<
type Rng, type Sent, type Comp = ranges::less, type Proj = hpx::identity>
RandomIt sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object `comp` (defaults to using operator<()).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

`comp` has to induce a strict weak ordering on the values.

The assignments in the parallel `sort` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: $O(N \log(N))$, where $N = \text{detail::distance}(\text{first}, \text{last})$ comparisons.

**Template Parameters**
- `RandomIt` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `RandomIt`.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `comp` – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
Returns The sort algorithm returns RandomIt. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type sort(ExPolicy &&policy, RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&&proj = Proj())

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator comp and a projection proj if for every iterator i pointing to the sequence and every non-negative integer n such that \( i + n \) is a valid iterator pointing to an element of the sequence, and \( \text{INVOKE}(\text{comp}, \text{INVOKE}(\text{proj}, *(i + n)), \text{INVOKE}(\text{proj}, *i)) == \) false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: \( O(N \log(N)) \), where \( N = \text{detail::distance(first, last)} \) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to hpx::identity

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate comp is invoked.

Returns The sort algorithm returns a hpx::future<RandomIt> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns RandomIt otherwise. The
algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename Rng, typename Comp, typename Proj>
hpx::traits::range_iterator_t<Rng> sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
Sorts the elements in the range rng in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator comp and a projection proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel sort algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = std::distance(begin(rng), end(rng)) comparisons.

Template Parameters
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to hpx::identity

Parameters
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate comp is invoked.

Returns The sort algorithm returns hpx::traits::range_iterator_t<Rng>. It returns last.

template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> sort(ExPolicy &&policy, Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
Sorts the elements in the range rng in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator comp and a projection proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing
to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.`

`comp` has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: $O(N \log(N))$, where $N = \text{std::distance}($begin(rng), end(rng))$ comparisons.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng` – Refers to the sequence of elements the algorithm will be applied to.
- `comp` – `comp` is a callable object. The return value of the `INVOKE` operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

**Returns**
The `sort` algorithm returns `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `hpx::traits::range_iterator_t<Rng>` otherwise. It returns `last`.

**hpx/parallel/container_algorithms/stable_sort.hpp**

See **Public API** for a list of names and headers that are part of the public **HPX API**.

namespace `hpx`

namespace `ranges`
Functions

template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
RandomIt stable_sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator comp and a projection proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel stable_sort algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- RandomIt – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- Sent – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- Comp – The type of the function/function object to use (deduced).
- Proj – The type of an optional projection function. This defaults to hpx::identity

Parameters

- first – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- last – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- comp – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- proj – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate comp is invoked.

Returns The stable_sort algorithm returns RandomIt. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type stable_sort(ExPolicy &&policy, RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).
A sequence is sorted with respect to a comparator \( \text{comp} \) and a projection \( \text{proj} \) if for every iterator \( i \) pointing to the sequence and every non-negative integer \( n \) such that \( i + n \) is a valid iterator pointing to an element of the sequence, and \( \text{INVOKE}(\text{comp}, \text{INVOKE}(\text{proj}, *(i + n)), \text{INVOKE}(\text{proj}, *i)) == \text{false} \).

\( \text{comp} \) has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type \textit{sequenced\_policy} execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type \textit{parallel\_policy} or \textit{parallel\_task\_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

\textbf{Note:} Complexity: \( O(N \log(N)) \), where \( N = \text{std::distance}(\text{first}, \text{last}) \) comparisons.

\section*{Template Parameters}
- \textbf{ExPolicy} – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- \textbf{RandomIt} – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- \textbf{Sent} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- \textbf{Comp} – The type of the function/function object to use (deduced).
- \textbf{Proj} – The type of an optional projection function. This defaults to \texttt{hpx::identity}

\section*{Parameters}
- \textbf{policy} – The execution policy to use for the scheduling of the iterations.
- \textbf{first} – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- \textbf{last} – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- \textbf{comp} – \texttt{comp} is a callable object. The return value of the \texttt{INVOKE} operation applied to an object of type \texttt{Comp}, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that \texttt{comp} will not apply any non-constant function through the dereferenced iterator.
- \textbf{proj} – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate \texttt{comp} is invoked.

\section*{Returns} The \texttt{stable\_sort} algorithm returns a \texttt{hpx::future\<RandomIt\>} if the execution policy is of type \texttt{sequenced\_task\_policy} or \texttt{parallel\_task\_policy} and returns \texttt{RandomIt} otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```cpp
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
hpx::traits::range_iterator_t<Rng> stable_sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range \([\text{first}, \text{last})\) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object \texttt{comp} (defaults to using operator\(<\)).

A sequence is sorted with respect to a comparator \texttt{comp} and a projection \texttt{proj} if for every iterator \( i \) pointing to the sequence and every non-negative integer \( n \) such that \( i + n \) is a valid iterator pointing
to an element of the sequence, and \( \text{INVOKED(comp, INVOKED(proj, *(i + n)), INVOKED(proj, *i)) == false} \).

\textit{comp} has to induce a strict weak ordering on the values.

The assignments in the parallel \textit{stable_sort} algorithm invoked without an execution policy object execute in sequential order in the calling thread.

\textbf{Note:} Complexity: \( O(N \log(N)) \), where \( N = \text{std::distance(first, last)} \) comparisons.

\textbf{Template Parameters}

- \textit{Rng} – The type of the source range used (deduced). The iterators extracted from this range must meet the requirements of an input iterator.
- \textit{Comp} – The type of the function/function object to use (deduced).
- \textit{Proj} – The type of an optional projection function. This defaults to \( \text{hpx::identity} \)

\textbf{Parameters}

- \textit{rng} – Refers to the sequence of elements the algorithm will be applied to.
- \textit{comp} – \textit{comp} is a callable object. The return value of the \text{INVOKED} operation applied to an object of type \text{Comp}, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that \text{comp} will not apply any non-constant function through the dereferenced iterator.
- \textit{proj} – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate \text{comp} is invoked.

\textbf{Returns} The \textit{stable_sort} algorithm returns \( \text{hpx::traits::range_iterator_t<Rng>} \). It returns \textit{last}.

```cpp
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> stable_sort(ExPolicy &&policy, Rng &&rng, Comp &&comp
  = Comp(), Proj &&proj
  = Proj())
```

Sorts the elements in the range \([\text{first}, \text{last})\) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object \text{comp} (defaults to using \text{operator<()}).

A sequence is sorted with respect to a comparator \text{comp} and a projection \text{proj} if for every iterator \( i \) pointing to the sequence and every non-negative integer \( n \) such that \( i + n \) is a valid iterator pointing to an element of the sequence, and \( \text{INVOKED(comp, INVOKED(proj, *(i + n)), INVOKED(proj, *i)) == false} \).

\textit{comp} has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type \text{sequenced_policy} execute in sequential order in the calling thread.
The application of function objects in parallel algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: \(O(N \log(N))\), where \(N = \text{std::distance(first, last)}\) comparisons.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

**Returns** The `stable_sort` algorithm returns a `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `hpx::traits::range_iterator_t<Rng>` otherwise. It returns `last`.

`hpx/parallel/container_algorithms/starts_with.hpp`

See `Public API` for a list of names and headers that are part of the public `HPX` API.

namespace `hpx`

namespace `ranges`

**Functions**

```cpp
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool starts_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by \([\text{first1, last1}]\) matches the prefix of the first range defined by \([\text{first2, last2}]\)

The assignments in the parallel `starts_with` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Linear: at most \(\min(N1, N2)\) applications of the predicate and both projections.
Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter1.
- **Iter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`.

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns

The `starts_with` algorithm returns `bool`. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
  hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> starts_with(ExPolicy &&policy,
  FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by `[first1, last1)` matches the prefix of the first range defined by `[first2, last2)`.

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.
Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns

The `starts_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```cpp
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool starts_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range `rng2` matches the prefix of the first range `rng1`.

The assignments in the parallel `starts_with` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.
this range type must meet the requirements of an forward iterator.

- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

**Parameters**
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

**Returns** The `starts_with` algorithm returns `bool`. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to,
          typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
  hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type
  starts_with(ExPolicy &&policy, Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(),
              Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range `rng2` matches the prefix of the first range `rng1`.

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
• **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`.

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.
• **rng1** – Refers to the source range.
• **rng2** – Refers to the destination range.
• **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

**Returns**

The `starts_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

### hpx/parallel/container_algorithms/swap_ranges.hpp

See **Public API** for a list of names and headers that are part of the public **HPX** API.

```cpp
namespace hpx
{

namespace ranges
{

### Functions

template<typename InIter1, typename Sent1, typename InIter2, typename Sent2>
swap_ranges_result<InIter1, InIter2> swap_ranges(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2)
Exchanges elements between range [first1, last1) and another range starting at first2.

The swap operations in the parallel `swap_ranges` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Linear in the distance between `first1` and `last1`

### Template Parameters

• **InIter1** – The type of the first range of iterators to swap (deduced).
• **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
• **InIter2** – The type of the second range of iterators to swap (deduced).
• **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

### Parameters

• **first1** – Refers to the beginning of the sequence of elements for the first range.

---

2.8. API reference 853
• **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
• **first2** – Refers to the beginning of the sequence of elements for the second range.
• **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

**Returns** The `swap_ranges` algorithm returns `swap_ranges_result<InIter1, InIter2>`. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<FwdIter1, FwdIter2>> swap_ranges(ExPolicy&& policy, FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2)
```

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

---

**Note:** Complexity: Linear in the distance between `first1` and `last1`

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for `FwdIter1`.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for `FwdIter2`.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.
**Returns** The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>` if the execution policy is of type `parallel_task_policy` and returns `FwdIter2` otherwise. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```
template<typename Rng1, typename Rng2>
swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>> swap_ranges(Rng1 &&rng1, Rng2 &&rng2)
```

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Linear in the distance between `first1` and `last1`

**Template Parameters**
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- `rng1` – Refers to the sequence of elements of the first range.
- `rng2` – Refers to the sequence of elements of the second range.

**Returns** The `swap_ranges` algorithm returns `swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>>`. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>>> swap_ranges(ExPolicy &&policy, Rng1 &&rng1, Rng2 &&rng2)
```

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.
Note: Complexity: Linear in the distance between first1 and last1

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns
The swap_ranges algorithm returns a `hpx::future<swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>>` if the execution policy is of type `parallel_task_policy` and returns `swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>`. otherwise.

The swap_ranges algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with first1 and the second element as the iterator to the element past the last element exchanged in the range beginning with first2.

hpx/parallel/container_algorithms/transform.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges

Functions

template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<FwdIter1, FwdIter2>>::type transform(ExPolicy&& policy, FwdIter1 first1, Sent1 last1, FwdIter2 dest, F&& f, Proj&& proj = Proj());
Applies the given function \( f \) to the given range \( \text{rng} \) and stores the result in another range, beginning at \( \text{dest} \).

The invocations of \( f \) in the parallel transform algorithm invoked with an execution policy object of type \text{sequenceed\_policy} execute in sequential order in the calling thread.

The invocations of \( f \) in the parallel transform algorithm invoked with an execution policy object of type \text{parallel\_policy} or \text{parallel\_task\_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Exactly \( \text{size(rng)} \) applications of \( f \)

### Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of \( f \).
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of \text{transform} requires \( F \) to meet the requirements of \text{Copy-Constructible}.
- **Proj** – The type of an optional projection function. This defaults to \text{hpx::identity}

### Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is an unary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret } \text{fun}(\text{const Type } &a);
\]

The signature does not need to have \text{const\&}. The type \text{Type} must be such that an object of type \text{FwdIter1} can be dereferenced and then implicitly converted to \text{Type}. The type \text{Ret} must be such that an object of type \text{FwdIter2} can be dereferenced and assigned a value of type \text{Ret}.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate \( f \) is invoked.

### Returns
The transform algorithm returns a \text{hpx::future<ranges::unary_transform_result<FwdIter1, FwdIter2>}> if the execution policy is of type \text{parallel\_task\_policy} and returns \text{ranges::unary_transform_result<FwdIter1, FwdIter2>} otherwise. The transform algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.
template<typename ExPolicy, typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>

parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<hpx::traits::range_iterator_t<Rng>, FwdIter>> transform(ExPolicy&& policy, Rng&& rng, FwdIter dest, F&& f, Proj&& proj = Proj())

Applies the given function \( f \) to the given range \( rng \) and stores the result in another range, beginning at \( dest \).

The invocations of \( f \) in the parallel transform algorithm invoked with an execution policy object of type \( \text{sequence}_{-}\text{policy} \) execute in sequential order in the calling thread.

The invocations of \( f \) in the parallel transform algorithm invoked with an execution policy object of type \( \text{parallel}_{-}\text{policy} \) or \( \text{parallel}_{-}\text{task}_{-}\text{policy} \) are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Exactly \( \text{size}(rng) \) applications of \( f \)

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of \( f \).
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of transform requires \( F \) to meet the requirements of Copy-Constructible.
- **Proj** – The type of an optional projection function. This defaults to hpx::identity

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is an unary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret } \text{fun}(\text{const Type } &a);
\]

The signature does not need to have const&. The type \( \text{Type} \) must be such that an object of type range_iterator\(<\text{Rng}>::\text{type} \) can be dereferenced and then implicitly converted to \( \text{Type} \). The type \( \text{Ret} \) must be such that an object of type OutIter can be dereferenced and...
assigned a value of type Ret.

• proj – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate f is invoked.

Returns The transform algorithm returns a `hpx::future<ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>>` if the execution policy is of type `parallel_task_policy` and returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>` otherwise.

The transform algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3, typename F = hpx::identity, typename Proj1 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>::type
transform(ExPolicy&& policy, FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2, FwdIter3 dest, F&& f, Proj1&& proj1 = Proj1(), Proj2&& proj2 = Proj2())
```

Applies the given function f to pairs of elements from two ranges: one defined by rng and the other beginning at first2, and stores the result in another range, beginning at dest.

The invocations of f in the parallel transform algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The invocations of f in the parallel transform algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Exactly size(rng) applications of f

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f.
• **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.

• **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.

• **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.

• **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.

• **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.

• **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `CopyConstructible`.

• **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to `hpx::identity`

• **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.

• **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.

• **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.

• **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.

• **dest** – Refers to the beginning of the destination range.

• **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter3` can be dereferenced and assigned a value of type `Ret`.

• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `f` is invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `f` is invoked.

**Returns** The `transform` algorithm returns a `hpx::future<ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>` if the execution policy is of type `parallel_task_policy` and returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>` otherwise. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2, typename FwdIter, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

860 Chapter 2. What’s so special about HPX?
Applies the given function \( f \) to pairs of elements from two ranges: one defined by \([\text{first1}, \text{last1})\) and the other beginning at \(\text{first2} \), and stores the result in another range, beginning at \(\text{dest}\).

The invocations of \( f \) in the parallel transform algorithm invoked with an execution policy object of type \textit{sequenced\_policy} execute in sequential order in the calling thread.

The invocations of \( f \) in the parallel transform algorithm invoked with an execution policy object of type \textit{parallel\_policy} or \textit{parallel\_task\_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

\textbf{Note:} Complexity: Exactly min(last2-first2, last1-first1) applications of \( f \)

\textbf{Note:} The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

\textbf{Template Parameters}
- \textbf{ExPolicy} – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of \( f \).
- \textbf{Rng1} – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \textbf{Rng2} – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \textbf{FwdIter} – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- \textbf{F} – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of transform requires \( F \) to meet the requirements of \textit{Copy\_Constructible}.
- \textbf{Proj1} – The type of an optional projection function to be used for elements of the first sequence. This defaults to \textit{hpx\::identity}
- \textbf{Proj2} – The type of an optional projection function to be used for elements of the second sequence. This defaults to \textit{hpx\::identity}
Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types `Type1` and `Type2` must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter` can be dereferenced and assigned a value of type `Ret`.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `f` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `f` is invoked.

Returns The `transform` algorithm returns a `hpx::future<ranges::binary_transform_result<
hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>,
FwdIter>>` if the execution policy is of type `parallel_task_policy` and returns `ranges::binary_transform_result<
hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter>` otherwise. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```cpp
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity>
ranges::unary_transform_result<FwdIter1, FwdIter2> transform(FwdIter1 first, Sent1 last, FwdIter2 dest, F &&f, Proj &&proj = Proj())
```

Applies the given function `f` to the given range `rng` and stores the result in another range, beginning at `dest`.

**Note:** Complexity: Exactly `size(rng)` applications of `f`
• **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
• **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret fun(const Type &a)};
\]

The signature does not need to have const&. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `Ret` must be such that an object of type `FwdIter2` can be dereferenced and assigned a value of type `Ret`.

• **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `f` is invoked.

**Returns** The `transform` algorithm returns `ranges::unary_transform_result<FwdIter1, FwdIter2>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename Rng, typename FwdIter, typename F = hpx::identity>
ranges::unary_transform_result<hpx::traits::range_iterator_t<Rng>, FwdIter> transform(Rng &&rng, FwdIter dest, F &f, Proj &&proj = Proj())
```

Applies the given function `f` to the given range `rng` and stores the result in another range, beginning at `dest`.

**Note:** Complexity: Exactly `size(rng)` applications of `f`

**Template Parameters**

• **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
• **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
• **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `CopyConstructible`.
• **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

• **rng** – Refers to the sequence of elements the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret fun(const Type &a)};
\]

The signature does not need to have const&. The type `Type` must be such that an object of type `range_iterator_t<Rng>::type` can be dereferenced and then implicitly converted to `Type`. The type `Ret` must be such that an object of type `OutIter` can be dereferenced and assigned a value of type `Ret`. 

2.8. API reference 863
• **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate \( f \) is invoked.

**Returns** The transform algorithm returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>`. The transform algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3> transform(FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2, FwdIter3 dest, F &&f, Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Applies the given function \( f \) to pairs of elements from two ranges: one defined by \( rng \) and the other beginning at \( \text{first2} \), and stores the result in another range, beginning at \( \text{dest} \).

**Note:** Complexity: Exactly \( \text{size}(rng) \) applications of \( f \)

**Template Parameters**
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires \( F \) to meet the requirements of `CopyConstructible`.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`

**Parameters**
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is a binary predicate. The signature of this predicate should be equivalent to:
The signature does not need to have const&. The types Type1 and Type2 must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to Type1 and Type2 respectively. The type Ret must be such that an object of type FwdIter3 can be dereferenced and assigned a value of type Ret.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate \( f \) is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate \( f \) is invoked.

**Returns** The `transform` algorithm returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```cpp
template<typename Rng1, typename Rng2, typename FwdIter, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter> transform(Rng1&& rng1, Rng2&& rng2, FwdIter dest, F&& f, Proj1&& proj1 = Proj1(), Proj2&& proj2 = Proj2())
```

Applies the given function \( f \) to pairs of elements from two ranges: one defined by \([\text{first1}, \text{last1})\) and the other beginning at \(\text{first2}\), and stores the result in another range, beginning at \(\text{dest}\).

**Note:** Complexity: Exactly min(last2-first2, last1-first1) applications of \( f \)

**Note:** The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

**Template Parameters**
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `CopyConstructible`.

• **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to `hpx::identity`

• **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`

**Parameters**

• **rng1** – Refers to the first sequence of elements the algorithm will be applied to.

• **rng2** – Refers to the second sequence of elements the algorithm will be applied to.

• **dest** – Refers to the beginning of the destination range.

• **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types `Type1` and `Type2` must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter` can be dereferenced and assigned a value of type `Ret`.

• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `f` is invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `f` is invoked.

**Returns** The `transform` algorithm returns `ranges::binary_transform_result<

hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

See *Public API* for a list of names and headers that are part of the public *HPX* API.
Functions

\[
\text{template<typename } \text{InIter}, \text{ typename } \text{Sent}, \text{ typename } \text{OutIter}, \text{ typename } \text{BinOp}, \text{ typename } \text{UnOp}, \text{ typename } \text{T} = \text{ typename std::iterator_traits<InIter>::value_type} > \\
\text{transform_exclusive_scan_result<InIter, OutIter> transform_exclusive_scan(InIter } \text{first, Sent } \text{last, OutIter } \text{dest, T } \text{init, BinOp } \&\&\text{binary_op, UnOp } \&\&\text{unary_op})
\]

Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of \(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{binary_op}, \text{init}, \text{conv}(\ast\text{first}),..., \text{conv}(\ast(\text{first} + (i - \text{result}) - 1)))\).

The reduce operations in the parallel transform_exclusive_scan algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither \(\text{conv}\) nor \(\text{op}\) shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first},\text{last})\) or \([\text{result},\text{result} + (\text{last} - \text{first}))\).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: \(O(\text{last} - \text{first})\) applications of the predicates \(\text{op}\) and \(\text{conv}\).

Note: \(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, \text{a1}, ..., \text{aN})\) is defined as:

- \(\text{a1}\) when \(\text{N}\) is \(1\)
- \(\text{op}\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, \text{a1}, ..., \text{aK}), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, \text{aM}, ..., \text{aN})\) where \(1 < \text{K+1} = \text{M} <\text{N}\).

Template Parameters

- \(\text{InIter}\) – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- \(\text{Sent}\) – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \(\text{InIter}\).
- \(\text{OutIter}\) – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- \(\text{T}\) – The type of the value to be used as initial (and intermediate) values (deduced).
- \(\text{BinOp}\) – The type of the binary function object used for the reduction operation.
- \(\text{UnOp}\) – The type of the unary function object used for the conversion operation.

Parameters

- \(\text{first}\) – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- \(\text{last}\) – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- \(\text{dest}\) – Refers to the beginning of the destination range.
- \(\text{init}\) – The initial value for the generalized sum.
- \(\text{binary_op}\) – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret } \text{fun}(\text{const Type1 } \&\text{a, const Type1 } \&\text{b});
\]
The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1 and Ret must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

\[
R \ fun(const \ Type &a);
\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

**Returns** The transform_exclusive_scan algorithm returns transform_exclusive_scan_result<InIter, OutIter>. The transform_exclusive_scan algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

**template**<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>

**parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_result<FwdIter1, FwdIter2>>::type** transform_exclusive_scan(ExPolicy&& policy, FwdIter1 first, Sent last, FwdIter2 dest, T init, BinOp&& binary_op, UnOp&& unary_op)

Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*((first + (i - \text{result}) - 1))))

The reduce operations in the parallel transform_exclusive_scan algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_exclusive_scan algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither conv nor op shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result, result + (last - first))

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \(O(\text{last} - \text{first})\) applications of the predicates op and conv.
Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- \(a1\) when \(N = 1\)
- \(\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a1, ..., aK), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, aM, ..., aN))\) where \(1 < K+1 = M \leq N\).

**Template Parameters**

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- `T` – The type of the value to be used as initial (and intermediate) values (deduced).
- `BinOp` – The type of the binary function object used for the reduction operation.
- `UnOp` – The type of the unary function object used for the conversion operation.

**Parameters**

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `dest` – Refers to the beginning of the destination range.
- `init` – The initial value for the generalized sum.
- `binary_op` – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- `unary_op` – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to Type. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns**

The `transform_exclusive_scan` algorithm returns a `std::future<transform_exclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_result<FwdIter1, FwdIter2>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.
transform_exclusive_scan_result<\texttt{hpx::traits::range_iterator_t<Rng>}, O> transform_exclusive_scan(Rng &&rng, O dest, T init, BinOp &&binary_op, UnOp &&unary_op)

Assigns through each iterator $i$ in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))).

The reduce operations in the parallel transform_exclusive_scan algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither conv nor op shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result, result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: $O(\text{last} - \text{first})$ applications of the predicates op and conv.

**Note:** GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:
- $a_1$ when $N$ is 1
- $\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a_1, \ldots, a_K), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a_M, \ldots, a_N))$ where $1 < K+1 = M \leq N$.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```c++
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1 and Ret must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The `transform_exclusive_scan` algorithm returns a returns `transform_exclusive_scan_result< traits::range_iterator_t<Rng>, O>`. The `transform_exclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O>>;
```

Assigns through each iterator \( i \) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, \text{conv}(*\text{first}), \ldots, \text{conv}(*\text{(first + (i - result) - 1)))`. The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \( O(\text{last} - \text{first}) \) applications of the predicates `op` and `conv`.

**Note:** `GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \ldots, a_N)` is defined as:
- \( a_1 \) when \( N = 1 \)
• \( \text{op}(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_1, \ldots, a_K), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_M, \ldots, a_N)) \) where \( 1 < K+1 = M \leq N \).

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns**

The `transform_exclusive_scan` algorithm returns an `hpx::future<transform_exclusive_scan_result<traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_scan_result<traits::range_iterator_t<Rng>, O>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.
namespace hpx

namespace ranges

**Functions**

```cpp
<InIter, OutIter, BinOp, UnOp> transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last, OutIter dest, BinOp &&binary_op, UnOp &&unary_op)
```

Assigns through each iterator \( i \) in \([result, result + (last - first))\) the value of generalized_noncommutative_sum\( (op, conv(*first), \ldots, conv(*(first + (i - result))))\).

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges \([first, last)\) or \([result, result + (last - first))\).

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \( O(last - first) \) applications of the predicates `op` and `conv`.

**Note:** `GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \ldots, a_N)` is defined as:
- \( a_1 \) when \( N = 1 \)
- \( \text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, a_1, \ldots, a_K), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, a_M, \ldots, a_N)) \) where \( 1 < K+1 = M \leq N \).

**Template Parameters**
- `InIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- `OutIter` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- `BinOp` – The type of the binary function object used for the reduction operation.
- `UnOp` – The type of the unary function object used for the conversion operation.

**Parameters**
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `dest` – Refers to the beginning of the destination range.
• **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

• **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The `transform_inclusive_scan` algorithm returns `transform_inclusive_scan_result<InIter, OutIter>`. The `transform_inclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp, typename UnOp>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type transform_inclusive_scan(
    ExPolicy &&policy,
    FwdIter1 first,
    Sent last,
    FwdIter2 dest,
    BinOp &&binary_op,
    UnOp &&unary_op)
```

Assigns through each iterator `i` in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first, last)` or `[result, result + (last - first))`.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.
Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates \textit{op} and \textit{conv}.

Note: \textsc{GENERALIZED\_NONCOMMUTATIVE\_SUM}\(\text{op, a1, \ldots, aN}\) is defined as:
\begin{itemize}
  \item a1 when N is 1
  \item \textit{op}\(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op, a1, \ldots, aK}), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op, aM, \ldots, aN})\) where \(1 < K+1 = M \leq N\).
\end{itemize}

Template Parameters
\begin{itemize}
  \item \textit{ExPolicy} – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
  \item \textit{FwdIter1} – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
  \item \textit{Sent} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \textit{FwdIter}.
  \item \textit{FwdIter2} – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
  \item \textit{BinOp} – The type of the binary function object used for the reduction operation.
  \item \textit{UnOp} – The type of the unary function object used for the conversion operation.
\end{itemize}

Parameters
\begin{itemize}
  \item \textit{policy} – The execution policy to use for the scheduling of the iterations.
  \item \textit{first} – Refers to the beginning of the sequence of elements the algorithm will be applied to.
  \item \textit{last} – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
  \item \textit{dest} – Refers to the beginning of the destination range.
  \item \textit{binary\_op} – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:
  \begin{verbatim}
  Ret fun(const Type1 &a, const Type1 &b);
  \end{verbatim}
  The signature does not need to have const&, but the function must not modify the objects passed to it. The types \textit{Type1} and \textit{Ret} must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
  \item \textit{unary\_op} – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is a unary predicate. The signature of this predicate should be equivalent to:
  \begin{verbatim}
  R fun(const Type &a);
  \end{verbatim}
  The signature does not need to have const&, but the function must not modify the objects passed to it. The type \textit{Type} must be such that an object of type \textit{FwdIter1} can be dereferenced and then implicitly converted to Type. The type \textit{R} must be such that an object of this type can be implicitly converted to \textit{T}.
\end{itemize}

Returns The \textit{transform\_inclusive\_scan} algorithm returns a \textit{hpx::future\:<transform\_inclusive\_result\:<FwdIter1, FwdIter2>>} if the execution policy is of type \textit{sequenced\_task\_policy} or \textit{parallel\_task\_policy} and returns \textit{transform\_inclusive\_result\:<FwdIter1, FwdIter2>} otherwise. The \textit{transform\_inclusive\_scan} algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

2.8. API reference 875
template<
    typename Rng,
    typename O,
    typename BinOp,
    typename UnOp
>
transform_inclusive_scan_result<
    hpx::traits::range_iterator_t<Rng>,
    O>
transform_inclusive_scan(
    Rng &&rng,
    O dest,
    BinOp &&binary_op,
    UnOp &&unary_op)

Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), \ldots, conv(*((first + (i - \text{result})))).

The reduce operations in the parallel transform_inclusive_scan algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither \textit{conv} nor \textit{op} shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first},\text{last})\) or \([\text{result},\text{result} + (\text{last} - \text{first}))\).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

\textbf{Note:} Complexity: \(O(\text{last} - \text{first})\) applications of the predicates \textit{op} and \textit{conv}.

\textbf{Note:} GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, \ldots, aN) is defined as:
- \(a1\) when \(N\) is 1
- \(\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, \ldots, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, \ldots, aN})\) where \(1 < K+1 = M \leq N\).

\textbf{Template Parameters}
- \textit{Rng} – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \textit{O} – The type of the iterator representing the destination range (deduced).
- \textit{BinOp} – The type of the binary function object used for the reduction operation.
- \textit{UnOp} – The type of the unary function object used for the conversion operation.

\textbf{Parameters}
- \textit{rng} – Refers to the sequence of elements the algorithm will be applied to.
- \textit{dest} – Refers to the beginning of the destination range.
- \textit{binary_op} – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret } \text{fun}(\text{const } \text{Type1 } &a, \text{ const } \text{Type1 } &b);
\]

The signature does not need to have \text{const}\&, but the function must not modify the objects passed to it. The types \text{Type1} and \text{Ret} must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- \textit{unary_op} – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is a unary predicate. The signature of this predicate should be equivalent to:
R fun(const Type &a);

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

Returns The transform_inclusive_scan algorithm returns a returns transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>. The transform_inclusive_scan algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

Template Parameters
- ExPolicy – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it
executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to Type. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<InIter>::value_type>
transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last, OutIter dest, BinOp &&binary_op, UnOp &&unary_op, T init)
```

Assigns through each iterator `i` in `[result, result + (last - first))` the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))).

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first)).`
The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: $O(last - first)$ applications of the predicates \textit{op} and \textit{conv}.

**Note:** \textsc{GeneralizedNoncommutativeSum}(\textit{op}, a1, \ldots, aN) is defined as:
- \textit{a1} when \textit{N} is 1
- \textit{op}(\textsc{GeneralizedNoncommutativeSum}(\textit{op}, a1, \ldots, aK), \textsc{GeneralizedNoncommutativeSum}(\textit{op}, aM, \ldots, aN)) where $1 < K+1 = M <= N$.

**Template Parameters**
- \textbf{InIter} – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- \textbf{Sent} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \textit{InIter}.
- \textbf{OutIter} – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- \textbf{BinOp} – The type of the binary function object used for the reduction operation.
- \textbf{UnOp} – The type of the unary function object used for the conversion operation.
- \textbf{T} – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**
- \textbf{first} – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- \textbf{last} – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- \textbf{dest} – Refers to the beginning of the destination range.
- \textbf{binary\_op} – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

\begin{verbatim}
Ret fun(const Type1 &a, const Type1 &b);
\end{verbatim}

The signature does not need to have const\&, but the function must not modify the objects passed to it. The types \textit{Type1} and \textit{Ret} must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- \textbf{unary\_op} – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \textit{[first, last)}. This is a unary predicate. The signature of this predicate should be equivalent to:

\begin{verbatim}
R fun(const Type &a);
\end{verbatim}

The signature does not need to have const\&, but the function must not modify the objects passed to it. The type \textit{Type} must be such that an object of type \textit{FwdIter1} can be dereferenced and then implicitly converted to \textit{Type}. The type \textit{R} must be such that an object of this type can be implicitly converted to \textit{T}.

- \textbf{init} – The initial value for the generalized sum.

**Returns** The transform_inclusive_scan algorithm returns transform_inclusive_scan_result\textit{<InIter, OutIter>}. The transform_inclusive_scan algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.
Assigns through each iterator $i$ in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*\text{first} + (i - \text{result})))).

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither conv nor op shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first, last})$ or $[\text{result, result} + (\text{last} - \text{first}))$.

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: $O(\text{last} - \text{first})$ applications of the predicates $\text{op}$ and $\text{conv}$.

**Note:** GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:
- $a1$ when $N$ is 1
- $\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a1, \ldots, aK), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, aM, \ldots, aN))$ where $1 < K+1 = M <= N$.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

• **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

• **dest** – Refers to the beginning of the destination range.

• **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret \ fun(const Type}_1 \ &a, \ \text{const Type}_1 \ &b);\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The types \text{Type}_1 and \text{Ret} must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

• **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is a unary predicate. The signature of this predicate should be equivalent to:

\[
\text{R \ fun(const Type} \ &a);\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The type \text{Type} must be such that an object of type \text{FwdIter1} can be dereferenced and then implicitly converted to \text{Type}. The type \text{R} must be such that an object of this type can be implicitly converted to \text{T}.

• **init** – The initial value for the generalized sum.

**Returns** The \text{transform_inclusive_scan} algorithm returns a \text{hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>}} if the execution policy is of type \text{sequenced_task_policy} or \text{parallel_task_policy} and returns \text{transform_inclusive_result<FwdIter1, FwdIter2> otherwise. The transform_inclusive_scan} algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

\[
\text{transform_inclusive_scan_result<hpx::traits::range_iterator} <\text{Rng}> <\text{T}= \text{typename std::iterator_traits<hpx::traits::range_iterator} <\text{Rng}>::value} _{\text{type}} \text{> \ transform_inclusive_scan} (\text{Rng} \&\&\text{rng}, \text{O} \text{dest}, \text{BinOp} \&\&\text{binary_op}, \text{UnOp} \&\&\text{unary_op}, \text{T} \text{init})\]

Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of \text{GENERALIZED_NONCOMMUTATIVE_SUM} \((\text{binary_op, init, conv(*first), \ldots, conv(*first + (i - result)))})

The reduce operations in the parallel \text{transform_inclusive_scan} algorithm invoked without an execution policy object execute in sequential order in the calling thread.
Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))].

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

**Note:** Complexity: $O(last - first)$ applications of the predicates `op` and `conv`.

**Note:** `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, \ldots, aN)` is defined as:
- $a_1$ when $N$ is 1
- $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \ldots, a_K), GENERALIZED_NONCOMMUTATIVE_SUM(op, a_{M}, \ldots, a_N))$ where $1 < K+1 = M \leq N$.

**Template Parameters**
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `O` – The type of the iterator representing the destination range (deduced).
- `BinOp` – The type of the binary function object used for the reduction operation.
- `UnOp` – The type of the unary function object used for the conversion operation.
- `T` – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**
- `rng` – Refers to the sequence of elements the algorithm will be applied to.
- `dest` – Refers to the beginning of the destination range.
- `binary_op` – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- `unary_op` – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.
- `init` – The initial value for the generalized sum.

**Returns** The `transform_inclusive_scan` algorithm returns a returns `transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>`. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename traits::range_iterator_t<Rng>::value_type>
```
Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of \(\text{GENERALIZED_NONCOMMUTATIVE\_SUM}(\text{binary\_op}, \text{init}, \text{conv}(\text{*first}), \ldots, \text{conv}(\text{*(first + (i - result))}))\).

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither \(\text{conv}\) nor \(\text{op}\) shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first}, \text{last})\) or \([\text{result}, \text{result} + (\text{last} - \text{first}))\).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \(O(\text{last} - \text{first})\) applications of the predicates \(\text{op}\) and \(\text{conv}\).

**Note:** \(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_1, \ldots, a_N)\) is defined as:
- \(a_1\) when \(N = 1\)
- \(\text{op}(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_1, \ldots, a_K), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_M, \ldots, a_N))\) where \(1 < K + 1 = M <= N\).

**Template Parameters**
- \(\text{ExPolicy}\) – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- \(\text{Rng}\) – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- \(\text{O}\) – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- \(\text{BinOp}\) – The type of the binary function object used for the reduction operation.
- \(\text{UnOp}\) – The type of the unary function object used for the conversion operation.
- \(\text{T}\) – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**
- \(\text{policy}\) – The execution policy to use for the scheduling of the iterations.
• **rng** – Refers to the sequence of elements the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

• **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

• **init** – The initial value for the generalized sum.

**Returns** The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

### hpx/parallel/container_algorithms/transform_reduce.hpp

See **Public API** for a list of names and headers that are part of the public **HPX** API.

namespace **hpx**

#### Functions

```cpp
template<typename ExPolicy, typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.
The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: $O(last - first)$ applications of the predicates `red_op` and `conv_op`.

**Note:** `GENERALIZED_SUM(op, a_1, \ldots, a_N)` is defined as follows:

- $a_1$ when $N$ is 1
- $op(GENERALIZED_SUM(op, b_1, \ldots, b_K), GENERALIZED_SUM(op, b_M, \ldots, b_N))$, where:
  - $b_1, \ldots, b_N$ may be any permutation of $a_1, \ldots, a_N$ and
  - $1 < K+1 = M \leq N$.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of `conv_op`. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1`, `Type2`, and `Ret` must be such that an object of a type as returned from `conv_op` can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:
R \texttt{fun(const Type &a);} 

The signature does not need to have const&, but the function must not modify the objects passed to it. The type \textit{Type} must be such that an object of type \textit{Iter} can be dereferenced and then implicitly converted to \textit{Type}. The type \textit{R} must be such that an object of this type can be implicitly converted to \textit{T}.

\textbf{Returns} The \textit{transform_reduce} algorithm returns a \texttt{hpx::future<T>} if the execution policy is of type \textit{parallel_task_policy} and returns \textit{T} otherwise. The \textit{transform_reduce} algorithm returns the result of the generalized sum over the values returned from \textit{conv_op} when applied to the elements given by the input range \([\texttt{first}, \texttt{last})).

\begin{verbatim}
template<typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
T transform_reduce(Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)
\end{verbatim}

Returns \texttt{GENERALIZED\_SUM(red_op, init, conv_op(*first), \ldots, conv_op(*(first + (last - first) - 1)))}.

The difference between \textit{transform_reduce} and \textit{accumulate} is that the behavior of \textit{transform_reduce} may be non-deterministic for non-associative or non-commutative binary predicate.

\textbf{Note:} Complexity: \(O(last - first)\) applications of the predicates \textit{red_op} and \textit{conv_op}.

\textbf{Note:} \texttt{GENERALIZED\_SUM(op, a1, \ldots, aN)} is defined as follows:

- \(a1\) when \(N\) is 1
- \(op(\texttt{GENERALIZED}\_\texttt{SUM}(op, b1, \ldots, bK), \texttt{GENERALIZED}\_\texttt{SUM}(op, bM, \ldots, bN))\), where:
  - \(b1, \ldots, bN\) may be any permutation of \(a1, \ldots, aN\) and
  - \(1 < K+1 = M <= N\).

\textbf{Template Parameters}

- \textit{Iter} – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- \textit{Sent} – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for \textit{Iter}.
- \textit{T} – The type of the value to be used as initial (and intermediate) values (deduced).
- \textit{Reduce} – The type of the binary function object used for the reduction operation.
- \textit{Convert} – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

\textbf{Parameters}

- \textit{first} – Refers to the beginning of the first sorted range the algorithm will be applied to.
- \textit{last} – Refers to the end of the second sorted range the algorithm will be applied to.
- \textit{init} – The initial value for the generalized sum.
- \textit{red\_op} – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of \textit{conv\_op}. This is a binary predicate. The signature of this predicate should be equivalent to:
Ret fun(const Type1 &a, const Type2 &b);

The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1, Type2, and Ret must be such that an object of a type as returned from conv_op can be implicitly converted to any of those types.

- conv_op – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

R fun(const Type &a);

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type Iter can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

Returns The transform_reduce algorithm returns T. The transform_reduce algorithm returns the result of the generalized sum over the values returned from conv_op when applied to the elements given by the input range [first, last).

template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter first, Sent last, Iter2 first2, T init)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*((first + (last - first) - 1)))).

The reduce operations in the parallel transform_reduce algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_reduce algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between transform_reduce and accumulate is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(last - first) applications of the predicates red_op and conv_op.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - 1 < K+1 = M <= N.

Template Parameters

2.8. API reference 887
• **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

• **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.

• **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.

• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.

• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

### Returns

The `transform_reduce` algorithm returns a `hpx::future<T>` if the execution policy is of type `parallel_task_policy` and returns `T` otherwise. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`.

```
template<typename Iter, typename Sent, typename Iter2, typename T>
T transform_reduce(Iter first, Sent last, Iter2 first2, T init)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1)))`.

The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: \(O(last - first)\) applications of the predicates `red_op` and `conv_op`.

**Note:** `GENERALIZED_SUM(op, a_1, \ldots, a_N)` is defined as follows:

- \(a_1\) when \(N = 1\)
- \(\text{op}(\text{GENERALIZED_SUM}(op, b_1, \ldots, b_K), \text{GENERALIZED_SUM}(op, b_M, \ldots, b_N))\), where:
  - \(b_1, \ldots, b_N\) may be any permutation of \(a_1, \ldots, a_N\) and
  - \(1 < K+1 = M \leq N\).

### Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
• **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.

• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.

• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

### Returns
The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```cpp
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*first + (last - first - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: O(last - first) applications of the predicates red_op and conv_op.

**Note:** GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - 1 < K+1 = M <= N.

### Template Parameters
• **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

• **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.

• **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.

• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.

• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

• **Reduce** – The type of the binary function object used for the reduction operation.

• **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.

• **last** – Refers to the end of the second sorted range the algorithm will be applied to.

• **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

• **init** – The initial value for the generalized sum.

• **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of **conv_op**. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types **Type1**, **Type2**, and **Ret** must be such that an object of a type as returned from **conv_op** can be implicitly converted to any of those types.

• **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type **Type** must be such that an object of type **Iter** can be dereferenced and then implicitly converted to Type. The type **R** must be such that an object of this type can be implicitly converted to **T**.

**Returns** The **transform_reduce** algorithm returns a `hpx::future<T>` if the execution policy is of type **parallel_task_policy** and returns **T** otherwise. The **transform_reduce** algorithm returns the result of the generalized sum over the values returned from **conv_op** when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
```
\( T \text{ transform\_reduce}(\text{Iter} \ first, \text{Sent} \ last, \text{Iter2} \ first2, \ T \ init, \text{Reduce} \ \&\&\ red\_op, \text{Convert} \ \&\&\ conv\_op) \)

Returns \( \text{GENERALIZED\_SUM}(\text{red\_op}, \ init, \ \text{conv\_op}(\ast\ first), \ldots, \ \text{conv\_op}(\ast(\ first + (last - first) - 1))) \).

The difference between \( \text{transform\_reduce} \) and \( \text{accumulate} \) is that the behavior of \( \text{transform\_reduce} \) may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: \( O(last - first) \) applications of the predicates \( red\_op \) and \( conv\_op \).

**Note:** \( \text{GENERALIZED\_SUM}(\text{op}, a1, \ldots, aN) \) is defined as follows:

- \( a1 \) when \( N \) is 1
- \( \text{op}(\text{GENERALIZED\_SUM}(\text{op}, b1, \ldots, bK), \text{GENERALIZED\_SUM}(\text{op}, bM, \ldots, bN)) \), where:
  - \( b1, \ldots, bN \) may be any permutation of \( a1, \ldots, aN \) and
  - \( 1 < K+1 = M <= N \).

**Template Parameters**

- \( \text{Iter} \) – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- \( \text{Sent} \) – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- \( \text{Iter2} \) – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- \( \ T \) – The type of the value to be used as initial (and intermediate) values (deduced).
- \( \text{Reduce} \) – The type of the binary function object used for the reduction operation.
- \( \text{Convert} \) – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- \( \text{first} \) – Refers to the beginning of the first sorted range the algorithm will be applied to.
- \( \text{last} \) – Refers to the end of the second sorted range the algorithm will be applied to.
- \( \text{first2} \) – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- \( \text{init} \) – The initial value for the generalized sum.
- \( \text{red\_op} \) – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of \( \text{conv\_op} \). This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret fun(const Type1 &a, const Type2 &b)};\]

The signature does not need to have \text{const}, but the function must not modify the objects passed to it. The types \( \text{Type1}, \text{Type2}, \) and \( \text{Ret} \) must be such that an object of a type as returned from \( \text{conv\_op} \) can be implicitly converted to any of those types.
• **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

\[
R \text{ fun}\left(const\ Type &a);\]

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `Iter` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The `transform_reduce` algorithm returns `T`. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng &&rng, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*first + (last - first) - 1))`.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: \( O(last - first) \) applications of the predicates `red_op` and `conv_op`.

**Note:** `GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - 1 < K+1 = M <= N.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

• **Reduce** – The type of the binary function object used for the reduction operation.

• **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **rng** – Refers to the sequence of elements the algorithm will be applied to.

• **init** – The initial value for the generalized sum.

• **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of **conv_op**. This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret } \text{fun}(\text{const Type1 &a, const Type2 &b});
\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1, Type2, and Ret must be such that an object of a type as returned from **conv_op** can be implicitly converted to any of those types.

• **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

\[
\text{R } \text{fun}(\text{const Type &a});
\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type Iter can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

**Returns** The **transform_reduce** algorithm returns a hpx::future<T> if the execution policy is of type parallel_task_policy and returns T otherwise. The **transform_reduce** algorithm returns the result of the generalized sum over the values returned from **conv_op** when applied to the elements given by the input range [first, last).

\[
\text{template<typename Rng, typename T, typename Reduce, typename Convert>}
\]

\[
\text{T } \text{transform_reduce}(\text{Rng &amp;rng, T init, Reduce &amp;red_op, Convert &amp;conv_op})
\]

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*((first + (last - first) - 1)))).

The difference between **transform_reduce** and **accumulate** is that the behavior of **transform_reduce** may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: O(last - first) applications of the predicates red_op and conv_op.

**Note:** GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

• a1 when N is 1

• op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
  – b1, ..., bN may be any permutation of a1, ..., aN and
- \( 1 < K+1 = M \leq N \).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of `conv_op`. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1`, `Type2`, and `Ret` must be such that an object of a type as returned from `conv_op` can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `Iter` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_reduce` algorithm returns `T`. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`. The operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread. The operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

```cpp
template<typename ExPolicy, typename Rng, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

The operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.
Note: Complexity: $O(last - first)$ applications of the predicate $op2$.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

**Returns** The `transform_reduce` algorithm returns `hpx::future<T>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `T` otherwise.

```cpp
template<typename Rng, typename Iter2, typename T>
T transform_reduce(Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

Note: Complexity: $O(last - first)$ applications of the predicate $op2$.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

**Returns** The `transform_reduce` algorithm returns `T`.
template<
    typename ExPolicy,
    typename Rng,
    typename Iter2,
    typename T,
    typename Reduce,
    typename Convert>

hpx::parallel::util::detail::algorithm_result_t<
    ExPolicy, T>
transform_reduce(
    ExPolicy &&policy,
    Rng &&rng,
    Iter2 &&first2,
    T init,
    Reduce &&red_op,
    Convert &&conv_op)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel transform_reduce algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The operations in the parallel transform_reduce algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: \(O(last - first)\) applications of the predicate op2.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return) values (deduced).

- **Reduce** – The type of the binary function object used for the multiplication operation.

- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.

- **init** – The initial value for the sum.

- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of op2. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```c
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Ret must be such that it can be implicitly converted to a type of T.
• **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```cpp
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Ret` must be such that it can be implicitly converted to an object for the second argument type of `op1`.

**Returns** The `transform_reduce` algorithm returns a `hpx::future<T>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `T` otherwise.

```cpp
template<typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
T transform_reduce(Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

**Note:** Complexity: \(O(last - first)\) applications of the predicate `op2`.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of `op2`. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Ret` must be such that it can be implicitly converted to a type of `T`.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```cpp
Ret fun(const Type1 &a, const Type2 &b);
```
The signature does not need to have const&, but the function must not modify the objects passed to it. The type Ret must be such that it can be implicitly converted to an object for the second argument type of op1.

**Returns**  The `transform_reduce` algorithm returns T.

**hpx/parallel/container_algorithms/uninitialized_copy.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges

**Functions**

template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>

hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_copy(InIter first1, Sent1 last1,

FwdIter first2, Sent2 last2)

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel `uninitialized_copy` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns**  The `uninitialized_copy` algorithm returns an `in_out_result<InIter, FwdIter>`. The `uninitialized_copy` algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized_copy(ExPolicy&& policy, FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2)

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel uninitialized_copy algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_copy algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The uninitialized_copy algorithm returns a hpx::future<in_out_result<InIter, FwdIter>>, if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns in_out_result<InIter, FwdIter> otherwise. The uninitialized_copy algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.
Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel `uninitialized_copy` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**
- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

**Returns** The `uninitialized_copy` algorithm returns an `in_out_result<`typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>`.

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel `uninitialized_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
• **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

• **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **rng1** – Refers to the range from which the elements will be copied from.

• **rng2** – Refers to the range to which the elements will be copied to.

**Returns** The `uninitialized_copy` algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `in_out_result<` type-name `hpx::traits::range_traits<Rng1>::iterator_type ,` type-name `hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The `uninitialized_copy` algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_copy_n(InIter first1, Size count, FwdIter first2, Sent2 last2)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel `uninitialized_copy_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

---

**Note:** Complexity: Performs exactly `last - first` assignments.

---

**Template Parameters**

• **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.

• **Size** – The type of the argument specifying the number of elements to apply `f` to.

• **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

• **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.

**Parameters**

• **first1** – Refers to the beginning of the sequence of elements that will be copied from.

• **count** – Refers to the number of elements starting at `first` the algorithm will be applied to.

• **first2** – Refers to the beginning of the destination range.

• **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The `uninitialized_copy_n` algorithm returns `in_out_result<InIter, FwdIter>`. The `uninitialized_copy_n` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```
Copies the elements in the range \([\text{first}, \text{first} + \text{count})\), starting from \text{first} and proceeding to \text{first} + \text{count} - 1., to another range beginning at \text{dest}. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel \texttt{uninitialized_copy_n} algorithm invoked with an execution policy object of type \texttt{sequenced_policy} execute in sequential order in the calling thread.

The assignments in the parallel \texttt{uninitialized_copy_n} algorithm invoked with an execution policy object of type \texttt{parallel_policy} or \texttt{parallel_task_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

\textbf{Note:} Complexity: Performs exactly \texttt{last - first} assignments.

\textbf{Template Parameters}

- \texttt{ExPolicy} – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- \texttt{FwdIter1} – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- \texttt{Size} – The type of the argument specifying the number of elements to apply \texttt{f} to.
- \texttt{FwdIter2} – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- \texttt{Sent2} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \texttt{InIter2}.

\textbf{Parameters}

- \texttt{policy} – The execution policy to use for the scheduling of the iterations.
- \texttt{first1} – Refers to the beginning of the sequence of elements that will be copied from
- \texttt{count} – Refers to the number of elements starting at \texttt{first} the algorithm will be applied to.
- \texttt{first2} – Refers to the beginning of the destination range.
- \texttt{last2} – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

\textbf{Returns} The \texttt{uninitialized_copy_n} algorithm returns a \texttt{hpx::future\langle\textit{in\_out\_result\langle\textit{FwdIter1, FwdIter2>>}}} if the execution policy is of type \texttt{sequenced\_task\_policy} or \texttt{parallel\_task\_policy} and returns \texttt{FwdIter2} otherwise. The \texttt{uninitialized\_copy\_n} algorithm returns the output iterator to the element in the destination range, one past the last element copied.

Functions

template<typename FwdIter, typename Sent>
FwdIter uninitialized_default_construct(FwdIter first, Sent last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_default_construct algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly last - first assignments.

Template Parameters
• FwdIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
• Sent – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters
• first – Refers to the beginning of the sequence of elements the algorithm will be applied to.
• last – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The uninitialized_default_construct algorithm returns a returns FwdIter. The uninitialized_default_construct algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename ExPolicy, typename FwdIter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_default_construct(ExPolicy &&policy, FwdIter first, Sent last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_default_construct algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.
The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

**Returns** The `uninitialized_default_construct` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The `uninitialized_default_construct` algorithm returns the iterator to the element in the source range, one past the last element constructed.

**Template Parameters**
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- **rng** – Refers to the range to which will be default constructed.

**Returns** The `uninitialized_default_construct` algorithm returns a returns `hpx::traits::range_traits<Rng>::iterator_type`. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy**, **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- **rng** – Refers to the range to which will be default constructed.

**Returns** The `uninitialized_default_construct` algorithm returns a returns `hpx::traits::range_traits<Rng>::iterator_type`. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.
designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng` – Refers to the range to which the value will be default constructed

**Returns** The `uninitialized_default_construct` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

```cpp
template<typename FwdIter, typename Size>
FwdIter uninitialized_default_construct_n(FwdIter first, Size count)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct_n` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly count assignments, if count > 0, no assignments otherwise.

**Template Parameters**
- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- `Size` – The type of the argument specifying the number of elements to apply f to.

**Parameters**
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `count` – Refers to the number of elements starting at first the algorithm will be applied to.

**Returns** The `uninitialized_default_construct_n` algorithm returns a returns `FwdIter`. The `uninitialized_default_construct_n` algorithm returns the iterator to the element in the source range, one past the last element constructed.
template<typename ExPolicy, typename FwdIter, typename Size>

parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type

uninitialized_default_construct_n(ExPolicy &&policy, FwdIter first, Size count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_default_construct_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_default_construct_n algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly count assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.

Returns The uninitialized_default_construct_n algorithm returns a hpx::future<FwdIter> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns FwdIter otherwise. The uninitialized_default_construct_n algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx/parallel/container_algorithms/uninitialized_fill.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges
Functions

```
template<typename FwdIter, typename Sent, typename T>
FwdIter uninitialized_fill(FwdIter first, Sent last, T const &value)
```

Copies the given value to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges uninitialized_fill algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Linear in the distance between first and last

**Template Parameters**
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

**Parameters**
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

**Returns** The uninitialized_fill algorithm returns a returns FwdIter. The uninitialized_fill algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
hpx::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_fill(ExPolicy &&policy, FwdIter first, Sent last, T const &value)
```

Copies the given value to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_fill algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_fill algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear in the distance between first and last

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it
executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

**Returns** The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```cpp
template<typename Rng, typename T>
hpx::traits::range_traits<Rng>::iterator_type
uninitialized_fill(Rng &&rng, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Linear in the distance between first and last

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

**Returns** The *uninitialized_fill* algorithm returns a returns

```cpp
template<typename ExPolicy, typename Rng, typename T>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng1>::iterator_type>::type
uninitialized_fill(ExPolicy &&policy, Rng &&rng, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of
type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_fill` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear in the distance between `first` and `last`

---

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

**Returns** The `uninitialized_fill` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_fill` algorithm returns the iterator to one past the last element filled in the range.

---

template<typename FwdIter, typename Size, typename T>

`FwdIter uninitialized_fill_n(FwdIter first, Size count, T const &value)`

Copies the given `value` value to the first `count` elements in an uninitialized memory area beginning at `first`. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_fill_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `count` assignments, if `count` > 0, no assignments otherwise.

---

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply `f` to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at `first` the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns** The `uninitialized_fill_n` algorithm returns a returns `FwdIter`. The `uninitialized_fill_n` algorithm returns the output iterator to the element in the range, one past the last element copied.

---

template<typename ExPolicy, typename FwdIter, typename Size, typename T>
Copies the given value value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_fill_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_fill_n algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly count assignments, if count > 0, no assignments otherwise.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- `Size` – The type of the argument specifying the number of elements to apply f to.
- `T` – The type of the value to be assigned (deduced).

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `count` – Refers to the number of elements starting at `first` the algorithm will be applied to.
- `value` – The value to be assigned.

**Returns** The uninitialized_fill_n algorithm returns a hpx::future<FwdIter>, if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns FwdIter otherwise. The uninitialized_fill_n algorithm returns the output iterator to the element in the range, one past the last element copied.

**See Public API for a list of names and headers that are part of the public HPX API.**
Functions

```cpp
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move(InIter first1, Sent1 last1,
  FwdIter first2, Sent2 last2)
```

Moves the elements in the range, defined by \([\text{first}, \text{last})\), to an uninitialized memory area beginning at \(dest\). If an exception is thrown during the initialization, some objects in \([\text{first}, \text{last})\) are left in a valid but unspecified state.

The assignments in the parallel `uninitialized_move` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly \(\text{last} - \text{first}\) assignments.

**Template Parameters**
- `InIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Sent1` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- `FwdIter` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter2`.

**Parameters**
- `first1` – Refers to the beginning of the sequence of elements that will be moved from
- `last1` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The `uninitialized_move` algorithm returns an `in_out_result<InIter, FwdIter>`. The `uninitialized_move` algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized_move(ExPolicy&& policy, FwdIter1 first1, Sent1 last1,
  FwdIter2 first2, Sent2 last2)
```

Moves the elements in the range, defined by \([\text{first}, \text{last})\), to an uninitialized memory area beginning at \(dest\). If an exception is thrown during the initialization, some objects in \([\text{first}, \text{last})\) are left in a valid but unspecified state.
The assignments in the parallel `uninitialized_move` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_move` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Sent1` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter2`.

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements that will be moved from
- `last1` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns**
The `uninitialized_move` algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `in_out_result<InIter, FwdIter>` otherwise. The `uninitialized_move` algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng1, typename Rng2>
hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>
uninitialized_move(Rng1&& rng1, Rng2&& rng2)
```

Moves the elements in the range, defined by `[first, last)`, to an uninitialized memory area beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, last)` are left in a valid but unspecified state.

The assignments in the parallel `uninitialized_move` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters**
• **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

• **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

**Returns**

The `uninitialized_move` algorithm returns an `in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>`. The `uninitialized_move` algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>>
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at `dest`. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel `uninitialized_move` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_move` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

**Returns**

The `uninitialized_move` algorithm returns a `hpx::future<in_out_result<Inter, FwdIter>>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The `uninitialized_move` algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

---

2.8. API reference 913
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move_n(InIter first1, Size count, 
FwdIter first2, Sent2 last2)

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel uninitialized_move_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly count movements, if count > 0, no move operations otherwise.

**Template Parameters**
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply \( f \) to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**
- **first1** – Refers to the beginning of the sequence of elements that will be moved from.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The uninitialized_move_n algorithm returns in_out_result<InIter, FwdIter>. The uninitialized_move_n algorithm returns the output iterator to the element in the destination range, one past the last element moved.

template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized_move_n

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel uninitialized_move_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.
The assignments in the parallel `uninitialized_move_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly `count` movements, if `count > 0`, no move operations otherwise.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Size` – The type of the argument specifying the number of elements to apply `f` to.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter2`.

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements that will be moved from.
- `count` – Refers to the number of elements starting at `first` the algorithm will be applied to.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The `uninitialized_move_n` algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter2` otherwise. The `uninitialized_move_n` algorithm returns the output iterator to the element in the destination range, one past the last element moved.

`hpx/parallel/container_algorithms/uninitialized_value_construct.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`

namespace `ranges`

**Functions**

```cpp
template<
type name `FwdIter`, type name `Sent`>
FwdIter uninitialized_value_construct(FwdIter first, Sent last)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.
Note: Complexity: Performs exactly \textit{last - first} assignments.

**Template Parameters**
- \texttt{FwdIter} – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- \texttt{Sent} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \texttt{FwdIter}.

**Parameters**
- \texttt{first} – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- \texttt{last} – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

**Returns** The \texttt{uninitialized_value_construct} algorithm returns a returns \texttt{FwdIter}. The \texttt{uninitialized_value_construct} algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename \texttt{ExPolicy}, typename \texttt{FwdIter}, typename \texttt{Sent}>  
\texttt{hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct(ExPolicy &&policy, FwdIter first, Sent last)}

Constructs objects of type typename \texttt{iterator_traits<ForwardIt>::value_type} in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel \texttt{uninitialized_value_construct} algorithm invoked with an execution policy object of type \texttt{sequenced_policy} execute in sequential order in the calling thread.

The assignments in the parallel \texttt{uninitialized_value_construct} algorithm invoked with an execution policy object of type \texttt{parallel_policy} or \texttt{parallel_task_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly \textit{last - first} assignments.

**Template Parameters**
- \texttt{ExPolicy} – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- \texttt{FwdIter} – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- \texttt{Sent} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \texttt{FwdIter}.

**Parameters**
- \texttt{policy} – The execution policy to use for the scheduling of the iterations.
- \texttt{first} – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- \texttt{last} – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
Returns The `uninitialized_value_construct` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The `uninitialized_value_construct` algorithm returns the iterator to the element in the source range, one past the last element constructed.

```cpp
template<typename Rng>
hpx::traits::range_traits<Rng>::iterator_type uninitialized_value_construct(Rng &&rng)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters**
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- **rng** – Refers to the range to which will be value constructed.

**Returns**
The `uninitialized_value_construct` algorithm returns a returns `hpx::traits::range_traits<Rng>::iterator_type`. The `uninitialized_value_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

```cpp
template<typename ExPolicy, typename Rng>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type uninitialized_value_construct(ExPolicy &&policy, Rng &&rng)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
• \textit{rng} – Refers to the range to which the value will be value constructed

\textbf{Returns} The \textit{uninitialized\_value\_construct} algorithm returns a \texttt{hpx::future<typename hpx::traits::range\_traits\langle Rng \rangle::iterator\_type>}, if the execution policy is of type \texttt{sequenced\_task\_policy} or \texttt{parallel\_task\_policy} and returns \texttt{typename hpx::traits::range\_traits\langle Rng \rangle::iterator\_type} otherwise. The \textit{uninitialized\_value\_construct} algorithm returns the output iterator to the element in the range, one past the last element constructed.

\begin{Verbatim}
\template<typename FwdIter, typename Size> 
FwdIter uninitialized\_value\_construct\_n(FwdIter first, Size count)
\end{Verbatim}

Constructs objects of type \texttt{typename iterator\_traits\langle ForwardIt\rangle::value\_type} in the uninitialized storage designated by the range \texttt{[first, first + count)} by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel \textit{uninitialized\_value\_construct\_n} algorithm invoked without an execution policy object execute in sequential order in the calling thread.

\textbf{Note:} Complexity: Performs exactly \texttt{count} assignments, if \texttt{count > 0}, no assignments otherwise.

\textbf{Template Parameters}

\begin{itemize}
  \item \texttt{FwdIter} – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
  \item \texttt{Size} – The type of the argument specifying the number of elements to apply \texttt{f} to.
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{first} – Refers to the beginning of the sequence of elements the algorithm will be applied to.
  \item \texttt{count} – Refers to the number of elements starting at \texttt{first} the algorithm will be applied to.
\end{itemize}

\textbf{Returns} The \textit{uninitialized\_value\_construct\_n} algorithm returns a returns \texttt{FwdIter}. The \textit{uninitialized\_value\_construct\_n} algorithm returns the iterator to the element in the source range, one past the last element constructed.

\begin{Verbatim}
\template<typename ExPolicy, typename FwdIter, typename Size> 
hpx::parallel::util::detail::algorithm\_result\_t\langle ExPolicy, FwdIter \rangle uninitialized\_value\_construct\_n(ExPolicy &&policy, FwdIter first, Size count)
\end{Verbatim}

Constructs objects of type \texttt{typename iterator\_traits\langle ForwardIt\rangle::value\_type} in the uninitialized storage designated by the range \texttt{[first, first + count)} by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel \textit{uninitialized\_value\_construct\_n} algorithm invoked with an execution policy object of type \texttt{sequenced\_policy} execute in sequential order in the calling thread.

The assignments in the parallel \textit{uninitialized\_value\_construct\_n} algorithm invoked with an execution policy object of type \texttt{parallel\_policy} or \texttt{parallel\_task\_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.
Note: Complexity: Performs exactly count assignments, if count > 0, no assignments otherwise.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply f to.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.

**Returns** The uninitialized_value_construct_n algorithm returns a hpx::future<FwdIter> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns FwdIter otherwise. The uninitialized_value_construct_n algorithm returns the iterator to the element in the source range, one past the last element constructed.

```cpp
hpx/parallel/container_algorithms/unique.hpp
```

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges

**Functions**

```cpp
template<typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<FwdIter, Sent> unique(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel unique algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than last - first assignments, exactly last - first - 1 applications of the predicate pred and no more than twice as many applications of the projection proj.

**Template Parameters**
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
• **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \(FwdIter\).

• **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`.

• **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

**Parameters**

• **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

• **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

• **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter` can be dereferenced and then implicitly converted to both `Type1` and `Type2`.

• **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns**

The `unique` algorithm returns ` subrange_t< FwdIter, Sent>`. The `unique` algorithm returns an object `{ret, last}`, where ret is a past-the-end iterator for a new subrange.

```cpp
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type
unique(ExPolicy &&policy,
FwdIter first, Sent last,
Pred &&pred = Pred(),
Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `[first, last)` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than `last - first` assignments, exactly `last - first - 1` applications of the predicate `pred` and no more than twice as many applications of the projection `proj`.

**Template Parameters**
• **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

• **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

• **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

• **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`

• **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter` can be dereferenced and then implicitly converted to both `Type1` and `Type2`

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns** The `unique` algorithm returns `subrange_t<FwdIter, Sent>`. The `unique` algorithm returns an object `{ret, last}`, where `ret` is a past-the-end iterator for a new subrange.

```cpp
template<typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>
unique(Rng &&rng, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `rng` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel `unique` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Performs not more than `N` assignments, exactly `N - 1` applications of the predicate `pred` and no more than twice as many applications of the projection `proj`, where `N = std::distance(begin(rng), end(rng))`.

**Template Parameters**
• **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

• **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`.

• **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

  ```cpp
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

### Returns

The `unique` algorithm returns `subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>`. The `unique` algorithm returns an object `{ret, last}`, where `ret` is a past-the-end iterator for a new subrange.

```cpp
template<typename ExPolicy, typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>, hpx::traits::range_iterator_t<Rng>>
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `rng` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than `N` assignments, exactly `N - 1` applications of the predicate `pred` and no more than twice as many applications of the projection `proj`, where `N = std::distance(begin(rng), end(rng))`. 
**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

  ```cpp
def pred(const Type &a, const Type &b):
  ```

  The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns**

The `unique` algorithm returns a `hpx::future < subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>` otherwise. The `unique` algorithm returns an object `{ret, last}`, where `ret` is a past-the-end iterator for a new subrange.

```cpp
template<typename InIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
unique_copy_result<InIter, O> unique_copy(InIter first, Sent last, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest` in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel `unique_copy` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs not more than `last - first` assignments, exactly `last - first - 1` applications of the predicate `pred` and no more than twice as many applications of the projection `proj`.

**Template Parameters**

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **O** – The type of the iterator representing the destination range (deduced).
• **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique_copy` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`
• **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `InIter1` can be dereferenced and then implicitly converted to `Type`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns** The `unique_copy` algorithm returns a returns `unique_copy_result<InIter, O>`. The `unique_copy` algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the `dest` range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<FwdIter, O>>, type unique_copy(ExPolicy &&policy, FwdIter first, Sent last, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at `dest` in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified
threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than last - first assignments, exactly last - first - 1 applications of the predicate pred and no more than twice as many applications of the projection proj

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of unique_copy requires Pred to meet the requirements of CopyConstructible. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to hpx::identity

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns true for the required elements. The signature of this predicate should be equivalent to:

  ```cpp
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns** The unique_copy algorithm returns returns a hpx::future<
unique_copy_result<FwdIter, O>> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns unique_copy_result<FwdIter, O> otherwise. The unique_copy algorithm returns an in_out_result with the source iterator to one past the last element and out containing the destination iterator to the end of the dest range.

```cpp
template<typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
unique_copy_result<hpx::traits::range_iterator_t<Rng>, O> unique_copy(Rng &&rng, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range rng, to another range beginning at dest in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel unique_copy algorithm invoked without an execution policy object
will execute in sequential order in the calling thread.

**Note:** Complexity: Performs not more than \( N \) assignments, exactly \( N - 1 \) applications of the predicate \( \text{pred} \), where \( N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng})) \).

**Template Parameters**
- **\( \text{Rng} \)** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **\( \text{O} \)** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **\( \text{Pred} \)** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique_copy` requires `\text{Pred}` to meet the requirements of `CopyConstructible`. This defaults to `\text{std::equal_to<}`
- **\( \text{Proj} \)** – The type of an optional projection function. This defaults to `\text{hpx::identity}`

**Parameters**
- **\( \text{rng} \)** – Refers to the sequence of elements the algorithm will be applied to.
- **\( \text{dest} \)** – Refers to the beginning of the destination range.
- **\( \text{pred} \)** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range \( \text{rng} \). This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool \text{pred}(\text{const Type &a, const Type &b});
```

The signature does not need to have `\text{const &}` but the function must not modify the objects passed to it. The type `\text{Type}` must be such that an object of type `\text{FwdIter1}` can be dereferenced and then implicitly converted to `\text{Type}`.
- **\( \text{proj} \)** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns** The `unique_copy` algorithm returns `\text{unique_copy_result<}`

\[
\text{hpx::traits::range_iterator_t<\text{Rng}>, O}.
\]

The `unique_copy` algorithm returns the pair of the source iterator to `\text{last}`, and the destination iterator to the end of the `\text{dest}` range.

```
template<typename \text{ExPolicy}, typename \text{Rng}, typename \text{O}, typename \text{Pred} = \text{ranges::equal_to},
        typename \text{Proj} = \text{hpx::identity}>
\text{parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>>> unique_copy
```

Copies the elements from the range `\text{rng}`, to another range beginning at `\text{dest}` in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.
The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate `pred`, where N = `std::distance(begin(rng), end(rng))`.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique_copy` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range `rng`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns** The `unique_copy` algorithm returns a `hpx::future<unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>` otherwise. The `unique_copy` algorithm returns the pair of the source iterator to `last`, and the destination iterator to the end of the `dest` range.
namespace hpx

namespace parallel

namespace util

**Typedefs**

template<typename Iterator, typename Sentinel = Iterator>
using range = hpx::util::iterator_range<Iterator, Sentinel>

**Functions**

template<typename Iter, typename Sent>
range<Iter, Sent> concat(range<Iter, Sent> const &it1, range<Iter, Sent> const &it2)

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
range<Iter2, Iter2> init_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const &src)

Move objects from the range src to dest.

**Parameters**

• dest – [in] : range where move the objects
• src – [in] : range from where move the objects

**Returns** range with the objects moved and the size adjusted

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
range<Iter2, Sent2> uninit_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const &src)

Move objects from the range src creating them in dest.

**Parameters**

• dest – [in] : range where move and create the objects
• src – [in] : range from where move the objects

**Returns** range with the objects moved and the size adjusted

template<typename Iter, typename Sent>
void destroy_range(range<Iter, Sent> r)

destroy a range of objects

**Parameters** r – [in] : range to destroy

template<typename Iter, typename Sent>
range<Iter, Sent> init(range<Iter, Sent> const &r, typename std::iterator_traits<Iter>::value_type &val)

initialize a range of objects with the object val moving across them

**Parameters**

• r – [in] : range of elements not initialized
• val – [in] : object used for the initialization

**Returns** range initialized
template<typename \texttt{Iter1}, typename \texttt{Sent1}, \texttt{Iter2}, \texttt{Sent2}, Compare>
bool \texttt{is\_mergeable}(range<\texttt{Iter1}, \texttt{Sent1}> \texttt{const} \&\texttt{src1}, range<\texttt{Iter2}, \texttt{Sent2}> \texttt{const} \&\texttt{src2}, \texttt{Compare} \texttt{comp})

: indicate if two ranges have a possible merge

\textbf{Remark}

\textbf{Parameters}
- \texttt{src1} \hspace{1em} \textit{[in]} : first range
- \texttt{src2} \hspace{1em} \textit{[in]} : second range
- \texttt{comp} \hspace{1em} \textit{[in]} : object for to compare elements

\textbf{Returns}
- \texttt{true} : they can be merged
- \texttt{false} : they can’t be merged

template<typename \texttt{Iter1}, \texttt{Sent1}, \texttt{Iter2}, \texttt{Sent2}, \texttt{Iter3}, \texttt{Sent3}, \texttt{Compare}>
range<\texttt{Iter3}, \texttt{Sent3}> \texttt{full\_merge}(range<\texttt{Iter3}, \texttt{Sent3}> \texttt{const} \&\texttt{dest}, range<\texttt{Iter1}, \texttt{Sent1}> \texttt{const} \&\texttt{src1}, range<\texttt{Iter2}, \texttt{Sent2}> \texttt{const} \&\texttt{src2}, \texttt{Compare} \texttt{comp})

Merge two contiguous ranges \texttt{src1} and \texttt{src2} , and put the result in the range \texttt{dest}, returning the \texttt{range} merged.

\textbf{Parameters}
- \texttt{dest} \hspace{1em} \textit{[in]} : range where locate the elements merged. the size of \texttt{dest} must be greater or equal than the sum of the sizes of \texttt{src1} and \texttt{src2}
- \texttt{src1} \hspace{1em} \textit{[in]} : first range to merge
- \texttt{src2} \hspace{1em} \textit{[in]} : second range to merge
- \texttt{comp} \hspace{1em} \textit{[in]} : comparison object

\textbf{Returns}
- range with the elements merged and the size adjusted

\textbf{Remark}

\textbf{Parameters}
- \texttt{dest} \hspace{1em} \textit{[in]} : range where locate the elements merged. the size of \texttt{dest} must be greater or equal than the sum of the sizes of \texttt{src1} and \texttt{src2}.
- \texttt{src1} \hspace{1em} \textit{[in]} : first range to merge
- \texttt{src2} \hspace{1em} \textit{[in]} : second range to merge
- \texttt{comp} \hspace{1em} \textit{[in]} : comparison object

\textbf{Returns}
- range with the elements merged and the size adjusted

\textbf{Remark}

\textbf{Parameters}
- \texttt{dest} \hspace{1em} \textit{[in]} : range where finish the two buffers merged
- \texttt{src1} \hspace{1em} \textit{[in]} : first range to merge in a separate memory

\textbf{Remark}

\textbf{Parameters}
- \texttt{dest} \hspace{1em} \textit{[in]} : range where finish the two buffers merged
- \texttt{src1} \hspace{1em} \textit{[in]} : first range to merge in a separate memory
• **src2** – [in]: second range to merge, in the final part of the range where deposit the final results
• **comp** – [in]: object for compare two elements of the type pointed by the Iter1 and Iter2

**Returns**: range with the two buffers merged

```cpp
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Sent3, typename Compare>
bool in_place_merge_uncontiguous(range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, range<Iter3, Sent3> &aux, Compare comp)
```

: merge two non contiguous buffers src1, src2, using the range aux as auxiliary memory

---

**Remark**

---

**Parameters**

- **src1** – [in]: first range to merge
- **src2** – [in]: second range to merge
- **aux** – [in]: auxiliary range used in the merge
- **comp** – [in]: object for to compare elements

**Returns** true: not changes done false: changes in the buffers

```cpp
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
range<Iter1, Sent1> in_place_merge(range<Iter1, Sent1> const &src1, range<Iter1, Sent1> const &src2, range<Iter2, Sent2> &buf, Compare comp)
```

: merge two contiguous buffers (src1, src2) using buf as auxiliary memory

---

**Remark**

---

**Parameters**

- **src1** – [in]: first range to merge
- **src2** – [in]: second range to merge
- **buf** – [in]: auxiliary memory used in the merge
- **comp** – [in]: object for to compare elements

**Returns** true: not changes done false: changes in the buffers

```cpp
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
void merge_flow(range<Iter1, Sent1> rng1, range<Iter2, Sent2> rbuf, range<Iter1, Sent1> rng2, Compare cmp)
```

: merge two ranges (rng1, rng2) using rbuf as auxiliary memory

**hpx/assertion/source_location.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**Defines**

*HPX_CURRENT_SOURCE_LOCATION()*

namespace *hpx*

**Functions**

*std::ostream & operator<<(std::ostream &os, source_location const &loc)*

struct *source_location*

    #include <source_location.hpp>  This contains the location information where *HPX_ASSERT* has been called The *source_location* class represents certain information about the source code, such as file names, line numbers, and function names. Previously, functions that desire to obtain this information about the call site (for logging, testing, or debugging purposes) must use macros so that predefined macros like and are expanded in the context of the caller. The *source_location* class provides a better alternative. *source_location* meets the *DefaultConstructible*, *CopyConstructible*, *CopyAssignable* and *Destructible* requirements. Lvalue of *source_location* meets the Swappable requirement. Additionally, the following conditions are true:

- `std::is_nothrow_move_constructible_v<std::source_location>`
- `std::is_nothrow_move_assignable_v<std::source_location>`
- `std::is_nothrow_swappable_v<std::source_location>`
It is intended that \textit{source\_location} has a small size and can be copied efficiently. It is unspecified whether the copy/move constructors and the copy/move assignment operators of \textit{source\_location} are trivial and/or \texttt{constexpr}.

Defines

**HPX_ASSERT(expr)**

This macro asserts that *expr* evaluates to true.

If *expr* evaluates to false, the source location and *msg* is being printed along with the expression and additional. Afterwards the program is being aborted. The assertion handler can be customized by calling hpx::assertion::set_assertion_handler().

Asserts are enabled if *HPX_DEBUG* is set. This is the default for **CMAKE_BUILD_TYPE=Debug**

**Parameters**

- *expr* – The expression to assert on. This can either be an expression that's convertible to bool or a callable which returns bool
- *msg* – The optional message that is used to give further information if the assert fails. This should be convertible to a std::string

**HPX_ASSERT_MSG(expr, msg)**

See also:

HPX_ASSERT

namespace **hpx**

namespace **assertion**

**Typedefs**

using **assertion_handler** = void (*)(hpx::source_location const &loc, const char *expr, std::string const &msg)

The signature for an assertion handler.

**Functions**

void **set_assertion_handler**(assertion_handler handler)

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

**Note:** This function is not thread safe
async_base

See *Public API* for a list of names and headers that are part of the public *HPX API*.

**hpx/async_base/async.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace hpx

**Functions**

template<typename F, typename ...Ts>
dcltype(auto) async(F &&f, Ts&&... ts)

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns an *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async | hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the async flag is set (i.e. (policy & *hpx::launch::async*) != 0), then async executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by hpx::thread(std::forward<F>(f), std::forward<Ts>(ts)...), except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the hpx::future that async returns to the caller.

- If the deferred flag is set (i.e. (policy & *hpx::launch::deferred*) != 0), then async converts *f* and *ts*... the same way as by hpx::thread constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the hpx::future that async returned to the caller will cause the copy of *f* to be invoked (as an rvalue) with the copies of *ts*... (also passed as rvalues) in the current thread (which does not have to be the thread that originally called hpx::async). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same hpx::future will return the result immediately.

- If neither *hpx::launch::async* nor *hpx::launch::deferred*, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the *hpx::launch::async* and *hpx::launch::deferred* flags are set in policy), standard recommends (but doesn’t require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to hpx::async synchronizes-with (as defined in std::memory_order) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the async policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<Ts>::type is not constructible from its corresponding argument, the program is ill-formed.

**Parameters**

- *f* – Callable object to call
- *ts* – parameters to pass to *f*

**Returns** hpx::future referring to the shared state created by this call to hpx::async.
namespace hpx

Functions

template<typename F, typename ...Ts>
declaytpe(auto) dataflow(F &&f, Ts&& ... ts)
    The function template dataflow runs the function f asynchronously (potentially in a separate thread which
    might be a part of a thread pool) and returns a hpx::future that will eventually hold the result of that
    function call. Its behavior is similar to hpx::async with the exception that if one of the arguments is a
    future, then hpx::dataflow will wait for the future to be ready to launch the thread. Hence, the operation
    is delayed until all the arguments are ready.

hpx/async_base/launch_policy.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

struct launch : public detail::policy_holder<>
    #include <launch_policy.hpp> Launch policies for hpx::async etc.

Public Functions

inline constexpr launch() noexcept
    Default constructor. This creates a launch policy representing all possible launch modes

inline constexpr launch(detail::async_policy p) noexcept
    Create a launch policy representing asynchronous execution.

inline constexpr launch(detail::fork_policy p) noexcept
    Create a launch policy representing asynchronous execution. The new thread is executed in a preferred
    way

inline constexpr launch(detail::sync_policy p) noexcept
    Create a launch policy representing synchronous execution.

inline constexpr launch(detail::deferred_policy p) noexcept
    Create a launch policy representing deferred execution.

inline constexpr launch(detail::apply_policy p) noexcept
    Create a launch policy representing fire and forget execution.

template<typename F>
inline constexpr launch(detail::select_policy<F> const &p) noexcept
    Create a launch policy representing fire and forget execution.

template<typename Launch, typename Enable =
    std::enable_if_t<hpx::traits::is_launch_policy_v<Launch>>>
inline constexpr launch(Launch l, threads::thread_priority priority, threads::thread_stacksize stacksize, threads::thread_schedule_hint hint) noexcept

Public Static Attributes

static const detail::async_policy async
    Predefined launch policy representing asynchronous execution.

static const detail::fork_policy fork
    Predefined launch policy representing asynchronous execution. The new thread is executed in a preferred way.

static const detail::sync_policy sync
    Predefined launch policy representing synchronous execution.

static const detail::deferred_policy deferred
    Predefined launch policy representing deferred execution.

static const detail::apply_policy apply
    Predefined launch policy representing fire and forget execution.

static const detail::select_policy_generator select
    Predefined launch policy representing delayed policy selection.

Friends

inline friend launch tag_invoke(hpx::execution::experimental::with_priority_t, launch const &policy, threads::thread_priority priority) noexcept

inline friend constexpr friend hpx::threads::thread_priority tag_invoke (hpx::execution::experimental::get_priority_t, launch const &policy) noexcept

inline friend launch tag_invoke(hpx::execution::experimental::with_stacksize_t, launch const &policy, threads::thread_stacksize stacksize) noexcept

inline friend constexpr friend hpx::threads::thread_stacksize tag_invoke (hpx::execution::experimental::get_stacksize_t, launch const &policy) noexcept

inline friend launch tag_invoke(hpx::execution::experimental::with_hint_t, launch const &policy, threads::thread_schedule_hint hint) noexcept

inline friend constexpr friend hpx::threads::thread_schedule_hint tag_invoke (hpx::execution::experimental::get_hint_t, launch const &policy) noexcept
namespace hpx

Functions

    template<typename F, typename ...Ts>
    bool post(F &&f, Ts&&... ts)

    Runs the function f asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an hpx::future that would hold the result of that function call).

    hpx::post is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the post function enables the launch of a new thread without the overhead of creating a future.

    Note: hpx::post is similar to hpx::async but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

hpx/async_base/sync.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

    template<typename F, typename ...Ts>
    decltype(auto) sync(F &&f, Ts&&... ts)

    The function template sync runs the function f synchronously and returns an hpx::future that will eventually hold the result of that function call.

async_combinators

See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx

Top level HPX namespace.

Functions

template<typename ...Ts>
inline tuple<future<Ts>...> split_future(future<tuple<Ts>...> &&f)

The function split_future is an operator allowing to split a given future of a sequence of values (any tuple, std::pair, or std::array) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of when_all.

| Note: The following cases are special:
| tuple<future<void>> > split_future(future<tuple<> > & & f);
| array<future<void>, 1> split_future(future<array<T, 0> > & & f);

Here the returned futures are directly representing the futures which were passed to the function.

Parameters

- f – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports hpx::tuple<>, std::pair<T1, T2>, and std::array<T, N>.

Returns

Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

template<typename T>
inline std::vector<future<T>> split_future(future<std::vector<T>> & & f, std::size_t size)

The function split_future is an operator allowing to split a given future of a sequence of values (any std::vector) into a std::vector of futures where each future represents one of the values from the original std::vector. In some sense this function provides the inverse operation of when_all.

Parameters

- size – [in] The number of elements the vector will hold once the input future has become ready.

Returns

Returns a std::vector of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.
See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

  Top level HPX namespace.

### Functions

**template<typename InputIter>**

**void wait_all(InputIter first, InputIter last)**

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note:** The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

**Note:** The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters**

- **first** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all` should wait.
- **last** – The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `wait_all` should wait.

**template<typename R>**

**void wait_all(std::vector<future<R>> &&futures)**

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note:** The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

**Note:** The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters** **futures** – A vector or array holding an arbitrary amount of `future` or `shared_future` objects for which `wait_all` should wait.

**template<typename R, std::size_t N>**

**void wait_all(std::array<future<R>, N> &&futures)**

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.
Note: The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

Note: The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters** futures – A vector or array holding an arbitrary amount of `future` or `shared_future` objects for which `wait_all` should wait.

```cpp
template<typename T>
void wait_all(hpx::future<T> const &f)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all` returns after the future has become ready. The input future is still valid after `wait_all` returns.

Note: The function `wait_all` will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters** f – A `future` or `shared_future` for which `wait_all` should wait.

```cpp
template<typename ...T>
void wait_all(T&&... futures)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

Note: The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters** futures – An arbitrary number of `future` or `shared_future` objects, possibly holding different types for which `wait_all` should wait.

```cpp
template<typename InputIter>
void wait_all_n(InputIter begin, std::size_t count)
```

The function `wait_all_n` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.
The function `wait_all_n` returns after all futures have become ready. All input futures are still valid after `wait_all_n` returns.

The function `wait_all_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_n_nothrow` instead.

**Parameters**

- `begin` – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_n` should wait.
- `count` – The number of elements in the sequence starting at `first`.

**Returns** The function `wait_all_n` will return an iterator referring to the first element in the input sequence after the last processed element.

---

### `hpx/async_combinators/wait_any.hpp`

See [Public API](#) for a list of names and headers that are part of the public HPX API.

**namespace hpx**

Top level HPX namespace.

**Functions**

```cpp
template<typename InputIter>
void wait_any(InputIter first, InputIter last)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note:** The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note:** The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

- `first` – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_any` should wait.
- `last` – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `wait_any` should wait.

```cpp
template<typename R>
```
void \texttt{wait\_any}(std::vector<future\<R\>> &futures)

The function \texttt{wait\_any} is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

\begin{itemize}
  \item \textbf{Note:} The function \texttt{wait\_any} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any} returns.
  \item \textbf{Note:} The function \texttt{wait\_any} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_nothrow} instead.
\end{itemize}

\textbf{Parameters futures} – [in] A vector holding an arbitrary amount of \texttt{future} or \texttt{shared\_future} objects for which \texttt{wait\_any} should wait.

\begin{Verbatim}
\textbf{template<typename R, std::size_t N>}
void \texttt{wait\_any}(std::array<future\<R\>, N> &futures)
\end{Verbatim}

The function \texttt{wait\_any} is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

\begin{itemize}
  \item \textbf{Note:} The function \texttt{wait\_any} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any} returns.
  \item \textbf{Note:} The function \texttt{wait\_any} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_nothrow} instead.
\end{itemize}

\textbf{Parameters futures} – [in] An array holding an arbitrary amount of \texttt{future} or \texttt{shared\_future} objects.

\begin{Verbatim}
\textbf{template<typename \ldots T>}
void \texttt{wait\_any}(T\&\&... futures)
\end{Verbatim}

The function \texttt{wait\_any} is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

\begin{itemize}
  \item \textbf{Note:} The function \texttt{wait\_any} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any} returns.
  \item \textbf{Note:} The function \texttt{wait\_any} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_nothrow} instead.
\end{itemize}

\textbf{Parameters futures} – [in] An arbitrary number of \texttt{future} or \texttt{shared\_future} objects, possibly holding different types for which \texttt{wait\_any} should wait.

\begin{Verbatim}
\textbf{template<typename InputIter>}
\end{Verbatim}
void wait_any_n(InputIter first, std::size_t count)

The function wait_any_n is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note:** The function wait_any_n returns after at least one future has become ready. All input futures are still valid after wait_any_n returns.

**Note:** The function wait_any_n will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use wait_any_n_nothrow instead.

### Parameters
- **first** – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which wait_any_n should wait.
- **count** – [in] The number of elements in the sequence starting at first.

### hpx/async_combinators/wait_each.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.

### Functions

```cpp
template<typename F, typename Future>
void wait_each(F &&f, std::vector<Future> &&futures)
```

The function wait_each is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. wait_each returns after all futures have become ready.

**Note:** This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that std::size_t is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

### Parameters
- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of future or shared_future objects for which wait_each should wait.

```cpp
template<typename F, typename Iterator>
```
void \texttt{wait\_each}(F &&f, \texttt{Iterator} begin, \texttt{Iterator} end)

The function \texttt{wait\_each} is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. \texttt{wait\_each} returns after all futures have become ready.

\textbf{Note:} This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that \texttt{std::size\_t} is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

\textbf{Parameters}

- \texttt{f} – The function which will be called for each of the input futures once the future has become ready.
- \texttt{begin} – The iterator pointing to the first element of a sequence of future or shared\_future objects for which \texttt{wait\_each} should wait.
- \texttt{end} – The iterator pointing to the last element of a sequence of future or shared\_future objects for which \texttt{wait\_each} should wait.

\begin{Verbatim}
template<typename F, typename ...T>
void \texttt{wait\_each}(F &&f, T&&... futures)
\end{Verbatim}

The function \texttt{wait\_each} is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. \texttt{wait\_each} returns after all futures have become ready.

\textbf{Note:} This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that \texttt{std::size\_t} is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

\textbf{Parameters}

- \texttt{f} – The function which will be called for each of the input futures once the future has become ready.
- \texttt{futures} – An arbitrary number of future or shared\_future objects, possibly holding different types for which \texttt{wait\_each} should wait.

\begin{Verbatim}
template<typename F, typename \texttt{Iterator}>
void \texttt{wait\_each\_n}(F &&f, \texttt{Iterator} begin, \texttt{std::size\_t} count)
\end{Verbatim}

The function \texttt{wait\_each} is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready.

\textbf{Note:} This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that \texttt{std::size\_t} is
implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

**Parameters**

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of future or shared_future objects for which wait_each_n should wait.
- **count** – The number of elements in the sequence starting at first.

**hpx/async_combinators/wait_some.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

**namespace hpx**

Top level HPX namespace.

**Functions**

**template<typename InputIter>**

```cpp
void wait_some(std::size_t n, InputIter first, InputIter last)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The function *wait_some* returns after n futures have become ready. All input futures are still valid after *wait_some* returns.

**Note:** The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which when_all should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of future or shared_future objects for which when_all should wait.

**template<typename R>**

```cpp
void wait_some(std::size_t n, std::vector<future<R>> &futures)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.
Note: The function `wait_some` returns after \( n \) futures have become ready. All input futures are still valid after `wait_some` returns.

Note: The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- \( n \) – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.

- `futures` – [in] A vector holding an arbitrary amount of `future` or `shared_future` objects for which `wait_some` should wait.

```cpp
template<typename R, std::size_t N>
void wait_some(std::size_t n, std::array<future<R>, N> &&futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after \( n \) of them finished executing.

Note: The function `wait_some` returns after \( n \) futures have become ready. All input futures are still valid after `wait_some` returns.

Note: The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- \( n \) – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.

- `futures` – [in] An array holding an arbitrary amount of `future` or `shared_future` objects for which `wait_some` should wait.

```cpp
template<typename ...T>
void wait_some(std::size_t n, T&&... futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after \( n \) of them finished executing.

Note: The function `wait_all` returns after \( n \) futures have become ready. All input futures are still valid after `wait_some` returns.

Note: The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.
Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of future or shared_future objects, possibly holding different types for which wait_some should wait.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

```cpp
template<typename InputIter>
void wait_some_n(std::size_t n, InputIter first, std::size_t count)
```

The function *wait_some_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

**Note:** The function *wait_some_n* returns after *n* futures have become ready. All input futures are still valid after *wait_some_n* returns.

**Note:** The function *wait_some_n* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_n_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which when_all should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

**hpx/async_combinators/when_all.hpp**

See Public API for a list of names and headers that are part of the public *HPX* API.

namespace hpx

Top level HPX namespace.

**Functions**

```cpp
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>> hpx::future<Container> when_all(InputIter first, InputIter last)
```

function *when_all* creates a future object that becomes ready when all elements in a set of future and shared_future objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.
Note: Calling this version of `when_all` where `first == last`, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

Parameters

- `first` – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- `last` – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.

Returns

Returns a future holding the same list of futures as has been passed to `when_all`.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
hpx::future<Range> when_all(Range &&values)
```

function `when_all` creates a future object that becomes ready when all elements in a set of `future` and `shared_future` objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Calling this version of `when_all` where the input container is empty, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

Parameters `values` – [in] A range holding an arbitrary amount of `future` or `shared_future` objects for which `when_all` should wait.

Returns

Returns a future holding the same list of futures as has been passed to `when_all`.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type.

```
template<typename ...T>
hpx::future<hpx::tuple<hpx::future<T>...>> when_all(T&&... futures)
```

function `when_all` creates a future object that becomes ready when all elements in a set of `future` and `shared_future` objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

Parameters `futures` – [in] An arbitrary number of `future` or `shared_future` objects, possibly holding different types for which `when_all` should wait.
Returns Returns a future holding the same list of futures as has been passed to \emph{when\_all}.

- \texttt{future<tuple<future<T0>, future<T1>, future<T2>>...>>}: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- \texttt{future<tuple<>>} if \emph{when\_all} is called with zero arguments. The returned future will be initially ready.

```
template<typename InputIter, typename Container = vector<future<typename std::iterator_traits<InputIter>::value_type>>> hpx::future<Container> when_all_n(InputIter begin, std::size_t count)
```

Function \emph{when\_all} creates a future object that becomes ready when all elements in a set of \emph{future} and \emph{shared\_future} objects become ready. It is an operator allowing to join on the result of all given futures. It \texttt{AND}-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

**Note:** As long as \texttt{ec} is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \texttt{ec}. Otherwise it throws an instance of \texttt{hpx::exception}.

**Note:** None of the futures in the input sequence are invalidated.

**Parameters**

- \texttt{begin} – [in] The iterator pointing to the first element of a sequence of \emph{future} or \emph{shared\_future} objects for which \emph{wait\_all\_n} should wait.
- \texttt{count} – [in] The number of elements in the sequence starting at \texttt{first}.

**Throws** This function will throw errors which are encountered while setting up the requested operation only. Errors encountered while executing the operations delivering the results to be stored in the futures are reported through the futures themselves.

**Returns** Returns a future holding the same list of futures as has been passed to \emph{when\_all\_n}.

- \texttt{future<Container<future<R>>>}: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output vector will be the same as given by the input iterator.

\texttt{hpx/async\_combinators/when\_any.hpp}

See \texttt{Public API} for a list of names and headers that are part of the public \texttt{HPX API}.

namespace \texttt{hpx}

Top level HPX namespace.
Functions

template<typename InputIter, typename Container = vector<future<typename std::iterator_traits<InputIter>::value_type>>>  
future<when_any_result<Container>> when_any(InputIter first, InputIter last)

function when_any creates a future object that becomes when at least one element in a set of future and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

- first – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which when_any should wait.
- last – [in] The iterator pointing to the last element of a sequence of future or shared_future objects for which when_any should wait.

Returns Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<when_any_result<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename Range>
future<when_any_result<Range>> when_any(Range &values)

function when_any creates a future object that becomes when at least one element in a set of future and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters values – [in] A range holding an arbitrary amount of futures or shared_future objects for which when_any should wait.

Returns Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<when_any_result<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename ...T>
future<when_any_result<tuple<future<T>...>> when_any(T &... futures)

function when_any creates a future object that becomes when at least one element in a set of future and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters futures – [in] An arbitrary number of future or shared_future objects, possibly holding different types for which when_any should wait.

Returns Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future..

- future<when_any_result<tuple<future<T0>, future<T1>...>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
future<when_any_result<tuple<>>> if when_any is called with zero arguments. The returned future will be initially ready.

```cpp
template<
typename InputIter, typename Container = vector<future<
typename std::iterator_traits<InputIter>::value_type>>> 
future<when_any_result<Container>> when_any_n(InputIter first, std::size_t count)
```

function when_any_n creates a future object that becomes when at least one element in a set of future and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

**Note:** None of the futures in the input sequence are invalidated.

**Parameters**
- **first** – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which when_any_n should wait.
- **count** – [in] The number of elements in the sequence starting at first.

**Returns** Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

```cpp
• future<when_any_result<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.
```

```cpp
template<
typename Sequence>
struct when_any_result
```

`#include <when_any.hpp>` Result type for when_any, contains a sequence of futures and an index pointing to a ready future.

**Public Members**

```cpp
std::size_t index
```

The index of a future which has become ready.

```cpp
Sequence futures
```

The sequence of futures as passed to hpx::when_any

**hpx/async_combinators/when_each.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.
Functions

```cpp
template<typename F, typename Future>
future<void> when_each(F &&f, std::vector<Future> &&futures)
```

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

**Note:** This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a `future` to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the `future` as the second parameter. The first parameter will correspond to the index of the current `future` in the collection.

**Parameters**

- `f` – The function which will be called for each of the input futures once the future has become ready.
- `futures` – A vector holding an arbitrary amount of `future` or `shared_future` objects for which `wait_each` should wait.

**Returns** Returns a future representing the event of all input futures being ready.

```cpp
template<typename F, typename Iterator>
future<Iterator> when_each(F &&f, Iterator begin, Iterator end)
```

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

**Note:** This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a `future` to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the `future` as the second parameter. The first parameter will correspond to the index of the current `future` in the collection.

**Parameters**

- `f` – The function which will be called for each of the input futures once the future has become ready.
- `begin` – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_each` should wait.
- `end` – The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `wait_each` should wait.

**Returns** Returns a future representing the event of all input futures being ready.

```cpp
template<typename F, typename ...Ts>
future<void> when_each(F &&f, Ts&&... futures)
```

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.
Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that std::size_t is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.

- **futures** – An arbitrary number of future or shared_future objects, possibly holding different types for which wait_each should wait.

Returns Returns a future representing the event of all input futures being ready.

template<typename F, typename Iterator>
future<Iterator> when_each_n(F &&f, Iterator begin, std::size_t count)

The function when_each is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that std::size_t is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.

- **begin** – The iterator pointing to the first element of a sequence of future or shared_future objects for which wait_each_n should wait.

- **count** – The number of elements in the sequence starting at first.

Returns Returns a future holding the iterator pointing to the first element after the last one.

hpx/async_combinators/when_some.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

    Top level HPX namespace.
The function `when_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The future returned by the function `when_some` becomes ready when at least n argument futures have become ready.

**Note:** Calling this version of `when_some` where `first == last`, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some` will not throw an exception, but the futures held in the output collection may.

**Parameters**

- `n` – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- `first` – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- `last` – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.

**Returns** Returns a `when_some_result` holding the same list of futures as has been passed to `when_some` and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

The function `when_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The future returned by the function `when_some` becomes ready when at least n argument futures have become ready.

**Note:** Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some` will not throw an exception, but the futures held in the output collection may.

**Parameters**
- \( n \) – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- \( \text{futures} \) – [in] A container holding an arbitrary amount of future or shared_future objects for which \( \text{when\_some} \) should wait.

**Returns** Returns a \( \text{when\_some\_result} \) holding the same list of futures as has been passed to \( \text{when\_some} \) and indices pointing to ready futures.
- \( \text{future<\text{when\_some\_result}<\text{Container<future<R>>>>>} \): If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```cpp
template<typename ...Ts>
future<when_some_result<tuple<future<T>...>>> when_some(std::size_t n, Ts&&... futures)
```

The function \( \text{when\_some} \) is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after \( n \) of them finished executing.

**Note:** The future returned by the function \( \text{when\_some} \) becomes ready when at least \( n \) argument futures have become ready.

**Note:** Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by \( \text{when\_some} \) will not throw an exception, but the futures held in the output collection may.

**Parameters**
- \( n \) – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- \( \text{futures} \) – [in] An arbitrary number of future or shared_future objects, possibly holding different types for which \( \text{when\_some} \) should wait.

**Returns** Returns a \( \text{when\_some\_result} \) holding the same list of futures as has been passed to \( \text{when\_some} \) and an index pointing to a ready future.
- \( \text{future<\text{when\_some\_result}<\text{tuple<future<T0>, future<T1>...>>>>} \): If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- \( \text{future<\text{when\_some\_result}<tuple<>>>} \): If \( \text{when\_some} \) is called with zero arguments. The returned future will be initially ready.

```cpp
template<typename InputIter, typename Container = vector<future<>>&>
future<when_some_result<Container>> when_some_n(std::size_t n, InputIter first, std::size_t count)
```

The function \( \text{when\_some\_n} \) is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after \( n \) of them finished executing.

**Note:** The future returned by the function \( \text{when\_some\_n} \) becomes ready when at least \( n \) argument futures have become ready.
Note: Calling this version of when_some when count == 0, returns a future with the same elements as the arguments that is immediately ready. Possibly none of the futures in that container are ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by when_some will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which when_all should wait.
- **count** – [in] The number of elements in the sequence starting at first.

Returns Returns a when_some_result holding the same list of futures as has been passed to when_some and indices pointing to ready futures.

- future<when_some_result<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```cpp
template<typename Sequence>
struct when_some_result
{
    #include <when_some.hpp> Result type for when_some, contains a sequence of futures and indices pointing to ready futures.

    Public Members

    `std::vector<std::size_t> indices`
    List of indices of futures that have become ready.

    `Sequence futures`
    The sequence of futures as passed to hpx::when_some.

async_cuda

See Public API for a list of names and headers that are part of the public HPX API.

hpx/async_cuda/cublas_executor.hpp

using queue_function_ptr_t = cl::sycl::event
(ocl::sycl::queue::*)(std::conditional_t<std::is_trivial_v<std::remove_reference_t<Params>>,
std::decay_t<Params>, Params>...)

Default Implementation without the extra intel code_location parameter. Removes the reference for trivial types to make the function matching easier (see sycl_stream.cpp test)
Public Functions

inline explicit sycl_executor(cl::sycl::default_selector selector)
Create a SYCL executor (based on a sycl queue)

~sycl_executor() = default

inline future_type get_future()
Get future for this command_queue (NOTE will be more efficient if an event is provided
&\#8212; otherwise a dummy kernel must be submitted to get an event)

inline future_type get_future(cl::sycl::event event)
Get future for that becomes ready when the given event completes.

template<typename ...Params>
inline void post(queue_function_ptr_t<Params...> &queue_member_function, Params&&... args)
Invoke queue member function given queue and parameters &\#8212; do not use event to return
a hpx::future (One way)

template<typename ...Params>
inline hpx::future<void> async_execute(queue_function_ptr_t<Params...> &queue_member_function, Params&&... args)
Invoke queue member function given queue and parameters &\#8212; hpx::future tied to the sycl
event / (two way)

template<typename F, typename ...Ts>
inline decltype(auto) friend tag_invoke(hpx::parallel::execution::post_t, sycl_executor &exec, F &&f, Ts&&... ts)

template<typename F, typename ...Ts>
inline decltype(auto) friend tag_invoke(hpx::parallel::execution::async_execute_t, sycl_executor &exec, F &&f, Ts&&... ts)

inline cl::sycl::device get_device() const
Return the device used by the underlying SYCL queue.

inline cl::sycl::context get_context() const
Return the context used by the underlying SYCL queue.

Protected Attributes

cl::sycl::queue command_queue

cache

See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx

namespace util

namespace cache

template<typename Key, typename Entry, typename UpdatePolicy = std::less<Entry>, typename InsertPolicy = policies::always<Entry>, typename CacheStorage = std::map<Key, Entry>, typename Statistics = statistics::no_statistics>
class local_cache

#include <hpx/cache/local_cache.hpp>  

The local_cache implements the basic functionality needed for a local (non-distributed) cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache, must model the CacheEntry concept
- **UpdatePolicy** – A (optional) type specifying a (binary) function object used to sort the cache entries based on their ‘age’. The ‘oldest’ entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is std::less<Entry>. The function object will be invoked using 2 entry instances of the type Entry. This type must model the UpdatePolicy model.
- **InsertPolicy** – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is policies::always, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the InsertPolicy model.
- **CacheStorage** – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container. The default is a std::map<Key, Entry>.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using key_type = Key

using entry_type = Entry

using update_policy_type = UpdatePolicy

using insert_policy_type = InsertPolicy
using `storage_type = CacheStorage`

using `statistics_type = Statistics`

using `value_type = typename entry_type::value_type`

using `size_type = typename storage_type::size_type`

using `storage_value_type = typename storage_type::value_type`

### Public Functions

```cpp
inline explicit local_cache(size_type max_size = 0, update_policy_type const &up = update_policy_type(), insert_policy_type const &ip = insert_policy_type())
```

Construct an instance of a `local_cache`.

**Parameters**
- `max_size` – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry’s `get_size` function.
- `up` – [in] An instance of the `UpdatePolicy` to use for this cache. The default is to use a default constructed instance of the type as defined by the `UpdatePolicy` template parameter.
- `ip` – [in] An instance of the `InsertPolicy` to use for this cache. The default is to use a default constructed instance of the type as defined by the `InsertPolicy` template parameter.

```cpp
local_cache(local_cache const &other) = default
```

```cpp
local_cache(local_cache &&other) = default
```

```cpp
local_cache &operator=(local_cache const &other) = default
```

```cpp
local_cache &operator=(local_cache &&other) = default
```

```cpp
~local_cache() = default
```

```cpp
inline constexpr size_type size() const noexcept
```

Return current size of the cache.

**Returns** The current size of this cache instance.

```cpp
inline constexpr size_type capacity() const noexcept
```

Access the maximum size the cache is allowed to grow to.

**Note:** The unit of this value is usually determined by the unit of the return values of the entry’s function `entry::get_size`.

**Returns** The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.
inline bool reserve(size_type max_size)

Change the maximum size this cache can grow to.

Parameters max_size – [in] The new maximum size this cache will be allowed to grow to.

Returns This function returns true if successful. It returns false if the new max_size is smaller than the current limit and the cache could not be shrunk to the new maximum size.

inline bool holds_key(key_type const &k) const

Check whether the cache currently holds an entry identified by the given key.

Note: This function does not call the entry’s function entry::touch. It just checks if the cache contains an entry corresponding to the given key.

Parameters k – [in] The key for the entry which should be looked up in the cache.

Returns This function returns true if the cache holds the referenced entry, otherwise it returns false.

inline bool get_entry(key_type const &k, key_type &realkey, entry_type &val)

Get a specific entry identified by the given key.

Note: The function will call the entry’s entry::touch function if the value corresponding to the provided key is found in the cache.

Parameters
• k – [in] The key for the entry which should be retrieved from the cache.
• realkey[out] – Return the full real key found in the cache
• val – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns true if the cache holds the referenced entry, otherwise it returns false.

inline bool get_entry(key_type const &k, entry_type &val)

Get a specific entry identified by the given key.

Note: The function will call the entry’s entry::touch function if the value corresponding to the provided key is found in the cache.

Parameters
• k – [in] The key for the entry which should be retrieved from the cache.
• val – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns true if the cache holds the referenced entry, otherwise it returns false.

inline bool get_entry(key_type const &k, value_type &val)

Get a specific entry identified by the given key.

Note: The function will call the entry’s entry::touch function if the value corresponding to the provided is found in the cache.
**Parameters**
- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

**Returns** This function returns `true` if the cache holds the referenced entry, otherwise it returns `false`.

```cpp
inline bool insert(key_type const &k, value_type const &val)
```

Insert a new element into this cache.

---

**Note:** This function invokes both, the insert policy as provided to the constructor and the function `entry::insert` of the newly constructed entry instance. If either of these functions returns false the key/value pair doesn’t get inserted into the cache and the `insert` function will return `false`. Other reasons for this function to fail (return `false`) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

---

**Parameters**
- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

**Returns** This function returns `true` if the entry has been successfully added to the cache, otherwise it returns `false`.

```cpp
inline bool insert(key_type const &k, value_type &&val)
```

Insert a new entry into this cache.

---

**Note:** This function invokes both, the insert policy as provided to the constructor and the function `entry::insert` of the provided entry instance. If either of these functions returns false the key/value pair doesn’t get inserted into the cache and the `insert` function will return `false`. Other reasons for this function to fail (return `false`) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

---

**Parameters**
- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

**Returns** This function returns `true` if the entry has been successfully added to the cache, otherwise it returns `false`.

```cpp
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool insert(key_type const &k, Entry_ &&e)
```

Insert a new entry into this cache.

---

**Note:** The function will call the entry’s `entry::touch` function if the indexed value is found in the cache.
Note: The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- `k` – [in] The key for the value which should be updated in the cache.
- `val` – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

Returns

This function returns `true` if the entry has been successfully updated, otherwise it returns `false`. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```cpp
template<typename F, typename Value, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>>>
inline bool update_if(key_type const &k, Value &&val, F &&f)
{
    // Update an existing element in this cache.
}
```

Note: The function will call the entry’s `entry::touch` function if the indexed value is found in the cache.

Note: The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- `k` – [in] The key for the value which should be updated in the cache.
- `val` – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- `f` – [in] A callable taking two arguments, `k` and the key found in the cache (in that order). If `f` returns true, then the update will continue. If `f` returns false, then the update will not succeed.

Returns

This function returns `true` if the entry has been successfully updated, otherwise it returns `false`. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```cpp
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool update(key_type const &k, Entry_ &&e)
{
    // Update an existing entry in this cache.
}
```

Note: The function will call the entry’s `entry::touch` function if the indexed value is found in the cache.

Note: The difference to the other overload of the `insert` function is that this overload replaces the whole cache entry, while the other overload replaces the cached value only, leaving the cache entry properties untouched.

Parameters
• **k** – [in] The key for the entry which should be updated in the cache.
• **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

**Returns** This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```cpp
template<typename Func = policies::always<storage_value_type>>
inline size_type erase(Func &&ep = Func())
```

Remove stored entries from the cache for which the supplied function object returns true.

**Parameters** **ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*. Even then the entry might not be removed from the cache as its entry::remove function might return false.

**Returns** This function returns the overall size of the removed entries (which is the sum of the values returned by the entry::get_size functions of the removed entries).

```cpp
inline size_type erase()
```

Remove all stored entries from the cache.

---

**Note:** All entries are considered for removal, but in the end an entry might not be removed from the cache as its entry::remove function might return false. This function is very useful for instance in conjunction with an entry’s entry::remove function enforcing additional criteria like entry expiration, etc.

**Returns** This function returns the overall size of the removed entries (which is the sum of the values returned by the entry::get_size functions of the removed entries).

```cpp
inline void clear()
```

Clear the cache. Unconditionally removes all stored entries from the cache.

```cpp
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

**Returns** This function returns a reference to the statistics instance embedded inside this cache

```cpp
inline statistics_type &get_statistics() noexcept
```

---

hpx/cache/lru_cache.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

namespace cache

template<typename Key, typename Entry, typename Statistics = statistics::no_statistics>
class lru_cache

#include <hpx/cache/lru_cache.hpp> The lru_cache implements the basic functionality needed for a local (non-distributed) LRU cache.

Template Parameters
• Key – The type of the keys to use to identify the entries stored in the cache
• Entry – The type of the items to be held in the cache.
• Statistics – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using key_type = Key

using entry_type = Entry

using statistics_type = Statistics

using entry_pair = std::pair<key_type, entry_type>

using storage_type = std::list<entry_pair>

using map_type = std::map<Key, typename storage_type::iterator>

using size_type = std::size_t
**Public Functions**

```cpp
inline explicit lru_cache(size_type max_size = 0)
Construct an instance of a lru_cache.

**Parameters**

**max_size** – [in] The maximal size this cache is allowed to reach any time.
The default is zero (no size limitation). The unit of this value is usually determined by
the unit of the values returned by the entry’s `get_size` function.
```

```cpp
lru_cache(lru_cache const &other) = default
lru_cache(lru_cache &&other) = default
lru_cache &operator=(lru_cache const &other) = default
lru_cache &operator=(lru_cache &&other) = default
```

```cpp
~lru_cache() = default
```

```cpp
inline constexpr size_type size() const noexcept
Return current size of the cache.

**Returns**
The current size of this cache instance.
```

```cpp
inline constexpr size_type capacity() const noexcept
Access the maximum size the cache is allowed to grow to.

**Note:** The unit of this value is usually determined by the unit of the return values of the entry’s
function `entry::get_size`.
```

```cpp
Returns
The maximum size this cache instance is currently allowed to reach. If this num-
ber is zero the cache has no limitation with regard to a maximum size.
```

```cpp
inline void reserve(size_type max_size)
Change the maximum size this cache can grow to.

**Parameters**

**max_size** – [in] The new maximum size this cache will be allowed to grow
to.
```

```cpp
inline bool holds_key(key_type const &key) const
Check whether the cache currently holds an entry identified by the given key.

**Note:** This function does not call the entry’s function `entry::touch`. It just checks if the cache
contains an entry corresponding to the given key.
```

```cpp
Parameters**

**key** – [in] The key for the entry which should be looked up in the cache.
**Returns**
This function returns `true` if the cache holds the referenced entry, otherwise it returns `false`.
```

```cpp
inline bool get_entry(key_type const &key, key_type &realkey, entry_type &entry)
Get a specific entry identified by the given key.

**Note:** The function will “touch” the entry and mark it as recently used if the key was found in
the cache.
```

**Parameters**
inline bool get_entry(key_type const &key, entry_type const &entry)

Get a specific entry identified by the given key.

**Returns**: This function returns `true` if the cache holds the referenced entry, otherwise it returns `false`.

**Parameters**
- **key** – [in] The key for the entry which should be retrieved from the cache.
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Note**: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

```
template<typename Entry_, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>> inline bool insert(key_type const &key, Entry_ &&entry)
```

Insert a new entry into this cache.

**Parameters**
- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

**Note**: This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior.

```
template<typename Entry_, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>> inline void update(key_type const &key, Entry_ &&entry)
```

Update an existing element in this cache.

**Parameters**
- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
inline bool update_if(key_type const &key, Entry_ &&entry, F &&f)
Update an existing element in this cache.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Note: The difference to the other overload of the insert function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters
• key – [in] The key for the value which should be updated in the cache.
• entry – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
• f – [in] A callable taking two arguments, k and the key found in the cache (in that order). If f returns true, then the update will continue. If f returns false, then the update will not succeed.

Returns This function returns true if the entry has been successfully updated, otherwise it returns false. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename Func>
inline size_type erase(Func const &ep)
Remove stored entries from the cache for which the supplied function object returns true.

Parameters ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is true.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the entry::get_size functions of the removed entries).

inline size_type erase()
Remove all stored entries from the cache.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the entry::get_size functions of the removed entries).

inline size_type clear()
Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr statistics_type const &get_statistics() const noexcept
Allow to access the embedded statistics instance.

Returns This function returns a reference to the statistics instance embedded inside this cache

inline statistics_type &get_statistics() noexcept
**Private Types**

using `update_on_exit` = typename `statistics_type`::update_on_exit

**Private Functions**

```
template<typename Entry_, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>
inline void insert_nonexist(key_type const &key, Entry_ &&entry)
inline void touch(typename `storage_type`::iterator it)
inline void evict()
```

**Private Members**

```

size_type `current_size_` = 0

`storage_type` `storage_`

`map_type` `map_`

`statistics_type` `statistics_`
```

**hpx/cache/entries/entry.hpp**

See _Public API_ for a list of names and headers that are part of the public _HPX_ API.

namespace `hpx`

namespace `util`

namespace `cache`

namespace `entries`

```cpp
class `entry`

#include <hpx/cache/entries/entry.hpp>

Template Parameters

- **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.
- **Derived** – The (optional) type for which this type is used as a base class.
```
Public Types

using value_type = Value

Public Functions

entry() = default
Any cache entry has to be default constructible.

inline explicit entry(value_type const &val) noexcept(std::is_nothrow_copy_constructible_v<value_type>)
Construct a new instance of a cache entry holding the given value.

inline explicit entry(value_type &&val) noexcept
Construct a new instance of a cache entry holding the given value.

inline value_type &get() noexcept
Get a reference to the stored data value.

Note: This function is part of the CacheEntry concept

inline constexpr value_type const &get() const noexcept

Public Static Functions

static inline constexpr bool touch() noexcept
The function touch is called by a cache holding this instance whenever it has been requested (touched).

Note: It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return true to indicate this to the cache, forcing to reorder the cache entries.

Note: This function is part of the CacheEntry concept

Returns This function should return true if the cache needs to update it’s internal heap. Usually this is needed if the entry has been changed by touch() in a way influencing the sort order as mandated by the cache’s UpdatePolicy

static inline constexpr bool insert() noexcept
The function insert is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns This function should return true if the entry should be added to the cache, otherwise it should return false.
static inline constexpr bool remove() noexcept
The function remove is called by a cache holding this instance whenever it is about to be removed from the cache.

**Note:** This function is part of the CacheEntry concept

**Returns** The return value can be used to avoid removing this instance from the cache.
If the value is true it is ok to remove the entry, otherwise it will stay in the cache.

static inline constexpr std::size_t get_size() noexcept
Return the 'size' of this entry. By default the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

### Private Members

```c++
value_type value_
```

### Friends

```c++
inline friend bool operator<(entry const &lhs, entry const &rhs)
    noexcept(noexcept(std::declval<value_type const&>() <
                 std::declval<value_type const&>()))
```
Forwarding operator< allowing to compare entries instead of the values.

---

See [Public API](index.html#public-api) for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

namespace cache

namespace entries

template<typename Value>
class fifo_entry : public hpx::util::cache::entries::entry<Value, fifo_entry<Value>>
    #include <hpx/cache/entries/fifo_entry.hpp> The fifo_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently inserted entries are discarded from the cache first.

**Note:** The fifo_entry conforms to the CacheEntry concept.
**Note:** This type can be used to model a ‘last in first out’ cache policy if it is used with a std::greater as the caches’ UpdatePolicy (instead of the default std::less).

**Template Parameters** **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

**Public Functions**

```cpp
default
```

Any cache entry has to be default constructible.

```cpp
inline explicit \texttt{\textcolor{blue}{fifo\_entry}}(Value\ const\ &val)

\textcolor{green}{\text{noexcept}}(\textcolor{blue}{\text{std::is\_nothrow\_constructible\_v<base\_type, Value const\&>}})
```

Construct a new instance of a cache entry holding the given value.

```cpp
inline explicit \texttt{\textcolor{blue}{fifo\_entry}}(Value \&\&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```cpp
inline constexpr bool \texttt{\textcolor{blue}{insert}}()
```

The function `insert` is called by a cache whenever it is about to be inserted into the cache.

**Note:** This function is part of the CacheEntry concept

**Returns** This function should return `true` if the entry should be added to the cache, otherwise it should return `false`.

```cpp
inline constexpr \texttt{\textcolor{blue}{time\_point}} \textcolor{green}{\text{const &get\_creation\_time}}() const noexcept
```

**Private Types**

```cpp
using base\_type = entry<Value, fifo\_entry<Value>>
```

```cpp
using time\_point = std::chrono::steady\_clock::time\_point
```

**Private Members**

```cpp
time\_point insertion\_time_
Friends

inline friend bool operator<(fifo_entry const &lhs, fifo_entry const &rhs)
    noexcept(noexcept(std::declval<time_point const&>() <
        std::declval<time_point const&>()))

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been created earlier (FIFO).

hpx/cache/entries/lfu_entry.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

namespace cache

namespace entries

template<typename Value>

class lfu_entry : public hpx::util::cache::entries::entry<Value, lfu_entry<Value>>

#include <hpx/cache/entries/lfu_entry.hpp> The lfu_entry type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least frequently used entries are discarded from the cache first.

Note: The lfu_entry conforms to the CacheEntry concept.

Note: This type can be used to model a ‘most frequently used’ cache policy if it is used with a std::greater as the caches’ UpdatePolicy (instead of the default std::less).

Template Parameters Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

lfu_entry() = default

Any cache entry has to be default constructible.

inline explicit lfu_entry(Value const &val)
    noexcept(std::is_nothrow_constructible_v base_type, Value const&)

Construct a new instance of a cache entry holding the given value.

inline explicit lfu_entry(Value &&val) noexcept

Construct a new instance of a cache entry holding the given value.
inline bool touch() noexcept
The function touch is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the operator<().

**Returns** This function should return true if the cache needs to update it’s internal heap. Usually this is needed if the entry has been changed by touch() in a way influencing the sort order as mandated by the cache’s UpdatePolicy.

inline constexpr unsigned long const &get_access_count() const noexcept

### Private Types

using base_type = entry<Value, lfu_entry<Value>>

### Private Members

unsigned long ref_count_ = 0

### Friends

inline friend bool operator<(lfu_entry const &lhs, lfu_entry const &rhs) noexcept
Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less frequently (LFU).

### hpx/cache/entries/lru_entry.hpp

namespace cache

namespace entries

template<typename Value>

class lru_entry : public hpx::util::cache::entries::entry<Value, lru_entry<Value>>

#include <hpx/cache/entries/lru_entry.hpp> The lru_entry type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least recently used entries are discarded from the cache first.
Note: The lru_entry conforms to the CacheEntry concept.

Note: This type can be used to model a ‘most recently used’ cache policy if it is used with a std::greater as the caches’ UpdatePolicy (instead of the default std::less).

**Template Parameters** Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

**Public Functions**

inline lru_entry()  
Any cache entry has to be default constructible.

inline explicit lru_entry(Value const &val)

   noexcept(std::is_nothrow_constructible_v<
base_type, Value
const&>)

    Construct a new instance of a cache entry holding the given value.

inline explicit lru_entry(Value &&val) noexcept
    Construct a new instance of a cache entry holding the given value.

inline bool touch()  
The function touch is called by a cache holding this instance whenever it has been requested (touched).

    In the case of the LRU entry we store the time of the last access which will be used to compare
the age of an entry during the invocation of the operator<().

Returns This function should return true if the cache needs to update it’s internal heap.
    Usually this is needed if the entry has been changed by touch() in a way influencing
the sort order as mandated by the cache’s UpdatePolicy

inline constexpr time_point const &get_access_time() const noexcept
    Returns the last access time of the entry.

inline ~**vector**()

inline **vector** &operator=(vector const &other)

inline **vector** &operator=(vector &other)

inline allocator_type get_allocator() const noexcept

Returns the allocator associated with the container.

inline **reference** operator[](size_type pos)

inline **const_reference** operator[](size_type pos) const
inline \texttt{pointer data()} noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range
\texttt{[data(); data() + size()]} is always a valid range, even if the container is empty \texttt{(data()) is not dereferenceable in that case).

inline \texttt{const_pointer data()} const noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range
\texttt{[data(); data() + size()]} is always a valid range, even if the container is empty \texttt{(data()) is not dereferenceable in that case).

inline \texttt{T *device_data()} const noexcept

Returns a raw pointer corresponding to the address of the data allocated on the device.

inline \texttt{std::size_t size()} const noexcept

Returns \texttt{size()} == 0.

inline void \texttt{resize(size_type)}

Effects: If \texttt{size <= size()}, equivalent to calling \texttt{pop_back()} \texttt{size() - size} times. If \texttt{size() < size},
appends \texttt{size - size()} default-inserted elements to the sequence.

Requires: \texttt{T} shall be \texttt{MoveInsertable} and \texttt{DefaultInsertable} into \texttt{*this}.

Remarks: If an exception is thrown other than by the move constructor of a non-\texttt{CopyInsertable} \texttt{T}
there are no effects.

inline void \texttt{resize(size_type, T const&)}

Effects: If \texttt{size <= size()}, equivalent to calling \texttt{pop_back()} \texttt{size() - size} times. If \texttt{size() < size},
appends \texttt{size - size()} copies of \texttt{val} to the sequence.

Requires: \texttt{T} shall be \texttt{CopyInsertable} into \texttt{*this}.

Remarks: If an exception is thrown there are no effects.

inline \texttt{iterator begin()} noexcept

inline \texttt{iterator end()} noexcept

inline \texttt{const_iterator cbegin()} const noexcept

inline \texttt{const_iterator cend()} const noexcept

inline \texttt{const_iterator begin()} const noexcept

inline \texttt{const_iterator end()} const noexcept

inline void \texttt{swap(vector &other)}

Effects: Exchanges the contents and capacity() of \texttt{*this} with that of \texttt{x}.

Complexity: Constant time.

inline void \texttt{clear()} noexcept

Effects: Erases all elements in the range \texttt{[begin(),end())}. Destroys all elements in \texttt{a}. Invalidates all
references, pointers, and iterators referring to the elements of \texttt{a} and may invalidate the past-the-end
iterator.

Post: \texttt{a.empty()} returns true.

Complexity: Linear.

hpx/compute_local/host/block_fork_join_executor.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace execution

namespace experimental

class block_fork_join_executor

#include <block_fork_join_executor.hpp> An executor with fork-join (blocking) semantics.

The block_fork_join_executor creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a fork_join_executor hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of bulk_(a)sync_execute.

This behaviour is similar to the plain fork_join_executor except that the block_fork_join_executor creates a hierarchy of fork_join_executors, one for each target used to initialize it.

Public Functions

inline explicit block_fork_join_executor(threads::thread_priority priority = threads::thread_priority::bound, threads::thread_stacksize stacksize = threads::thread_stacksize::small_, fork_join_executor::loop_schedule const schedule = fork_join_executor::loop_schedule::static_, std::chrono::nanoseconds yield_delay = std::chrono::milliseconds(1))
Construct a `block_fork_join_executor`.

**Note:** This constructor will create one fork_join_executor for each numa domain.

**Parameters**
- `priority` – The priority of the worker threads.
- `stacksize` – The stacksize of the worker threads. Must not be nostack.
- `schedule` – The loop schedule of the parallel regions.
- `yield_delay` – The time after which the executor yields to other work if it has not received any new work for execution.

```cpp
inline explicit block_fork_join_executor(std::vector<compute::host::target> const &targets, threads::thread_priority priority = threads::thread_priority::bound, threads::thread_stacksize stacksize = threads::thread_stacksize::small_, fork_join_executor::loop_schedule const schedule = fork_join_executor::loop_schedule::static_, std::chrono::nanoseconds yield_delay = std::chrono::milliseconds(1))
```

Construct a `block_fork_join_executor`.

**Note:** This constructor will create one fork_join_executor for each given target.

**Parameters**
- `targets` – The list of targets to use for thread placement
- `priority` – The priority of the worker threads.
- `stacksize` – The stacksize of the worker threads. Must not be nostack.
- `schedule` – The loop schedule of the parallel regions.
- `yield_delay` – The time after which the executor yields to other work if it has not received any new work for execution.

```cpp
template<typename F, typename S, typename ...Ts>
inline void bulk_sync_execute_helper(F &&f, S const &shape, Ts&&... ts):
```

```cpp
template<typename F, typename S, typename ...Ts>
inline decltype(auto) friend tag_invoke(hpx::parallel::execution::bulk_async_execute_t, block_fork_join_executor &exec, F &&f, S const &shape, Ts&&... ts):
```

namespace hpx

namespace threads

Enums

enum class thread_schedule_state : std::int8_t

The thread_schedule_state enumerator encodes the current state of a thread instance.

Values:

enumerator unknown

enumerator active

thread is currently active (running, has resources)

enumerator pending

thread is pending (ready to run, but no hardware resource available)

enumerator suspended

thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator depleted

thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator terminated

thread has been stopped an may be garbage collected

enumerator staged

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator pending_do_not_schedule

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)
enumerator **pending_boost**

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator **deleted**

thread has been stopped and was deleted

enum class **thread_priority** : std::int8_t

This enumeration lists all possible thread-priorities for HPX threads.

*Values:*

enumerator **unknown**

enumerator **default_**

Will assign the priority of the task to the default (normal) priority.

enumerator **low**

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator **normal**

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator **high_recursive**

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator **boost**

Same as `thread_priority_high` except that the thread will fall back to `thread_priority_normal` if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator **bound**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enum class **thread_restart_state** : std::int8_t

The `thread_restart_state` enumerator encodes the reason why a thread is being restarted

*Values:*

enumerator **unknown**

enumerator **signaled**
  The thread has been signaled.

enumerator **timeout**
  The thread has been reactivated after a timeout.

enumerator **terminate**
  The thread needs to be terminated.

enumerator **abort**
  The thread needs to be aborted.

enum class **thread_stacksize** : std::int8_t
  A `thread_stacksize` references any of the possible stack-sizes for HPX threads.
  **Values:**

  enumerator **unknown**

  enumerator **small_**
    use small stack size (the underscore is to work around ‘small’ being defined to char on Windows)

  enumerator **medium**
    use medium sized stack size

  enumerator **large**
    use large stack size

  enumerator **huge**
    use very large stack size

  enumerator **nostack**
    this thread does not suspend (does not need a stack)

  enumerator **current**
    use size of current thread’s stack

  enumerator **default_**
    use default stack size

  enumerator **minimal**
    use minimally stack size
enumerator maximal
    use maximally stack size

enum class thread_schedule_hint_mode : std::int8_t
    The type of hint given when creating new tasks.
    Values:

enumerator none
    A hint that leaves the choice of scheduling entirely up to the scheduler.

denumerator thread
    A hint that tells the scheduler to prefer scheduling a task on the local thread number associated
    with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how
    to interpret thread numbers that are larger than the number of threads available to the scheduler.
    Typically thread numbers will wrap around when too large.

denumerator numa
    A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with
    this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to
    interpret NUMA domain indices that are larger than the number of available NUMA domains to
    the scheduler. Typically indices will wrap around when too large.

enum class thread_placement_hint : std::int8_t
    The type of hint given to the scheduler related to thread placement
    The type of hint given to the scheduler related running a thread as a child directly in the context of the
    parent thread
    Values:

enumerator none
    No hint is specified. The implementation is free to chose what placement methods to use.

denumerator depth_first
    A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e.
    consecutively scheduled threads are placed on the same core).

denumerator breadth_first
    A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e.
    consecutively scheduled threads are placed on the neighboring cores).

denumerator depth_first_reverse
    A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e.
    consecutively scheduled threads are placed on the same core). Threads are being scheduled in
    reverse order.

denumerator breadth_first_reverse
    A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e.
consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class thread_sharing_hint : std::int8_t

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

Values:

enumerator none
No hint is specified. The implementation is free to chose what sharing methods to use.

do_not_share_function
A hint that tells the scheduler to avoid sharing the given function (object) between threads.

do_not_combine_tasks
A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class thread_execution_hint : std::int8_t

Values:

enumerator none
No hint is specified. Always run the thread in its own execution environment.

run_as_child
Attempt to run the thread in the execution context of the parent thread.

**Functions**

std::ostream &operator<<(std::ostream &os, thread_schedule_state t)

char const *get_thread_state_name(thread_schedule_state state) noexcept

Returns the name of the given state.

Get the readable string representing the name of the given thread_state constant.

Parameters state – this represents the thread state.

std::ostream &operator<<(std::ostream &os, thread_priority t)

char const *get_thread_priority_name(thread_priority priority) noexcept

Return the thread priority name.

Get the readable string representing the name of the given thread_priority constant.

Parameters priority – this represents the thread priority.

std::ostream &operator<<(std::ostream &os, thread_restart_state t)

char const *get_thread_state_ex_name(thread_restart_state state) noexcept

Get the readable string representing the name of the given thread_restart_state constant.
char const *get_thread_state_name(thread_state state) noexcept

Get the readable string representing the name of the given thread_state constant.

std::ostream &operator<<(std::ostream &os, thread_stacksize t)

char const *get_stack_size_enum_name(thread_stacksize size) noexcept

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters size – this represents the stack size

constexpr thread_sharing_hint operator|(thread_sharing_hint lhs, thread_sharing_hint rhs) noexcept

canvas

canvas

Variables

constexpr thread_execution_hint default_runs_as_child_hint = thread_execution_hint::none

Default value to use for runs-as-child mode (if true, then futures will attempt to execute associated threads directly if they have not started running).

struct thread_schedule_hint

#include <thread_enums.hpp> A hint given to a scheduler to guide where a task should be scheduled.

A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

Public Functions

inline constexpr thread_schedule_hint() noexcept

Construct a default hint with mode thread_schedule_hint_mode::none.

inline explicit constexpr thread_schedule_hint(std::int16_t thread_hint, thread_placement_hint placement = thread_placement_hint::none, thread_execution_hint runs_as_child = default_runs_as_child_hint, thread_sharing_hint sharing = thread_sharing_hint::none) noexcept

Construct a hint with mode thread_schedule_hint_mode::thread and the given hint as the local thread number.

inline constexpr thread_schedule_hint(thread_schedule_hint_mode mode, std::int16_t hint, thread_placement_hint placement = thread_placement_hint::none, thread_execution_hint runs_as_child = default_runs_as_child_hint, thread_sharing_hint sharing = thread_sharing_hint::none) noexcept

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is thread_schedule_hint_mode::none.
inline constexpr thread_placement_hint placement_mode() const noexcept
inline void placement_mode(thread_placement_hint bits) noexcept
inline constexpr thread_sharing_hint sharing_mode() const noexcept
inline void sharing_mode(thread_sharing_hint bits) noexcept
inline constexpr thread_execution_hint runs_as_child_mode() const noexcept
inline void runs_as_child_mode(thread_execution_hint bits) noexcept

Public Members

std::int16_t hint = -1
The hint associated with the mode. The interpretation of this hint depends on the given mode.

thread_schedule_hint_mode mode = thread_schedule_hint_mode::none
The mode of the scheduling hint.

std::uint8_t placement_mode_bits
The mode of the desired thread placement.

std::uint8_t sharing_mode_bits
The mode of the desired sharing hint.

std::uint8_t runs_as_child_mode_bits
The thread will run as a child directly in the context of the current thread

 template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
T *any_cast(util::basic_any<IArch, OArch, Char, Copyable> *operand) noexcept

Performs type-safe access to the contained object.

Parameters operand – target any object
Returns If operand is not a null pointer, and the typeid of the requested T matches that of the contents of operand, a pointer to the value contained by operand, otherwise a null pointer.

template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
T const *any_cast(util::basic_any<IArch, OArch, Char, Copyable> const *operand) noexcept
Performs type-safe access to the contained object.

Parameters operand – target any object

Returns If operand is not a null pointer, and the typeid of the requested T matches that of the contents of operand, a pointer to the value contained by operand, otherwise a null pointer.

Parameters operand – target any object

Returns static_cast<T>(*std::any_cast<U>(&operand))

The program is ill-formed if std::is_constructible_v<T, U&> is false.

Parameters operand – target any object

Returns static_cast<T>(*std::any_cast<U>(&operand))

The program is ill-formed if std::is_constructible_v<T, const U&> is false.

Parameters operand – target any object

Returns static_cast<T>(*std::any_cast<U>(&operand))

struct bad_any_cast : public bad_cast

#include <any.hpp> Defines a type of object to be thrown by the value-returning forms of hpx::any_cast on failure.

Public Functions

inline bad_any_cast(stl::type_info const &src, stl::type_info const &dest)

Constructs a new bad_any_cast object with an implementation-defined null-terminated byte string which is accessible through what().

inline char const *what() const noexcept override

Returns the explanatory string.

Note: Implementations are allowed but not required to override what().

Returns Pointer to a null-terminated string with explanatory information. The string is suitable for conversion and display as a std::wstring. The pointer is guaranteed to be valid at least until the exception object from which it is obtained is destroyed, or until a non-const member function (e.g. copy assignment operator) on the exception object is called.

hpx/datastructures/tuple.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

    Top level HPX namespace.

Functions

template<typename ...Ts>
constexpr tuple<util::decay_unwrap_t<Ts>...> make_tuple(Ts&&... ts)

    Provides compile-time indexed access to the types of the elements of the tuple.

template<typename ...Ts>
constexpr tuple<Ts&&...> forward_as_tuple(Ts&&... ts)

    Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

    Parameters ts – zero or more arguments to construct the tuple from

    Returns hpx::tuple object created as if by

    ```cpp
    hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)  
    ```

    template<typename ...Ts>
    constexpr tuple<Ts&...> tie(Ts&... ts)

    Creates a tuple of lvalue references to its arguments or instances of hpx::ignore.

    Parameters ts – zero or more lvalue arguments to construct the tuple from

    Returns hpx::tuple object containing lvalue references.

    template<typename ...Tuples>
    constexpr auto tuple_cat(Tuples&&... tuples)

    Constructs a tuple that is a concatenation of all tuples in tuples. The behavior is undefined if any type in std::decay_t<Tuples>... is not a specialization of hpx::tuple. However, an implementation may choose to support types (such as std::array and std::pair) that follow the tuple-like protocol.

    Parameters tuples – zero or more tuples to concatenate

    Returns hpx::tuple object composed of all elements of all argument tuples constructed from

    ```cpp
    hpx::get<Is>(HPX_FORWARD(UTuple, t) for each individual element.
    ```
util::at_index<, Ts...>::type & get() noexcept

Extracts the Ith element from the tuple. I must be an integer value in [0, sizeof...(Ts)).

template<std::size_t I>
util::at_index<, Ts...>::type const & get() const noexcept

Extracts the Ith element from the tuple. I must be an integer value in [0, sizeof...(Ts)).

Variables

cconstexpr hpx::detail::ignore_type ignore = {}

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with hpx::tie when unpacking a hpx::tuple, as a placeholder for the arguments that are not used. While the behavior of hpx::ignore outside of hpx::tie is not formally specified, some code guides recommend using hpx::ignore to avoid warnings from unused return values of [[nodiscard]] functions.

template<typename ...Ts>
class tuple

#include <tuple.hpp> Class template hpx::tuple is a fixed-size collection of heterogeneous values. It is a generalization of hpx::pair. If std::is_trivially_destructible<Ti>::value is true for every Ti in Ts, the destructor of tuple is trivial.

Param Ts... the types of the elements that the tuple stores.

template<std::size_t I, typename T, typename Enable = void>
struct tuple_element

#include <tuple.hpp> Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

template<typename T>
struct tuple_size

#include <tuple.hpp> Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

hpx/datastructures/serialization/serializable_any.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Enums

enum class error : std::int16_t

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

Values:

eumerator success

The operation was successful.

eumerator no_success

The operation did failed, but not in an unexpected manner.

eumerator not_implemented

The operation is not implemented.

eumerator out_of_memory

The operation caused an out of memory condition.

eumerator bad_action_code

enumerator bad_component_type

The specified component type is not known or otherwise invalid.
enumerator network_error
   A generic network error occurred.

enumerator version_too_new
   The version of the network representation for this object is too new.

enumerator version_too_old
   The version of the network representation for this object is too old.

enumerator version_unknown
   The version of the network representation for this object is unknown.

enumerator unknown_component_address

enumerator duplicate_component_address
   The given global id has already been registered.

enumerator invalid_status
   The operation was executed in an invalid status.

enumerator bad_parameter
   One of the supplied parameters is invalid.

enumerator internal_server_error

enumerator service_unavailable

enumerator bad_request

enumerator repeated_request

enumerator lock_error

enumerator duplicate_console
   There is more than one console locality.

enumerator no_registered_console
   There is no registered console locality available.

enumerator startup_timed_out

enumerator uninitialized_value

enumerator bad_response_type
enumerator **deadlock**

enumerator **assertion_failure**

enumerator **null_thread_id**

  Attempt to invoke a API function from a non-HPX thread.

enumerator **invalid_data**

enumerator **yield_aborted**

  The yield operation was aborted.

enumerator **dynamic_link_failure**

enumerator **commandline_option_error**

  One of the options given on the command line is erroneous.

enumerator **serialization_error**

  There was an error during serialization of this object.

enumerator **unhandled_exception**

  An unhandled exception has been caught.

enumerator **kernel_error**

  The OS kernel reported an error.

enumerator **broken_task**

  The task associated with this future object is not available anymore.

enumerator **task_moved**

  The task associated with this future object has been moved.

enumerator **task_already_started**

  The task associated with this future object has already been started.

enumerator **future_already_retrieved**

  The future object has already been retrieved.

enumerator **promise_already_satisfied**

  The value for this future object has already been set.

enumerator **future_does_not_support_cancellation**

  The future object does not support cancellation.
enumerator **future_can_not_be_cancelled**
   The future can’t be canceled at this time.

enumerator **no_state**
   The future object has no valid shared state.

enumerator **broken.promise**
   The promise has been deleted.

enumerator **thread_resource_error**

enumerator **future_cancelled**

enumerator **thread_cancelled**

enumerator **thread_not_interruptable**

enumerator **duplicate_component_id**
   The component type has already been registered.

enumerator **unknown_error**
   An unknown error occurred.

enumerator **bad_plugin_type**
   The specified plugin type is not known or otherwise invalid.

enumerator **filesystem_error**
   The specified file does not exist or other filesystem related error.

enumerator **bad_function_call**
   equivalent of std::bad_function_call

enumerator **task_canceled_exception**
   parallel::task_canceled_exception

enumerator **task_block_not_active**
   task_region is not active

enumerator **out_of_range**
   Equivalent to std::out_of_range.

enumerator **length_error**
   Equivalent to std::length_error.

enumerator **migration_needs_retry**
   migration failed because of global race, retry

hpx/errors/error_code.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Unnamed Group

inline error_code make_error_code(error e, throwmode mode = throwmode::plain)
   Returns a new error_code constructed from the given parameters.
inline error_code make_error_code(error e, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, char const *msg, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, char const *msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, std::string const &msg, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, std::string const &msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
inline error_code make_error_code(std::exception_ptr const &e)

Functions

std::error_category const &get_hpx_category() noexcept
   Returns generic HPX error category used for new errors.
std::error_category const &get_hpx_rethrow_category() noexcept
   Returns generic HPX error category used for errors re-thrown after the exception has been de-serialized.
inline error_code make_success_code(throwmode mode = throwmode::plain)
   Returns error_code(hpx::error::success, “success”, mode).

class error_code : public error_code
   #include <error_code.hpp> A hpx::error_code represents an arbitrary error condition.
   The class hpx::error_code describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.
Note: Class `hpx::error_code` is an adjunct to error reporting by exception.

Public Functions

```cpp
inline explicit error_code(throwmode mode = throwmode::plain)

Construct an object of type `error_code`.

Parameters

- **mode** – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Throws nothing –
```
explicit error_code(error e, throwmode mode = throwmode::plain)

Construct an object of type `error_code`.

Parameters

- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Throws nothing –
```
```cpp
error_code(error e, char const *func, char const *file, long line, throwmode mode = throwmode::plain)

Construct an object of type `error_code`.

Parameters

- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- `func` – The name of the function where the error was raised.
- `file` – The file name of the code where the error was raised.
- `line` – The line number of the code line where the error was raised.
- **mode** – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Throws nothing –
```
```cpp
error_code(error e, char const *msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)

Construct an object of type `error_code`.

Parameters

- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
- `func` – The name of the function where the error was raised.
- `file` – The file name of the code where the error was raised.
- `line` – The line number of the code line where the error was raised.
- **mode** – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).
```
```cpp
error_code(error e, char const *msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)

Construct an object of type `error_code`.

Parameters

- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
- `func` – The name of the function where the error was raised.
- `file` – The file name of the code where the error was raised.
- `line` – The line number of the code line where the error was raised.
```
• **mode** – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

**error_code(error e, std::string const &msg, throwmode mode = throwmode::plain)**

Construct an object of type `error_code`.

**Parameters**

• `e` – The parameter `e` holds the `hpx::error code` the new exception should encapsulate.
• `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
• `mode` – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

**error_code(error e, std::string const &msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)**

Construct an object of type `error_code`.

**Parameters**

• `e` – The parameter `e` holds the `hpx::error code` the new exception should encapsulate.
• `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
• `func` – The name of the function where the error was raised.
• `file` – The file name of the code where the error was raised.
• `line` – The line number of the code line where the error was raised.
• `mode` – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

**std::string get_message() const**

Return a reference to the error message stored in the `hpx::error_code`.

Throws nothing –

inline void **clear()**

Clear this `error_code` object. The postconditions of invoking this method are.

• `value() == hpx::error::success` and `category() == hpx::get_hpx_category()`

**error_code(error_code const &rhs)**

Copy constructor for `error_code`

**Note:** This function maintains the error category of the left hand side if the right hand side is a success code.

**error_code & operator=(error_code const &rhs)**

Assignment operator for `error_code`

**Note:** This function maintains the error category of the left hand side if the right hand side is a success code.
Private Functions

```cpp
class error_code
{
public:
  explicit error_code(const std::exception_ptr& e);
  int err() const;
  hpx::exception& exception() const;
  static void set_custom_exception_info_handler(custom_exception_info_handler_type f);
  static void set_pre_exception_handler(pre_exception_handler_type f);
  static std::string get_error_what(const exception_info &xi);
private:
  std::exception_ptr exception_
};

namespace hpx
{

typedefs

using custom_exception_info_handler_type = std::function<hpx::exception_info(const std::string&,
                                                                   const std::string&,
                                                                   long,
                                                                   const std::string&)>;

using pre_exception_handler_type = std::function<void>();

Functions

void set_custom_exception_info_handler(custom_exception_info_handler_type f);
void set_pre_exception_handler(pre_exception_handler_type f);
std::string get_error_what(exception_info const &xi);
```

Return the error message of the thrown exception.

The function `hpx::get_error_what` can be used to extract the diagnostic information element representing the error message as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_config()`,
`hpx::get_error_state()`
Parameters $\xi$ – The parameter $e$ will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The error message stored in the exception. If the exception instance does not hold this information, the function will return an empty string.

```cpp
error get_error(hpx::exception const &e)
```

Return the error code value of the exception thrown.

The function `hpx::get_error` can be used to extract the diagnostic information element representing the error value code as stored in the given exception instance.

See also:

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
- `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
- `hpx::get_error_state()`

Parameters $e$ – The parameter $e$ will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception`, `hpx::error_code`, or `std::exception_ptr`.

Throws nothing –

Returns The error value code of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

```cpp
error get_error(hpx::error_code const &e)
```

```cpp
std::string get_error_function_name(hpx::exception_info const &xi)
```

Return the function name from which the exception was thrown.

The function `hpx::get_error_function_name` can be used to extract the diagnostic information element representing the name of the function as stored in the given exception instance.

See also:

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,
- `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error_backtrace()`,
- `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
- `hpx::get_error_state()`

Parameters $\xi$ – The parameter $\xi$ will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)
Returns The name of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
std::string get_error_file_name(hpx::exception_info const &xi)
```

Return the (source code) file name of the function from which the exception was thrown.

The function `hpx::get_error_file_name` can be used to extract the diagnostic information element representing the name of the source file as stored in the given exception instance.

See also:

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`, `hpx::get_error_function_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`, `hpx::get_error_state()`

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The name of the source file of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
long get_error_line_number(hpx::exception_info const &xi)
```

Return the line number in the (source code) file of the function from which the exception was thrown.

The function `hpx::get_error_line_number` can be used to extract the diagnostic information element representing the line number as stored in the given exception instance.

See also:

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`, `hpx::get_error_function_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`, `hpx::get_error_state()`

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws nothing –

Returns The line number of the place where the exception was thrown. If the exception instance does not hold this information, the function will return -1.

```cpp
class exception : public system_error
#include <exception.hpp>
```

A `hpx::exception` is the main exception type used by HPX to report errors.
The `hpx::exception` type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by `hpx::exception_list`  

**Public Functions**

### explicit `exception(error e = hpx::error::success)`

Construct a `hpx::exception` from a `hpx::error`.

**Parameters**
- `e` – The parameter `e` holds the `hpx::error` code the new exception should encapsulate.

### explicit `exception(std::system_error const &e)`

Construct a `hpx::exception` from a `boost::system_error`.

### explicit `exception(std::error_code const &e)`

Construct a `hpx::exception` from a `boost::system::error_code` (this is new for Boost V1.69). This constructor is required to compensate for the changes introduced as a resolution to LWG3162 (https://cplusplus.github.io/LWG/issue3162).

### `exception(error e, char const *msg, throwmode mode = throwmode::plain)`

Construct a `hpx::exception` from a `hpx::error` and an error message.

**Parameters**
- `e` – The parameter `e` holds the `hpx::error` code the new exception should encapsulate.
- `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
- `mode` – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is `plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

### `exception(error e, std::string const &msg, throwmode mode = throwmode::plain)`

Construct a `hpx::exception` from a `hpx::error` and an error message.

**Parameters**
- `e` – The parameter `e` holds the `hpx::error` code the new exception should encapsulate.
- `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
- `mode` – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is `plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

### ~exception() override

Destruct a `hpx::exception`.

**Throws** nothing –

### error get_error() const noexcept

The function `get_error()` returns the `hpx::error` code stored in the referenced instance of a `hpx::exception`. It returns the `hpx::error` code this exception instance was constructed from.

**Throws** nothing –

### error_code get_error_code(throwmode mode = throwmode::plain) const noexcept

The function `get_error_code()` returns a `hpx::error_code` which represents the same error condition as this `hpx::exception` instance.

**Parameters**
- `mode` – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is `throwmode::plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).
struct thread_interrupted : public exception

#include <exception.hpp> A hpx::thread_interrupted is the exception type used by HPX to interrupt a running HPX thread.

The hpx::thread_interrupted type is the exception type used by HPX to interrupt a running thread.

A running thread can be interrupted by invoking the interrupt() member function of the corresponding hpx::thread object. When the interrupted thread next executes one of the specified interruption points (or if it is currently blocked whilst executing one) with interruption enabled, then a hpx::thread_interrupted exception will be thrown in the interrupted thread. If not caught, this will cause the execution of the interrupted thread to terminate. As with any other exception, the stack will be unwound, and destructors for objects of automatic storage duration will be executed.

If a thread wishes to avoid being interrupted, it can create an instance of hpx::this_thread::disable_interruption. Objects of this class disable interruption for the thread that created them on construction, and restore the interruption state to whatever it was before on destruction.

```cpp
void f()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::disable_interruption di2;
            // interruption still disabled
        } // di2 destroyed, interruption state restored
        // interruption still disabled
    } // di destroyed, interruption state restored
    // interruption now enabled
}
```

The effects of an instance of hpx::this_thread::disable_interruption can be temporarily reversed by constructing an instance of hpx::this_thread::restore_interruption, passing in the hpx::this_thread::disable_interruption object in question. This will restore the interruption state to what it was when the hpx::this_thread::disable_interruption object was constructed, and then disable interruption again when the hpx::this_thread::restore_interruption object is destroyed.

```cpp
void g()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::restore_interruption ri(di);
            // interruption now enabled
        } // ri destroyed, interruption disable again
        // di destroyed, interruption state restored
    } // interruption now enabled
}
```
At any point, the interruption state for the current thread can be queried by calling
`hpx::this_thread::interruption_enabled()`.

### hpx/errors/exception_fwd.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

#### Defines

`HPX_THROWMODE_UNSscoped_ENUM_DEPREcATIoN_MSG`

namespace `hpx`

#### Enums

enum class `throwmode` : `std::uint8_t`

Encode error category for new `error_code`.

Values:

- enumerator `plain`
- enumerator `rethrow`
- enumerator `lightweight`

#### Functions

```cpp
constexpr bool operator&(throwmode lhs, throwmode rhs) noexcept
```

#### Variables

```cpp
constexpr throwmode `plain` = throwmode::plain
constexpr throwmode `rethrow` = throwmode::rethrow
constexpr throwmode `lightweight` = throwmode::lightweight
constexpr throwmode `lightweight_rethrow` = throwmode::lightweight_rethrow
```
**error_code throws**

Predefined `error_code` object used as “throw on error” tag.

The predefined `hpx::error_code` object `hpx::throws` is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form `error_code& ec=throws` (with appropriate namespace qualifiers), have the following error handling semantics:

If `&ec != &throws` and an error occurred: `ec.value()` returns the implementation specific error number for the particular error that occurred and `ec.category()` returns the error_category for `ec.value()`.

If `&ec != &throws` and an error did not occur, `ec.clear()`.

If an error occurs and `&ec == &throws`, the function throws an exception of type `hpx::exception` or of a type derived from it. The exception’s `get_errorcode()` member function returns a reference to an `hpx::error_code` object with the behavior as specified above.

**hpx/errors/exception_list.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

class exception_list : public hpx::exception

```
#include <exception_list.hpp> The class exception_list is a container of exception_ptr objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm
```

The type `exception_list::const_iterator` fulfills the requirements of a forward iterator.

**Public Types**

```
using iterator = exception_list_type::const_iterator
    bidirectional iterator
```

**Public Functions**

```
inline std::size_t size() const noexcept
    The number of exception_ptr objects contained within the exception_list.
```

**Note:** Complexity: Constant time.

```
inline exception_list_type::const_iterator begin() const noexcept
    An iterator referring to the first exception_ptr object contained within the exception_list.
```

```
inline exception_list_type::const_iterator end() const noexcept
    An iterator which is the past-the-end value for the exception_list.
```
hpx/errors/throw_exception.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

**HPX_THROW_EXCEPTION**(errcode, f, ...)

Throw a hpx::exception initialized from the given parameters.

The macro **HPX_THROW_EXCEPTION** can be used to throw a hpx::exception. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter **errcode** holds the hpx::error code the new exception should encapsulate. The parameter **f** is expected to hold the name of the function exception is thrown from and the parameter **msg** holds the error message the new exception should encapsulate.

```cpp
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
        "simulated error");
}
```

Example:

**HPX_THROWS_IF**(ec, errcode, f, ...)

Either throw a hpx::exception or initialize hpx::error_code from the given parameters.

The macro **HPX_THROWS_IF** can be used to either throw a hpx::exception or to initialize a hpx::error_code from the given parameters. If &ec == &hpx::throws, the semantics of this macro are equivalent to **HPX_THROW_EXCEPTION**. If &ec != &hpx::throws, the hpx::error_code instance ec is initialized instead.

The parameter **errcode** holds the hpx::error code from which the new exception should be initialized. The parameter **f** is expected to hold the name of the function exception is thrown from and the parameter **msg** holds the error message the new exception should encapsulate.

namespace hpx
**execution**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/execution/executors/adaptive_static_chunk_size.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace *hpx*

    namespace *execution*

    **Typedefs**

typedef *hpx::execution::experimental::adaptive_static_chunk_size* instead

namespace *experimental*

    struct *adaptive_static_chunk_size*

    #include <adaptive_static_chunk_size.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

    **Note:** This executor parameters type is equivalent to OpenMP’s STATIC scheduling directive.

**Public Functions**

*adaptive_static_chunk_size() = default*

    Construct a *adaptive_static_chunk_size* executor parameters object

    **Note:** By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr *adaptive_static_chunk_size*(std::size_t *chunk_size*) noexcept

    Construct a *adaptive_static_chunk_size* executor parameters object

    **Parameters** *chunk_size* – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.
namespace hpx

namespace execution

namespace experimental

struct auto_chunk_size
    
#include <auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to
threads. The number of loop iterations combined is determined based on measurements of how
long the execution of 1% of the overall number of iterations takes. This executor parameters type
makes sure that as many loop iterations are combined as necessary to run for the amount of time
specified.

**Public Functions**

inline explicit constexpr auto_chunk_size(
    std::uint64_t num_iters_for_timing = 0
) noexcept
Construct an auto_chunk_size executor parameters object

**Note:** Default constructed auto_chunk_size executor parameter types will use 80 microseconds
as the minimal time for which any of the scheduled chunks should run.

inline explicit auto_chunk_size(
    hpx::chrono::steady_duration const &rel_time,
    std::uint64_t num_iters_for_timing = 0
) noexcept
Construct an auto_chunk_size executor parameters object

**Parameters**

- rel_time – [in] The time duration to use as the minimum to decide how many loop
  iterations should be combined.
- num_iters_for_timing – [in] The number of iterations to use for the timing oper-
  ation

hpx/execution/executors/default_parameters.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace execution

namespace experimental
struct `default_parameters`

```cpp
#include <default_parameters.hpp>
```

Loop iterations are divided into pieces of size `chunk_size` and then assigned to threads. If `chunk_size` is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

**Note:** This executor parameters type is equivalent to OpenMP’s STATIC scheduling directive.

### Public Functions

`default_parameters()` = default

Construct a `default_parameters` executor parameters object

**Note:** By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

### hpx/execution/executors/dynamic_chunk_size.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx
```

```cpp
namespace execution
```

```cpp
namespace experimental
```

struct `dynamic_chunk_size`

```cpp
#include <dynamic_chunk_size.hpp>
```

Loop iterations are divided into pieces of size `chunk_size` and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another. If `chunk_size` is not specified, the default chunk size is 1.

**Note:** This executor parameters type is equivalent to OpenMP’s DYNAMIC scheduling directive.

### Public Functions

`dynamic_chunk_size()` = default

Construct a `dynamic_chunk_size` executor parameters object

**Note:** Default constructed `dynamic_chunk_size` executor parameter types will use a chunk size of ‘1’.
inline explicit constexpr dynamic_chunk_size(std::size_t chunk_size) noexcept

Construct a dynamic_chunk_size executor parameters object

Parameters chunk_size – [in] The optional chunk size to use as the number of loop iterations to schedule together. The default chunk size is 1.

hpx/execution/executors/execution.hpp

See Public API for a list of names and headers that are part of the public HPX API.
	namespace hpx

namespace hpx

.namespace parallel

namespace execution

Variables

hpx::parallel::execution::has_pending_closures_t has_pending_closures

hpx::parallel::execution::get_pu_mask_t get_pu_mask

hpx::parallel::execution::set_scheduler_mode_t set_scheduler_mode

struct get_pu_mask_t : public hpx::functional::detail::tag_fallback<get_pu_mask_t>

#include <execution_information.hpp> Retrieve the bitmask describing the processing units the given thread is allowed to run on

All threads::executors invoke sched.get_pu_mask().

Note: If the executor does not support this operation, this call will always invoke hpx::threads::get_pu_mask()

Param exec [in] The executor object to use for querying the number of pending tasks.

Param topo [in] The topology object to use to extract the requested information.

Param thread_num [in] The sequence number of the thread to retrieve information for.

### Private Functions

```cpp
template<typename Executor>
inline decltype(auto) friend tag_fallback_invoke(get_pu_mask_t, Executor&&,
threads::topology &topo, std::size_t
thread_num)
```

```cpp
template<typename Executor>
inline decltype(auto) friend tag_invoke(get_pu_mask_t,
Executor &&exec, threads::topology &topo, std::size_t thread_num)
```

```cpp
struct has_pending_closures_t : public
hpx::functional::detail::tag_fallback<has_pending_closures_t>
#include <execution_information.hpp>
```

**Retrieve whether this executor has operations pending or not.**

**Note:** If the executor does not expose this information, this call will always return `false`.

**Param exec** [in] The executor object to use to extract the requested information for.

### Private Functions

```cpp
template<typename Executor>
inline decltype(auto) friend tag_fallback_invoke(has_pending_closures_t, Executor&&)
```

```cpp
template<typename Executor>
inline decltype(auto) friend tag_invoke(has_pending_closures_t,
Executor &&exec)
```

```cpp
struct set_scheduler_mode_t : public
hpx::functional::detail::tag_fallback<set_scheduler_mode_t>
#include <execution_information.hpp>
```

**Set various modes of operation on the scheduler underneath the given executor.**

**Note:** This calls `exec.set_scheduler_mode(mode)` if it exists; otherwise it does nothing.

**Param exec** [in] The executor object to use.

**Param mode** [in] The new mode for the scheduler to pick up

### Friends

```cpp
template<typename Executor, typename Mode>
inline friend void tag_fallback_invoke(set_scheduler_mode_t, Executor&&, Mode const&)
```

```cpp
template<typename Executor, typename Mode>
inline friend void tag_invoke(set_scheduler_mode_t, Executor &&exec, Mode const &mode)
```

    hpx::functional::detail::tag_priority<reset_thread_distribution_t>
#include <execution_parameters_fwd.hpp> Reset the internal round robin thread distribution
scheme for the given executor.

Note: This calls params.reset_thread_distribution(exec) if it exists; otherwise it does nothing.

Param params  [in] The executor parameters object to use for resetting the thread distribu-
tion scheme.
Param exec  [in] The executor object to use.
Private Functions

template<typename Parameters, typename Executor>
inline decltype(auto) friend tag_fallback_invoke(reset_thread_distribution_t, Parameters
&&params, Executor &&exec)

struct with_processing_units_count_t : public
hpx::functional::detail::tag_priority<with_processing_units_count_t>
#include <execution_parameters_fwd.hpp> Generate a policy that supports setting the number of cores for execution.

hpx/execution/executors/guided_chunk_size.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace execution

namespace experimental

struct guided_chunk_size
#include <guided_chunk_size.hpp> Iterations are dynamically assigned to threads in blocks as threads request those until no blocks remain to be assigned. Similar to dynamic_chunk_size except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to number_of_iterations / number_of_cores. Subsequent blocks are proportional to number_of_iterations_remaining / number_of_cores. The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

Note: This executor parameters type is equivalent to OpenMP’s GUIDED scheduling directive.

Public Functions

guided_chunk_size() = default
Construct an dynamic_chunk_size executor parameters object

Note: Default constructed dynamic_chunk_size executor parameter types will use a chunk size of ‘1’.

inline explicit constexpr guided_chunk_size(std::size_t min_chunk_size) noexcept
Construct a guided_chunk_size executor parameters object
Parameters min_chunk_size – [in] The optional minimal chunk size to use as the minimal number of loop iterations to schedule together. The default minimal chunk size is 1.
namespace hpx

namespace execution

namespace experimental

struct num_cores

#include <num_cores.hpp> Control number of cores in executors which need a functionality for setting the number of cores to be used by an algorithm directly

Public Functions

inline explicit constexpr num_cores(std::size_t cores = 1) noexcept

Construct a num_cores executor parameters object

Note: make sure the minimal number of cores is and the maximum number of cores is what’s available to HPX

namespace hpx

namespace execution

namespace experimental

struct persistent_auto_chunk_size

#include <persistent_auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.
Public Functions

```cpp
inline explicit constexpr persistent_auto_chunk_size(std::uint64_t num_iters_for_timing = 0) noexcept

Construct an persistent_auto_chunk_size executor parameters object

Note: Default constructed persistent_auto_chunk_size executor parameter types will use 0 microseconds as the execution time for each chunk and 80 microseconds as the minimal time for which any of the scheduled chunks should run.
```

```cpp
inline explicit persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs, std::uint64_t num_iters_for_timing = 0) noexcept

Construct an persistent_auto_chunk_size executor parameters object

Parameters

- `time_cs` – The execution time for each chunk.
- `num_iters_for_timing` – [in] The number of iterations to use for measuring the execution time of one iteration
```

```cpp
inline persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs, hpx::chrono::steady_duration const &rel_time, std::uint64_t num_iters_for_timing = 0) noexcept

Construct an persistent_auto_chunk_size executor parameters object

Parameters

- `rel_time` – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- `time_cs` – The execution time for each chunk.
- `num_iters_for_timing` – [in] The number of iterations to use for measuring the execution time of one iteration
```

**hpx::parallel::execution::async_invoke_t** `async_invoke`

**hpx::parallel::execution::sync_invoke_t** `sync_invoke`

---

**struct** `async_execute_t` : public `hpx::functional::detail::tag_fallback<async_execute_t>`

```
#include <execution.hpp>
```

Customization point for asynchronous execution agent creation. This asynchronously creates a single function invocation `f()` using the associated executor.

**Note:** Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

---

**Note:** This is valid for one way executors (calls `make_ready_future(exec.sync_execute(f, ts...)` if it exists) and for two way executors (calls `exec.async_execute(f, ts...)` if it exists).

---

**Param exec** [in] The executor object to use for scheduling of the function `f`.

**Param f** [in] The function which will be scheduled using the given executor.

**Param ts** [in] Additional arguments to use to invoke `f`.

**Return** `f(ts...)`'s result through a future

---

**Private Functions**

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend `tag_fallback_invoke`(`async_execute_t`, Executor &&exec, F &&f, Ts&&... ts)
```

---

**struct** `async_invoke_t` : public `hpx::functional::detail::tag_fallback<async_invoke_t>`

```
#include <execution.hpp>
```

Asynchronously invoke the given set of nullary functions, each on its own execution agent.

This creates a group of function invocations whose ordering is given by the execution_category associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

**Note:** This calls `exec.async_invoke(fs...)` if it exists; otherwise it executes `async_execute(fs)` for each `fs`.

---

**Param exec** [in] The executor object to use for scheduling of the functions `fs`.

**Param fs** [in] The functions which will be scheduled using the given executor.

**Return** The return type of `executor_type::async_invoke` if defined by `executor_type`. Otherwise a future<`void>` representing finishing the execution of all functions `fs`. 

---

Chapter 2. What’s so special about HPX?
Private Functions

template<typename Executor, typename F, typename ...Fs>
inline decltype(auto) friend tag_fallback_invoke(async_invoke_t, Executor &&exec, F 
&&f, Fs&&... fs)

struct bulk_async_execute_t : public
hpx::functional::detail::tag_fallback<bulk_async_execute_t>
#include <execution.hpp> Bulk form of asynchronous execution agent creation.

This asynchronously creates a group of function invocations f(i) whose ordering is given by the 
execution_category associated with the executor.

Here i takes on all values in the index space implied by shape. All exceptions thrown by invocations 
of f(i) are reported in a manner consistent with parallel algorithm execution through the returned 
future.

Note: This is deliberately different from the bulk_async_execute customization points specified 
in P0443. The bulk_async_execute customization point defined here is more generic and is used 
as the workhorse for implementing the specified APIs.

Note: This calls exec.bulk_async_execute(f, shape, ts...) if it exists; otherwise it executes 
async_execute(f, shape, ts...) as often as needed.

Param exec [in] The executor object to use for scheduling of the function f.
Param f [in] The function which will be scheduled using the given executor.
Param shape [in] The shape objects which defines the iteration boundaries for the argu-
ments to be passed to f.
Param ts [in] Additional arguments to use to invoke f.
Return The return type of executor_type::bulk_async_execute if defined by executor_type.
Otherwise a vector of futures holding the returned values of each invocation of f.

Private Functions

template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_async_execute_t, Executor 
&&exec, F &&f, Shape const &shape, Ts&&... ts)

template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_async_execute_t, Executor 
&&exec, F &&f, Shape const &shape, Ts&&... ts)

struct bulk_sync_execute_t : public hpx::functional::detail::tag_fallback<bulk_sync_execute_t>
#include <execution.hpp> Bulk form of synchronous execution agent creation.
This synchronously creates a group of function invocations \( f(i) \) whose ordering is given by the execution\_category associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here \( i \) takes on all values in the index space implied by shape. All exceptions thrown by invocations of \( f(i) \) are reported in a manner consistent with parallel algorithm execution through the returned future.

**Note:** This is deliberately different from the bulk\_sync\_execute customization points specified in P0443. The bulk\_sync\_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

**Note:** This calls exec.bulk\_sync\_execute\((f, \text{shape}, \text{ts}...)\) if it exists; otherwise it executes sync\_execute\((f, \text{shape}, \text{ts}...)\) as often as needed.

**Param exec** [in] The executor object to use for scheduling of the function \( f \).
**Param f** [in] The function which will be scheduled using the given executor.
**Param shape** [in] The shape objects which defines the iteration boundaries for the arguments to be passed to \( f \).
**Param ts** [in] Additional arguments to use to invoke \( f \).
**Return** The return type of \texttt{executor\_type::bulk\_sync\_execute} if defined by \texttt{executor\_type}. Otherwise a vector holding the returned values of each invocation of \( f \) except when \( f \) returns void, which case void is returned.

### Private Functions

template<typename \texttt{Executor}, typename \texttt{F}, typename \texttt{Shape}, typename ...\texttt{Ts}>
inline decltype(auto) friend \texttt{tag\_fallback\_invoke}(\texttt{bulk\_sync\_execute\_t}, \texttt{Executor} \&\&exec, \texttt{F} \&\&f, \texttt{Shape} const &shape, \texttt{Ts}&&... ts)

template<typename \texttt{Executor}, typename \texttt{F}, typename \texttt{Shape}, typename ...\texttt{Ts}>
inline decltype(auto) friend \texttt{tag\_fallback\_invoke}(\texttt{bulk\_sync\_execute\_t} tag, \texttt{Executor} \&\&exec, \texttt{F} \&\&f, \texttt{Shape} const &shape, \texttt{Ts}&&... ts)

struct \texttt{bulk\_then\_execute\_t} : public \texttt{hpx::functional::detail::tag\_fallback<bulk\_then\_execute\_t>}
#include <execution.hpp> Bulk form of execution agent creation depending on a given future.

This creates a group of function invocations \( f(i) \) whose ordering is given by the execution\_category associated with the executor.

Here \( i \) takes on all values in the index space implied by shape. All exceptions thrown by invocations of \( f(i) \) are reported in a manner consistent with parallel algorithm execution through the returned future.

**Note:** This is deliberately different from the then\_sync\_execute customization points specified in P0443. The bulk\_then\_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.
**Note:** This calls `exec.bulk_then_execute(f, shape, pred, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, pred.share(), ts...)` (if this executor is also an OneWayExecutor), or `async_execute(f, shape, pred.share(), ts...)` (if this executor is also a TwoWayExecutor) - as often as needed.

**Param exec** [in] The executor object to use for scheduling of the function \( f \).

**Param f** [in] The function which will be scheduled using the given executor.

**Param shape** [in] The shape objects which defines the iteration boundaries for the arguments to be passed to \( f \).

**Param predecessor** [in] The future object the execution of the given function depends on.

**Param ts** [in] Additional arguments to use to invoke \( f \).

**Return** The return type of `executor_type::bulk_then_execute` if defined by `executor_type`. Otherwise a vector holding the returned values of each invocation of \( f \).

**Private Functions**

```cpp
template<typename Executor, typename F, typename Shape, typename Future, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_then_execute_t, Executor &&exec, F &&f, Shape const &shape, Future &&predecessor, Ts&&... ts)
```

```cpp
template<typename Executor, typename F, typename Shape, typename Future, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_then_execute_t tag, Executor &&exec, F &&f, Shape const &shape, Future &&predecessor, Ts&&... ts)
```

```cpp
struct post_t : public hpx::functional::detail::tag_fallback<post_t>
```

`#include <execution.hpp>` Customization point for asynchronous fire & forget execution agent creation.

This asynchronously (fire & forget) creates a single function invocation \( f() \) using the associated executor.

**Note:** This is valid for two way executors (calls `exec.post(f, ts...)`, if available, otherwise it calls `exec.async_execute(f, ts...)` while discarding the returned future), and for non-blocking two way executors (calls `exec.post(f, ts...)` if it exists).

**Param exec** [in] The executor object to use for scheduling of the function \( f \).

**Param f** [in] The function which will be scheduled using the given executor.

**Param ts** [in] Additional arguments to use to invoke \( f \).
Private Functions

template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_t, Executor &&exec, F &&f, Ts&&... ts)

struct sync_execute_t : public hpx::functional::detail::tag_fallback<sync_execute_t>
#include <execution.hpp>
Customization point for synchronous execution agent creation.
This synchronously creates a single function invocation f() using the associated executor. The
execution of the supplied function synchronizes with the caller

Note: It will call tag_invoke(sync_execute_t, exec, f, ts...) if it exists. For two-way executors it
will invoke asynch_execute_t and wait for the task’s completion before returning.

Param exec [in] The executor object to use for scheduling of the function f.
Param f [in] The function which will be scheduled using the given executor.
Param ts [in] Additional arguments to use to invoke f.
Return f(ts...)’s result

Private Functions

template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(sync_execute_t, Executor &&exec, F &&f, Ts&&... ts)

struct sync_invoke_t : public hpx::functional::detail::tag_fallback<sync_invoke_t>
#include <execution.hpp>
Synchronously invoke the given set of nullary functions, each on its
own execution agent
This creates a group of function invocations whose ordering is given by the execution_category
associated with the executor.
All exceptions thrown by invocations of the functions are reported in a manner consistent with
parallel algorithm execution through the returned future.

Note: This calls exec.sync_invoke(fs...) if it exists; otherwise it executes sync_execute(fs) for
each fs.

Param exec [in] The executor object to use for scheduling of the functions fs.
Param fs [in] The functions which will be scheduled using the given executor.
Return The return type of executor_type::async_invoke if defined by executor_type.
Private Functions

template<typename Executor, typename F, typename ...Fs>
inline decltype(auto) friend tag_fallback_invoke(sync_invoke_t, Executor &&exec, F &&f, Fs&&... fs)

struct then_execute_t : public hpx::functional::detail::tag_fallback<then_execute_t>
#include <execution.hpp> Customization point for execution agent creation depending on a given future.
This creates a single function invocation f() using the associated executor after the given future object has become ready.

Note: This is valid for two way executors (calls exec.then_execute(f, predecessor, ts...) if it exists) and for one way executors (calls predecessor.then(bind(f, ts...))).

Param exec [in] The executor object to use for scheduling of the function f.
Param f [in] The function which will be scheduled using the given executor.
Param predecessor [in] The future object the execution of the given function depends on.
Param ts [in] Additional arguments to use to invoke f.
Return f(ts...)'s result through a future

Private Functions

template<typename Executor, typename F, typename Future, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(then_execute_t, Executor &&exec, F &&f, Future &&&predecessor, Ts&&... ts)

hpx/execution_base/receiver.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace execution

namespace experimental

Functions

template<typename R, typename ...As>
void set_value(R &&r, As&&... as)
set_value is a customization point object. The expression hpx::execution::set_value(r, as...) is equivalent to:
• r.set_value(as...), if that expression is valid. If the function selected does not send the value(s) as... to the Receiver r’s value channel, the program is ill-formed (no diagnostic required).

2.8. API reference
• Otherwise, `set_value(r, as...)`, if that expression is valid, with overload resolution performed in a context that include the declaration `void set_value();`
• Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

```cpp
template<typename R>
void set_stopped(R &&r)
```

set_stopped is a customization point object. The expression `hpx::execution::set_stopped(r)` is equivalent to:
• `r.set_stopped()`, if that expression is valid. If the function selected does not signal the Receiver r’s done channel, the program is ill-formed (no diagnostic required).
• Otherwise, `set_stopped(r)`, if that expression is valid, with overload resolution performed in a context that include the declaration `void set_stopped();`
• Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

```cpp
template<typename R, typename E>
void set_error(R &&r, E &&e)
```

set_error is a customization point object. The expression `hpx::execution::set_error(r, e)` is equivalent to:
• `r.set_stopped(e)`, if that expression is valid. If the function selected does not send the error e the Receiver r’s error channel, the program is ill-formed (no diagnostic required).
• Otherwise, `set_error(r, e)`, if that expression is valid, with overload resolution performed in a context that include the declaration `void set_error();`
• Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

```

```cpp
template<typename T, typename E>
```
struct **is_receiver**

```
#include <receiver.hpp>  Receiving values from asynchronous computations is handled by the Receiver concept. A Receiver needs to be able to receive an error or be marked as being canceled. As such, the Receiver concept is defined by having the following two customization points defined, which form the completion-signal operations:
• hpx::execution::experimental::set_stopped * hpx::execution::experimental::set_error
  Those two functions denote the completion-signal operations. The Receiver contract is as follows:
• None of a Receiver’s completion-signal operation shall be invoked before
  hpx::execution::experimental::start has been called on the operation state object that was returned by connecting a Receiver to a sender
  hpx::execution::experimental::connect.
• Once hpx::execution::start has been called on the operation state object, exactly one of
  the Receiver’s completion-signal operation shall complete without an exception before the Receiver is destroyed.

Once one of the Receiver’s completion-signal operation has been completed without throwing an exception, the Receiver contract has been satisfied. In other words: The asynchronous operation has been completed.
```

See also:

```
hpx::execution::experimental::is_receiver_of
```

template<
typename T, typename CS>

struct **is_receiver_of**

```
#include <receiver.hpp>  The receiver_of concept is a refinement of the Receiver concept by requiring one additional completion-signal operation:
• hpx::execution::set_value
  The receiver_of concept takes a receiver and an instance of the completion_signatures<> class template. The receiver_of concept, rather than accepting a receiver and some value types, is changed to take a receiver and an instance of the completion_signatures<> class template. A sender uses completion_signatures<> to describe the signals with which it completes. The receiver_of concept ensures that a particular receiver is capable of receiving those signals.

This completion-signal operation adds the following to the Receiver’s contract:
• If hpx::execution::set_value exits with an exception, it is still valid to call
  hpx::execution::set_error or hpx::execution::set_stopped

Typedefs

typedef hpx::execution::parallel_executor instead

namespace this_thread

Functions

hpx::execution::parallel_executor get_executor(error_code &ec = throws)

Returns a reference to the executor that was used to create the current thread.

Throws If ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an hpx::exception with an error code of hpx::error::yield_aborted if it is signaled with wait_aborted. If called outside of a HPX-thread, this function will throw an hpx::exception with an error code of hpx::error::null_thread_id. If this function is called while the thread-manager is not running, it will throw an hpx::exception with an error code of hpx::error::invalid_status.

namespace threads
Functions

`hpx::execution::parallel_executor get_executor(thread_id_type const &id, error_code &ec = throws)`

Returns a reference to the executor that was used to create the given thread.

**Throws** If `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

**Typedefs**

using **sequenced_task_policy** = detail::sequenced_task_policy_shim<sequenced_executor,
    hpx::traits::executor_parameters_type_t<sequenced_executor>>

    Extension: The class sequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may not be parallelized (has to run sequentially).

    The algorithm returns a future representing the result of the corresponding algorithm when invoked with the sequenced_policy.

using **sequenced_policy** = detail::sequenced_policy_shim<sequenced_executor,
    hpx::traits::executor_parameters_type_t<sequenced_executor>>

    The class sequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm’s execution may not be parallelized.

using **parallel_task_policy** = detail::parallel_task_policy_shim<parallel_executor,
    hpx::traits::executor_parameters_type_t<parallel_executor>>

    Extension: The class parallel_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.
The algorithm returns a future representing the result of the corresponding algorithm when invoked with the parallel_policy.

```cpp
using parallel_policy = detail::parallel_policy_shim<parallel_executor,
    hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class parallel_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.

```cpp
using parallel_unsequenced_task_policy =
    detail::parallel_unsequenced_task_policy_shim<parallel_executor,
    hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class parallel_unsequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized.

```cpp
using parallel_unsequenced_policy =
    detail::parallel_unsequenced_policy_shim<parallel_executor,
    hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class parallel_unsequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized.

```cpp
using unsequenced_task_policy = detail::unsequenced_task_policy_shim<sequenced_executor,
    hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

The class unsequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized.

```cpp
using unsequenced_policy = detail::unsequenced_policy_shim<sequenced_executor,
    hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

The class unsequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized.

**Variables**

hpx/functional/bind.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

   Top level namespace.

Functions

template<typename F, typename ...Ts, typename Enable = 
std::enable_if_t<!traits::is_action_v<std::decay_t<F>>>>
constexpr detail::bound<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind(F &&f, 
Ts&&... vs)

The function template bind generates a forwarding call wrapper for f. Calling this wrapper is equivalent to invoking f with some of its arguments bound to vs.
Parameters

- \( f \) – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments

- \( \text{vs} \) – list of arguments to bind, with the unbound arguments replaced by the placeholders \(_1, _2, _3…\) of namespace hpx::placeholders

Returns A function object of unspecified type \( T \), for which

\[
\text{hpx::is_bind_expression}<T>::\text{value} == \text{true}.
\]

namespace placeholders

The \( \text{hpx::placeholders} \) namespace contains the placeholder objects \([_1, \ldots, _N]\) where \( N \) is an implementation defined maximum number.

When used as an argument in a \( \text{hpx::bind} \) expression, the placeholder objects are stored in the generated function object, and when that function object is invoked with unbound arguments, each placeholder \( _N \) is replaced by the corresponding \( N \)th unbound argument.

The types of the placeholder objects are DefaultConstructible and CopyConstructible, their default copy/move constructors do not throw exceptions, and for any placeholder \( _N \), the type \( \text{hpx::is_placeholder}<\text{decltype}(\_N)> \) is defined, where \( \text{hpx::is_placeholder}<\text{decltype}(\_N)> \) is derived from std::integral_constant<int, \( N \)>.

    Functions

    template<typename F, typename ...Ts>
    constexpr hpx::detail::bound_back<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind_back(F&& f, Ts&&... vs)

Function templates bind_back generate a forwarding call wrapper for f. Calling this wrapper is equivalent to invoking f with its last sizeof...(Ts) parameters bound to vs.

    Parameters

    • f – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments

    • vs – list of the arguments to bind to the last sizeof...(Ts) parameters of f

    Returns A function object of type T that is unspecified, except that the types of objects returned by two calls to hpx::bind_back with the same arguments are the same.

    template<typename F>
    constexpr std::decay_t<F> bind_back(F&& f)

hpx/functional/bind_front.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level namespace.

Functions

template<typename F, typename... Ts>
constexpr detail::bound_front<
    std::decay_t<F>,
    util::make_index_pack_t<sizeof...(Ts)>,
    util::decay_unwrap_t<Ts>...>
bind_front(F &&f,
    Ts &&... vs)

Function template bind_front generates a forwarding call wrapper for \(f\). Calling this wrapper is equivalent to invoking \(f\) with its first \(\text{sizeof}...(\text{Ts})\) parameters bound to \(\text{vs}\).

Parameters

- \(f\) – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- \(\text{vs}\) – list of the arguments to bind to the first or \(\text{sizeof}...(\text{Ts})\) parameters of \(f\)

Returns A function object of type \(T\) that is unspecified, except that the types of objects returned by two calls to hpx::bind_front with the same arguments are the same.

Defines

HPX_UTIL_REGISTER_FUNCTION_DECLARATION(Sig, F, Name)
HPX_UTIL_REGISTER_FUNCTION(Sig, F, Name)

namespace hpx

Top level namespace.

template<typename Sig, bool Serializable = false>

class function

#include <function.hpp> Class template hpx::function is a general-purpose polymorphic function wrapper. Instances of hpx::function can store, copy, and invoke any CopyConstructible Callable target &amp;#8212; functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of hpx::function. If an hpx::function contains no target, it is called empty. Invoking the target of an empty hpx::function results in hpx::error::bad_function_call exception being thrown. hpx::function satisfies the requirements of CopyConstructible and CopyAssignable.

template<typename R, typename ...Ts, bool Serializable>

class function&lt;R(Ts...), Serializable&gt; : public util::detail::basic_function&lt;R(Ts...), true, Serializable&gt;

Public Types

template<typename F, typename FD = std::decay_t<F>, typename Enable1 = std::enable_if_t<!std::is_same_v<FD, function>>, typename Enable2 = std::enable_if_t<is_invocable_r_v<R, FD&, Ts...>>>
inline function(F &&f) {
}

namespace distributed

namespace util

namespace hpx

template<typename Sig>
class function_ref

#include <function_ref.hpp> function_ref class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is retry(n, f) which attempts to call f up to n times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.
using payload = std::optional</* ... */ >;
// Repeatedly invokes `action` up to `times` repetitions.
// Immediately returns if `action` returns a valid `payload`.
// Returns `std::nullopt` otherwise.
payload retry(size_t times, /* ????? */ action);

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, hpx::function or a template but it is much simpler with function_ref as seen below:

payload retry(size_t times, function_ref<payload()> action);

Defines

HPX_INVOKER_R(R, F, ...)

namespace hpx

    Top level namespace.

Functions

template<typename F, typename ...Ts>
constexpr util::invoke_result_t<F, Ts&&...> invoke(F&& f, Ts&&... vs) noexcept(noexcept(HPX_INVOKER(HPX_FORWARD(F, f), HPX_FORWARD(Ts, vs)...)))

Invokes the given callable object f with the content of the argument pack vs

Note: This function is similar to std::invoke (C++17)

Parameters

• f – Requires to be a callable object. If f is a member function pointer, the first argument in the pack will be treated as the callee (this object).
• vs – An arbitrary pack of arguments

Throws std::exception – like objects thrown by call to object f with the argument types vs.
**Returns** The result of the callable object when it’s called with the given argument types.

template<typename R, typename F, typename ...Ts>
constexpr R invoke_r(F &&f, Ts&&... vs) noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F,f),
HPX_FORWARD(Ts,vs)...)))

Invokes the given callable object f with the content of the argument pack vs

**Note:** This function is similar to std::invoke (C++17)

**Parameters**

- **f** – Requires to be a callable object. If f is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- **vs** – An arbitrary pack of arguments

**Throws** std::exception – like objects thrown by call to object f with the argument types vs.

**Template Parameters** R – The result type of the function when it’s called with the content of the given argument types vs.

**Returns** The result of the callable object when it’s called with the given argument types.

namespace functional

struct invoke

**Public Functions**

template<typename F, typename ...Ts>
inline constexpr util::invoke_result_t<F, Ts&&...> operator()(F &&f, Ts&&... vs) const noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F,f),
HPX_FORWARD(Ts,vs)...)))

template<typename R>
struct invoke_r

**Public Functions**

template<typename F, typename ...Ts>
inline constexpr R operator()(F &&f, Ts&&... vs) const
noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F,f),
HPX_FORWARD(Ts,vs)...)))
namespace hpx

Top level namespace.

**Functions**

template<typename F, typename Tuple>
constexpr detail::invoke_fused_result_t<F, Tuple> invoke_fused(F &&f, Tuple &&t) noexcept
detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{},
HPX_FORWARD(F, f),
HPX_FORWARD(Tuple, t)))

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

**Parameters**

• f – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).

• t – A type whose contents are accessible through a call to hpx::get.

**Throws** std::exception – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

**Returns** The result of the callable object when it’s called with the content of the given sequenced type.

template<typename R, typename F, typename Tuple>
constexpr R invoke_fused_r(F &&f, Tuple &&t) noexcept
detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{},
HPX_FORWARD(F, f), HPX_FORWARD(Tuple, t)))

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

**Note:** This function is similar to std::apply (C++17). The difference between hpx::invoke and hpx::invoke_fused is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes hpx::invoke_fused rather useful.

**Parameters**

• f – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
• t – A type whose contents are accessible through a call to hpx::get.

Throws std::exception – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

Template Parameters R – The result type of the function when it’s called with the content of the given sequenced type.

Returns The result of the callable object when it’s called with the content of the given sequenced type.

hpx/functional/mem_fn.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level namespace.

Functions

template<typename M, typename C>
constexpr detail::mem_fn<M C::*> mem_fn(M C::* pm) noexcept

Function template hpx::mem_fn generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a hpx::mem_fn.

Parameters pm – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator() (Ts&&... vs) noexcept;
```

Let fn be the call wrapper returned by a call to hpx::mem_fn with a pointer to member pm. Then the expression fn(t, a2, ..., aN) is equivalent to HPX_INVOKE(pm, t, a2, ..., aN). Thus, the return type of operator() is std::result_of<decay_type(pm)(Ts&&...)>::type or equivalently std::invoke_result_t<decay_type(pm), Ts&&...>, and the value in noexcept specifier is equal to std::is_nothrow_invocable_v<decay_type(pm), Ts&&...>. Each argument in vs is perfectly forwarded, as if by std::forward<Ts>(vs)....

template<typename R, typename C, typename ...Ps>
constexpr detail::mem_fn<R (C::*)(Ps...)> mem_fn(R C::* pm)(Ps...) noexcept

Function template hpx::mem_fn generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a hpx::mem_fn.

Parameters pm – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator() (Ts&&... vs) noexcept;
```
Let \( \text{fn} \) be the call wrapper returned by a call to \textit{hpx::mem_fn} with a pointer to member \( \text{pm} \). Then the expression \( \text{fn}(t, a_2, \ldots, a_N) \) is equivalent to \text{HPX_INVOKE}(\text{pm}, t, a_2, \ldots, a_N). Thus, the return type of operator() is \text{std::result_of}<\text{decltype}(\text{pm})(\text{Ts}\&\ldots)>::\text{type} or equivalently \text{std::invoke_result_t}<\text{decltype}(\text{pm}), \text{Ts}\&\ldots>\), and the value in \text{noexcept} specifier is equal to \text{std::is_nothrow_invocable_v}<\text{decltype}(\text{pm}), \text{Ts}\&\ldots\>). Each argument in \( \text{vs} \) is perfectly forwarded, as if by \text{std::forward}<\text{Ts}>(\text{vs})\).

```cpp
template<typename R, typename C, typename ...Ps>
constexpr detail::mem_fn<R (C::*)(Ps...) const> mem_fn(R (C::* pm)(Ps...) const) noexcept
```

Function template \textit{hpx::mem_fn} generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a \textit{hpx::mem_fn}.

**Parameters** \text{pm} — pointer to member that will be wrapped

**Returns** a call wrapper of unspecified type with the following member:

```cpp
template <typename ... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type operator()(Ts&&... vs) noexcept;
```

Let \( \text{fn} \) be the call wrapper returned by a call to \textit{hpx::mem_fn} with a pointer to member \( \text{pm} \). Then the expression \( \text{fn}(t, a_2, \ldots, a_N) \) is equivalent to \text{HPX_INVOKE}(\text{pm}, t, a_2, \ldots, a_N). Thus, the return type of operator() is \text{std::result_of}<\text{decltype}(\text{pm})(\text{Ts}\&\ldots)>::\text{type} or equivalently \text{std::invoke_result_t}<\text{decltype}(\text{pm}), \text{Ts}\&\ldots>\), and the value in \text{noexcept} specifier is equal to \text{std::is_nothrow_invocable_v}<\text{decltype}(\text{pm}), \text{Ts}\&\ldots\>). Each argument in \( \text{vs} \) is perfectly forwarded, as if by \text{std::forward}<\text{Ts}>(\text{vs})\).

**hpx\/functional/move_only_function.hpp**

See \textit{Public API} for a list of names and headers that are part of the public \textit{HPX} API.

**Defines**

\texttt{HPX\_UTIL\_REGISTER\_UNIQUE\_FUNCTION\_DECLARATION}(Sig, F, Name)

\texttt{HPX\_UTIL\_REGISTER\_UNIQUE\_FUNCTION}(Sig, F, Name)

**namespace** hpx

Top level namespace.

```cpp
template<typename Sig, bool Serializable = false>
class \texttt{move\_only\_function}
```

\#include \texttt{<move\_only\_function.hpp>} Class template \texttt{hpx::move\_only\_function} is a general-purpose polymorphic function wrapper. \texttt{hpx::move\_only\_function} objects can store and invoke any constructible (not required to be move constructible) Callable target &\#8212; functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of \texttt{hpx::move\_only\_function}. If an \texttt{hpx::move\_only\_function} contains no target, it is called empty. Unlike \texttt{hpx::function}, invoking an empty \texttt{hpx::move\_only\_function} results in undefined behavior.
hpx::move_only_functions supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). hpx::move_only_function satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

template<typename R, typename ...Ts, bool Serializable>

class move_only_function<R(Ts...), Serializable> : public util::detail::basic_function<R(Ts...), false, Serializable>

namespace util

**hpx/functional/trait/is_bind_expression.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace hpx

Top level namespace.

**Variables**

```cpp
template<typename T>
constexpr bool is_bind_expression_v = is_bind_expression<T>::value
```

```cpp
template<typename T>
struct is_bind_expression : public std::is_bind_expression<T>
```

#include <is_bind_expression.hpp> If T is the type produced by a call to hpx::bind, this template is derived from std::true_type. For any other type, this template is derived from std::false_type.

This template may be specialized for a user-defined type T to implement UnaryTypeTrait with base characteristic of std::true_type to indicate that T should be treated by hpx::bind as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

Subclassed by hpx::is_bind_expression<T const>

```cpp
template<typename T>
struct is_bind_expression<T const> : public hpx::is_bind_expression<T>
```

namespace traits

**Typedefs**

```cpp
typedef hpx::is_bind_expression<T> instead
```
Functions

```cpp
template<typename T> HPX_DEPRECATED_V (1, 8, "hpx::traits::is_bind_expression_v is deprecated,
use " "hpx::is_bind_expression_v instead") inline const expr bool is_bind_expression_v
```

`hpx/functional/traits/is_placeholder.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level namespace.

template<typename T>

struct is_placeholder

#include <is_placeholder.hpp> If T is a standard, Boost, or HPX placeholder (_1, _2, _3, ...) then this
template is derived from std::integral_constant<int,1>, std::integral_constant<int, 2>, std::integral_constant<int,3>, respectively. Otherwise, it is derived from
std::integral_constant<int,0>.

The template may be specialized for any user-defined T type: the specialization must satisfy UnaryTypeTrait
with base characteristic of std::integral_constant<int,N> with N>0 to indicate that T should be
treated as N'th placeholder type. hpx::bind uses hpx::is_placeholder to detect placeholders for
unbound arguments.

namespace traits

Functions

template<typename T, typename Allocator, typename ...Ts>
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> make_ready_future_alloc(Allocator const &a, Ts&&... ts)
```

Creates a pre-initialized future object with allocator (extension)

```cpp
template<typename T, typename ...Ts>
```
The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

```cpp
template<int DeductionGuard = 0, typename Allocator, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_alloc(Allocator const &a, T &&init)
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

```cpp
template<typename T>
future<T> make_exceptional_future(std::exception_ptr const &e)
```

Creates a pre-initialized future object which holds the given error (extension)

```cpp
template<typename T, typename E>
future<T> make_exceptional_future(E e)
```

Creates a pre-initialized future object which holds the given error (extension)

```cpp
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_at(hpx::chrono::steady_time_point const &abs_time, T &&init)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

```cpp
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_after(hpx::chrono::steady_duration const &rel_time, T &&init)
```

Creates a pre-initialized future object which gets ready after a given point in time (extension)

```cpp
inline future<void> make_ready_future_alloc(Allocator const &a)
```

```cpp
future<void> make_ready_future()
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

```cpp
inline future<void> make_ready_future_at(hpx::chrono::steady_time_point const &abs_time)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

```cpp
inline future<void> make_ready_future_after(hpx::chrono::steady_duration const &rel_time)
```

Creates a pre-initialized future object which gets ready after a given point in time (extension)

```cpp
template<typename R>
class future : public hpx::lcos::detail::future_base<future<R>, R>
```

#include <future_fwd.hpp> The class template `hpx::future` provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via `hpx::async`, `hpx::packaged_task`, or `hpx::promise`) can provide a `hpx::future` object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the `hpx::future`. These methods may block if the asynchronous operation has not yet provided a value.
• When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. hpx::promise::set_value) that is linked to the creator’s hpx::future. Note that hpx::future references shared state that is not shared with any other asynchronous return objects (as opposed to hpx::shared_future).

Public Types

using result_type = R

using shared_state_type = typename base_type::shared_state_type

Public Functions

constexpr future() noexcept = default

future(future &&other) noexcept = default

future(future const &other) noexcept = delete

inline future(future<future> &&other) noexcept

inline future(future<shared_future<R>> &&other) noexcept

template<typename T>
inline future(future<T> &&other, std::enable_if_t<std::is_void_v<R> && !traits::is_future_v<T>, T>* = nullptr) noexcept

~future() = default

future &operator=(future &&&other) noexcept = default

future &operator=(future const &other) noexcept = delete

inline shared_future<R> share() noexcept

inline hpx::traits::future_traits<future>::result_type get()

inline hpx::traits::future_traits<future>::result_type get(error_code &ec)

template<typename F>
inline decltype(auto) then(F &f, error_code &ec = throws)

Attaches a continuation to *this. The behavior is undefined if *this has no associated shared state (i.e., valid()==false).

In cases where decltype(func(*this)) is future<R>, the resulting type is future<R> instead of future<future<R>>. Effects:

• The continuation is called when the object’s shared state is ready (has a value or exception stored).
• The continuation launches according to the specified launch policy or executor.
• When the executor or launch policy is not provided the continuation inherits the parent’s launch policy or executor.
• If the parent was created with std::promise or with a packaged_task (has no associated launch policy), the continuation behaves the same as the third overload with a policy argument of launch::async | launch::deferred and the same argument for func.
• If the parent has a policy of `launch::deferred` and the continuation does not have a specified launch policy or scheduler, then the parent is filled by immediately calling `.wait()`, and the policy of the antecedent is `launch::deferred`.

**Note:** Postcondition:
- The future object is moved to the parameter of the continuation function.
- `valid() == false` on original future object immediately after it returns.

**Template Parameters**
- `F` – The type of the function/function object to use (deduced). `F` must meet requirements of `MoveConstructible`.
- `error_code` – The type of error code.

**Parameters**
- `f` – A continuation to be attached.
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` & `#812`: A special ‘throw on error’ `error_code`.

**Returns** An object of type `future<decltype(func(*this))>` that refers to the shared state created by the continuation.

template<typename T0, typename F>
inline decltype(auto) then(T0 &&t0, F &&f, error_code &ec = throws)

Attaches a continuation to `*this`. The behavior is undefined if `*this` has no associated shared state (i.e., `valid()==false`). `copydetail hpx::future::then(F&& f, error_code& ec = throws)`

**Note:** Postcondition:
- The future object is moved to the parameter of the continuation function.
- `valid() == false` on original future object immediately after it returns.

**Template Parameters**
- `T0` – The type of executor or launch policy.
- `F` – The type of the function/function object to use (deduced). `F` must meet requirements of `MoveConstructible`.
- `error_code` – The type of error code.

**Parameters**
- `t0` – The executor or launch policy to be used.
- `f` – A continuation to be attached.
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` & `#812`: A special ‘throw on error’ `error_code`.

**Returns** An object of type `future<decltype(func(*this))>` that refers to the shared state created by the continuation.

template<typename Allocator, typename F>

Friends

friend struct hpx::traits::future_access

class shared_future : public hpx::lcos::detail::future_base<shared_future<R>, R>

#include <future_fwd.hpp> The class template hpx::shared_future provides a mechanism to access the result of asynchronous operations, similar to hpx::future, except that multiple threads are allowed to wait for the same shared state. Unlike hpx::future, which is only moveable (so only one instance can refer to any particular asynchronous result), hpx::shared_future is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a shared_future object.

template<typename R, typename Allocator>
struct uses_allocator<hpx::promise<R>, Allocator> : public true_type

namespace `hpx`

Top level HPX namespace.

template<typename R>
class promise : public hpx::detail::promise_base<R>

```cpp
#include <promise.hpp>
```
The class template `hpx::promise` provides a facility to store a value or an exception that is later acquired asynchronously via a `hpx::future` object created by the `hpx::promise` object. Note that the `hpx::promise` object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- **make ready**: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- **release**: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by `hpx::async` which is not yet ready, this operation does not block.
- **abandon**: the promise stores the exception of type `hpx::future_error` with error code `hpx::error::broken_promise`, makes the shared state ready, and then releases it. The promise is the “push” end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes with (as defined in `hpx::memory_order`) the successful return from any function that is waiting on the shared state (such as `hpx::future::get`). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of `hpx::shared_future::get` must either all be read-only or provide external synchronization.

template<typename R, typename Allocator> promise<R>, Allocator > : public true_type
io_service

See Public API for a list of names and headers that are part of the public HPX API.

hpx/io_service/io_service_pool.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

class io_service_pool

#include <io_service_pool.hpp> A pool of io_service objects.

Public Functions

HPX_NON_COPYABLE(io_service_pool)

explicit io_service_pool(std::size_t pool_size = 2, threads::policies::callback_notifier const &notifier = threads::policies::callback_notifier(), char const *pool_name = "", char const *name_postfix = "")

Construct the io_service pool.

Parameters

• pool_size – [in] The number of threads to run to serve incoming requests
• notifier – [in]
• pool_name – [in]
• name_postfix – [in]

explicit io_service_pool(threads::policies::callback_notifier const &notifier, char const *pool_name = "", char const *name_postfix = "")

Construct the io_service pool.

Parameters

• notifier – [in]
• pool_name – [in]
• name_postfix – [in]

~io_service_pool()

bool run(bool join_threads = true, barrier *startup = nullptr)

Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete

bool run(std::size_t num_threads, bool join_threads = true, barrier *startup = nullptr)

Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete

void stop()

Stop all io_service objects in the pool.

void join()

Join all io_service threads in the pool.
void **clear**()
    Clear all internal data structures.

void **wait**()
    Wait for all work to be done.

bool **stopped**()

asio::io_context &**get_io_service**(int index = -1)
    Get an io_service to use.

**std::thread &get_os_thread_handle**(std::size_t thread_num)
    access underlying thread handle

inline constexpr std::size_t **size**() const noexcept
    Get number of threads associated with this I/O service.

void **thread_run**(std::size_t index, barrier *startup = nullptr) const
    Activate the thread index for this thread pool.

inline constexpr char const *get_name() const noexcept
    Return name of this pool.

void **init**(std::size_t pool_size)

Protected Functions

bool **run_locked**(std::size_t num_threads, bool join_threads, barrier *startup)

void **stop_locked**()

void **join_locked**()

void **clear_locked**()

void **wait_locked**()

Private Types

using **io_service_ptr** = **std::unique_ptr**<asio::io_context>

using **work_type** = **std::unique_ptr**<asio::io_context::work>

Private Members

**std::mutex mtx_**

**std::vector<io_service_ptr> io_services_**
    The pool of io_services.
`std::vector<thread> threads_`

`std::vector<work_type> work_`

The work that keeps the io_services running.

`std::size_t next_io_service_`

The next io_service to use for a connection.

`bool stopped_`

set to true if stopped

`std::size_t pool_size_`

initial number of OS threads to execute in this pool

`threads::policies::callback_notifier const &notifier_`

call this for each thread start/stop

`char const *pool_name_`

`char const *pool_name_postfix_`

`bool waiting_`

Set to true if waiting for work to finish.

`std::unique_ptr<barrier> wait_barrier_`

`std::unique_ptr<barrier> continue_barrier_`

**Private Static Functions**

static inline `work_type initialize_work(asio::io_context &io_service)`

**lcos_local**

See [Public API](#) for a list of names and headers that are part of the public HPX API.

pack_traversal

See Public API for a list of names and headers that are part of the public HPX API.

hpx/pack_traversal/pack_traversal.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

```cpp
namespace util
```

Functions

```cpp
template<
typename Mapper, typename...
T>
< unspecified > map_pack (Mapper &&mapper, T &&... pack)
```

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.
Elements that aren’t accepted by the mapper are routed through and preserved through the hierarchy.

```cpp
// Maps all integers to floats
map_pack([](int value) {
    return float(value);
}, 1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

Throws `std::exception` – like objects which are thrown by an invocation to the mapper.

**Parameters**
- `mapper` – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- `pack` – An arbitrary variadic pack which may contain any type.

**Returns** The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

### hpx/pack_traversal/pack_traversal_async.hpp

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```cpp
namespace hpx

namespace util

Functions

```cpp
template<typename Visitor, typename ...T>
auto traverse_pack_async(Visitor &&visitor, T &&... pack) ->
decatype<
    decltype(detail::apply_pack_transform_async(HPX_FORWARD(Visitor, visitor), HPX_FORWARD(T, pack)...))>
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```cpp
// The synchronous overload is called for each object, // it may return false to suspend the current control. // In that case the overload below is called. template <typename T> bool operator()(async_traverse_visit_tag, T&& element) {
    return true;
}

// The asynchronous overload this is called when the // synchronous overload returned false. // In addition to the current visited element the overload is // called with a continuation callable object which resumes the // traversal when it's called later. // The continuation next may be stored and
```

(continues on next page)
called later or // dropped completely to abort the traversal
early. template <typename T, typename N> void
operator()(async_traverse_detach_tag, T&& element, N&& next) { }

// The overload is called when the traversal was finished. // As
argument the whole pack is passed over which we // traversed
asynchronously. template <typename T> void
operator()(async_traverse_complete_tag, T&& pack) { }
};

See traverse_pack for a detailed description about the traversal behavior and capabilities.

Parameters
- **visitor** – A visitor object which provides the three operator() overloads that were
described above. Additionally the visitor must be compatible for referencing it from a
hpx::intrusive_ptr. The visitor must have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects
inside containers and tuple like types are traversed recursively.

Returns A hpx::intrusive_ptr that references an instance of the given visitor object.

hpx/pack_traversal/unwrap.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

template<typename ...Args>
auto unwrap(Args&&... args) -> decltype(util::detail::unwrap_depth_impl<1U>(HPX_FORWARD(Args,
args)...))

A helper function for retrieving the actual result of any hpx::future like type which is wrapped in an arbitrary
way.

Unwraps the given pack of arguments, so that any hpx::future object is replaced by its future result type in
the argument pack:

- hpx::future<int> -> int
- hpx::future<std::vector<float>> -> std::vector<float>
- std::vector<hpx::future<float>> -> std::vector<float>

The function is capable of unwrapping hpx::future like objects that are wrapped inside any container or tuple
like type, see hpx::util::map_pack() for a detailed description about which surrounding types are supported.
Non hpx::future like types are permitted as arguments and passed through.

hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
hpx::unwrap(hpx::make_ready_future(1),
    hpx::make_ready_future(2));

Note: This function unwraps the given arguments until the first traversed nested hpx::future which corresponds to an unwrapping depth of one. See hpx::unwrap_n() for a function which unwraps the given arguments to a particular depth or hpx::unwrap_all() that unwraps all future like objects recursively which are contained in the arguments.

Parameters args – the arguments that are unwrapped which may contain any arbitrary future or non future type.

Throws std::exception – like objects in case any of the given wrapped hpx::future objects were resolved through an exception. See hpx::future::get() for details.

Returns Depending on the count of arguments this function returns a hpx::tuple containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

template<std::size_t Depth, typename ...Args>
auto unwrap_n(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<Depth>(HPX_FORWARD(Args, args)...))

An alternative version of hpx::unwrap(), which unwraps the given arguments to a certain depth of hpx::future like objects.

See unwrap for a detailed description.

Template Parameters Depth – The count of hpx::future like objects which are unwrapped maximally.

template<typename ...Args>
auto unwrap_all(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<0U>(HPX_FORWARD(Args, args)...))

An alternative version of hpx::unwrap(), which unwraps the given arguments recursively so that all contained hpx::future like objects are replaced by their actual value.

See hpx::unwrap() for a detailed description.

template<typename T>
auto unwrapping(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<1U>(HPX_FORWARD(T, callable)))

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap() function and then passes the result to the given callable object.

    return left + right;
    });

int i1 = callable(hpx::make_ready_future(1),
    hpx::make_ready_future(2));

See hpx::unwrap() for a detailed description.
**Parameters callable** – the callable object which is called with the result of the corresponding unwrap function.

```
template< std::size_t Depth, typename T>
auto unwrapping_n(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<Depth>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap_n() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

```
template<typename T>
auto unwrapping_all(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<0U>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap_all() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

**namespace functional**

```
struct unwrap
    #include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap. For more information please refer to its documentation.
```

```
struct unwrap_all
    #include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap_all. For more information please refer to its documentation.
```

```
template< std::size_t Depth>
struct unwrap_n
    #include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap_n. For more information please refer to its documentation.
```

**preprocessor**

See **Public API** for a list of names and headers that are part of the public HPX API.

**hpx/preprocessor/cat.hpp**

See **Public API** for a list of names and headers that are part of the public HPX API.
Defines

**HPX_PP_CAT(A, B)**

Concatenates the tokens A and B into a single token. Evaluates to AB

**Parameters**

- A – First token
- B – Second token

**hpx/preprocessor/expand.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

**HPX_PP_EXPAND(X)**

The HPX_PP_EXPAND macro performs a double macro-expansion on its argument. This macro can be used to produce a delayed preprocessor expansion.

Example:

```cpp
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)
HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

**Parameters**

- X – Token to be expanded twice

**hpx/preprocessor/nargs.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

**HPX_PP_NARGS(...)**

Expands to the number of arguments passed in

Example Usage:

```cpp
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:
Parameters

• ... – The variadic number of arguments

hpx/preprocessor/stringize.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_PP_STRINGIZE(X)

The HPX_PP_STRINGIZE macro stringizes its argument after it has been expanded.

The passed argument X will expand to "X". Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

Parameters

• X – The text to be converted to a string literal

hpx/preprocessor/strip_parens.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_PP_STRIP_PARENS(X)

For any symbol X, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to X itself without error.

The original implementation of this macro is from Steven Watanbe as shown in http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976

Example Usage:

This produces the following output

no_parens
with_parens
• X – Symbol to strip parens from

**resiliency**

See Public API for a list of names and headers that are part of the public HPX API.

**hpx/resiliency/replay_executor.hpp**

runtime_configuration

See Public API for a list of names and headers that are part of the public HPX API.

hpx/runtime_configuration/component_commandline_base.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

```cpp
HPX_REGISTER_COMMANDLINE_REGISTRY(RegistryType, componentname)
```

The macro `HPX_REGISTER_COMMANDLINE_REGISTRY` is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

```cpp
HPX_REGISTER_COMMANDLINE_REGISTRY_DYNAMIC(RegistryType, componentname)
```

```cpp
HPX_REGISTER_COMMANDLINE_OPTIONS()
```

The macro `HPX_REGISTER_COMMANDLINE_OPTIONS` is used to define the required Hpx.Plugin entry point for the command line option registry. This macro has to be used in not more than one compilation unit of a component module.

```cpp
HPX_REGISTER_COMMANDLINE_OPTIONS_DYNAMIC()
```

namespace hpx

```
namespace components
```
struct component_commandline_base

#include <component_commandline_base.hpp> The component_commandline_base has to be used as a base class for all component command-line handling registries.

**Public Functions**

virtual ~component_commandline_base() = default

virtual hpx::program_options::options_description add_commandline_options() = 0

Return any additional command line options valid for this component.

**Note:** This function will be executed by the runtime system during system startup.

**Returns** The module is expected to fill a options_description object with any additional command line options this component will handle.

hpx/runtime_configuration/component_registry_base.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**Defines**

HPX_REGISTER_COMPONENT_REGISTRY(RegistryType, componentname)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_COMPONENT_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_REGISTRY_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

HPX_REGISTER_REGISTRY_MODULE_DYNAMIC()

namespace hpx

namespace components

struct component_registry_base

#include <component_registry_base.hpp> The component_registry_base has to be used as a base class for all component registries.
Public Functions

virtual ~component_registry_base() = default

virtual bool get_component_info(std::vector<std::string> &fillini, std::string const &filepath, bool is_static = false) = 0

Return the ini-information for all contained components.

Parameters

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]
- **is_static** – [in]

Returns

Returns true if the parameter fillini has been successfully initialized with the registry data of all implemented in this module.

virtual void register_component_type() = 0

Register the component type represented by this component.

hpx/runtime_configuration/plugin_registry_base.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

**HPX_REGISTER_PLUGIN_BASE_REGISTRY**(PluginType, name)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

**HPX_REGISTER_PLUGIN_REGISTRY_MODULE()**

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

**HPX_REGISTER_PLUGIN_REGISTRY_MODULE_DYNAMIC()**

namespace hpx

namespace plugins

struct plugin_registry_base

#include <plugin_registry_base.hpp> The plugin_registry_base has to be used as a base class for all plugin registries.
Public Functions

virtual ~plugin_registry_base() = default

virtual bool get_plugin_info(std::vector<std::string> &fillini) = 0

  Return the configuration information for any plugin implemented by this module

  **Parameters** fillini – [in, out] The module is expected to fill this vector with the ini-
  information (one line per vector element) for all plugins implemented in this module.

  **Returns** Returns true if the parameter fillini has been successfully initialized with the reg-
  istry data of all implemented in this module.

  inline virtual void init(int*, char***, util::runtime_configuration&)

hpx/runtime_configuration/runtime_mode.hpp

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace hpx

**Enums**

enum class runtime_mode

  A HPX runtime can be executed in two different modes: console mode and worker mode.

  **Values:**

  enumerator invalid

  enumerator console

    The runtime is the console locality.

  enumerator worker

    The runtime is a worker locality.

  enumerator connect

    The runtime is a worker locality connecting late

  enumerator local

    The runtime is fully local.

  enumerator default_

    The runtime mode will be determined based on the command line arguments

  enumerator last
Functions

char const *get_runtime_mode_name(runtime_mode state) noexcept
    Get the readable string representing the name of the given runtime_mode constant.

runtime_mode get_runtime_mode_from_name(std::string const &mode)
    Returns the internal representation (runtime_mode constant) from the readable string representing the
    name.
    This represents the internal representation from the readable string representing the name.
    Parameters mode – this represents the runtime mode

runtime_local

See Public API for a list of names and headers that are part of the public HPX API.

hpx/runtime_local/component_startup_shutdown_base.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY(RegistryType, componentname)
    This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each
    of the components.

HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS()
    This macro is used to define the required Hpx.Plugin entry point for the startup/shutdown registry. This macro
    has to be used in not more than one compilation unit of a component module.

HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS_DYNAMIC()

namespace hpx

namespace components

struct component_startup_shutdown_base
    #include <component_startup_shutdown_base.hpp> The component_startup_shutdown_base has to
    be used as a base class for all component startup/shutdown registries.
Public Functions

virtual ~component_startup_shutdown_base() = default

virtual bool get_startup_function(startup_function_type &startup, bool &pre_startup) = 0

Return any startup function for this component.

Parameters startup – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

Returns Returns true if the parameter startup has been successfully initialized with the startup function.

virtual bool get_shutdown_function(shutdown_function_type &shutdown, bool &pre_shutdown) = 0

Return any startup function for this component.

Parameters shutdown – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

Returns Returns true if the parameter shutdown has been successfully initialized with the shutdown function.

hpx/runtime_local/custom_exception_info.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

std::string diagnostic_information(exception_info const &xi)

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function hpx::diagnostic_information can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

See also:

hpx::get_error_locality_id(), hpx::get_error_host_name(), hpx::get_error_process_id(), hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(), hpx::get_error_os_thread(), hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error(), hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(), hpx::get_error_state()

Parameters xi – The parameter e will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: hpx::exception_info, hpx::error_code, std::exception, or std::exception_ptr.

Throws std::bad_alloc – (if any of the required allocation operations fail)
**Returns** The formatted string holding all of the available diagnostic information stored in the given exception instance.

`std::uint32_t get_error_locality_id(hpx::exception_info const &xi)`

Returns the locality id where the exception was thrown.

The function `hpx::get_error_locality_id` can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

**See also:**

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`, `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`, `hpx::get_error_state()`

**Parameters** `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** nothing –

**Returns** The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

`std::string get_error_host_name(hpx::exception_info const &xi)`

Return the hostname of the locality where the exception was thrown.

The function `hpx::get_error_host_name` can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

**See also:**

`hpx::diagnostic_information()`, `hpx::get_error_process_id()`, `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`, `hpx::get_error_state()`

**Parameters** `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `std::bad_alloc` – (if one of the required allocations fails)

**Returns** The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return empty string.

`std::int64_t get_error_process_id(hpx::exception_info const &xi)`

Return the (operating system) process id of the locality where the exception was thrown.

The function `hpx::get_error_process_id` can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.
See also:

\begin{verbatim}
  hpx::diagnostic_information(), hpx::get_error_host_name(), hpx::get_error_function_name(),
  hpx::get_error_file_name(), hpx::get_error_line_number(), hpx::get_error_os_thread(),
  hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error(),
  hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(),
  hpx::get_error_state()
\end{verbatim}

Parameters \texttt{xi} – The parameter \texttt{e} will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: \texttt{hpx::exception_info}, \texttt{hpx::error_code}, \texttt{std::exception}, or \texttt{std::exception_ptr}.

Throws \texttt{nothing} –

Returns The process id of the OS-process which threw the exception If the exception instance does not hold this information, the function will return 0.

\begin{verbatim}
std::string get_error_env(hpx::exception_info const &xi)
\end{verbatim}

Return the environment of the OS-process at the point the exception was thrown.

The function \texttt{hpx::get_error_env} can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

See also:

\begin{verbatim}
  hpx::diagnostic_information(), hpx::get_error_host_name(), hpx::get_error_process_id(),
  hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(),
  hpx::get_error_os_thread(), hpx::get_error_thread_id(), hpx::get_error_thread_description(),
  hpx::get_error(), hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(),
  hpx::get_error_state()
\end{verbatim}

Parameters \texttt{xi} – The parameter \texttt{e} will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: \texttt{hpx::exception_info}, \texttt{hpx::error_code}, \texttt{std::exception}, or \texttt{std::exception_ptr}.

Throws \texttt{std::bad_alloc} – (if one of the required allocations fails)

Returns The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

\begin{verbatim}
std::string get_error_backtrace(hpx::exception_info const &xi)
\end{verbatim}

Return the stack backtrace from the point the exception was thrown.

The function \texttt{hpx::get_error_backtrace} can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

See also:

\begin{verbatim}
  hpx::diagnostic_information(), hpx::get_error_host_name(), hpx::get_error_process_id(),
  hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(),
  hpx::get_error_os_thread(), hpx::get_error_thread_id(), hpx::get_error_thread_description(),
  hpx::get_error(), hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(),
  hpx::get_error_state()
\end{verbatim}
**Parameters xi** – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: hpx::exception_info, hpx::error_code, std::exception, or std::exception_ptr.

**Throws std::bad_alloc** – (if one of the required allocations fails)

**Returns** The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
std::size_t get_error_os_thread(hpx::exception_info const &xi)
```

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function hpx::get_error_os_thread can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

**See also:**

hpx::diagnostic_information(), hpx::get_error_host_name(), hpx::get_error_process_id(),
hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(),
hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error(),
hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(),
hpx::get_error_state()

**Parameters xi** – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: hpx::exception_info, hpx::error_code, std::exception, or std::exception_ptr.

**Throws nothing** –

**Returns** The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return std::size(-1).

```cpp
std::size_t get_error_thread_id(hpx::exception_info const &xi)
```

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function hpx::get_error_thread_id can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

**See also:**

hpx::diagnostic_information(), hpx::get_error_host_name(), hpx::get_error_process_id(),
hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(),
hpx::get_error_os_thread() hpx::get_error_thread_description(), hpx::get_error(),
hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(),
hpx::get_error_state()
**Returns** The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return std::size_t(0).

```cpp
std::string get_error_thread_description(hpx::exception_info const &xi)
```

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_description` can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

**See also:**
- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,
- `hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,
- `hpx::get_error_thread_description()`

**Parameters** `xi` - The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `std::bad_alloc` – (if one of the required allocations fails)

**Returns** Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
std::string get_error_config(hpx::exception_info const &xi)
```

Return the HPX configuration information point from which the exception was thrown.

The function `hpx::get_error_config` can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

**See also:**
- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,
- `hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,
- `hpx::get_error_thread_description()`

**Parameters** `xi` - The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `std::bad_alloc` – (if one of the required allocations fails)

**Returns** Any additionally available HPX configuration information point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.
std::string get_error_state(hpx::exception_info const &xi)

Return the HPX runtime state information at which the exception was thrown.

The function hpx::get_error_state can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

See also:

- hpx::diagnostic_information()
- hpx::get_error_host_name()
- hpx::get_error_process_id()
- hpx::get_error_function_name()
- hpx::get_error_file_name()
- hpx::get_error_line_number()
- hpx::get_error_os_thread()
- hpx::get_error_thread_id()
- hpx::get_error_backtrace()
- hpx::get_error_env()
- hpx::get_error()
- hpx::get_error_what()
- hpx::get_error_thread_description()

Parameters xi – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: hpx::exception_info, hpx::error_code, std::exception, or std::exception_ptr.

Throws std::bad_alloc – (if one of the required allocations fails)

Returns The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

hpx/runtime_local/get_locality_id.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

std::uint32_t get_locality_id(error_code &ec = throws)

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

Note: The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by get_num_localities()).

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.
namespace hpx

**Functions**

```cpp
std::string get_locality_name()
```

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

See also:

```cpp
future<std::string> get_locality_name(hpx::id_type const& id)
```

**Returns** This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

namespace hpx

**Functions**

```cpp
std::uint32_t get_initial_num_localities()
```

Return the number of localities which were registered at startup for the running application.

The function `get_initial_num_localities` returns the number of localities which were connected to the console at application startup.

See also:

`hpx::find_all_localities`, `hpx::get_num_localities`

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

```cpp
hpx::future<std::uint32_t> get_num_localities()
```

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.
std::uint32_t get_num_localities(launch::sync_policy, error_code &ec = throws)
Return the number of localities which are currently registered for the running application.
The function get_num_localities returns the number of localities currently connected to the console.

See also:
hpx::find_all_localities, hpx::get_num_localities

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

hpx/runtime_local/get_os_thread_count.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

std::size_t get_os_thread_count()
Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

std::size_t get_os_thread_count(threads::executor const &exec)
Return the number of worker OS-threads used by the given executor to execute HPX threads.
This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

Parameters exec – [in] The executor to be used.

namespace threads
namespace hpx

Functions

std::string get_thread_name()

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

namespace hpx

Functions

void report_error(std::size_t num_thread, std::exception_ptr const &e)

The function report_error reports the given exception to the console.

void report_error(std::exception_ptr const &e)

The function report_error reports the given exception to the console.
Functions

```cpp
void set_error_handlers(hpx::util::runtime_configuration const &cfg)
```

class `runtime`

Public Types

```cpp
using notification_policy_type = threads::policies::callback_notifier
    Generate a new notification policy instance for the given thread name prefix
```

```cpp
using hpx_main_function_type = int()
    The hpx_main_function_type is the default function type usable as the main HPX thread function.
```

```cpp
using hpx_errorsink_function_type = void(std::uint32_t, std::string const&)
```

Public Functions

```cpp
virtual notification_policy_type get_notification_policy(char const *prefix,
                     runtime_local::os_thread_type type)
```

```cpp
state get_state() const
```

```cpp
void set_state(state s)
```

```cpp
explicit runtime(hpx::util::runtime_configuration &rtcfg, bool initialize)
    Construct a new HPX runtime instance.
```

```cpp
virtual ~runtime()
    The destructor makes sure all HPX runtime services are properly shut down before exiting.
```

```cpp
void on_exit(hpx::function<void()> const &f)
    Manage list of functions to call on exit.
```

```cpp
void starting()
    Manage runtime ‘stopped’ state.
```

```cpp
void stopping()
    Call all registered on_exit functions.
```

```cpp
bool stopped() const
    This accessor returns whether the runtime instance has been stopped.
```

```cpp
hpx::util::runtime_configuration &get_config()
    access configuration information
```

```cpp
hpx::util::runtime_configuration const &get_config() const
```

```cpp
std::size_t get_instance_number() const
```

```cpp
util::thread_mapper &get_thread_mapper()
    Return a reference to the internal PAPI thread manager.
```
```
threads::topology const &get_topology() const

virtual int run(hpx::function<hpx_main_function_type> const &func)
   Run the HPX runtime system, use the given function for the main thread and block waiting for all threads to finish.

   **Note:** The parameter `func` is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

   **Parameters**
   - `func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef `hpx_main_function_type`. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

   **Returns**
   This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

virtual int run()
   Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

   **Returns**
   This function will always return 0 (zero).

virtual void rethrow_exception()
   Rethrow any stored exception (to be called after `stop()`)

virtual int start(hpx::function<hpx_main_function_type> const &func, bool blocking = false)
   Start the runtime system.

   **Parameters**
   - `func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef `hpx_main_function_type`.
   - `blocking` – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is `true` the function `runtime::start` will call `runtime::wait` internally.

   **Returns**
   If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise it will return zero.

virtual int start(bool blocking = false)
   Start the runtime system.

   **Parameters**
   - `blocking` – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is `true` the function `runtime::start` will call `runtime::wait` internally.

   **Returns**
   If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise it will return zero.

virtual int wait()
   Wait for the shutdown action to be executed.

   **Returns**
   This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

virtual void stop(bool blocking = true)
   Initiate termination of the runtime system.
```
Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is false then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to true to wait for all internal work to be completed.

```cpp
virtual int suspend()
Suspend the runtime system.
```

```cpp
virtual int resume()
Resume the runtime system.
```

```cpp
virtual int finalize(double)
```

```cpp
virtual bool is_networking_enabled()
Return true if networking is enabled.
```

```cpp
virtual hpx::threads::threadmanager &get_thread_manager()
Allow access to the thread manager instance used by the HPX runtime.
```

```cpp
virtual std::string here() const
Returns a string of the locality endpoints (usable in debug output)
```

```cpp
virtual bool report_error(std::size_t num_thread, std::exception_ptr const &e, bool terminate_all = true)
Report a non-recoverable error to the runtime system.
```

**Parameters**
- **num_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.

```cpp
virtual bool report_error(std::exception_ptr const &e, bool terminate_all = true)
```

Report a non-recoverable error to the runtime system.

**Note:** This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

**Parameters**
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.

```cpp
virtual void add_pre_startup_function(startup_function_type f)
Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with add_startup_function.
```

**Note:** The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

**Parameters**
- **f** – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

```cpp
virtual void add_startup_function(startup_function_type f)
Add a function to be executed inside a HPX thread before hpx_main
```

**Parameters**
- **f** – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)
virtual void **add_pre_shutdown_function**(**shutdown_function_type** f)
Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

**Note:** The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

**Parameters**
- **f** – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void **add_shutdown_function**(**shutdown_function_type** f)
Add a function to be executed inside a HPX thread during hpx::finalize

**Parameters**
- **f** – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual **hpx::util::io_service_pool** *get_thread_pool**(char const *name)
Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument **name** are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

virtual bool **register_thread**(char const *name, **std::size_t** num = 0, bool service_thread = true, **error_code** &ec = **throws**)
Register an external OS-thread with HPX.
This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

**Note:** The function will compose a thread name of the form ‘<name>-thread#<num>’ which is used to register the thread. It is the user’s responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

**Note:** This function should be called for each thread exactly once. It will fail if it is called more than once.

**Parameters**
- **name** – [in] The name to use for thread registration.
- **num** – [in] The sequence number to use for thread registration. The default for this parameter is zero.
- **service_thread** – [in] The thread should be registered as a service thread. The default for this parameter is ‘true’. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.

**Returns** This function will return whether the requested operation succeeded or not.

virtual bool **unregister_thread**()
Unregister an external OS-thread with HPX.
This function will unregister any external OS-thread from HPX.
Note: This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see register_thread).

Returns This function will return whether the requested operation succeeded or not.

virtual runtime_local::os_thread_data get_os_thread_data(std::string const &label) const
Access data for a given OS thread that was previously registered by register_thread.

virtual bool enumerate_os_threads(hpx::function<bool(runtime_local::os_thread_data const&)> const &f) const
Enumerate all OS threads that have registered with the runtime.

**Private Functions**

void stop_helper(bool blocking, std::condition_variable &cond, std::mutex &mtx)

Helper function to stop the runtime.

Parameters blocking – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is false then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to true to wait for all internal work to be completed.

void deinit_tss_helper(char const *context, std::size_t num)

void init_tss_ex(char const *context, runtime_local::os_thread_type type, std::size_t local_thread_num, std::size_t global_thread_num, char const *pool_name, char const *postfix, bool service_thread, error_code &ec)

namespace **threads**

**Functions**

`char const *get_stack_size_name(std::ptrdiff_t size)`
- Returns the stack size name.

Get the readable string representing the given stack size constant.

**Parameters** `size` – this represents the stack size

*std::ptrdiff_t get_default_stack_size()*
- Returns the default stack size.

Get the default stack size in bytes.

*std::ptrdiff_t get_stack_size(thread_stacksize)*
- Returns the stack size corresponding to the given stack size enumeration.

Get the stack size corresponding to the given stack size enumeration.

**Parameters** `size` – this represents the stack size

namespace **util**
Functions

```cpp
bool retrieve_commandline_arguments(hpx::program_options::options_description const &app_options,
                                    hpx::program_options::variables_map &vm)
```

```cpp
bool retrieve_commandline_arguments(std::string const &appname,
                                    hpx::program_options::variables_map &vm)
```

`hpx/runtime_local/runtime_local_fwd.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

```cpp
bool register_thread(runtime *rt, char const *name,
                     error_code &ec = throws)
```

Register the current kernel thread with HPX, this should be done once for each external OS-thread intended

```cpp
void unregister_thread(runtime *rt)
```

Unregister the thread from HPX, this should be done once in the end before the external thread exists.

```cpp
runtime_local::os_thread_data get_os_thread_data(std::string const &label)
```

Access data for a given OS thread that was previously registered by register_thread. This function must be
called from a thread that was previously registered with the runtime.

```cpp
bool enumerate_os_threads(hpx::function<bool(os_thread_data const&)> const &f)
```

Enumerate all OS threads that have registered with the runtime.

```cpp
std::size_t get_runtime_instance_number()
```

Return the runtime instance number associated with the runtime instance the current thread is running in.

```cpp
bool register_on_exit(hpx::function<void()> const &)
```

Register a function to be called during system shutdown.

```cpp
bool is_starting()
```

Test whether the runtime system is currently being started.

This function returns whether the runtime system is currently being started or not, e.g. whether the current
state of the runtime system is hpx::state::startup

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

```cpp
bool tolerate_node_faults()
```

Test if HPX runs in fault-tolerant mode.

This function returns whether the runtime system is running in fault-tolerant mode
bool is_running()
    Test whether the runtime system is currently running.
    This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is \texttt{hpx::state::running}

\textbf{Note:} This function needs to be executed on a HPX-thread. It will return false otherwise.

bool is_stopped()
    Test whether the runtime system is currently stopped.
    This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is \texttt{hpx::state::stopped}

\textbf{Note:} This function needs to be executed on a HPX-thread. It will return false otherwise.

bool is_stopped_or_shutting_down()
    Test whether the runtime system is currently being shut down.
    This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is \texttt{hpx::state::stopped} or \texttt{hpx::state::shutdown}

\textbf{Note:} This function needs to be executed on a HPX-thread. It will return false otherwise.

\texttt{std::size_t get_num_worker_threads()}
    Return the number of worker OS-threads used to execute HPX threads.
    This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

\texttt{std::uint64_t get_system_uptime()}
    Return the system uptime measure on the thread executing this call.
    This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Typedefs

typedef hpx::move_only_function<void()> shutdown_function_type

The type of a function which is registered to be executed as a shutdown or pre-shutdown function.

Functions

void register_pre_shutdown_function(shutdown_function_type f)

Add a function to be executed by a HPX thread during hpx::finalize() but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with register_pre_shutdown_function are guaranteed to be executed by an HPX thread during the execution of hpx::finalize() before any of the registered shutdown functions are executed (see: hpx::register_shutdown_function()).

See also:

hpx::register_shutdown_function()

Note: If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise an invalid_status exception.

Parameters f – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

void register_shutdown_function(shutdown_function_type f)

Add a function to be executed by a HPX thread during hpx::finalize() but guaranteed after any pre-shutdown function is executed (system-wide)
Any of the functions registered with `register_shutdown_function` are guaranteed to be executed by an HPX thread during the execution of `hpx::finalize()` after any of the registered pre-shutdown functions are executed (see: `hpx::register_pre_shutdown_function()`).

See also:

`hpx::register_pre_shutdown_function()`

Note: If this function is called while the shutdown functions are being executed, or after that point, it will raise a invalid_status exception.

**Parameters**

- `f` – [in] The function to be registered to run by an HPX thread as a shutdown function.

**Typedefs**

```cpp
typedef hpx::move_only_function<void()> startup_function_type
```

The type of a function which is registered to be executed as a startup or pre-startup function.

**Functions**

```cpp
void register_pre_startup_function(startup_function_type f)
```

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with `register_pre_startup_function` are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see `hpx::register_startup_function()`).

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

`hpx::register_startup_function()`

Note: If this function is called while the pre-startup functions are being executed or after that point, it will raise a invalid_status exception.
Parameters  **f** – [in] The function to be registered to run by an HPX thread as a pre-startup function.

```c
void register_startup_function(startup_function_type f)
```

Add a function to be executed by a HPX thread before hpx_main but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with `register_startup_function` are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: `hpx::register_pre_startup_function()`), but before `hpx_main` is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

**See also:**

`hpx::register_pre_startup_function()`

**Note:** If this function is called while the startup functions are being executed or after that point, it will raise a invalid_status exception.

Parameters  **f** – [in] The function to be registered to run by an HPX thread as a startup function.

**hpx/runtime_local/thread_hooks.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

**Functions**

```c
threads::policies::callback_notifier::on_startstop_type get_thread_on_start_func()
```

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see `register_thread_on_start_func`).

**Note:** This function can be called before the HPX runtime is initialized.

**Returns** The currently installed error handler function.

```c
threads::policies::callback_notifier::on_startstop_type get_thread_on_stop_func()
```

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see `register_thread_on_stop_func`).
Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_error_type get_thread_on_error_func()

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see register_thread_on_error_func).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type register_thread_on_start_func(threads::policies::callback_notifier::on_startstop_type &&f)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see get_thread_on_start_func).

Note: This function can be called before the HPX runtime is initialized.

Parameters f – The function to install as the new start handler.

Returns The previously registered function of this category. It is the user’s responsibility to call that function if the callback is invoked by HPX.

threads::policies::callback_notifier::on_startstop_type register_thread_on_stop_func(threads::policies::callback_notifier::on_startstop_type &&f)

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see get_thread_on_stop_func).

Note: This function can be called before the HPX runtime is initialized.

Parameters f – The function to install as the new stop handler.

Returns The previously registered function of this category. It is the user’s responsibility to call that function if the callback is invoked by HPX.

threads::policies::callback_notifier::on_error_type register_thread_on_error_func(threads::policies::callback_notifier::on_error_type &&f)

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference,
thus the caller needs to make sure any newly registered error function chains into the previous one (see `get_thread_on_error_func`).

---

**Note:** This function can be called before the HPX runtime is initialized.

---

**Parameters** `f` – The function to install as the new error handler.

**Returns** The previously registered function of this category. It is the user’s responsibility to call that function if the callback is invoked by HPX.

---

`hpx/runtime_local/thread_pool_helpers.hpp`

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **resource**

---

**Functions**

`std::size_t get_num_thread_pools()`  
Return the number of thread pools currently managed by the `resource_partitioner`

`std::size_t get_num_threads()`  
Return the number of threads in all thread pools currently managed by the `resource_partitioner`

`std::size_t get_num_threads(std::string const &pool_name)`  
Return the number of threads in the given thread pool currently managed by the `resource_partitioner`

`std::size_t get_num_threads(std::size_t pool_index)`  
Return the number of threads in the given thread pool currently managed by the `resource_partitioner`

`std::size_t get_pool_index(std::string const &pool_name)`  
Return the internal index of the pool given its name.

`std::string const &get_pool_name(std::size_t pool_index)`  
Return the name of the pool given its internal index.

`threads::thread_pool_base &get_thread_pool(std::string const &pool_name)`  
Return the name of the pool given its name.

`threads::thread_pool_base &get_thread_pool(std::size_t pool_index)`  
Return the thread pool given its internal index.

`bool pool_exists(std::string const &pool_name)`  
Return true if the pool with the given name exists.

`bool pool_exists(std::size_t pool_index)`  
Return true if the pool with the given index exists.

---

namespace **threads**
Functions

```cpp
std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown)
```

The function `get_thread_count` returns the number of currently known threads.

**Note:** If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

**Parameters**
- `state` – [in] This specifies the thread-state for which the number of threads should be retrieved.

```cpp
std::int64_t get_thread_count(thread_priority priority, thread_schedule_state state = thread_schedule_state::unknown)
```

The function `get_thread_count` returns the number of currently known threads.

**Note:** If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

**Parameters**
- `priority` – [in] This specifies the thread-priority for which the number of threads should be retrieved.
- `state` – [in] This specifies the thread-state for which the number of threads should be retrieved.

```cpp
std::int64_t get_idle_core_count()
```

The function `get_idle_core_count` returns the number of currently idling threads (cores).

```cpp
mask_type get_idle_core_mask()
```

The function `get_idle_core_mask` returns a bit-mask representing the currently idling threads (cores).

```cpp
bool enumerate_threads(hpx::function<bool(thread_id_type)> const &f, thread_schedule_state state = thread_schedule_state::unknown)
```

The function `enumerate_threads` will invoke the given function `f` for each thread with a matching thread state.

**Parameters**
- `f` – [in] The function which should be called for each matching thread. Returning ‘false’ from this function will stop the enumeration process.
- `state` – [in] This specifies the thread-state for which the threads should be enumerated.

synchronization

See Public API for a list of names and headers that are part of the public HPX API.

hpx/synchronization/barrier.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

```cpp
template<typename OnCompletion = detail::empty_oncompletion>
class barrier
```

#include <barrier.hpp> A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [ Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note ] Each barrier phase consists of the following steps:
• The expected count is decremented by each call to arrive or arrive_and_drop.

• When the expected count reaches zero, the phase completion step is run. For the specialization with the
default value of the CompletionFunction template parameter, the completion step is run as part of the
call to arrive or arrive_and_drop that caused the expected count to reach zero. For other specializations,
the completion step is run on one of the threads that arrived at the barrier during the phase.

• When the completion step finishes, the expected count is reset to what was specified by the expected
argument to the constructor, possibly adjusted by calls to arrive_and_drop, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can
block on the phase synchronization point by calling wait, and will remain blocked until the phase completion
step is run. The phase completion step that is executed at the end of each phase has the following effects:

• Invokes the completion function, equivalent to completion().

• Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the
completion step. For specializations that do not have the default value of the CompletionFunction template
parameter, the behavior is undefined if any of the barrier object’s member functions other than wait are
called while the completion step is in progress.

Concurrent invocations of the member functions of barrier, other than its destructor, do not introduce data
races. The member functions arrive and arrive_and_drop execute atomically.

CompletionFunction shall meet the Cpp17MoveConstructible (Table 28) and Cpp17Destructible (Table 32)
requirements. std::is_nothrow_invocable_v<CompletionFunction&> shall be true.

The default value of the CompletionFunction template parameter is an unspecified type, such that, in addi-
tion to satisfying the requirements of CompletionFunction, it meets the Cpp17DefaultConstructible re-
quirements (Table 27) and completion() has no effects.

barrier::arrival_token is an unspecified type, such that it meets the Cpp17MoveConstructible (Table 28),
Cpp17MoveAssignable (Table 30), and Cpp17Destructible (Table 32) requirements.

Public Types

using arrival_token = bool

Public Functions

inline explicit constexpr barrier(std::ptrdiff_t expected, OnCompletion completion = OnCompletion())

Preconditions: expected >= 0 is true and expected <= max() is true.

Effects: Sets both the initial expected count for each barrier phase and the current expected count for
the first phase to expected. Initializes completion with std::move(f). Starts the first phase. [Note: If
expected is 0 this object can only be destroyed.- end note]

Throws: Any exception thrown by CompletionFunction’s move constructor.

~barrier() = default
inline \texttt{arrival\_token arrive(std::ptrdiff_t update = 1)}

Preconditions: update > 0 is true, and update is less than or equal to the expected count for the current barrier phase.

Effects: Constructs an object of type arrival\_token that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by update.

Synchronization: The call to arrive strongly happens before the start of the phase completion step for the current phase.

Error conditions: Any of the error conditions allowed for mutex types([thread.mutex.requirements.mutex]). [Note: This call can cause the completion step for the current phase to start.- end note]

\textbf{Throws} system\_error – when an exception is required ([thread.req.exception]).

\textbf{Returns} : The constructed arrival\_token object.

inline void \texttt{wait(arrival\_token \&\&old\_phase) const}

Preconditions: arrival is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

Effects: Blocks at the synchronization point associated with HPX\_MOVE(arrival) until the phase completion step of the synchronization point’s phase is run. [ Note: If arrival is associated with the synchronization point for a previous phase, the call returns immediately. - end note ]

\textbf{Throws} system\_error – when an exception is required ([thread.req.exception]).

\textbf{Error conditions:} Any of the error conditions allowed for mutex types ([thread.mutex.requirements.mutex]).

inline void \texttt{arrive\_and\_wait()}

Effects: Equivalent to: wait(arrive()).

inline void \texttt{arrive\_and\_drop()}

Preconditions: The expected count for the current barrier phase is greater than zero.

Effects: Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

Synchronization: The call to arrive\_and\_drop strongly happens before the start of the phase completion step for the current phase.

\textbf{Throws} system\_error – when an exception is required ([thread.req.exception]).Error conditions: Any of the error conditions allowed for mutex types ([thread.mutex.requirements.mutex]). [Note: This call can cause the completion step for the current phase to start.- end note]

hpx/synchronization/binary_semaphore.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

class binary_semaphore

#include <binary_semaphore.hpp> A binary semaphore is a semaphore object that has only two states.

binary_semaphore is an alias for specialization of hpx::counting_semaphore with LeastMaxValue being 1.

HPX’s implementation of binary_semaphore is more efficient than the default implementation of a counting semaphore with a unit resource count (hpx::counting_semaphore).

Public Functions

binary_semaphore(binary_semaphore const&) = delete

binary_semaphore &operator=(binary_semaphore const&) = delete

binary_semaphore(binary_semaphore&&) = delete

binary_semaphore &operator=(binary_semaphore&&) = delete

explicit binary_semaphore(std::ptrdiff_t value = 1)

Constructs an object of type hpx::binary_semaphore with the internal counter initialized to value.

Parameters value – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.
~binary_semaphore() = default

void release(std::ptrdiff_t update = 1)
    Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of try_acquire that observe the result of the effects.

    Throws std::system_error –
    Parameters update – the amount to increment the internal counter by
    Pre Both update >= 0 and update <= max() – counter are true, where counter is the value of the internal counter.

bool try_acquire() noexcept
    Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.
    Returns true if it decremented the internal counter, otherwise false

void acquire()
    Repeatedly performs the following steps, in order:
    • Evaluates try_acquire. If the result is true, returns.
    Blocks on *this until counter is greater than zero.
    Throws std::system_error –
    Returns void.

bool try_acquire_until(hpx::chrono::steady_time_point const &abs_time)
    Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the abs_time time point has been passed.
    Parameters abs_time – the earliest time the function must wait until in order to fail
    Throws std::system_error –
    Returns true if it decremented the internal counter, otherwise false.

bool try_acquire_for(hpx::chrono::steady_duration const &rel_time)
    Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the rel_time duration has been exceeded.
    Throws std::system_error –
    Parameters rel_time – the minimum duration the function must wait for to fail
    Returns true if it decremented the internal counter, otherwise false

Public Static Functions

static constexpr std::ptrdiff_t max() noexcept
    Returns The maximum value of counter. This value is greater than or equal to LeastMaxValue.
    Returns The internal counter’s maximum possible value, as a std::ptrdiff_t.
namespace hpx

Enums

eenum class cv_status

   The scoped enumeration hpx::cv_status describes whether a timed wait returned because of timeout or not. hpx::cv_status is used by the wait_for and wait_until member functions of hpx::condition_variable and hpx::condition_variable_any.

   Values:

     enumerator no_timeout
       The condition variable was awakened with notify_all, notify_one, or spuriously

     enumerator timeout
       the condition variable was awakened by timeout expiration

     enumerator error
       there was an error

class condition_variable

   #include <condition_variable.hpp> The condition_variable class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the condition_variable.

   The thread that intends to modify the shared variable has to

      i. acquire a hpx::mutex (typically via std::lock_guard)
   
      ii. perform the modification while the lock is held

      iii. execute notify_one or notify_all on the condition_variable (the lock does not need to be held for notification)

   Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on condition_variable has to

      i. acquire a std::unique_lock<hpx::mutex>, on the same mutex as used to protect the shared variable
   
      ii. either

          A. check the condition, in case it was already updated and notified

          B. execute wait, await_for, or wait_until. The wait operations atomically release the mutex and suspend the execution of the thread.

          C. When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake up was spurious.
A. use the predicated overload of \texttt{wait}, \texttt{wait\_for}, and \texttt{wait\_until}, which takes care of the three steps above.

\texttt{hpx::condition\_variable} works only with \texttt{std::unique\_lock<hpx::mutex>}. This restriction allows for maximal efficiency on some platforms. \texttt{hpx::condition\_variable\_any} provides a condition variable that works with any \texttt{Basic\_Lockable} object, such as \texttt{std::shared\_lock}.

Condition variables permit concurrent invocation of the \texttt{wait}, \texttt{wait\_for}, \texttt{wait\_until}, \texttt{notify\_one} and \texttt{notify\_all} member functions.

The class \texttt{hpx::condition\_variable} is a \texttt{Standard\_Layout\_Type}. It is not \texttt{Copy\_Constructible}, \texttt{Move\_Constructible}, \texttt{Copy\_Assignable}, or \texttt{Move\_Assignable}.

\section*{Public Functions}

\begin{verbatim}
inline \texttt{condition\_variable}()
    Construct an object of type \texttt{hpx::condition\_variable}.

\texttt{~condition\_variable}() = default
    Destroys the object of type \texttt{hpx::condition\_variable}.
\end{verbatim}

IOW, \texttt{~condition\_variable}() can execute before a signalled thread returns from a wait. If this happens with \texttt{condition\_variable}, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the \texttt{condition\_variable} object and the member functions \texttt{wait} (\texttt{wait\_for}, etc.).

\textbf{Note:} Preconditions: There is no thread blocked on *this. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on *this once the destructor has been started, especially when the waiting threads are calling the \texttt{wait} functions in a loop or using the overloads of \texttt{wait}, \texttt{wait\_for}, or \texttt{wait\_until} that take a predicate. end note]

\texttt{condition\_variable(condition\_variable const&)} = delete

\texttt{condition\_variable(condition\_variable&&)} = delete

\texttt{condition\_variable\& operator=\texttt{(condition\_variable const&)} = delete}

\texttt{condition\_variable\& operator=\texttt{(condition\_variable&&)} = delete}

\begin{verbatim}
inline void \texttt{notify\_one(error\_code \&ec = \texttt{throws}) const
    If any threads are waiting on *this, calling \texttt{notify\_one} unblocks one of the waiting threads.
    \textbf{Parameters ec} – Used to hold error code value originated during the operation. \texttt{throws} defaults to
    \#8212; A special ‘throw on error’ \texttt{error\_code}.
    \textbf{Returns} \texttt{notify\_one} returns \texttt{void}.
\end{verbatim}

\begin{verbatim}
inline void \texttt{notify\_all(error\_code \&ec = \texttt{throws}) const
    Unblocks all threads currently waiting for *this.
    \textbf{Parameters ec} – Used to hold error code value originated during the operation. \texttt{throws} defaults to
    \#8212; A special ‘throw on error’ \texttt{error\_code}.
    \textbf{Returns} \texttt{notify\_all} returns \texttt{void}.
\end{verbatim}
template<typename Mutex>
inline void wait(std::unique_lock<Mutex> &lock, error_code &ec = throws)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on *this. The thread will be unblocked when notify_all() or notify_one() is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

Note: 1. Calling this function if lock.mutex() is not locked by the current thread is undefined behavior.
A. Calling this function if lock.mutex() is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

**Template Parameters** Mutex – Type of mutex to wait on.

**Parameters**
- lock – unique_lock that must be locked by the current thread
- ec – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

**Returns** wait returns void.

template<typename Mutex, typename Predicate>
inline void wait(std::unique_lock<Mutex> &lock, Predicate pred, error_code & = throws)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

```
while (!pred()) {
    wait(lock);
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after wait(lock) exits, which means that lock can be used to guard access to pred().

Note: 1. Calling this function if lock.mutex() is not locked by the current thread is undefined behavior.
A. Calling this function if lock.mutex() is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

**Template Parameters**
- Mutex – Type of mutex to wait on.
- Predicate – Type of predicate pred function.

**Parameters**
- lock – unique_lock that must be locked by the current thread
- pred – Predicate which returns false if the waiting should be continued (bool(pred())==false). The signature of the predicate function should be equivalent to the following: bool pred();

**Returns** wait returns void.

template<typename Mutex>
inline cv_status wait_until(std::unique_lock<Mutex> &lock, hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)

wait_until causes the current thread to block until the condition variable is notified, a specific
time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on *this. The thread will be unblocked when notify_all() or notify_one() is executed, or when the absolute time point abs_time is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait_until exits.

**Note:** 1. Calling this function if lock.mutex() is not locked by the current thread is undefined behavior.  
A. Calling this function if lock.mutex() is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

**Template Parameters**  
*Mutex* – Type of mutex to wait on.  

**Parameters**  
- *lock* – unique_lock that must be locked by the current thread  
- *abs_time* – Represents the time when waiting should be stopped  
- *ec* – Used to hold error code value originated during the operation. Defaults to throws &8212; A special ‘throw on error’ error_code.

**Returns**  
*cv_status* wait_until returns hpx::cv_status::timeout if the absolute timeout specified by *abs_time* was reached and hpx::cv_status::no_timeout otherwise.

```cpp
template<typename Mutex, typename Predicate>
inline bool wait_until(std::unique_lock<Mutex> &lock, hpx::chrono::steady_time_point const &abs_time, Predicate pred, error_code &ec = throws)
```

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

```cpp
while (!pred()) {
    if (wait_until(lock, abs_time) == hpx::cv_status::timeout) {
        return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

**Note:** 1. Calling this function if lock.mutex() is not locked by the current thread is undefined behavior.  
A. Calling this function if lock.mutex() is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

**Template Parameters**  
- *Mutex* – Type of mutex to wait on.  
- *Predicate* – Type of predicate pred function.

**Parameters**  
- *lock* – unique_lock that must be locked by the current thread  
- *abs_time* – Represents the time when waiting should be stopped  
- *pred* – Predicate which returns false if the waiting should be continued (bool(pred())==false). The signature of the predicate function should be equivalent to the following: bool pred();
• \textbf{ec} – Used to hold error code value originated during the operation. Defaults to \textit{throws} &\#8212; A special ‘throw on error’ \textit{error_code}.

\textbf{Returns} bool \textit{wait\_until} returns \textit{false} if the predicate \textit{pred} still evaluates to false after the \textit{abs\_time} timeout has expired, otherwise \textit{true}. If the timeout had already expired, evaluates and returns the result of \textit{pred}.

```cpp
template<typename \textbf{Mutex}>
inline \textit{cv\_status} \textbf{wait\_for} (std::unique\_lock<\textbf{Mutex}> &lock, hpx::chrono::steady\_duration const &rel\_time, \textit{error\_code} &\textbf{ec} = \textit{throws})
```

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on \textit{*this}. The thread will be unblocked when \textit{notify\_all()} or \textit{notify\_one()} is executed, or when the relative timeout \textit{rel\_time} expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and \textbf{wait\_for()} exits.

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than \textit{rel\_time} due to scheduling or resource contention delays.

\begin{itemize}
  \item \textbf{lock} – \textit{unique\_lock} that must be locked by the current thread
  \item \textbf{rel\_time} – represents the maximum time to spend waiting. Note that \textit{rel\_time} must be small enough not to overflow when added to \textit{hpx::chrono::steady\_clock::now()}. \item \textbf{ec} – Used to hold error code value originated during the operation. Defaults to \textit{throws} &\#8212; A special ‘throw on error’ \textit{error\_code}.
\end{itemize}

\textbf{Returns} \textit{cv\_status} \textit{hpx::cv\_status::timeout} if the relative timeout specified by \textit{rel\_time} expired, \textit{hpx::cv\_status::no\_timeout} otherwise.

```cpp
template<typename \textbf{Mutex}, typename \textbf{Predicate}>
inline bool \textbf{wait\_for} (std::unique\_lock<\textbf{Mutex}> &lock, hpx::chrono::steady\_duration const &\textbf{rel\_time}, \textbf{Predicate} \textbf{pred}, \textit{error\_code} &\textbf{ec} = \textit{throws})
```

Equivalent to.

```cpp
\textbf{return} \textbf{wait\_until}(\textbf{lock},
  hpx::chrono::steady\_clock::now() + \textbf{rel\_time},
  hpx::move(\textbf{pred}));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (bool(prel())==true).

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than \textit{rel\_time} due to scheduling or resource contention delays.

\begin{itemize}
  \item \textbf{lock} is not locked by the current thread is undefined behavior.
  \end{itemize}

\textbf{Note:} 1. Calling this function if \textit{lock\_mutex()} is not locked by the current thread is undefined behavior.

\begin{itemize}
  \item Calling this function if \textit{lock\_mutex()} is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.
  \item Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.
\end{itemize}
### Template Parameters
- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate `pred` function.

### Parameters
- **lock** – `unique_lock` that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- **pred** – Predicate which returns `false` if the waiting should be continued (`bool(pred())==false`). The signature of the predicate function should be equivalent to the following: `bool pred();`
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` &`#8212; A special ‘throw on error’ `error_code`.

### Returns
`bool wait_for` returns `false` if the predicate `pred` still evaluates to `false` after the `rel_time` timeout expired, otherwise `true`.

### Private Types

```cpp
using mutex_type = lcos::local::detail::condition_variable_data::mutex_type

using data_type = hpx::intrusive_ptr<lcos::local::detail::condition_variable_data>
```

### Private Members

```cpp
hpx::util::cacheAlignedDataDerived<data_type> data_
```

class **condition_variable_any**

```cpp
#include <condition_variable.hpp>  The condition_variable_any class is a generalization of hpx::condition_variable. Whereas hpx::condition_variable works only on `std::unique_lock<std::mutex>`, a condition_variable_any can operate on any lock that meets the BasicLockable requirements.

See hpx::condition_variable for the description of the semantics of condition variables. It is not CopyConstructible, MoveConstructible, CopyAssignable, or MoveAssignable.

### Public Functions

```cpp
inline condition_variable_any() Constructs an object of type hpx::condition_variable_any.

~condition_variable_any() = default Destroys the object of type hpx::condition_variable_any.
```

It is only safe to invoke the destructor if all threads have been notified. It is not required that they have exited their respective wait functions: some threads may still be waiting to reacquire the associated lock, or may be waiting to be scheduled to run after reacquiring it.

The programmer must ensure that no threads attempt to wait on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or are using the overloads of the wait functions that take a predicate.

Preconditions: There is no thread blocked on `*this`. (Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would
have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. end note

IOW, ~condition_variable_any() can execute before a signaled thread returns from a wait. If this happens with condition_variable_any, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the condition_variable_any object and the member functions wait (wait_for, etc.).

condition_variable_any(condition_variable_any const&) = delete
condition_variable_any(condition_variable_any&&) = delete
condition_variable_any& operator=(condition_variable_any const&) = delete
condition_variable_any& operator=(condition_variable_any&&) = delete

inline void notify_one(error_code& ec = throws) const

If any threads are waiting on *this, calling notify_one unblocks one of the waiting threads.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock. However, some implementations (in particular many implementations of pthreads) recognize this situation and avoid this “hurry up and wait” scenario by transferring the waiting thread from the condition variable’s queue directly to the queue of the mutex within the notify call, without waking it up.

Notifying while under the lock may nevertheless be necessary when precise scheduling of events is required, e.g. if the waiting thread would exit the program if the condition is satisfied, causing destruction of the notifying thread’s condition variable. A spurious wakeup after mutex unlock but before notify would result in notify called on a destroyed object.

Note: The effects of notify_one()/notify_all() and each of the three atomic parts of wait()/wait_for()/wait_until() (unlock+wait wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.

Returns notify_one returns void.

inline void notify_all(error_code& ec = throws) const

Unblocks all threads currently waiting for *this.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock.

Note: The effects of notify_one()/notify_all() and each of the three atomic parts of wait()/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that
can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

**Parameters**
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` & `#8212; A special ‘throw on error’ error_code.

**Returns**
- `notify_all()` returns `void`.

```cpp
template<typename Lock>
inline void wait(Lock &lock, error_code &ec = throws)
```

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomicity ensures that lock is unlocked, blocks the current executing thread, and adds it to the list of threads waiting on `*this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

**Note:** If these functions fail to meet the postconditions (lock is locked by the calling thread), `std::terminate` is called. For example, this could happen if re-locking the mutex throws an exception.

**Template Parameters**
- **Lock** – Type of lock.

**Parameters**
- **lock** – An object of type Lock that meets the BasicLockable requirements, which must be locked by the current thread
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` & `#8212; A special ‘throw on error’ error_code.

**Returns**
- `wait()` returns `void`.

```cpp
template<typename Lock, typename Predicate>
inline void wait(Lock &lock, Predicate pred, error_code & = throws)
```

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

```cpp
while (!pred()) {
    wait(lock);
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after `wait(lock)` exits, which means that lock can be used to guard access to `pred()`.

The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual
condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

**Note:** If these functions fail to meet the postconditions (lock is locked by the calling thread), `std::terminate` is called. For example, this could happen if re-locking the mutex throws an exception.

### Template Parameters
- **Lock** – Type of lock.
- **Predicate** – Type of `pred`.

### Parameters
- **lock** – an object of type `Lock` that meets the `BasicLockable` requirements, which must be locked by the current thread
- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred()`.

### Returns
`wait` returns `void`.

### Template

```cpp
template<typename Lock>
inline cv_status wait_until(Lock &lock, hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on `this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed, or when the absolute time point `abs_time` is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and `wait_until` exits.

**Note:** The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

### Template Parameters
- **Lock** – Type of lock.

### Parameters
- **lock** – an object of type `Lock` that meets the requirements of `BasicLockable`, which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **ec** – used to hold error code value originated during the operation. Defaults to `throws` &`#8212; A special ‘throw on error’ `error_code`.

### Returns
`cv_status hpx::cv_status::timeout` if the absolute timeout specified by `abs_time` was reached, `hpx::cv_status::no_timeout` otherwise.

```cpp
template<typename Lock, typename Predicate>
inline bool wait_until(Lock &lock, hpx::chrono::steady_time_point const &abs_time, Predicate pred, error_code &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Equivalent to
while (!pred()) {
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout) {
        return pred();
    }
} return true;

This overload may be used to ignore spurious wakeups.

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters
- **Lock** – Type of lock.
- **Predicate** – Type of `pred`.

Parameters
- **lock** – an object of type `Lock` that meets the requirements of `BasicLockable`\(^{533}\), which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **pred** – predicate which returns `false` if the waiting should be continued (bool\((\text{pred}()) == \text{false}\)). The signature of the predicate function should be equivalent to the following: bool \(\text{pred}()\);
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` \&\&\#8212; A special ‘throw on error’ `error_code`.

Returns `bool` `false` if the predicate `pred` still evaluates to `false` after the `abs_time` timeout expired, otherwise `true`. If the timeout had already expired, evaluates and returns the result of `pred`.

```cpp
template<typename Lock>
inline cv_status wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, error_code &ec = throws)
```

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on `*this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed, or when the relative timeout `rel_time` expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, `lock` is reacquired and `wait_for()` exits.

The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Note: Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

Template Parameters **Lock** – Type of lock.

Parameters
• **lock** – an object of type `Lock` that meets the `BasicLockable` requirements, which must be locked by the current thread.

• **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.

• **ec** – Used to hold error code value originated during the operation. Defaults to `throws`.

R**eturns** `cv_status` `hpx::cv_status::timeout` if the relative timeout specified by `rel_time` expired, `hpx::cv_status::no_timeout` otherwise.

```cpp
template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, Predicate pred, error_code &ec = throws)
```

Equivalent to.

```cpp
return wait_until(lock,
    hpx::chrono::steady_clock::now() + rel_time,
    std::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied `(bool(pred())) == true`.

**Note:** The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

**Template Parameters**
- **Lock** – Type of `lock`.
- **Predicate** – Type of `pred`.

**Parameters**
- **lock** – an object of type `Lock` that meets the `BasicLockable` requirements, which must be locked by the current thread.
- **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- **pred** – predicate which returns `false` if the waiting should be continued `(bool(pred())) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws`.

R**eturns** `bool false` if the predicate `pred` still evaluates to `false` after the `rel_time` timeout expired, otherwise `true`.

```cpp
template<typename Lock, typename Predicate>
inline bool wait(Lock &lock, stop_token stoken, Predicate pred, error_code &ec = throws)
```

`wait` causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied `(bool(pred()))==true`).

An interruptible wait: registers the `condition_variable_any` for the duration of `wait()`, to be notified if a stop request is made on the given stoken’s associated stop-state; it is then equivalent to
while (!stoken.stop_requested()) {
    if (pred()) return true;
    wait(lock);
} return pred();

Note that the returned value indicates whether pred evaluated to \textit{true}, regardless of whether there was a stop requested or not.

\textbf{Note:} The effects of \textit{notify_one()/notify_all()} and each of the three atomic parts of \textit{wait()/wait_for()/wait_until()} (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for \textit{notify_one()} to, for example, be delayed and unblock a thread that started waiting just after the call to \textit{notify_one()} was made.

\textbf{Template Parameters}

- \textbf{Lock} – Type of lock.
- \textbf{Predicate} – Type of pred.

\textbf{Parameters}

- \textbf{lock} – an object of type Lock that meets the BasicLockable\textsuperscript{536} requirements, which must be locked by the current thread
- \textbf{stoken} – a hpx::stop_token to register interruption for
- \textbf{pred} – predicate which returns false if the waiting should be continued (bool(pred()) == false). The signature of the predicate function should be equivalent to the following: bool pred().
- \textbf{ec} – Used to hold error code value originated during the operation. Defaults to throws &\textsuperscript{8212}; A special ‘throw on error’ \textit{error_code}.

\textbf{Returns} bool result of \textit{pred()}.

template<typename \textbf{Lock}, typename \textbf{Predicate}>
inline bool \textbf{wait\_until}(\textbf{Lock} &lock, \textbf{stop\_token} stoken, hpx::chrono::steady_time_point const &\textbf{abs\_time}, \textbf{Predicate} \textbf{pred}, \textbf{error\_code} &\textbf{ec} = \textbf{throws})

\textit{wait\_until} causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred()) == true).

An interruptible wait: registers the \textit{condition\_variable\_any} for the duration of \textit{wait\_until()}, to be notified if a stop request is made on the given stoken’s associated stop-state; it is then equivalent to

\textbf{Note:} The effects of \textit{notify_one()/notify_all()} and each of the three atomic parts of \textit{wait()/wait_for()/wait_until()} (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for \textit{notify_one()} to, for example, be delayed and unblock a
thread that started waiting just after the call to `notify_one()` was made.

Template Parameters
- **Lock** – Type of `lock`.  
- **Predicate** – Type of `pred`.

Parameters
- **lock** – an object of type `Lock` that meets the requirements of `BasicLockable`, which must be locked by the current thread.  
- **stoken** – a `hpx::stop_token` to register interruption for.  
- **abs_time** – represents the time when waiting should be stopped.  
- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`  
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws`.

Returns` bool pred()`, regardless of whether the timeout was met or stop was requested.

```
template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, stop_token stoken, hpx::chrono::steady_duration const &rel_time, 
    Predicate pred, error_code &ec = throws)

Equivalent to.
```

```
return wait_until(lock, std::move(stoken),
    hpx::chrono::steady_clock::now() + rel_time,
    std::move(pred));
```

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters
- **Lock** – Type of `lock`.  
- **Predicate** – Type of `pred`.

Parameters
- **lock** – an object of type `Lock` that meets the `BasicLockable` requirements, which must be locked by the current thread.  
- **stoken** – a `hpx::stop_token` to register interruption for.  
- **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.  
- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`  
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws`.

Returns` bool pred()`, regardless of whether the timeout was met or stop was requested.

hpx/synchronization/counting_semaphore.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

template<std::ptrdiff_t LeastMaxValue = PTRDIFF_MAX>
class counting_semaphore

#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming system.
environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike hpx::mutex a counting_semaphore is not tied to threads of execution; acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on counting_semaphore can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template counting_semaphore maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of hpx::counting_semaphore are not DefaultConstructible, CopyConstructible, Move-Constructible, CopyAssignable, or MoveAssignable.

**Note:** counting_semaphore’s try_acquire() can spuriously fail.

**Template Parameters LeastMaxValue**—counting_semaphore allows more than one concurrent access to the same resource, for at least LeastMaxValue concurrent accessors. As its name indicates, the LeastMaxValue is the minimum max value, not the actual max value. Thus max() can yield a number larger than LeastMaxValue.

**Public Functions**

- `counting_semaphore(const counting_semaphore&)` = delete
- `counting_semaphore& operator=(const counting_semaphore&)` = delete
- `counting_semaphore& operator=(counting_semaphore&&)` = delete
- `counting_semaphore& operator=(counting_semaphore&&)` = delete
- `explicit counting_semaphore(std::ptrdiff_t value)`
  Constructs an object of type hpx::counting_semaphore with the internal counter initialized to value.

**Parameters value**—The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

- `~counting_semaphore()` = default
void **release**(std::ptrdiff_t update = 1)

Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

**Note:** Synchronization: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

**Throws** std::system_error –

**Parameters** update – the amount to increment the internal counter by

**Pre** Both update >= 0 and update <= max() - counter are true, where counter is the value of the internal counter.

bool **try_acquire**()

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

**Returns** true if it decremented the internal counter, otherwise false

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates try_acquire. If the result is true, returns.
- Blocks on *this until counter is greater than zero.

**Throws** std::system_error –

**Returns** void.

bool **try_acquire_until**(hpx::chrono::steady_time_point const &abs_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the abs_time time point has been passed.

**Parameters** abs_time – the earliest time the function must wait until in order to fail

**Throws** std::system_error –

**Returns** true if it decremented the internal counter, otherwise false.

bool **try_acquire_for**(hpx::chrono::steady_duration const &rel_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the rel_time duration has been exceeded.

**Throws** std::system_error –

**Parameters** rel_time – the minimum duration the function must wait for to fail

**Returns** true if it decremented the internal counter, otherwise false

**Public Static Functions**

static constexpr std::ptrdiff_t **max**()

Returns The maximum value of counter. This value is greater than or equal to LeastMaxValue.

**Returns** The internal counter’s maximum possible value, as a std::ptrdiff_t.

template<typename Mutex = hpx::spinlock, int N = 0>

class **counting_semaphore_var**

#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes
the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike `hpx::mutex` a `counting_semaphore_var` is not tied to threads of execution &amp;#8212; acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on `counting_semaphore_var` can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template `counting_semaphore_var` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of `hpx::counting_semaphore_var` are not `DefaultConstructible`, `CopyConstructible`, `MoveConstructible`, `CopyAssignable`, or `MoveAssignable`.

| Note: | `counting_semaphore_var`’s `try_acquire()` can spuriously fail. |

</tr>
</tbody>
</table>
bool **try_wait**(std::ptrdiff_t count = 1)

Try to wait for the semaphore to be signaled.

**Parameters** count – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

**Returns** try_wait returns true if the calling thread was able to acquire the requested amount of credits. try_wait returns false if not sufficient credits are available at this point in time.

void **signal**(std::ptrdiff_t count = 1)

Signal the semaphore.

**Parameters** count – The value by which the internal lock count will be incremented.

std::ptrdiff_t **signal_all**()

Unblock all acquirers.

**Returns** std::ptrdiff_t internal lock count after the operation.

void **release**(std::ptrdiff_t update = 1)

Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

---

**Note:** Synchronization: Strongly happens before invocations of **try_acquire** that observe the result of the effects.

Throws std::system_error –

**Parameters** update – the amount to increment the internal counter by

Pre Both update >= 0 and update <= max() – counter are true, where counter is the value of the internal counter.

---

bool **try_acquire**() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

**Returns** true if it decremented the internal counter, otherwise false

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates try_acquire. If the result is true, returns.
  Blocks on *this until counter is greater than zero.

  **Throws** std::system_error –

  **Returns** void.

bool **try_acquire_until**(hpx::chrono::steady_time_point const &abs_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the abs_time time point has been passed.

**Parameters** abs_time – the earliest time the function must wait until in order to fail

**Throws** std::system_error –

**Returns** true if it decremented the internal counter, otherwise false.

bool **try_acquire_for**(hpx::chrono::steady_duration const &rel_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the rel_time duration has been exceeded.

**Throws** std::system_error –

**Parameters** rel_time – the minimum duration the function must wait for to fail
**Returns** *true* if it decremented the internal counter, otherwise false

**Public Static Functions**

static constexpr std::ptrdiff_t max() noexcept

Returns The maximum value of counter. This value is greater than or equal to LeastMaxValue.

**Returns** The internal counter’s maximum possible value, as a std::ptrdiff_t.

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

    class latch
        #include <latch.hpp> Latches are a thread coordination mechanism that allow one or more threads to
block until an operation is completed. An individual latch is a single-use object; once the operation has
been completed, the latch cannot be reused.

        Subclassed by hpx:lcos::local::latch
**Public Functions**

```cpp
latch(latch const&) = delete
latch(latch&&) = delete
latch &operator=(latch const&) = delete
latch &operator=(latch&&) = delete
```

```cpp
inline explicit latch(std::ptrdiff_t count)
  Initialize the latch
  Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.
```

```cpp
~latch() = default
  Requires: No threads are blocked at the synchronization point.
```

---

**Note:** May be called even if some threads have not yet returned from `wait()` or `count_down_and_wait()`, provided that counter_ is 0.

---

**Note:** The destructor might not return until all threads have exited `wait()` or `count_down_and_wait()`.

---

**Note:** It is the caller’s responsibility to ensure that no other thread enters `wait()` after one thread has called the destructor. This may require additional coordination.

---

```cpp
inline void count_down(std::ptrdiff_t update)
  Decrements counter_ by n. Does not block.
  Requires: counter_ >= n and n >= 0.
  Synchronization: Synchronizes with all calls that block on this latch and with all try_wait calls on this latch that return true.
  **Throws** Nothing.
```

```cpp
inline bool try_wait() const noexcept
  Returns: With very low probability false. Otherwise counter == 0.
```

```cpp
inline void wait() const
  If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.
  **Throws** Nothing.
```

```cpp
inline void arrive_and_wait(std::ptrdiff_t update = 1)
  Effects: Equivalent to: count_down(update); wait;
```
Public Static Functions

static inline constexpr std::ptrdiff_t() max () noexcept

Returns: The maximum value of counter that the implementation supports.

bool notified_

namespace lcos

namespace local

class latch : public hpx::latch

#include <latch.hpp> A latch maintains an internal counter_ that is initialized when the latch is created. Threads may block at a synchronization point waiting for counter_ to be decremented to 0. When counter_ reaches 0, all such blocked threads are released.

Calls to countdown_and_wait(), count_down(), wait(), is_ready(), count_up(), and reset() behave as atomic operations.

Note: A hpx::latch is not an LCO in the sense that it has no global id and it can’t be triggered using the action (parcel) mechanism. Use hpx::distributed::latch instead if this is required. It is just a low level synchronization primitive allowing to synchronize a given number of threads.

Public Functions

HPX_NON_COPYABLE(latch)

inline explicit latch(std::ptrdiff_t count)

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.
\texttt{~\_\_latch()} = default

Requires: No threads are blocked at the synchronization point.

\textbf{Note:} May be called even if some threads have not yet returned from \texttt{wait()} or \texttt{count\_down\_and\_wait()}, provided that counter\_ is 0.

\textbf{Note:} The destructor might not return until all threads have exited \texttt{wait()} or \texttt{count\_down\_and\_wait()}.

\textbf{Note:} It is the caller's responsibility to ensure that no other thread enters \texttt{wait()} after one thread has called the destructor. This may require additional coordination.

\begin{verbatim}
inline void \_\_count\_down\_and\_wait()
    Decrements counter\_ by 1. Blocks at the synchronization point until counter\_ reaches 0.
    Requires: counter\_ > 0.
    Synchronization: Synchronizes with all calls that block on this latch and with all \texttt{is\_ready} calls on this latch that return true.
    \textbf{Throws} Nothing. –

inline bool \_\_is\_ready() const noexcept
    Returns: counter\_ == 0. Does not block.
    \textbf{Throws} Nothing. –

inline void \_\_abort\_all() const

inline void \_\_count\_up(\texttt{std::ptrdiff\_t n})
    Increments counter\_ by n. Does not block.
    Requires: n >= 0.
    \textbf{Throws} Nothing. –

inline void \_\_reset(\texttt{std::ptrdiff\_t n})
    Reset counter\_ to n. Does not block.
    Requires: n >= 0.
    \textbf{Throws} Nothing. –

inline bool \_\_reset\_if\_needed\_and\_count\_up(\texttt{std::ptrdiff\_t n, std::ptrdiff\_t count})
    Effects: Equivalent to: if \texttt{(is\_ready())} reset(count); count\_up(n); Returns: true if the latch was reset
\end{verbatim}
HPX Documentation, master

hpx/synchronization/mutex.hpp
See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx
class mutex
#include <mutex.hpp> mutex class is a synchronization primitive that can be used to protect shared data
from being simultaneously accessed by multiple threads. mutex offers exclusive, non-recursive ownership
semantics:
• A calling thread owns a mutex from the time that it successfully calls either lock or try_lock until it
calls unlock.
• When a thread owns a mutex, all other threads will block (for calls to lock) or receive a false return
value (for try_lock) if they attempt to claim ownership of the mutex.
• A calling thread must not own the mutex prior to calling lock or try_lock.
The behavior of a program is undefined if a mutex is destroyed while still owned by any threads, or a thread
terminates while owning a mutex. The mutex class satisfies all requirements of Mutex549 and StandardLayoutType550 .
hpx::mutex is neither copyable nor movable.
Subclassed by hpx::timed_mutex
Public Functions
HPX_NON_COPYABLE(mutex)
hpx::mutex is neither copyable nor movable
inline HPX_HOST_DEVICE_CONSTEXPR mutex(char const*const = "") noexcept
Constructs the mutex. The mutex is in unlocked state after the constructor completes.
Note: Because the default constructor is constexpr, static mutexes are initialized as part of static
non-local initialization, before any dynamic non-local initialization begins. This makes it safe to lock
a mutex in a constructor of any static object.
Parameters description – description of the mutex.
~mutex()
Destroys the mutex. The behavior is undefined if the mutex is owned by any thread or if any thread
terminates while holding any ownership of the mutex.
void lock(char const *description, error_code &ec = throws)
Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution
until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior
is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and
throws a std::system_error with error condition resource_deadlock_would_occur instead of deadlocking. Prior unlock() operations on the same mutex synchronize- with (as defined in std::memory_order)
this operation.

1194

Chapter 2. What’s so special about HPX ?


Note: lock() is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking.

Parameters

- **description** – Description of the mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.

Returns void lock returns void.

```cpp
inline void lock(error_code &ec = throws)
```

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlocking. Prior `unlock()` operations on the same mutex synchronize with (as defined in `std::memory_order`) this operation.

Note: lock() is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking. This overload essentially calls void lock(char const* description, error_code& ec = throws); with description as mutex::lock.

Parameters

- **ec** – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.

Returns bool try_lock returns true on successful lock acquisition, otherwise returns false.

```cpp
inline bool try_lock(error_code &ec = throws)
```

Tries to lock the mutex. Returns immediately. On successful lock acquisition returns true, otherwise returns false. This function is allowed to fail spuriously and return false even if the mutex is not currently locked by any other thread. If try_lock is called by a thread that already owns the mutex, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. Note that prior lock() does not synchronize with this operation if it returns false.

Parameters

- **description** – Description of the mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.

Returns bool try_lock returns true on successful lock acquisition, otherwise returns false.

```cpp
inline bool try_lock(error_code &ec = throws)
```

Tries to lock the mutex. Returns immediately. On successful lock acquisition returns true, otherwise returns false. This function is allowed to fail spuriously and return false even if the mutex is not currently locked by any other thread. If try_lock is called by a thread that already owns the mutex, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. Note that prior lock() does not synchronize with this operation if it returns false.

Note: This overload essentially calls

```cpp
void try_lock(char const* description,
              error_code& ec = throws);
```
with description as mutex::try_lock.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &8212; A special ‘throw on error’ error_code.

Returns bool try_lock returns true on successful lock acquisition, otherwise returns false.

void unlock(error_code &ec = throws)

Unlocks the mutex. The mutex must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation synchronizes-with (as defined in std::memory_order) any subsequent lock operation that obtains ownership of the same mutex.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &8212; A special ‘throw on error’ error_code.

Returns unlock returns void.

class timed_mutex : private hpx::mutex

#include <mutex.hpp> The timed_mutex class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to mutex, timed_mutex offers exclusive, non-recursive ownership semantics. In addition, timed_mutex provides the ability to attempt to claim ownership of a timed_mutex with a timeout via the member functions try_lock_for() and try_lock_until(). The timed_mutex class satisfies all requirements of TimedMutex and StandardLayoutType.

hpx::timed_mutex is neither copyable nor movable.

Public Functions

HPX_NON_COPYABLE(timed_mutex)

hpx::timed_mutex is neither copyable nor movable

timed_mutex(char const *const description = "")

Constructs a timed_mutex. The mutex is in unlocked state after the call.

Parameters description – Description of the timed_mutex.

~timed_mutex()

Destroys the timed_mutex. The behavior is undefined if the mutex is owned by any thread or if any thread terminates while holding any ownership of the mutex.

bool try_lock_until(hpx::chrono::steady_time_point const &abs_time, char const *description, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified abs_time has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns true, otherwise returns false. If abs_time has already passed, this function behaves like try_lock(). As with try_lock(), this function is allowed to fail spuriously and return false even if the mutex was not locked by any other thread at some point before abs_time. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. If try_lock_until is called by a thread that already owns the mutex, the behavior is undefined.

Parameters

• abs_time – time point to block until

• description – Description of the timed_mutex

• ec – Used to hold error code value originated during the operation. Defaults to throws &8212; A special ‘throw on error’ error_code.

Returns bool try_lock_until returns true if the lock was acquired successfully, otherwise false.
inline bool try_lock_until(hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified abs_time has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns true, otherwise returns false. If abs_time has already passed, this function behaves like try_lock(). As with try_lock(), this function is allowed to fail spuriously and return false even if the mutex was not locked by any other thread at some point before abs_time. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. If try_lock_until is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```cpp
bool try_lock_until(
    hpx::chrono::steady_time_point const& abs_time,
    char const* description, error_code& ec = throws);
```

with description as mutex::try_lock_until.

### Parameters

- **abs_time** – time point to block until
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special 'throw on error' error_code.

### Returns

bool try_lock_until returns true if the lock was acquired successfully, otherwise false.

inline bool try_lock_for(hpx::chrono::steady_duration const &rel_time, char const *description, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified rel_time has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns true, otherwise returns false. If rel_time is less or equal rel_time.zero(), the function behaves like try_lock(). This function may block for longer than rel_time due to scheduling or resource contention delays. As with try_lock(), this function is allowed to fail spuriously and return false even if the mutex was not locked by any other thread at some point during rel_time. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. If try_lock_for is called by a thread that already owns the mutex, the behavior is undefined.

### Parameters

- **rel_time** – minimum duration to block for
- **description** – Description of the timed_mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special 'throw on error' error_code.

### Returns

bool try_lock_for returns true if the lock was acquired successfully, otherwise false.

inline bool try_lock_for(hpx::chrono::steady_duration const &rel_time, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified rel_time has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns true, otherwise returns false. If rel_time is less or equal rel_time.zero(), the function behaves like try_lock(). This function may block for longer than rel_time due to scheduling or resource contention delays. As with try_lock(), this function is allowed to fail spuriously and return false even if the mutex was not locked by any other thread at some point during rel_time. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. If try_lock_for is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

### 2.8. API reference
**bool try_lock_for**

```cpp
bool try_lock_for(
    hpx::chrono::steady_duration const& rel_time,
    char const* description, error_code& ec = throws)
```

with `description` as `mutex::try_lock_for`.

**Parameters**
- `rel_time` – minimum duration to block for
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &#8212; A special ‘throw on error’ `error_code`.

**Returns** `bool try_lock_for` returns `true` if the lock was acquired successfully, otherwise `false`.

**void lock**

```cpp
void lock(char const* description, error_code& ec = throws)
```

Locks the mutex. If another thread has already locked the mutex, a call to `lock` will block execution until the lock is acquired. If `lock` is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlock- ing. Prior `unlock()` operations on the same mutex synchronize- with (as defined in `std::memory_order`) this operation.

**Note:** `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking.

**Parameters**
- `description` – Description of the `mutex`
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &#8212; A special ‘throw on error’ `error_code`.

**Returns** `void lock` returns `void`.

**inline void lock**

```cpp
inline void lock(error_code &ec = throws)
```

Locks the mutex. If another thread has already locked the mutex, a call to `lock` will block execution until the lock is acquired. If `lock` is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlock- ing. Prior `unlock()` operations on the same mutex synchronize - with (as defined in `std::memory_order`) this operation.

**Note:** `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking. This overload essentially calls `void lock(char const* description, error_code& ec = throws);` with `description` as `mutex::lock`.

**Parameters**
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &#8212; A special ‘throw on error’ `error_code`.

**Returns** `void lock` returns `void`.

**bool try_lock**

```cpp
bool try_lock(char const* description, error_code &ec = throws)
```

Tries to lock the `mutex`. Returns immediately. On successful lock acquisition returns `true`, otherwise returns `false`. This function is allowed to fail spuriously and return `false` even if the `mutex` is not currently locked by any other thread. If `try_lock` is called by a thread that already owns the `mutex`, the behavior is undefined. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns `true`. Note that prior `lock()` does not synchronize with this operation if it returns `false`.

**Parameters**
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &#8212; A special ‘throw on error’ `error_code`.

**Returns** `bool try_lock` returns `false`.
Parameters

• description – Description of the mutex
• ec – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.

Returns bool try_lock returns true on successful lock acquisition, otherwise returns false.

inline bool try_lock(error_code &ec = throws)

Tries to lock the mutex. Returns immediately. On successful lock acquisition returns true, otherwise returns false. This function is allowed to fail spuriously and return false even if the mutex is not currently locked by any other thread. If try_lock is called by a thread that already owns the mutex, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. Note that prior lock() does not synchronize with this operation if it returns false.

Note: This overload essentially calls

```cpp
void try_lock(char const* description, 
              error_code & ec = throws);
```

with description as mutex::try_lock.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.

Returns bool try_lock returns true on successful lock acquisition, otherwise returns false.

void unlock(error_code & ec = throws)

Unlocks the mutex. The mutex must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation synchronizes-with (as defined in std::memory_order) any subsequent lock operation that obtains ownership of the same mutex.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.

Returns unlock returns void.

HPX_ONCE_INIT

namespace hpx

Functions

template<typename F, typename ...Args>
void call_once(once_flag &flag, F &&f, Args&&... args)

Executes the Callable object \( f \) exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time call_once is called, flag indicates that \( f \) was already called, call_once returns right away (such a call to call_once is known as passive).

- Otherwise, call_once invokes std::forward<Callable>(f) with the arguments std::forward<Args>(args)... (as if by hpx::invoke). Unlike the hpx::thread constructor or hpx::async, the arguments are not moved or copied because they don’t need to be transferred to another thread of execution. (such a call to call_once is known as active).

  - If that invocation throws an exception, it is propagated to the caller of call_once, and the flag is not flipped so that another call will be attempted (such a call to call_once is known as exceptional).

  - If that invocation returns normally (such a call to call_once is known as returning), the flag is flipped, and all other calls to call_once with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to call_once are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note: If concurrent calls to call_once pass different functions \( f \), it is unspecified which \( f \) will be called. The selected function runs in the same thread as the call_once invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using hpx::call_once. The POSIX equivalent of this function is pthread_once.

Parameters

- flag – an object, for which exactly one function gets executed
- \( f \) – Callable object to invoke
- args – arguments to pass to the function

Throws std::system_error – if any condition prevents calls to call_once from executing as specified or any exception thrown by \( f \)

struct once_flag

#include <once.hpp> The class hpx::once_flag is a helper structure for hpx::call_once. An object of type hpx::once_flag that is passed to multiple calls to hpx::call_once allows those calls to coordinate
with each other such that only one of the calls will actually run to completion. `hpx::once_flag` is neither copyable nor movable.

**Public Functions**

**HPX_NON_COPYABLE**(`once_flag`)

inline `once_flag()` noexcept

Constructs an `once_flag` object. The internal state is set to indicate that no function has been called yet.

**Private Members**

```
std::atomic<long> status_

lcos::local::event event_
```

**Friends**

```
template<typename F, typename ...Args>
friend void call_once(`once_flag` &flag, F &&f, Args&&... args)
```

Executes the Callable object `f` exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time `call_once` is called, flag indicates that `f` was already called, `call_once` returns right away (such a call to `call_once` is known as passive).
- Otherwise, `call_once` invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)`... (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to `call_once` is known as active).
  - If that invocation throws an exception, it is propagated to the caller of `call_once`, and the flag is not flipped so that another call will be attempted (such a call to `call_once` is known as exceptional).
  - If that invocation returns normally (such a call to `call_once` is known as returning), the flag is flipped, and all other calls to `call_once` with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to `call_once` are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

**Note:** If concurrent calls to `call_once` pass different functions `f`, it is unspecified which `f` will be called. The selected function runs in the same thread as the `call_once` invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is `pthread_once`.

**Parameters**

- `flag` – an object, for which exactly one function gets executed
- `f` – Callable object to invoke
• **args** – arguments to pass to the function.

*Throws* `std::system_error` – if any condition prevents calls to `call_once` from executing as specified or any exception thrown by `f`.

```cpp
namespace lcos

namespace local

### hpx/synchronization/shared_mutex.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx

## Typedefs

```cpp
using shared_mutex = detail::shared_mutex<>
```

The *shared_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a *shared_mutex* has two levels of access:

* **shared** - several threads can share ownership of the same mutex.
* **exclusive** - only one thread can own the mutex.
If one thread has acquired the exclusive lock (through lock, try_lock), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through lock_shared, try_lock_shared), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The shared_mutex class satisfies all requirements of SharedMutex and StandardLayoutType.

namespace lcos

namespace local

hpx/synchronization/sliding_semaphore.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

**Typedefs**

using sliding_semaphore = sliding_semaphore_var<>

template<typename Mutex = hpx::spinlock>

class sliding_semaphore_var

#include <sliding_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.
Public Functions

```cpp
sliding_semaphore_var(sliding_semaphore_var const&) = delete
```

```cpp
sliding_semaphore_var &operator=(sliding_semaphore_var const&) = delete
```

```cpp
sliding_semaphore_var(sliding_semaphore_var&&) = delete
```

```cpp
sliding_semaphore_var &operator=(sliding_semaphore_var&&) = delete
```

```cpp
inline explicit sliding_semaphore_var(std::int64_t max_difference, std::int64_t lower_limit = 0)
    noexcept
```

Construct a new sliding semaphore.

**Parameters**

- `max_difference` – [in] The max difference between the upper limit (as set by `wait()`) and the lower limit (as set by `signal()`) which is allowed without suspending any thread calling `wait()`.

```cpp
inline void set_max_difference(std::int64_t max_difference, std::int64_t lower_limit = 0)
    noexcept
```

Set/Change the difference that will cause the semaphore to trigger.

**Parameters**

- `max_difference` – [in] The max difference between the upper limit (as set by `wait()`) and the lower limit (as set by `signal()`) which is allowed without suspending any thread calling `wait()`.

```cpp
inline void wait(std::int64_t upper_limit)
```

Wait for the semaphore to be signaled.

**Parameters**

- `upper_limit` – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by `signal()` is larger than the max_difference.

```cpp
inline bool try_wait(std::int64_t upper_limit = 1)
```

Try to wait for the semaphore to be signaled.

**Parameters**

- `upper_limit` – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by `signal()` is larger than the max_difference.

**Returns**

The function returns true if the calling thread would not block if it was calling `wait()`.

```cpp
inline void signal(std::int64_t lower_limit)
```

Signal the semaphore.

**Parameters**

- `lower_limit` – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the max_difference.

```cpp
inline std::int64_t signal_all()
```

hpx/synchronization/stop_token.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx
Functions

```cpp
template<typename Callback>
class stop_callback(stop_token, Callback) -> stop_callback<Callback>
```

The `stop_callback` class template provides an RAII object type that registers a callback function for an associated `hpx::stop_token` object, such that the callback function will be invoked when the `hpx::stop_token`'s associated `hpx::stop_source` is requested to stop. Callback functions registered via `stop_callback`'s constructor are invoked either in the same thread that successfully invokes `request_stop()` for a `hpx::stop_source` of the `stop_callback`'s associated `hpx::stop_token`; or if stop has already been requested prior to the constructor's registration, then the callback is invoked in the thread constructing the `stop_callback`. More than one `stop_callback` can be created for the same `hpx::stop_token`, from the same or different threads concurrently. No guarantee is provided for the order in which they will be executed, but they will be invoked synchronously; except for `stop_callback(s)` constructed after stop has already been requested for the `hpx::stop_token`, as described previously. If an invocation of a callback exits via an exception then `hpx::terminate` is called. `hpx::stop_callback` is not `CopyConstructible`, `CopyAssignable`, `MoveConstructible`, nor `MoveAssignable`. The template param Callback type must be both `invocable` and `destructible`. Any return value is ignored.

```cpp
inline void swap(stop_token &lhs, stop_token &rhs) noexcept
inline void swap(stop_source &lhs, stop_source &rhs) noexcept
```

Variables

```cpp
constexpr nostopstate_t nostopstate = {}
```

This is a constant object instance of `hpx::nostopstate_t` for use in constructing an empty `hpx::stop_source`, as a placeholder value in the non-default constructor.

```cpp
struct nostopstate_t
#include <stop_token.hpp> Unit type intended for use as a placeholder in `hpx::stop_source` non-default constructor, that makes the constructed `hpx::stop_source` empty with no associated stop-state.
```

Public Functions

```cpp
explicit nostopstate_t() = default
```

```cpp
template<typename Callback>
class stop_callback
```

```cpp
class stop_source
#include <stop_token.hpp> The `stop_source` class provides the means to issue a stop request, such as for `hpx::jthread` cancellation. A stop request made for one `stop_source` object is visible to all `stop_sources` and `hpx::stop_tokens` of the same associated stop-state; any `hpx::stop_callback(s)` registered for associated `hpx::stop_token(s)` will be invoked, and any `hpx::condition_variable_any` objects waiting on associated `hpx::stop_token(s)` will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

**Note:** For the purposes of `hpx::jthread` cancellation the `stop_source` object should be retrieved from the `hpx::jthread` object using `get_stop_source()`; or stop should be requested directly from the `hpx::jthread`
object using request_stop(). This will then use the same associated stop-state as that passed into the hpx::jthread’s invoked function argument (i.e., the function being executed on its thread). For other uses, however, a stop_source can be constructed separately using the default constructor, which creates new stop-state.

**Public Functions**

```cpp
inline stop_source() noexcept;
inline explicit stop_source(nostopstate_t) noexcept;
inline stop_source(stop_source const &rhs) noexcept;
stop_source(stop_source &&) noexcept = default;
inline stop_source & operator=(stop_source const &rhs) noexcept;
inline stop_source & operator=(stop_source &&) noexcept = default;
inline ~stop_source() noexcept;
inline void swap(stop_source &s) noexcept;
inline stop_token get_token() const noexcept;
inline bool stop_possible() const noexcept;
inline bool stop_requested() const noexcept;
inline bool request_stop() const noexcept;
```

```

**Friends**

```cpp
inline friend bool operator==(stop_source const &lhs, stop_source const &rhs) noexcept;
inline friend bool operator!=(stop_source const &lhs, stop_source const &rhs) noexcept;
```

**class stop_token**

```
#include <stop_token.hpp> The stop_token class provides the means to check if a stop request has been made or can be made, for its associated hpx::stop_source object. It is essentially a thread-safe “view” of the associated stop-state. The stop_token can also be passed to the constructor of hpx::stop_callback, such that the callback will be invoked if the stop_token’s associated hpx::stop_source is requested to stop. And```
stop_token can be passed to the interruptible waiting functions of hpx::condition_variable_any, to interrupt the condition variable’s wait if stop is requested.

**Note:** A stop_token object is not generally constructed independently, but rather retrieved from a hpx::jthread or hpx::stop_source. This makes it share the same associated stop-state as the hpx::jthread or hpx::stop_source.

\textbf{Functions}

\begin{verbatim}
\texttt{hpx::future<\texttt{void}> resume_processing_unit(thread_pool_base \&pool, std::size_t virt_core)}
\end{verbatim}

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

\begin{minipage}{\textwidth}
\textbf{Note:} Can only be called from an HPX thread. Use resume_processing_unit\texttt{\_cb} or to resume the processing unit from outside HPX. Requires that the pool has \texttt{threads::policies::enable\_elasticity} set.
\end{minipage}

\begin{itemize}
\item \textbf{Parameters} \texttt{virt\_core} – [in] The processing unit on the the pool to be resumed. The processing units are indexed starting from 0.
\item \textbf{Returns} A \texttt{future<\texttt{void}>} which is ready when the given processing unit has been resumed.
\end{itemize}

\begin{verbatim}
void resume_processing_unit\texttt{\_cb}(thread_pool_base \&pool, hpx::function<\texttt{void}(\texttt{void})> \texttt{callback, std::size_t virt\_core, error\_code \&ec = throws})
\end{verbatim}

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

\begin{minipage}{\textwidth}
\textbf{Note:} Requires that the pool has \texttt{threads::policies::enable\_elasticity} set.
\end{minipage}

\begin{itemize}
\item \textbf{Parameters}
\end{itemize}
• **callback** – [in] Callback which is called when the processing unit has been suspended.
• **virt_core** – [in] The processing unit to resume.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
hpx::future<void> suspend_processing_unit(thread_pool_base &pool, std::size_t virt_core)
```

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

**Note:** Can only be called from an HPX thread. Use `suspend_processing_unit_cb` or to suspend the processing unit from outside HPX. Requires that the pool has threads::policies::enable_elasticity set.

Parameters

- **virt_core** – [in] The processing unit on the the pool to be suspended. The processing units are indexed starting from 0.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A `future<void>` which is ready when the given processing unit has been suspended.

```cpp
void suspend_processing_unit_cb(hpx::function<void()> callback, thread_pool_base &pool, std::size_t virt_core, error_code &ec = throws)
```

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

**Note:** Requires that the pool has threads::policies::enable_elasticity set.

Parameters

- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to suspend.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
hpx::future<void> resume_pool(thread_pool_base &pool)
```

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

**Note:** Can only be called from an HPX thread. Use `resume_cb` or `resume_direct` to suspend the pool from outside HPX.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A `future<void>` which is ready when the thread pool has been resumed.

```cpp
void resume_pool_cb(thread_pool_base &pool, hpx::function<void()> callback, error_code &ec = throws)
```

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

Parameters

- **callback** – [in] called when the thread pool has been resumed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
hpx::future<void> suspend_pool(thread_pool_base &pool)
```
Suspend the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

**Note:** Can only be called from an HPX thread. Use suspend_cb or suspend_direct to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

**Throws** hpx::exception – if called from outside the HPX runtime.

**Returns** A future<void> which is ready when the thread pool has been suspended.

```cpp
void suspend_pool_cb(thread_pool_base &pool, hpx::function<void(void)> callback, error_code &ec = throws)
```

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

**Note:** A thread pool cannot be suspended from an HPX thread running on the pool itself.

**Parameters**
- `callback` – [in] called when the thread pool has been suspended.
- `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** hpx::exception – if called from an HPX thread which is running on the pool itself.

**thread_support**

See Public API for a list of names and headers that are part of the public HPX API.

**hpx/thread_support/unlock_guard.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

**namespace hpx**

```cpp
template<typename Mutex>
class unlock_guard
```

#include <unlock_guard.hpp> The class unlock_guard is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

**unlock_guard** performs the opposite functionality of lock_guard. When a lock_guard object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the lock_guard object was created, the lock_guard is destructed and the mutex is released. Accordingly, when an unlock_guard object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the unlock_guard object was created, the unlock_guard is destructed and the mutex is owned again. In this way, the mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

namespace hpx

Functions

inline void swap(jthread &lhs, jthread &rhs) noexcept

class jthread

#include <jthread.hpp> The class jthread represents a single thread of execution. It has the same general behavior as hpx::thread, except that jthread automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, hpx::terminate is called. The top-level function may communicate its return value or an exception to the caller via hpx::promise or by modifying shared variables (which may require synchronization, see hpx::mutex and hpx::atomic) Unlike hpx::thread, the jthread logically holds an internal private
member of type `hpx::stop_source`, which maintains a shared stop-state. The `jthread` constructor accepts a function that takes a `hpx::stop_token` as its first argument, which will be passed in by the jthread from its internal `stop_source`. This allows the function to check if stop has been requested during its execution, and return if it has. `hpx::jthread` objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any `jthread` objects (after detach). No two `hpx::jthread` objects may represent the same thread of execution; `hpx::jthread` is not `CopyConstructible` or `CopyAssignable`, although it is `MoveConstructible` and `MoveAssignable`.

### Public Types

Using

```cpp
using id = thread::id
```

Using

```cpp
using native_handle_type = thread::native_handle_type
```

### Public Functions

```cpp
inline jthread() noexcept
```

```cpp
template<typename F, typename ... Ts, typename Enable = std::enable_if_t<std::is_same_v<std::decay_t<F>, jthread>>> inline explicit jthread(F &&f, Ts &&... ts)

```cpp
jthread(jthread const&) = delete
```

```cpp
jthread(jthread &x) noexcept = default
```

```cpp
jthread &operator=(jthread const&) = delete
```

```cpp
jthread &operator=(jthread&&) noexcept = default
```

Moves the jthread object

```cpp
inline void swap(jthread &t) noexcept
```

Swaps two jthread objects

```cpp
inline bool joinable() const noexcept
```

Checks whether the thread is joinable, i.e. potentially running in parallel context

```cpp
inline void join()
```

waits for the thread to finish its execution

```cpp
inline void detach()
```

permits the thread to execute independently from the thread handle

```cpp
inline id get_id() const noexcept
```

Returns the id of the thread

```cpp
inline native_handle_type native_handle()
```

Returns the underlying implementation-defined thread handle

```cpp
inline stop_source get_stop_source() noexcept
```

Returns a stop_source object associated with the shared stop state of the thread
inline stop_token get_stop_token() const noexcept
    returns a stop_token associated with the shared stop state of the thread

inline bool request_stop() noexcept
    requests execution stop via the shared stop state of the thread

namespace this_thread

Functions

```cpp
thread::id get_id() noexcept

Returns the id of the current thread.

void yield() noexcept

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

```

Note: The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler (SCHED_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

void yield_to(thread::id) noexcept

```cpp
threads::thread_priority get_priority() noexcept

std::ptrdiff_t get_stack_size() noexcept

void interruption_point()

bool interruption_enabled()

bool interruption_requested()
```
void interrupt()

void sleep_until(hpx::chrono::steady_time_point const &abs_time)

Blocks the execution of the current thread until specified abs_time has been reached.

It is recommended to use the clock tied to abs_time, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than abs_time-Clock::now() at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after abs_time has been reached due to process scheduling or resource contention delays.

Parameters abs_time – absolute time to block until

inline void sleep_for(hpx::chrono::steady_duration const &rel_time)

Blocks the execution of the current thread for at least the specified rel_time. This function may block for longer than rel_time due to scheduling or resource contention delays.

It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.

Parameters rel_time – time duration to sleep

std::size_t get_thread_data()

std::size_t set_thread_data(std::size_t)

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

template<typename F>
constexpr F &&annotated_function(F &&f, char const* = nullptr) noexcept

Returns a function annotated with the given annotation.

Annotating includes setting the thread description per thread id.

Parameters function –

template<typename F>
constexpr F &&annotated_function(F &&f, std::string const&) noexcept

namespace util
Functions

template<typename F>
constexpr decltype(auto) annotated_function(F &&f, char const *name = nullptr) noexcept

template<typename F>
constexpr decltype(auto) annotated_function(F &&f, std::string const &name) noexcept

hpx/threading_base/print.hpp

namespace hpx

namespace threads

Functions

template<typename F>
thread_function_type make_thread_function(F &&f)

template<typename F>
thread_function_type make_thread_function_nullary(F &&f)

void register_thread(threads::thread_init_data &data, threads::thread_pool_base *pool,
threads::thread_id_ref_type &id, error_code &ec = hpx::throws)

Create a new thread using the given data.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters

- data – [in] The data to use for creating the thread.
- pool – [in] The thread pool to use for launching the work.
- id – [out] The id of the newly created thread (if applicable)
- ec – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws
  the function will throw on error instead.

Throws invalid_status – if the runtime system has not been started yet.

Returns This function will return the internal id of the newly created HPX-thread.

threads::thread_id_ref_type register_thread(threads::thread_init_data &data,
threads::thread_pool_base *pool, error_code &ec = hpx::throws)
void register_thread(threads::thread_init_data &data, threads::thread_id_ref_type &id, error_code &ec = throws)

Create a new thread using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **data** – [in] The data to use for creating the thread.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** invalid_status – if the runtime system has not been started yet.

**Returns** This function will return the internal id of the newly created HPX-thread.

thread_id_ref_type register_work(threads::thread_init_data &data, error_code &ec = throws)

Create a new work item using the given data.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** invalid_status – if the runtime system has not been started yet.

thread_id_ref_type register_work(threads::thread_init_data &data, threads::thread_pool_base *pool, error_code &ec = hpx::throws)

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** invalid_status – if the runtime system has not been started yet.
namespace hpx

struct scoped_annotation
    #include <scoped_annotation.hpp> scoped_annotation associates a name with a section of code (scope). It can be used to visualize code execution in profiling tools like Intel VTune, Apex Profiler, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

namespace hpx

namespace threads

**Functions**

constexpr thread_data *get_thread_id_data(thread_id_ref_type const &tid) noexcept

constexpr thread_data *get_thread_id_data(thread_id_type const &tid) noexcept

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx/threading_base/thread_data.hpp

namespace hpx/threading_base/scoped_annotation.hpp
class **thread_data**: public thread_data_reference_counting

#include <thread_data.hpp> A thread is the representation of a HPX thread. It’s a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the thread-manager.

A thread encapsulates:
- A thread status word (see the functions `thread::get_state` and `thread::set_state`)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, threads are not created or executed directly. All functionality related to the management of threads is implemented by the thread-manager.

### Public Types

using **spinlock_pool** = util::spinlock_pool<thread_data>

### Public Functions

```cpp
thread_data(thread_data const&) = delete
thread_data(thread_data&&) = delete
thread_data& operator=(thread_data const&) = delete
thread_data& operator=(thread_data&&) = delete
```

```cpp
inline thread_state get_state(std::memory_order const order = std::memory_order_acquire) const noexcept
```

The `get_state` function queries the state of this thread instance.

**Note:** This function will be seldom used directly. Most of the time the state of a thread will be retrieved by using the function `threadmanager::get_state`.

**Returns** This function returns the current state of this thread. It will return one of the values as defined by the `thread_state` enumeration.

```cpp
inline thread_state set_state(thread_schedule_state const state, thread_restart_state state_ex = thread_restart_state::unknown, std::memory_order const load_order = std::memory_order_acquire, std::memory_order const exchange_order = std::memory_order_acq_rel) const noexcept
```

The `set_state` function changes the state of this thread instance.

**Note:** This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the thread-manager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread’s status word. To change the thread’s scheduling status `threadmanager::set_state` should be used.

**Parameters**
- **state** – [in] The new state to be set for the thread.

### inline bool set_state_tagged(thread_schedule_state const newstate, thread_state const &prev_state, thread_state &new_tagged_state, std::memory_order exchange_order = std::memory_order_acq_rel) const noexcept

### inline bool restore_state(thread_state const new_state, thread_state const old_state, std::memory_order const load_order = std::memory_order_relaxed, std::memory_order const load_exchange = std::memory_order_acq_rel) const noexcept

The restore_state function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise it won’t touch the thread state of this instance.

**Parameters**
- **new_state** – [in] The new state to be set for the thread.
- **old_state** – [in] The old state of the thread which still has to be the current state.
- **load_order** – [in]
- **load_exchange** – [in]

**Returns** This function returns `true` if the state has been changed successfully.

Functions

std::ostream &operator<<(std::ostream &, thread_description const &)

std::string as_string(thread_description const &desc)

threads::thread_description get_thread_description(thread_id_type const &id, error_code &ec = throws)

The function get_thread_description is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters

• id – [in] The thread id of the thread being queried.
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns the description of the thread referenced by the id parameter. If the thread is not known to the thread-manager the return value will be the string "<unknown>".

threads::thread_description set_thread_description(thread_id_type const &id, thread_description const &desc = threads::thread_description(), error_code &ec = throws)

threads::thread_description get_thread_lco_description(thread_id_type const &id, error_code &ec = throws)

namespace hpx

namespace this_thread

Functions

```cpp
threads::thread_restart_state suspend(threads::thread_schedule_state state, threads::thread_id_type nextid, threads::thread_description const &description = threads::thread_description("this_thread::suspend"), error_code &ec = throws)
```

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

**Note:** Must be called from within a HPX-thread.

**Throws** If `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

```cpp
inline threads::thread_restart_state suspend(threads::thread_schedule_state state = threads::thread_schedule_state::pending,
                                          threads::thread_description const &description = threads::thread_description("this_thread::suspend"),
                                          error_code &ec = throws)
```

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

**Note:** Must be called from within a HPX-thread.

**Throws** If `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`. 
threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
threads::thread_id_type id, threads::thread_description const &description =
threads::thread_description("this_thread::suspend"), error_code &ec = throws)

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to `suspended` and schedules a wakeup for this thread at the given time.

**Note:** Must be called from within a HPX-thread.

**Throws** If `– &ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

inline threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
threads::thread_description const &description =
threads::thread_description("this_thread::suspend"),
error_code &ec = throws)

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to `suspended` and schedules a wakeup for this thread at the given time.

**Note:** Must be called from within a HPX-thread.

**Throws** If `– &ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,
threads::thread_description const &description =
threads::thread_description("this_thread::suspend"),
error_code &ec = throws)

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to `suspended` and schedules a wakeup for this thread after the given duration.

**Note:** Must be called from within a HPX-thread.

**Throws** If `– &ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

1236 Chapter 2. What’s so special about HPX?
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,
   threads::thread_id_type const &id,
   threads::thread_description const &description =
   threads::thread_description("this_thread::suspend"),
   error_code &ec = throws)

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to `suspended` and schedules a wakeup for this threads after the given duration.

**Note:** Must be called from within a HPX-thread.

Throws If $\& ec \neq \& throws$, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

inline threads::thread_restart_state suspend(std::uint64_t ms, threads::thread_description const
   &description =
   threads::thread_description("this_thread::suspend"),
   error_code &ec = throws)

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to `suspended` and schedules a wakeup for this threads after the given time (specified in milliseconds).

**Note:** Must be called from within a HPX-thread.

Throws If $\& ec \neq \& throws$, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

threads::thread_pool_base *get_pool(error_code &ec = throws)

Returns a pointer to the pool that was used to run the current thread

**Throws** If $\& ec \neq \& throws$, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

namespace threads
Functions

thread_state set_thread_state(thread_id_type const &id, thread_schedule_state state = thread_schedule_state::pending, thread_restart_state stateex = thread_restart_state::signaled, thread_priority priority = thread_priority::normal, bool retry_on_active = true, hpx::error_code &ec = throws)

Set the thread state of the thread referenced by the thread_id id.

Note: If the thread referenced by the parameter id is in thread_state::active state this function schedules a new thread which will set the state of the thread as soon as its not active anymore. The function returns thread_state::active in this case.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- id – [in] The thread id of the thread the state should be modified for.
- state – [in] The new state to be set for the thread referenced by the id parameter.
- stateex – [in] The new extended state to be set for the thread referenced by the id parameter.
- priority – [in]
- retry_on_active – [in]
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns the previous state of the thread referenced by the id parameter. It will return one of the values as defined by the thread_state enumeration. If the thread is not known to the thread-manager the return value will be thread_state::unknown.

thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_time_point const &abs_time, std::atomic<bool> *started, thread_schedule_state state = thread_schedule_state::pending, thread_restart_state stateex = thread_restart_state::timeout, thread_priority priority = thread_priority::normal, bool retry_on_active = true, error_code &ec = throws)

Set the thread state of the thread referenced by the thread_id id.

Set a timer to set the state of the given thread to the given new value after it expired (at the given time)

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- id – [in] The thread id of the thread the state should be modified for.
- abs_time – [in] Absolute point in time for the new thread to be run
- started – [in,out] A helper variable allowing to track the state of the timer helper thread
- state – [in] The new state to be set for the thread referenced by the id parameter.
- stateex – [in] The new extended state to be set for the thread referenced by the id parameter.
- priority – [in]
- retry_on_active – [in]
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**

```cpp
inline thread_id_ref_type set_thread_state(thread_id_type const &id,
                                          hpx::chrono::steady_time_point const &abs_time,
                                          thread_schedule_state state = thread_schedule_state::pending,
                                          thread_restart_state stateex = thread_restart_state::timeout,
                                          thread_priority priority = thread_priority::normal,
                                          bool retry_on_active = true,
                                          error_code & = throws)
```

```cpp
inline thread_id_ref_type set_thread_state(thread_id_type const &id,
                                          hpx::chrono::steady_duration const &rel_time,
                                          thread_schedule_state state = thread_schedule_state::pending,
                                          thread_restart_state stateex = thread_restart_state::timeout,
                                          thread_priority priority = thread_priority::normal,
                                          bool retry_on_active = true,
                                          error_code &ec = throws)
```

Set the thread state of the thread referenced by the thread_id `id`.

Set a timer to set the state of the given thread to the given new value after it expired (after the given duration)

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**

- **id** – [in] The thread id of the thread the state should be modified for.
- **rel_time** – [in] Time duration after which the new thread should be run
- **state** – [in] The new state to be set for the thread referenced by the `id` parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the `id` parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**

```cpp
thread_state get_thread_state(thread_id_type const &id,
                               error_code &ec = throws) noexcept
```

The function get_thread_backtrace is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`. The function get_thread_state is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

**Parameters**

- **id** – [in] The thread id of the thread being queried.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.
• **id** – [in] The thread id of the thread the state should be modified for.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns the currently captured stack back trace of the thread referenced by the `id` parameter. If the thread is not known to the thread-manager the return value will be the zero.

**Returns** This function returns the thread state of the thread referenced by the `id` parameter. If the thread is not known to the thread-manager the return value will be terminated.

```cpp
std::size_t get_thread_phase(thread_id_type const &id, error_code &ec = throws) noexcept
```

The function `get_thread_phase` is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
• **id** – [in] The thread id of the thread the phase should be modified for.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns the thread phase of the thread referenced by the `id` parameter. If the thread is not known to the thread-manager the return value will be ~0.

```cpp
bool get_thread_interruption_enabled(thread_id_type const &id, error_code &ec = throws)
```

Returns whether the given thread can be interrupted at this point.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
• **id** – [in] The thread id of the thread which should be queried.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if the given thread can be interrupted at this point in time. It will return `false` otherwise.

```cpp
bool set_thread_interruption_enabled(thread_id_type const &id, bool enable, error_code &ec = throws)
```

Set whether the given thread can be interrupted at this point.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
• **id** – [in] The thread id of the thread which should receive the new value.
• **enable** – [in] This value will determine the new interruption enabled status for the given thread.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.
Returns
This function returns the previous value of whether the given thread could have been interrupted.

```cpp
bool get_thread_interruption_requested(thread_id_type const &id, error_code &ec = throws)
```

Returns whether the given thread has been flagged for interruption.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `id` – [in] The thread id of the thread which should be queried.
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**
This function returns `true` if the given thread was flagged for interruption. It will return `false` otherwise.

```cpp
void interrupt_thread(thread_id_type const &id, bool flag, error_code &ec = throws)
```

Flag the given thread for interruption.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `id` – [in] The thread id of the thread which should be interrupted.
- `flag` – [in] The flag encodes whether the thread should be interrupted (if it is `true`), or ‘uninterrupted’ (if it is `false`).
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
inline void interrupt_thread(thread_id_type const &id, error_code &ec = throws)
```

```cpp
void interruption_point(thread_id_type const &id, error_code &ec = throws)
```

Interrupt the current thread at this point if it was canceled. This will throw a `thread_interrupted` exception, which will cancel the thread.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `id` – [in] The thread id of the thread which should be interrupted.
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
threads::thread_priority get_thread_priority(thread_id_type const &id, error_code &ec = throws)
```

Return priority of the given thread

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
• **id** – [in] The thread id of the thread whose priority is queried.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
std::ptrdiff_t get_stack_size(thread_id_type const &id, error_code &ec = throws) noexcept
```

Return stack size of the given thread.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
• **id** – [in] The thread id of the thread whose priority is queried.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
threads::thread_pool_base *get_pool(thread_id_type const &id, error_code &ec = throws)
```

Returns a pointer to the pool that was used to run the current thread.

**Throws** If – &ec != &throws, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

### hpx/threading_base/thread_num_tss.hpp

See **Public API** for a list of names and headers that are part of the public HPX API.

namespace **hpx**

### Functions

#### `std::size_t get_worker_thread_num()`

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

**Note:** The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`).

**Note:** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

```cpp
std::size_t get_worker_thread_num(error_code &ec)
```

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.
Note: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit.

```cpp
std::size_t get_local_worker_thread_num()
```

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

```cpp
std::size_t get_local_worker_thread_num(error_code &ec)
```

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit.

```cpp
std::size_t get_thread_pool_num()
```

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.
std::size_t get_thread_pool_num(error_code &ec)

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

**Note:** The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

**Parameters**

- **ec** – [in,out] this represents the error status on exit.

See Public API for a list of names and headers that are part of the public HPX API.
virtual void **resume_processing_unit_direct**(std::size_t virt_core, error_code &ec = throws) = 0

Resumes the given processing unit. Blocks until the processing unit has been resumed.

**Parameters**

- **virt_core** – [in] The processing unit on the the pool to be resumed. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to **hpx::throws** the function will throw on error instead.

virtual void **resume_direct**(error_code &ec = throws) = 0

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

**Parameters**

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to **hpx::throws** the function will throw on error instead.

virtual void **suspend_direct**(error_code &ec = throws) = 0

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

**Note:** A thread pool cannot be suspended from an HPX thread running on the pool itself.

**Parameters**

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to **hpx::throws** the function will throw on error instead.

**Throws** **hpx::exception** – if called from an HPX thread which is running on the pool itself.

namespace hpx

namespace threads

**Functions**

`thread_data *get_self_id_data() noexcept`

The function `get_self_id_data` returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

`thread_self &get_self()`

The function `get_self` returns a reference to the (OS thread specific) self reference to the current HPX thread.
The function `get_self_ptr` returns a pointer to the (OS thread specific) self reference to the current HPX thread.

The function `get_ctx_ptr` returns a pointer to the internal data associated with each coroutine.

The function `get_self_ptr_checked` returns a pointer to the (OS thread specific) self reference to the current HPX thread.

The function `get_self_id` returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

The function `get_outer_self_id` returns the HPX thread id of the current outer thread (or zero if the current thread is not a HPX thread). This usually returns the same as `get_self_id`, except for directly executed threads, in which case this returns the thread id of the outermost HPX thread.

The function `get_parent_id` returns the HPX thread id of the current thread’s parent (or zero if the current thread is not a HPX thread).

Note:  This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

The function `get_parent_phase` returns the HPX phase of the current thread’s parent (or zero if the current thread is not a HPX thread).

Note:  This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

The function `get_self_stacksize` returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

The function `get_self_stacksize_enum` returns the stack size of the current thread.

The function `get_parent_locality_id` returns the id of the locality of the current thread’s parent (or zero if the current thread is not a HPX thread).

Note:  This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

The function `get_self_component_id` returns the lva of the component the current thread is acting on.
namespace policies

threadmanager

namespace hpx

namespace threads

class threadmanager

#include <threadmanager.hpp> The thread-manager class is the central instance of management for all (non-depleted) threads

Public Types

typedef threads::policies::callback_notifier notification_policy_type

typedef std::unique_ptr<thread_pool_base> pool_type

typedef threads::policies::scheduler_base scheduler_type

typedef std::vector<pool_type> pool_vector

Public Functions

threadmanager(hpx::util::runtime_configuration &rtcfg_, notification_policy_type &notifier,
      detail::network_background_callback_type network_background_callback =
      detail::network_background_callback_type())

~threadmanager()

void init()

void create_pools()
void print_pools(std::ostream&)  
    FIXME move to private and add &amp;#8212;hpx:printpools cmd line option.

thread_pool_base & default_pool() const

scheduler_type & default_scheduler() const

thread_pool_base & get_pool(std::string const & pool_name) const

thread_pool_base & get_pool(pool_id_type const & pool_id) const

thread_pool_base & get_pool(std::size_t thread_index) const

bool pool_exists(std::string const & pool_name) const

bool pool_exists(std::size_t pool_index) const

thread_id_ref_type register_work(thread_init_data & data, error_code & ec = throws)

The function register_work adds a new work item to the thread manager. It doesn’t immediately create a new thread, it just adds the task parameters (function, initial state and description) to the internal management data structures. The thread itself will be created when the number of existing threads drops below the number of threads specified by the constructors max_count parameter.

Parameters
• func – [in] The function or function object to execute as the thread’s function. This must have a signature as defined by thread_function_type.
• description – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.

void register_thread(thread_init_data & data, thread_id_ref_type & id, error_code & ec = throws)

The function register_thread adds a new work item to the thread manager. It creates a new thread, adds it to the internal management data structures, and schedules the new thread, if appropriate.

Parameters
• func – [in] The function or function object to execute as the thread’s function. This must have a signature as defined by thread_function_type.
• id – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
• description – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.

bool run()

Run the thread manager’s work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function tfunc.

Returns The function returns true if the thread manager has been started successfully, otherwise it returns false.

void stop(bool blocking = true)

Forcefully stop the thread-manager.

Parameters blocking –

bool is_busy()

bool is_idle()

void wait()
bool \texttt{wait\_for(hpx::chrono::steady\_duration} \texttt{const} \texttt{&rel\_time)}

void \texttt{suspend()} 

void \texttt{resume()} 

inline state \texttt{status()} const 

Return whether the thread manager is still running. This returns the “minimal state”, i.e. the state of the least advanced thread pool. 

\begin{Verbatim}
std::int64_t \texttt{get\_thread\_count(thread\_schedule\_state} state = thread\_schedule\_state::unknown, thread\_priority priority = thread\_priority::default_, std::size\_t num\_thread = std::size\_t(-1), bool reset = false)

return the number of HPX-threads with the given state
\end{Verbatim}

\textbf{Note:} This function lock the internal OS lock in the thread manager

\begin{Verbatim}
std::int64_t \texttt{get\_idle\_core\_count()}

mask\_type \texttt{get\_idle\_core\_mask()}

std::int64_t \texttt{get\_background\_thread\_count()} const

void \texttt{abort\_all\_suspended\_threads()}

bool \texttt{cleanup\_terminated(bool delete\_all)}

inline \texttt{std::size\_t get\_os\_thread\_count()} const

Return the number of OS threads running in this thread-manager. 

This function will return correct results only if the thread-manager is running.

inline \texttt{std::thread \&get\_os\_thread\_handle(std::size\_t num\_thread)} const

inline void \texttt{report\_error(std::size\_t num\_thread, std::exception\_ptr const \&e)} const 

API functions forwarding to notification policy. 

This notifies the thread manager that the passed exception has been raised. The exception will be routed through the notifier and the scheduler (which will result in it being passed to the runtime object, which in turn will report it to the console, etc.).

inline mask\_type \texttt{get\_used\_processing\_units()} const 

Returns the mask identifying all processing units used by this thread manager.

inline \texttt{hwloc\_bitmap\_ptr get\_pool\_numa\_bitmap(std::string const \&pool\_name)} const

inline void \texttt{set\_scheduler\_mode(threads::policies::scheduler\_mode mode) noexcept}

#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation f() using the associated executor at the given point in time.

**Note:** This calls exec.async_execute_after(rel_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::async_execute() on the underlying non-time-scheduled execution agent.

**Param exec** [in] The executor object to use for scheduling of the function f.
**Param rel_time** [in] The duration of time after which the given function should be scheduled to run.
**Param f** [in] The function which will be scheduled using the given executor.
**Param ts...** [in] Additional arguments to use to invoke f.
**Return** f(ts...)’s result through a future
Private Functions

template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(
  async_execute_after_t, Executor &&exec,
  hpx::chrono::steady_duration const &rel_time, F &&f, Ts&&... ts)

#include <timed_execution_fwd.hpp>
Customization point of asynchronous execution agent creation supporting timed execution.
This asynchronously creates a single function invocation f() using the associated executor at the
given point in time.

Note: This calls exec.async_execute_at(abs_time, f, ts...), if available, otherwise it emulates
timed scheduling by delaying calling execution::async_execute() on the underlying non-time-
scheduled execution agent.

Param exec [in] The executor object to use for scheduling of the function f.
Param abs_time [in] The point in time the given function should be scheduled at to run.
Param f [in] The function which will be scheduled using the given executor.
Param ts... [in] Additional arguments to use to invoke f.
Return f(ts...)’s result through a future

Private Functions

template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(
  async_execute_at_t, Executor &&exec,
  hpx::chrono::steady_time_point const &abs_time, F &&f, Ts&&... ts)

#include <timed_execution_fwd.hpp>
Customization point of asynchronous fire & forget execution agent creation supporting timed execution.
This asynchronously (fire & forget) creates a single function invocation f() using the associated
executor at the given point in time.

Note: This calls exec.post_after(rel_time, f, ts...), if available, otherwise it emulates timed
scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution
agent.

Param exec [in] The executor object to use for scheduling of the function f.
Param rel_time [in] The duration of time after which the given function should be sched-
uled to run.
Param f [in] The function which will be scheduled using the given executor.
Param ts... [in] Additional arguments to use to invoke f.
**Private Functions**

```cpp
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_after_t, Executor &&exec,
  hpx::chrono::steady_duration const &rel_time, F &&f, Ts&&... ts)
```

```
#include <timed_execution_fwd.hpp>
```

Customization point of asynchronous fire & forget execution agent creation supporting timed execution.

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor at the given point in time.

**Note:** This calls exec.post_at(abs_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution agent.

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param abs_time** [in] The point in time the given function should be scheduled at to run.

**Param f** [in] The function which will be scheduled using the given executor.

**Param ts...** [in] Additional arguments to use to invoke f.

---

**Private Functions**

```cpp
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_at_t, Executor &&exec,
  hpx::chrono::steady_time_point const &abs_time, F &&f, Ts&&... ts)
```

```
#include <timed_execution_fwd.hpp>
```

Customization point of synchronous execution agent creation supporting timed execution.

This synchronously creates a single function invocation f() using the associated executor at the given point in time.

**Note:** This calls exec.sync_execute_after(rel_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::sync_execute() on the underlying non-time-scheduled execution agent.

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param rel_time** [in] The duration of time after which the given function should be scheduled to run.

**Param f** [in] The function which will be scheduled using the given executor.

**Param ts...** [in] Additional arguments to use to invoke f.

**Return** f(ts...)'s result
Private Functions

template<typename Executor, typename F, typename ...Ts>

inline std::size_t get_socket_number(std::size_t num_thread, [[maybe_unused]] error_code &ec = throws) const noexcept

Return the Socket number of the processing unit the given thread is running on.

Parameters

• num_thread – [in]
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

inline std::size_t get_numa_node_number(std::size_t num_thread, [[maybe_unused]] error_code &ec = throws) const noexcept

Return the NUMA node number of the processing unit the given thread is running on.

Parameters

• num_thread – [in]
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

mask_cref_type get_machine_affinity_mask(error_code &ec = throws) const noexcept

Return a bit mask where each set bit corresponds to a processing unit available to the application.

Parameters

• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

mask_type get_service_affinity_mask(mask_cref_type used_processing_units, error_code &ec = throws) const

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

Parameters

• used_processing_units – [in] This is the mask of processing units which are not available for service threads.
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

mask_cref_type get_socket_affinity_mask(std::size_t num_thread, error_code &ec = throws) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.

Parameters

• num_thread – [in]
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

mask_cref_type get_numa_node_affinity_mask(std::size_t num_thread, error_code &ec = throws) const

Chapter 2. What’s so special about HPX?
Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

Parameters
- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
mask_cref_type get_core_affinity_mask(std::size_t num_thread, error_code &ec = throws) const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

Parameters
- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
mask_cref_type get_thread_affinity_mask(std::size_t num_thread, error_code &ec = throws) const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

Parameters
- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
void set_thread_affinity_mask(mask_cref_type mask, error_code &ec = throws) const
```

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

**Note:** Use this function on systems where the affinity must be set from inside the thread itself.

```cpp
mask_type get_thread_affinity_mask_from_lva(void const *lva, error_code &ec = throws) const
```

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

Parameters
- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
void print_affinity_mask(std::ostream &os, std::size_t num_thread, mask_cref_type m, std::string const &pool_name) const
```

Prints the given mask `m` to `os` in a human readable form.

```cpp
bool reduce_thread_priority(error_code &ec = throws) const
```

Reduce thread priority of the current thread.

**Parameters**
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

\texttt{\textit{std}::size\_t get\_number\_of\_sockets()} const

Return the number of available NUMA domains.

\texttt{\textit{std}::size\_t get\_number\_of\_numa\_nodes()} const

Return the number of available NUMA domains.

\texttt{\textit{std}::size\_t get\_number\_of\_cores()} const

Return the number of available cores.

\texttt{\textit{std}::size\_t get\_number\_of\_pus()} const noexcept

Return the number of available hardware processing units.

\texttt{\textit{std}::size\_t get\_number\_of\_numa\_node\_cores(\textit{std}::size\_t numa)} const

Return number of cores in given numa domain.

\texttt{\textit{std}::size\_t get\_number\_of\_numa\_node\_pus(\textit{std}::size\_t numa)} const

Return number of processing units in a given numa domain.

\texttt{\textit{std}::size\_t get\_number\_of\_socket\_pus(\textit{std}::size\_t socket)} const

Return number of processing units in a given socket.

\texttt{\textit{std}::size\_t get\_number\_of\_core\_pus(\textit{std}::size\_t core)} const

Return number of processing units in given core.

\texttt{\textit{std}::size\_t get\_number\_of\_socket\_cores(\textit{std}::size\_t socket)} const

Return number of cores units in given socket.

\texttt{\textit{inline std}::size\_t get\_core\_number(\textit{std}::size\_t num\_thread, \textit{error\_code} \& = throws)} const

\texttt{\textit{std}::size\_t get\_pu\_number(\textit{std}::size\_t num\_core, \textit{std}::size\_t num\_pu, \textit{error\_code} \&\textit{ec} = throws)} const

\texttt{\textit{std}::size\_t get\_cache\_size(\textit{mask\_cref\_type mask}, \textit{int level}) const

Return the size of the cache associated with the given mask.

\texttt{\textit{mask\_type get\_cpubind\_mask(\textit{error\_code} \&\textit{ec} = throws)} const

\texttt{\textit{mask\_type get\_cpubind\_mask(\textit{std}::thread \&\textit{handle}, \textit{error\_code} \&\textit{ec} = throws)} const

\texttt{\textit{hwloc\_bitmap\_ptr cpuset\_to\_nodeset(\textit{mask\_cref\_type mask}) const

convert a cpu mask into a numa node mask in hwloc bitmap form

\texttt{\textit{void write\_to\_log()} const

\texttt{\textit{void \star allocate(\textit{std}::size\_t len)} const

This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

\texttt{\textit{void \star allocate\_membind(\textit{std}::size\_t len, const \textit{hwloc\_bitmap\_ptr} \&bitmap, \textit{hp\_x\_hwloc\_membind\_policy} policy, \textit{int flags}) const

allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc docs)

\texttt{\textit{threads::mask\_type get\_area\_membind\_nodeset(\textit{void const \star addr, \textit{std}::size\_t len}) const

\texttt{\textit{bool set\_area\_membind\_nodeset(\textit{void const \star addr, \textit{std}::size\_t len, \textit{void \star nodeset}) const

hpx/util/insert_checked.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

Functions

template<typename Iterator>
constexpr bool insert_checked(std::pair<Iterator, bool> const &r) noexcept

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters
- r – [in] The return value of a std::map insert operation.

Returns
This function returns r.second.

template<typename Iterator>
bool insert_checked(std::pair<Iterator, bool> const &r, Iterator &it)

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters
- r – [in] The return value of a std::map insert operation.
- r – [out] A reference to an Iterator, which is set to r.first.
- it – [out] on exit, will hold the iterator referring to the inserted element

Returns
This function returns r.second.

hpx/util/sed_transform.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util
Functions

bool parse_sed_expression(std::string const &input, std::string &search, std::string &replace)
Parse a sed command.

Note: Currently, only supports search and replace syntax (s/search/replace/)

Parameters
• input – [in] The content to parse.
• search – [out] If the parsing is successful, this string is set to the search expression.
• replace – [out] If the parsing is successful, this string is set to the replace expression.

Returns true if the parsing was successful, false otherwise.

struct sed_transform
#include <sed_transform.hpp> An unary function object which applies a sed command to its subject and returns the resulting string.

Note: Currently, only supports search and replace syntax (s/search/replace/)

Public Functions

Defines

**HPX_REGISTER_ACTION_DECLARATION(...)**

Declare the necessary component action boilerplate code.

The macro `HPX_REGISTER_ACTION_DECLARATION` can be used to declare all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter `action` is the type of the action to declare the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as ‘<’, ‘>’, or ‘:’.

```cpp
namespace app
{
    // Define a simple component exposing one action 'print_greeting'
    class HPX_COMPONENT_EXPORT server :
        public hpx::components::component_base<server>
    {
        void print_greeting ()
        {
            hpx::cout << "Hey, how are you?\n" << std::flush;
        }
        // Component actions need to be declared, this also defines the
        // type 'print_greeting_action' representing the action.
        HPX_DEFINE_COMPONENT_ACTION(server,
            print_greeting, print_greeting_action);
    }

    // Declare boilerplate code required for each of the component actions.
    HPX_REGISTER_ACTION_DECLARATION(app::server::print_greeting_action)
}
```

Example:

---

Note: This macro has to be used once for each of the component actions defined using one of the `HPX_DEFINE_COMPONENT_ACTION` macros. It has to be visible in all translation units using the action, thus it is recommended to place it into the header file defining the component.

**HPX_REGISTER_ACTION_DECLARATION_(...)**

**HPX_REGISTER_ACTION_DECLARATION_1(action)**
**HPX_REGISTER_ACTION(...)**

Define the necessary component action boilerplate code.

The macro `HPX_REGISTER_ACTION` can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter `action` is the type of the action to define the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

**Note:** This macro has to be used once for each of the component actions defined using one of the `HPX_DEFINE_COMPONENT_ACTION` or `HPX_DEFINE_PLAIN_ACTION` macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

**Note:** Only one of the forms of this macro `HPX_REGISTER_ACTION` or `HPX_REGISTER_ACTION_ID` should be used for a particular action, never both.

**HPX_REGISTER_ACTION_ID(action, actionname, actionid)**

Define the necessary component action boilerplate code and assign a predefined unique id to the action.

The macro `HPX_REGISTER_ACTION` can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter `action` is the type of the action to define the boilerplate for.

The parameter `actionname` specifies a unique name of the action to be used for serialization purposes. The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

The parameter `actionid` specifies an unique integer value which will be used to represent the action during serialization.

**Note:** This macro has to be used once for each of the component actions defined using one of the `HPX_DEFINE_COMPONENT_ACTION` or global actions `HPX_DEFINE_PLAIN_ACTION` macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

**Note:** Only one of the forms of this macro `HPX_REGISTER_ACTION` or `HPX_REGISTER_ACTION_ID` should be used for a particular action, never both.

```cpp
define namespace hpx

define namespace actions
```
namespace hpx

namespace actions

    template<typename Component, typename Signature, typename Derived>
    struct basic_action
        #include <basic_action_fwd.hpp>

        Template Parameters
        • Component – component type
        • Signature – return type and arguments
        • Derived – derived action class

hpx/actions_base/component_action.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_DEFINE_COMPONENT_ACTION(...)  
Registers a member function of a component as an action type with HPX.

The macro HPX_DEFINE_COMPONENT_ACTION can be used to register a member function of a component as an action type named action_type.

The parameter component is the type of the component exposing the member function func which should be associated with the newly defined action type. The parameter action_type is the name of the action type to register with HPX.

namespace app
{
    // Define a simple component exposing one action 'print_greeting'
    class HPX_COMPONENT_EXPORT server : public hpx::components::component_base<server>
    {
        void print_greeting() const
        {
            hpx::cout << "Hey, how are you?\n" << std::flush;
        }

        // Component actions need to be declared, this also defines the
        // type 'print_greeting_action' representing the action.
        HPX_DEFINE_COMPONENT_ACTION(server, print_greeting, print_greeting_action);
    }
Example:

The first argument must provide the type name of the component the action is defined for. The second argument must provide the member function name the action should wrap.

The default value for the third argument (the typename of the defined action) is derived from the name of the function (as passed as the second argument) by appending ‘_action’. The third argument can be omitted only if the second argument with an appended suffix ‘_action’ resolves to a valid, unqualified C++ type name.

Note: The macro `HPX_DEFINE_COMPONENT_ACTION` can be used with 2 or 3 arguments. The third argument is optional.

```
namespace hpx

namespace actions

hpx/actions_base/lambda_to_action.hpp

See Public API for a list of names and headers that are part of the public HPX API.

hpx/actions_base/plain_action.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

`HPX_DEFINE/plain_ACTION(...)`

Defines a plain action type.

```
namespace app
{
    void some_global_function(double d)
    {
        cout << d;
    }

    // This will define the action type 'app::some_global_action' which
    // represents the function 'app::some_global_function'.
    // HPX_DEFINE/plain_ACTION(some_global_function, some_global_action);
}
```

Example:
Note: Usually this macro will not be used in user code unless the intent is to avoid defining the action_type in global namespace. Normally, the use of the macro `HPX_PLAIN_ACTION` is recommended.

Note: The macro `HPX_DEFINE_PLAIN_ACTION` can be used with 1 or 2 arguments. The second argument is optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending ‘_action’. The second argument can be omitted only if the first argument with an appended suffix ‘_action’ resolves to a valid, unqualified C++ type name.

`HPX_DECLARE_PLAIN_ACTION(...)`
Declares a plain action type.

`HPX_PLAIN_ACTION(...)`
Defines a plain action type based on the given function `func` and registers it with HPX.

The macro `HPX_PLAIN_ACTION` can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function `func`. It defines the action type `name` representing the given function. This macro additionally registers the newly define action type with HPX.

The parameter `func` is a global or free (non-member) function which should be encapsulated into a plain action. The parameter `name` is the name of the action type defined by this macro.

```cpp
namespace app {
    void some_global_function(double d)
    {
        cout << d;
    }
}

// This will define the action type 'some_global_action' which represents
// the function 'app::some_global_function'.
HPX_PLAIN_ACTION(app::some_global_function, some_global_action)
```

Example:

Note: The macro `HPX_PLAIN_ACTION` has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

Note: The macro `HPX_PLAIN_ACTION_ID` can be used with 1, 2, or 3 arguments. The second and third arguments are optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending ‘_action’. The second argument can be omitted only if the first argument with an appended suffix ‘_action’ resolves to a valid, unqualified C++ type name. The default value for the third argument is `hpx::components::factory_check`.

Note: Only one of the forms of this macro `HPX_PLAIN_ACTION` or `HPX_PLAIN_ACTION_ID` should be
used for a particular action, never both.

**HPX.PLAIN ACTION_ID(func, name, id)**

Defines a plain action type based on the given function `func` and registers it with HPX.

The macro `HPX.PLAIN ACTION_ID` can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function `func`. It defines the action type `actionname` representing the given function. The parameter `actionid` specifies an unique integer value which will be used to represent the action during serialization.

The parameter `func` is a global or free (non-member) function which should be encapsulated into a plain action. The parameter `name` is the name of the action type defined by this macro.

The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as `<`, `>`, or `:`.

```cpp
namespace app
{
    void some_global_function(double d)
    {
        cout << d;
    }
}

// This will define the action type 'some_global_action' which represents
// the function 'app::some_global_function'.
HPX.PLAIN ACTION_ID(app::some_global_function, some_global_action, some_unique_id);
```

**Example:**

**Note:** The macro `HPX.PLAIN ACTION_ID` has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

**Note:** Only one of the forms of this macro `HPX.PLAIN ACTION` or `HPX.PLAIN ACTION_ID` should be used for a particular action, never both.

bool register_locality(parcelset::endpoints_type const &endpoints, naming::gid_type &prefix, std::uint32_t num_threads, error_code &ec = throws)

Add a locality to the runtime.

parcelset::endpoints_type const &resolve_locality(naming::gid_type const &gid, error_code &ec = throws)

Resolve a locality to its prefix.

Returns Returns an empty vector if the locality is not registered.

bool has_resolved_locality(naming::gid_type const &gid)
bool unregister_locality(naming::gid_type const &gid, error_code &ec = throws)
Remove a locality from the runtime.

void remove_resolved_locality(naming::gid_type const &gid)
remove given locality from locality cache

bool get_console_locality(naming::gid_type &locality, error_code &ec = throws)
Get locality locality_id of the console locality.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- locality – [out] The locality_id value uniquely identifying the console locality. This is valid only, if the return value of this function is true.
- try_cache – [in] If this is set to true the console is first tried to be found in the local cache. Otherwise this function will always query AGAS, even if the console locality_id is already known locally.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns true if a console locality_id exists and returns false otherwise.

bool get_localities(std::vector<naming::gid_type> &locality_ids, components::component_type type, error_code &ec = throws) const
Query for the locality_ids of all known localities.
This function returns the locality_ids of all localities known to the AGAS server or all localities having a registered factory for a given component type.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- locality_ids – [out] The vector will contain the prefixes of all localities registered with the AGAS server. The returned vector holds the prefixes representing the runtime_support components of these localities.
- type – [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is components::component_invalid, which will return prefixes of all localities.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

inline bool get_localities(std::vector<naming::gid_type> &locality_ids, error_code &ec = throws) const

hpx::future<std::uint32_t> get_num_localities_async(components::component_type type = components::component_invalid) const
Query for the number of all known localities.
This function returns the number of localities known to the AGAS server or the number of localities having a registered factory for a given component type.
**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

### Parameters
- **type** – [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is `components::component_invalid`, which will return prefixes of all localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```cpp
std::uint32_t get_num_localities(components::component_type type, error_code &ec = throws) const
```

```cpp
inline std::uint32_t get_num_localities(error_code &ec = throws) const
```

```cpp
hpx::future<std::uint32_t> get_num_overall_threads_async() const
```

```cpp
std::uint32_t get_num_overall_threads(error_code &ec = throws) const
```

```cpp
hpx::future<std::vector<std::uint32_t>> get_num_threads_async() const
```

```cpp
std::vector<std::uint32_t> get_num_threads(error_code &ec = throws) const
```

**components::component_type get_component_id(const std::string &name, error_code &ec = throws) const**

Return a unique id usable as a component type.

This function returns the component type id associated with the given component name. If this is the first request for this component name a new unique id will be created.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

### Parameters
- **name** – [in] The component name (string) to get the component type for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** The function returns the currently associated component type. Any error results in an exception thrown from this function.

```cpp
void iterate_types(iterate_types_function_type const &f, error_code &ec = throws) const
```

```cpp
std::string get_component_type_name(components::component_type id, error_code &ec = throws) const
```

```cpp
inline components::component_type register_factory(naming::gid_type const &locality_id, std::string const &name, error_code &ec = throws) const
```

Register a factory for a specific component type.

This function allows to register a component factory for a given locality and component type.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.  

---

1280 Chapter 2. What’s so special about HPX?
Parameters

- **locality_id** – [in] The locality value uniquely identifying the given locality the factory needs to be registered for.
- **name** – [in] The component name (string) to register a factory for the given component type for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns The function returns the currently associated component type. Any error results in an exception thrown from this function. The returned component type is the same as if the function `get_component_id` was called using the same component name.

```cpp
components::component_type register_factory(std::uint32_t locality_id, std::string const &name, error_code &ec = hpx::throws) const
```

```cpp
bool get_id_range(std::uint64_t count, naming::gid_type &lower_bound, naming::gid_type &upper_bound, error_code &ec = hpx::throws)
```

Get unique range of freely assignable global ids.

Every locality needs to be able to assign global ids to different components without having to consult the AGAS server for every id to generate. This function can be called to preallocate a range of ids usable for this purpose.

**Note:** This function assigns a range of global ids usable by the given locality for newly created components. Any of the returned global ids still has to be bound to a local address, either by calling `bind` or `bind_range`.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **l** – [in] The locality the locality id needs to be generated for. Repeating calls using the same locality results in identical locality_id values.
- **count** – [in] The number of global ids to be generated.
- **lower_bound** – [out] The lower bound of the assigned id range. The returned value can be used as the first id to assign. This is valid only, if the return value of this function is true.
- **upper_bound** – [out] The upper bound of the assigned id range. The returned value can be used as the last id to assign. This is valid only, if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function returns `true` if a new range has been generated (it has been called for the first time for the given locality) and returns `false` if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

```cpp
inline bool bind_local(naming::gid_type const &id, naming::address const &addr, error_code &ec = hpx::throws)
```

Bind a global address to a local address.

Every element in the HPX namespace has a unique global address (global id). This global address has to be associated with a concrete local address to be able to address an instance of a component using its global address.
**Note:** As long as \( ec \) is not pre-initialized to \( hpx::throws \) this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of \( hpx::exception \).

**Note:** Binding a gid to a local address sets its global reference count to one.

**Parameters**
- **id** – [in] The global address which has to be bound to the local address.
- **addr** – [in] The local address to be bound to the global address.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to \( hpx::throws \) the function will throw on error instead.

**Returns** This function returns \( true \), if this global id got associated with an local address. It returns \( false \) otherwise.

```cpp
inline hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, std::uint32_t locality_id)
```

```cpp
inline hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, naming::gid_type const &locality)
```

```cpp
bool bind_range_local(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, error_code &ec = throws)
```

Bind unique range of global ids to given base address.

Every locality needs to be able to bind global ids to different components without having to consult the AGAS server for every id to bind. This function can be called to bind a range of consecutive global ids to a range of consecutive local addresses (separated by a given \( offset \)).

**Note:** As long as \( ec \) is not pre-initialized to \( hpx::throws \) this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of \( hpx::exception \).

**Note:** Binding a gid to a local address sets its global reference count to one.

**Parameters**
- **lower_id** – [in] The lower bound of the assigned id range. The value can be used as the first id to assign.
- **count** – [in] The number of consecutive global ids to bind starting at \( lower_id \).
- **baseaddr** – [in] The local address to bind to the global id given by \( lower_id \). This is the base address for all additional local addresses to bind to the remaining global ids.
- **offset** – [in] The offset to use to calculate the local addresses to be bound to the range of global ids.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to \( hpx::throws \) the function will throw on error instead.

**Returns** This function returns \( true \), if the given range was successfully bound. It returns \( false \) otherwise.

```cpp
hpx::future<bool> bind_range_async(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, naming::gid_type const &locality)
```
inline `hpx::future<bool>` **bind_range_async**(`naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, std::uint32_t locality_id)"

inline bool **unbind_local**(`naming::gid_type const &id, error_code &ec = throws`) Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

__Note:__ You can unbind only global ids bound using the function `bind`. Do not use this function to unbind any of the global ids bound using `bind_range`.

__Note:__ As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

__Note:__ This function will raise an error if the global reference count of the given gid is not zero!

**Parameters**
- **id** – [in] The global address (id) for which the association has to be removed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**
The function returns `true` if the association has been removed, and it returns `false` if no association existed. Any error results in an exception thrown from this function.

inline bool **unbind_local**(`naming::gid_type const &id, naming::address &addr, error_code &ec = throws`) Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

__Note:__ You can unbind only global ids bound using the function `bind`. Do not use this function to unbind any of the global ids bound using `bind_range`.

__Note:__ As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

__Note:__ This function will raise an error if the global reference count of the given gid is not zero!

**Parameters**
- **id** – [in] The global address (id) for which the association has to be removed.
- **addr** – [out] The local address which was associated with the given global address (id). 
  This is valid only if the return value of this function is true.
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** The function returns `true` if the association has been removed, and it returns `false` if no association existed. Any error results in an exception thrown from this function.

```cpp
inline bool unbind_range_local(naming::gid_type const &lower_id, std::uint64_t count,
                               error_code &ec = throws)
```

Unbind the given range of global ids.

**Note:** You can unbind only global ids bound using the function `bind_range`. Do not use this function to unbind any of the global ids bound using `bind`.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** This function will raise an error if the global reference count of the given gid is not zero!

**Parameters**
- **lower_id** – [in] The lower bound of the assigned id range. The value must the first id of the range as specified to the corresponding call to `bind_range`.
- **count** – [in] The number of consecutive global ids to unbind starting at `lower_id`. This number must be identical to the number of global ids bound by the corresponding call to `bind_range`.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if a new range has been generated (it has been called for the first time for the given locality) and returns `false` if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

```cpp
bool unbind_range_local(naming::gid_type const &lower_id, std::uint64_t count,
                        naming::address &addr, error_code &ec = throws)
```

Unbind the given range of global ids.

**Note:** You can unbind only global ids bound using the function `bind_range`. Do not use this function to unbind any of the global ids bound using `bind`.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** This function will raise an error if the global reference count of the given gid is not zero!

**Parameters**
- **lower_id** – [in] The lower bound of the assigned id range. The value must the first id of the range as specified to the corresponding call to `bind_range`.
- **count** – [in] The number of consecutive global ids to unbind starting at `lower_id`. This number must be identical to the number of global ids bound by the corresponding call.
to bind_range

- `addr` – [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if a new range has been generated (it has been called for the first time for the given locality) and returns `false` if this locality already got a range assigned in an earlier call.

```cpp
hpx::future<naming::address> unbind_range_async(naming::gid_type const &lower_id, std::uint64_t count = 1)
```

inline bool **is_local_address_cached**(naming::gid_type const &id, error_code &ec = throws)

Test whether the given address refers to a local object.

This function will test whether the given address refers to an object living on the locality of the caller.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**

- `id` – [in] The address to test.
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if the passed address refers to an object which lives on the locality of the caller.

```cpp
bool is_local_address_cached(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
bool is_local_address_cached(naming::gid_type const &id, naming::address &addr, std::pair<bool, components::pinned_ptr> &r, hpx::move_only_function<std::pair<bool, components::pinned_ptr>(naming::address const&)> &&f, error_code &ec = throws)
```

```cpp
bool is_local_lva_encoded_address(std::uint64_t msb) const
```

```cpp
inline bool resolve_local(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

Resolve a given global address (id) to its associated local address.

This function returns the local address which is currently associated with the given global address (id).

**Note:** As long as `ec` is not pre-initialize to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**

- `id` – [in] The global address (id) for which the associated local address should be returned.
- `addr` – [out] The local address which currently is associated with the given global address (id), this is valid only if the return value of this function is true.
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hpx::throws} the function will throw on error instead.

\textbf{Returns} This function returns \texttt{true} if the global address has been resolved successfully (there exists an association to a local address) and the associated local address has been returned. The function returns \texttt{false} if no association exists for the given global address. Any error results in an exception thrown from this function.

```cpp
inline bool resolve_local(hpx::id_type const &id, naming::address &addr, error_code &ec = throws)

inline naming::address resolve_local(naming::gid_type const &id, error_code &ec = throws)
```

```cpp
hpx::future_or_value<naming::address> resolve_async(naming::gid_type const &id)
```

```cpp
hpx::future_or_value<naming::address> resolve_asyncc(hpx::id_type const &id)
```

```cpp
hpx::future_or_value<id_type> get_colocation_id_async(hpx::id_type const &id)
```

```cpp
bool resolve_full_local(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
inline bool resolve_full_local(hpx::id_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
inline naming::address resolve_full_local(naming::gid_type const &id, error_code &ec = throws)
```

```cpp
hpx::future_or_value<naming::address> resolve_full_async(naming::gid_type const &id)
```

```cpp
hpx::future_or_value<naming::address> resolve_full_async(hpx::id_type const &id)
```

```cpp
bool resolve_cached(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
inline bool resolve_cached(hpx::id_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
inline bool resolve_cached(naming::gid_type const &gids, naming::address *addrs, std::size_t size, hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)
```

```cpp
inline bool resolve_local(naming::gid_type const *gids, naming::address *addrs, std::size_t size, hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)
```

```cpp
bool resolve_full_local(naming::gid_type const *gids, naming::address *addrs, std::size_t size, hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)
```

```cpp
bool resolve_cached(naming::gid_type const *gids, naming::address *addrs, std::size_t size, hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)
```

```cpp
hpx::future_or_value<std::int64_t> incref_async(naming::gid_type const &gid, std::int64_t credits = 1, hpx::id_type const &keep_alive = hpx::invalid_id)
```

Increment the global reference count for the given id.

\textbf{Note}: As long as \texttt{ec} is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \texttt{ec}. Otherwise it throws an instance of hpx::exception.
Parameters

- **gid** – [in] The global address (id) for which the global reference count has to be increased.
- **credits** – [in] The number of reference counts to add for the given id.
- **keep_alive** – [in] Id to keep alive (if valid)
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns Whether the operation was successful.

```cpp
inline std::int64_t incref(naming::gid_type const &gid, std::int64_t credits = 1, error_code &ec = throws)
```

```cpp
void decref(naming::gid_type const &id, std::int64_t credits = 1, error_code &ec = throws)
```

Decrement the global reference count for the given id.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The global address (id) for which the global reference count has to be decremented.
- **t** – [out] If this was the last outstanding global reference for the given gid (the return value of this function is zero), t will be set to the component type of the corresponding element. Otherwise t will not be modified.
- **credits** – [in] The number of reference counts to add for the given id.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The global reference count after the decrement.

```cpp
hpx::future<iterate_names_return_type> iterate_ids(std::string const &pattern)
```

Invoke the supplied `hpx::function` for every registered global name.

Parameters **pattern** – [in] pattern (possibly using wildcards) to match all existing entries against

```cpp
bool register_name(std::string const &name, naming::gid_type const &id, error_code &ec = throws)
```

Register a global name with a global address (id)

Parameters **name** – [in] The global name (string) to be associated with the global address.
- **id** – [in] The global address (id) to be associated with the global address.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The function returns `true` if the global name was registered. It returns false if the global name is not registered.
**HPX Documentation, master**

```cpp
hpx::future<bool> register_name_async(std::string const &name, hpx::id_type const &id) const

bool register_name(std::string const &name, hpx::id_type const &id, error_code &ec = throws)
const

hpx::future<hpx::id_type> unregister_name_async(std::string const &name) const

Unregister a global name (release any existing association)
This function releases any existing association of the given global name with a global address (id).

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of hpx::exception.

**Parameters**
- name – [in] The global name (string) for which any association with a global address (id) has to be released.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**
The function returns `true` if an association of this global name has been released, and it returns `false`, if no association existed. Any error results in an exception thrown from this function.

```cpp
hpx::id_type unregister_name(std::string const &name, error_code &ec = throws) const

hpx::future<hpx::id_type> resolve_name_async(std::string const &name) const

Query for the global address associated with a given global name.
This function returns the global address associated with the given global name.

This function returns true if it returned global address (id), which is currently associated with the given global name, and it returns false, if currently there is no association for this global name. Any error results in an exception thrown from this function.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of hpx::exception.

**Parameters**
- name – [in] The global name (string) for which the currently associated global address has to be retrieved.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**
[out] The id currently associated with the given global name (valid only if the return value is true).

```cpp
hpx::id_type resolve_name(std::string const &name, error_code &ec = throws) const

future<hpx::id_type> on_symbol_namespace_event(std::string const &name, bool call_for_past_events = false) const

Install a listener for a given symbol namespace event.
This function installs a listener for a given symbol namespace event. It returns a future which becomes ready as a result of the listener being triggered.
```
Note: The only event type which is currently supported is `symbol_ns.bind`, i.e., the listener is triggered whenever a global id is registered with the given name.

Parameters
- **name** – [in] The global name (string) for which the given event should be triggered.
- **evt** – [in] The event for which a listener should be installed.
- **call_for_past_events** – [in, optional] Trigger the listener even if the given event has already happened in the past. The default for this parameter is `false`.

Returns: A future instance encapsulating the global id which is causing the registered listener to be triggered.

```cpp
void update_cache_entry(naming::gid_type const &gid, gva const &gva, error_code &ec = throws)
```

**Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

```cpp
inline void update_cache_entry(naming::gid_type const &gid, naming::address const &addr,
                                 std::uint64_t count = 0, std::uint64_t offset = 0, error_code &ec = throws)
```

**Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

```cpp
bool get_cache_entry(naming::gid_type const &gid, gva &gva, naming::gid_type &idbase,
                     error_code &ec = throws) const
```

**Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

```cpp
void remove_cache_entry(naming::gid_type const &id, error_code &ec = throws) const
```

**Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

```cpp
void clear_cache(error_code &ec = throws) const
```

**Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

```cpp
void start_shutdown(error_code &ec = throws)
```

```cpp
hpx::future<std::pair<hpx::id_type, naming::address>> begin_migration(hpx::id_type const &id)
```

Start/stop migration of an object

**Returns** Current locality and address of the object to migrate
bool end_migration(hpx::id_type const &id)

std::pair<bool, components::pinned_ptr> was_object_migrated(naming::gid_type const &gid, hpx::move_only_function<components::pinned_ptr>(&f))

Maintain list of migrated objects.

hpx::future<void> mark_as_migrated(naming::gid_type const &gid, hpx::move_only_function<std::pair<bool, hpx::future<void>>>(&f, bool expect_to_be_marked_as_migrating)

Mark the given object as being migrated (if the object is unpinned). Delay migration until the object is unpinned otherwise.

void unmark_as_migrated(naming::gid_type const &gid_, hpx::move_only_function<void()>(&f))

Remove the given object from the table of migrated objects.

void pre_cache_endpoints(std::vector<parcelset::endpoints_type> const&)

Variables

HPX_ACTION_USES_MEDIUM_STACK(hpx::agas::server::primary_namespace::allocate_action) HPX_REGISTER_ACTION_DECLARATION(hpx::agas::server::primary_namespace::allocate_action)

namespace hpx

namespace agas

Functions

naming::gid_type bootstrap_primary_namespace_gid()

hpx::id_type bootstrap_primary_namespace_id()

namespace server

AGAS’s primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS’s primary namespace.
### HPX Documentation, master

<table>
<thead>
<tr>
<th>MSB</th>
<th>LSB</th>
<th>prefix</th>
<th>RC</th>
<th>identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSB - Most significant bits (bit 64 to bit 127)</td>
<td>LSB - Least significant bits (bit 0 to bit 63)</td>
<td>prefix - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.</td>
<td>RC - Bit 88 to bit 92 of the MSB. This is the log2 of the number of reference counting credits on the GID. Bit 93 is used by the locking scheme for gid_types. Bit 94 is a flag which is set if the credit value is valid. Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality).</td>
<td>identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The content of these bits depends on the component type of the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For a hpx#components#component_runtime_support the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.</td>
</tr>
</tbody>
</table>

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxxxxxxxx
   Historically unused address space reserved for future use.
xxxxxxxxxxxx0000xxxxxxxxxxxxxxxxxxxx
   Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxxxxxxx
   Prefix of the bootstrap AGAS locality.
00000001000000010000000000000001
   Address of the primary_namespace component on the bootstrap AGAS locality.
00000001000000010000000000000002
   Address of the component_namespace component on the bootstrap AGAS locality.
00000001000000010000000000000003
   Address of the symbol_namespace component on the bootstrap AGAS locality.
00000001000000010000000000000004
   Address of the locality_namespace component on the bootstrap AGAS locality.
```

**Note:** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned...
GIDs will be unique.

namespace `hpx`
Functions

\texttt{hpx::id\_type get\_colocation\_id(launch\_sync\_policy, hpx::id\_type const \&id, error\_code \&ec = throws)}

Return the id of the locality where the object referenced by the given id is currently located on.

The function \texttt{hpx::get\_colocation\_id()} returns the id of the locality where the given object is currently located.

\textbf{See also:}

\texttt{hpx::get\_colocation\_id()}

\textbf{Note:} As long as \textit{ec} is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \textit{ec}. Otherwise it throws an instance of \texttt{hpx::exception}.

\begin{itemize}
  \item \textbf{id} – [in] The id of the object to locate.
  \item \textbf{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hpx::throws} the function will throw on error instead.
\end{itemize}

\texttt{hpx::future<hpx::id\_type> get\_colocation\_id(hpx::id\_type const \&id)}

Asynchronously return the id of the locality where the object referenced by the given id is currently located on.

\textbf{See also:}

\texttt{hpx::get\_colocation\_id(launch::sync\_policy)}

\begin{itemize}
  \item \textbf{Parameters} \textit{id} – [in] The id of the object to locate.
\end{itemize}

static inline constexpr hpx::lcos::base_lco const *call(hpx::naming::address_type lva) noexcept

namespace lcos

class base_lco

#include <base_lco.hpp> The base_lco class is the common base class for all LCO’s implementing a simple set_event action

Subclassed by hpx::lcos::base_lco_with_value< Result, RemoteResult, ComponentTag >, hpx::lcos::base_lco_with_value< void, void, ComponentTag >

Public Types

typedef components::managed_component<base_lco> wrapping_type

typedef base_lco base_type_holder
Public Functions

virtual void set_event() = 0
virtual void set_exception(std::exception_ptr const &e)
virtual void connect(hpx::id_type const &)
virtual void disconnect(hpx::id_type const &)
virtual ~base_lco()

Destructor, needs to be virtual to allow for clean destruction of derived objects

void set_event_nonvirt()

The function set_event_nonvirt is called whenever a set_event_action is applied on an instance of a LCO. This function just forwards to the virtual function set_event, which is overloaded by the derived concrete LCO.

void set_exception_nonvirt(std::exception_ptr const &e)

The function set_exception is called whenever a set_exception_action is applied on an instance of a LCO. This function just forwards to the virtual function set_exception, which is overloaded by the derived concrete LCO.

Parameters e – [in] The exception encapsulating the error to report to this LCO instance.

void connect_nonvirt(hpx::id_type const &id)

The function connect_nonvirt is called whenever a connect_action is applied on an instance of a LCO. This function just forwards to the virtual function connect, which is overloaded by the derived concrete LCO.

Parameters id – [in] target id

void disconnect_nonvirt(hpx::id_type const &id)

The function disconnect_nonvirt is called whenever a disconnect_action is applied on an instance of a LCO. This function just forwards to the virtual function disconnect, which is overloaded by the derived concrete LCO.

Parameters id – [in] target id

HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, set_event_nonvirt, set_event_action)
HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, set_exception_nonvirt, set_exception_action)
HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, connect_nonvirt, connect_action)
HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, disconnect_nonvirt, disconnect_action)

Each of the exposed functions needs to be encapsulated into an action type, allowing to generate all required boilerplate code for threads, serialization, etc.

The set_event_action may be used to unconditionally trigger any LCO instances, it carries no additional parameters. The set_exception_action may be used to transfer arbitrary error information from the remote site to the LCO instance specified as a continuation. This action carries 2 parameters:

Parameters std::exception_ptr – [in] The exception encapsulating the error to report to this LCO instance.

set_exception_action HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, connect_nonvirt, connect_action)
HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, disconnect_nonvirt, disconnect_action)

The connect_action may be used to.

The set_exception_action may be used to

namespace hpx

namespace components

namespace lcos

template<typename Result, typename RemoteResult, typename ComponentTag>

class base_lco_with_value : public hpx::lcos::base_lco, public ComponentTag

#include <base_lco_with_value.hpp>

The base_lco_with_value class is the common base class for all LCO’s synchronizing on a value. The RemoteResult template argument should be set to the type of the argument expected for the set_value action.

Template Parameters
• RemoteResult – The type of the result value to be carried back to the LCO instance.
• ComponentTag – The tag type representing the type of the component (either component_tag or managed_component_tag).

Public Types

using wrapping_type = typename detail::base_lco_wrapping_type<ComponentTag, base_lco_with_value>::type

using base_type_holder = base_lco_with_value

Public Functions

inline void set_value_nonvirt(RemoteResult &&result)

The function set_value_nonvirt is called whenever a set_value_action is applied on this LCO instance. This function just forwards to the virtual function set_value, which is overloaded by the derived concrete LCO.

Parameters result – [in] The result value to be transferred from the remote operation back to this LCO instance.

inline Result get_value_nonvirt()

The function get_result_nonvirt is called whenever a get_result_action is applied on this LCO instance. This function just forwards to the virtual function get_result, which is overloaded by the derived concrete LCO.

HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco_with_value, set_value_nonvirt, set_value_action) HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco_with_value

The set_value_action may be used to trigger any LCO instances while carrying an additional parameter of any type.

RemoteResult is taken by rvalue ref. This allows for perfect forwarding. When the action thread function is created, the values are moved into the called function. If we took it by const lvalue reference, we would disable the possibility to further move the result to the designated destination.

Parameters RemoteResult – [in] The type of the result to be transferred back to this LCO instance. The get_value_action may be used to query the value this LCO instance exposes as its ‘result’ value.

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace distributed

template<typename Result, typename RemoteResult>

class promise

#include <promise.hpp> A promise can be used by a single thread to invoke a (remote) action and wait for the result. The result is expected to be sent back to the promise using the LCO’s set_event action

A promise is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on an eager evaluated remote operation returning a result of the type Result. The promise allows to synchronize exactly one thread (the one passed during construction time).

// Create the promise (the expected result is a id_type)
hpX::distributed::promise<hpx::id_type> p;

// Get the associated future
future<hpx::id_type> f = p.get_future();

// initiate the action supplying the promise as a
// continuation
apply<some_action>(new continuation(p.get_id()), ...);

// Wait for the result to be returned, yielding control
// in the meantime.
hpX::id_type result = f.get();
// ...

Note: The action executed by the promise must return a value of a type convertible to the type as specified by the template parameter RemoteResult
Template Parameters
- **Result** – The template parameter `Result` defines the type this promise is expected to return from `promise::get`.
- **RemoteResult** – The template parameter `RemoteResult` defines the type this promise is expected to receive from the remote action.

```cpp
namespace lcos

Typedefs

using instead = hpx::distributed::promise<Result, RemoteResult>

template<typename Result, typename RemoteResult, typename ComponentTag>
class base_lco_with_value : public hpx::lcos::base_lco, public ComponentTag
#include <base_lco_with_value.hpp>

template<typename Action, typename Result = typename traits::promise_local_result<typename Action::remote_result_type>::type, bool DirectExecute = Action::direct_execution::value>
class packaged_action
#include <packaged_action.hpp> A packaged_action can be used by a single thread to invoke a (remote) action and wait for the result. The result is expected to be sent back to the packaged_action using the LCO’s set_event action.

A packaged_action is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type `Result`.

**Note:** The action executed using the packaged_action as a continuation must return a value of a type convertible to the type as specified by the template parameter `Result`.

```

```cpp
promise() = default

constructs a promise object and a shared state.
```

```cpp
template<typename Allocator>
inline promise(std::allocator_arg_t, Allocator const &a)

constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory for the shared state.
```

```cpp
promise(promise &&other) noexcept = default

constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly-constructed object.
```

```cpp
Post other has no shared state.
```

```cpp
~promise() = default

Abandons any shared state.
```

```cpp
promise &operator=(promise &&other) noexcept = default

Abandons any shared state (30.6.4) and then as if promise(HPX_MOVE(other)).swap(*this).
```

```cpp
Returns *this.
```

```cpp
inline void swap(promise &other) noexcept

Exchanges the shared state of *this and other.
```

```cpp
Post *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.
```

```cpp
inline void set_value()

atomically stores the value r in the shared state and makes that state ready (30.6.4).
```

```cpp
Throws future_error – if its shared state already has a stored value. if shared state has no stored value exception is raised. promise_already_satisfied if its shared state already has a stored value or exception. no_state if *this has no shared state.
```

```

constructs a promise object and a shared state.

```cpp
template<typename Allocator>
inline promise(std::allocator_arg_t, Allocator const &a)
```

constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory for the shared state.

```cpp
promise(promise &&other) noexcept = default
```

constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly-constructed object.

```cpp
Post other has no shared state.
```

```cpp
~promise() = default
```

Abandons any shared state.

```cpp
promise &operator=(promise &&other) noexcept = default
```

Abandons any shared state (30.6.4) and then as if promise(HPX_MOVE(other)).swap(*this).

```cpp
Returns *this.
```
inline void **swap**(promise &other) noexcept

Exchanges the shared state of *this and other.

**Post** *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

inline void **set_value**()

atomically stores the value r in the shared state and makes that state ready (30.6.4).

**Throws** future_error – if its shared state already has a stored value. if shared state has no stored value exception is raised. promise_already_satisfied if its shared state already has a stored value or exception. no_state if *this has no shared state.

Functions

void trigger_lco_event(hpx::id_type const &id, naming::address &&addr, bool move_credits = true)
    Trigger the LCO referenced by the given id.

Parameters

• id – [in] This represents the id of the LCO which should be triggered.
• addr – [in] This represents the addr of the LCO which should be triggered.
• move_credits – [in] If this is set to true then it is ok to send all credits in id along with
  the generated message. The default value is true.

inline void trigger_lco_event(hpx::id_type const &id, bool move_credits = true)
    Trigger the LCO referenced by the given id.

Parameters

• id – [in] This represents the id of the LCO which should be triggered.
• move_credits – [in] If this is set to true then it is ok to send all credits in id along with
  the generated message. The default value is true.

void trigger_lco_event(hpx::id_type const &id, naming::address &&addr, hpx::id_type const &cont, bool
    move_credits = true)
    Trigger the LCO referenced by the given id.

Parameters

• id – [in] This represents the id of the LCO which should be triggered.
• addr – [in] This represents the addr of the LCO which should be triggered.
• cont – [in] This represents the LCO to trigger after completion.
• move_credits – [in] If this is set to true then it is ok to send all credits in id along with
  the generated message. The default value is true.

inline void trigger_lco_event(hpx::id_type const &id, hpx::id_type const &cont, bool move_credits =
    true)
    Trigger the LCO referenced by the given id.

Parameters

• id – [in] This represents the id of the LCO which should be triggered.
• cont – [in] This represents the LCO to trigger after completion.
• move_credits – [in] If this is set to true then it is ok to send all credits in id along with
  the generated message. The default value is true.

template<typename Result>
void set_lco_value(hpx::id_type const &id, naming::address &&addr, Result &&t, bool move_credits =
    true)
    Set the result value for the LCO referenced by the given id.

Parameters

• id – [in] This represents the id of the LCO which should receive the given value.
• addr – [in] This represents the addr of the LCO which should be triggered.
• t – [in] This is the value which should be sent to the LCO.
• **move_credits** – [in] If this is set to true then it is ok to send all credits in `id` along with the generated message. The default value is true.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type
set_lco_value(hpx::id_type const &id, Result &&t, bool move_credits = true)
```

Set the result value for the (managed) LCO referenced by the given id.

**Parameters**

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in `id` along with the generated message. The default value is true.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type
set_lco_value_unmanaged(hpx::id_type const &id, Result &&t, bool move_credits = true)
```

Set the result value for the (unmanaged) LCO referenced by the given id.

**Parameters**

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in `id` along with the generated message. The default value is true.

```cpp
void set_lco_value(hpx::id_type const &id, naming::address &&addr, Result &&t, hpx::id_type const &cont, bool move_credits = true)
```

Set the result value for the LCO referenced by the given id.

**Parameters**

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
• `move_credits` – [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type set_lco_value(hpx::id_type const &id, Result &&t, hpx::id_type const &cont, bool move_credits = true)
```

Set the result value for the (managed) LCO referenced by the given id.

**Parameters**
- `id` – [in] This represents the id of the LCO which should receive the given value.
- `t` – [in] This is the value which should be sent to the LCO.
- `cont` – [in] This represents the LCO to trigger after completion.
- `move_credits` – [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type set_lco_value_unmanaged(hpx::id_type const &id, Result &&t, hpx::id_type const &cont, bool move_credits = true)
```

Set the result value for the (unmanaged) LCO referenced by the given id.

**Parameters**
- `id` – [in] This represents the id of the LCO which should receive the given value.
- `t` – [in] This is the value which should be sent to the LCO.
- `cont` – [in] This represents the LCO to trigger after completion.
- `move_credits` – [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

```cpp
void set_lco_error(hpx::id_type const &id, naming::address &&addr, std::exception_ptr const &e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.
Parameters

- **id** – **[in]** This represents the id of the LCO which should receive the error value.
- **addr** – **[in]** This represents the addr of the LCO which should be triggered.
- **e** – **[in]** This is the error value which should be sent to the LCO.
- **move_credits** – **[in]** If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
void set_lco_error(hpx::id_type const &id, naming::address &&addr, std::exception_ptr &e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – **[in]** This represents the id of the LCO which should receive the error value.
- **addr** – **[in]** This represents the addr of the LCO which should be triggered.
- **e** – **[in]** This is the error value which should be sent to the LCO.
- **move_credits** – **[in]** If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
inline void set_lco_error(hpx::id_type const &id, std::exception_ptr const &e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – **[in]** This represents the id of the LCO which should receive the error value.
- **e** – **[in]** This is the error value which should be sent to the LCO.
- **move_credits** – **[in]** If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
void set_lco_error(hpx::id_type const &id, std::exception_ptr &e, hpx::id_type const &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – **[in]** This represents the id of the LCO which should receive the error value.
- **addr** – **[in]** This represents the addr of the LCO which should be triggered.
- **e** – **[in]** This is the error value which should be sent to the LCO.
- **cont** – **[in]** This represents the LCO to trigger after completion.
- **move_credits** – **[in]** If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.
void set_lco_error(hpx::id_type const &id, naming::address &&addr, std::exception_ptr &e, hpx::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

inline void set_lco_error(hpx::id_type const &id, std::exception_ptr const &e, hpx::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

inline void set_lco_error(hpx::id_type const &id, std::exception_ptr &&e, hpx::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

**checkpoint**

See Public API for a list of names and headers that are part of the public HPX API.

hpx/checkpoint/checkpoint.hpp

See Public API for a list of names and headers that are part of the public HPX API.

This header defines the save_checkpoint and restore_checkpoint functions. These functions are designed to help HPX application developer’s checkpoint their applications. Save_checkpoint serializes one or more objects and saves them as a byte stream. Restore_checkpoint converts the byte stream back into instances of the objects.

namespace hpx

namespace util

Functions

inline std::ostream &operator<<(std::ostream &ost, checkpoint const &ckp)

    Operator<< Overload

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint’s data. The operator>> overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

Parameters
• ost – Output stream to write to.
• ckp – Checkpoint to copy from.

Returns Operator<< returns the ostream object.

inline std::istream &operator>>(std::istream &ist, checkpoint &ckp)

    Operator>> Overload

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint’s data in the operator<< overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

Parameters
• ist – Input stream to write from.
• ckp – Checkpoint to write to.

Returns Operator>> returns the ostream object.

template<typename T, typename ...Ts, typename U = typename std::enable_if<!hpx::traits::is_launch_policy<T>::value && !std::is_same<typename std::decay<T>::type, checkpoint>::value>::type>
hpx::future<checkpoint> save_checkpoint(T &&t, Ts&&... ts)

    Save_checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.
Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

**Template Parameters**
- T – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- Ts – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- U – This parameter is used to make sure that T is not a launch policy or a checkpoint. This forces the compiler to choose the correct overload.

**Parameters**
- t – A container to restore.
- ts – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

**Returns** Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts>
hpx::future<checkpoint> save_checkpoint(checkpoint &&c, T &&t, Ts&&... ts)
```

Save_checkpoint - Take a pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

**Template Parameters**
- T – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- Ts – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

**Parameters**
- c – Takes a pre-initialized checkpoint to copy data into.
- t – A container to restore.
- ts – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

**Returns** Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename std::decay<T>::type, checkpoint>::value>::type>
hpx::future<checkpoint> save_checkpoint(hpx::launch p, T &&t, Ts&&... ts)
```

Save_checkpoint - Policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

**Template Parameters**
- T – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
• **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.

**Parameters**
- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** `Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts>
hpx::future<checkpoint> save_checkpoint(hpx::launch p, checkpoint &&c, T &&t, Ts&&... ts)
```

Save_checkpoint - Policy overload & pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a `shared_ptr` to the component or by passing a component’s client instance to `save_checkpoint`. Additionally, the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

**Template Parameters**
- **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.

**Parameters**
- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** `Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename std::decay<T>::type, checkpoint>::value>::type>
checkpoint save_checkpoint(hpx::launch::sync_policy sync_p, T &&t, Ts&&... ts)
```

Save_checkpoint - Sync_policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a `shared_ptr` to the component or by passing a component’s client instance to `save_checkpoint`. Additionally, the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

**Template Parameters**
- **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
• **U** – This parameter is used to make sure that T is not a checkpoint. This forces the compiler to choose the correct overload.

**Parameters**

• **sync_p** – `hpx::launch::sync_policy`
• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** Save_checkpoint which is passed `hpx::launch::sync_policy` will return a checkpoint which contains the serialized values checkpoint.

template<typename T, typename ...Ts>

```cpp
checkpoint save_checkpoint(hpx::launch::sync_policy &c, T &t, Ts &... ts)
```

Save_checkpoint - Sync_policy overload & pre-init. checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a `shared_ptr` to the component or by passing a component’s client instance to `save_checkpoint`. Additionally, the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

**Template Parameters**

• **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
• **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.

**Parameters**

• **sync_p** – `hpx::launch::sync_policy`
• **c** – Takes a pre-initialized checkpoint to copy data into.
• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** Save_checkpoint which is passed `hpx::launch::sync_policy` will return a checkpoint which contains the serialized values checkpoint.

template<typename T, typename ...Ts, typename U = typename

```cpp
std::enable_if<!hpx::traits::is_launch_policy<T>::value && !std::is_same<typename
std::decay<T>::type, checkpoint>::value>::type>
```

```cpp
hpx::future<checkpoint> prepare_checkpoint(T const &t, Ts const &... ts)
```

prepare_checkpoint

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Template Parameters**

• **T** – A container to restore.
• **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**

• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

template<typename T, typename ...Ts>
**prepare_checkpoint**

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Template Parameters**
- `T` – A container to restore.
- `Ts` – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**
- `c` – Takes a pre-initialized checkpoint to prepare
- `t` – A container to restore.
- `ts` – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

**Template**

```cpp
hpx::future<checkpoint> prepare_checkpoint(checkpoint &&c, T const &t, Ts const&... ts)
```

**prepare_checkpoint**

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Template Parameters**
- `T` – A container to restore.
- `Ts` – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**
- `p` – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- `t` – A container to restore.
- `ts` – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

**Template**

```cpp
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<T, checkpoint>::value>::type>
hpx::future<checkpoint> prepare_checkpoint(hpx::launch p, T const &t, Ts const&... ts)
```

**prepare_checkpoint**

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Template Parameters**
- `T` – A container to restore.
- `Ts` – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**
- `p` – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- `c` – Takes a pre-initialized checkpoint to prepare
- `t` – A container to restore.
• ts – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns**
prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

```cpp
template<
typename T, typename ...Ts>
void restore_checkpoint(checkpoint const &c, T &t, Ts&... ts)
```

**Restore_checkpoint**

Restore_checkpoint takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in save_checkpoint). Restore_checkpoint can resurrect a stored component in two ways: by passing in an instance of a component’s shared_ptr or by passing in an instance of the component’s client.

**Template Parameters**
- T – A container to restore.
- Ts – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**
- c – The checkpoint to restore.
- t – A container to restore.
- ts – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns**
Restore_checkpoint returns void.

**class checkpoint**

```cpp
#include <checkpoint.hpp>
```

Checkpoint Object

Checkpoint is the container object which is produced by save_checkpoint and is consumed by a restore_checkpoint. A checkpoint may be moved into the save_checkpoint object to write the byte stream to the pre-created checkpoint object.

Checkpoints are able to store all containers which are able to be serialized including components.

**Public Types**

    Functions

    template<typename Container, typename ...Ts>
    void save_checkpoint_data(Container &data, Ts&... ts)
        save_checkpoint_data

    Save_checkpoint_data takes any number of objects which a user may wish to store in the given container.

    Template Parameters
    • Container – Container used to store the check-pointed data.
    • Ts – Types of variables to checkpoint

    Parameters
    • data – Container instance used to store the checkpoint data
    • ts – Variable instances to be inserted into the checkpoint.

    template<typename ...Ts>
\texttt{std::size_t prepare\_checkpoint\_data(Ts const\&... ts)}

\begin{verbatim}
prepare_checkpoint_data
\end{verbatim}

prepare\_checkpoint\_data takes any number of objects which a user may wish to store in a subsequent\n\texttt{save\_checkpoint\_data}operation. The function will return the number of bytes necessary to store the\ndata that will be produced.

\textbf{Template Parameters} Ts – Types of variables to checkpoint
\textbf{Parameters} ts – Variable instances to be inserted into the checkpoint.

\begin{verbatim}
template<typename Container, typename ...Ts>
void restore\_checkpoint\_data(Container const &cont, Ts&... ts)
\end{verbatim}

\begin{verbatim}
restore_checkpoint_data
\end{verbatim}

\begin{verbatim}
restore\_checkpoint\_data takes any number of objects which a user may wish to restore from the given\ncontainer. The sequence of objects has to correspond to the sequence of objects for the corresponding\ncall to \texttt{save\_checkpoint\_data} that had used the given container instance.

\textbf{Template Parameters} 
• Container – Container used to restore the check-pointed data.
• Ts – Types of variables restore

\textbf{Parameters} 
• cont – Container instance used to restore the checkpoint data
• ts – Variable instances to be restored from the container

namespace \texttt{collectives}

Top level HPX namespace.
AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_gather operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_gather operation has been completed.
than zero.

• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

**Returns** This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_gather operation has been completed.

**hpx/collectives/all_reduce.hpp**

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

**Functions**

```cpp
template<typename T, typename F>
hpx::future<std::decay_t<T>> all_reduce(char const *basename, T &&result, F &&op,
    num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(),
    generation_arg generation = generation_arg(), root_site_arg root_site = root_site_arg())
```

AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Parameters**

• **basename** – The base name identifying the all_reduce operation
• **local_result** – The value to transmit to all participating sites from this call site.
• **op** – Reduction operation to apply to all values supplied from all participating sites
• **num_sites** – The number of participating sites (default: all localities).
• **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns. 'params root_site The site that is responsible for creating the all_reduce support object. This value is optional and defaults to '0' (zero).

**Returns** This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```cpp
template<typename T, typename F>
hpx::future<std::decay_t<T>> all_reduce(communicator comm, T &&result, F &&op, this_site_arg this_site = this_site_arg(),
    generation_arg generation = generation_arg())
```

AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.
AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Parameters**

- `comm` – A communicator object returned from `create_communicator`
- `local_result` – The value to transmit to all participating sites from this call site.
- `op` – Reduction operation to apply to all values supplied from all participating sites
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- `generation` – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- `comm` – A communicator object returned from `create_communicator`
- `local_result` – The value to transmit to all participating sites from this call site.
- `op` – Reduction operation to apply to all values supplied from all participating sites
- `generation` – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**Returns**

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```cpp
#include <hpx/collectives/all_to_all.hpp>

// See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx
{
    namespace collectives
    {
        template<typename T>
        hpx::future<std::vector<T>> all_to_all(char const *basename, T &&result, num_sites_arg num_sites = num_sites_arg(),
                 this_site_arg this_site = this_site_arg(),
                 generation_arg generation = generation_arg(),
                 root_site_arg root_site = root_site_arg())
    }
}
```

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.
Parameters

- **basename** – The base name identifying the all_to_all operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the all_to_all operation performed on the given base name. This is optional and needs to be supplied only if the all_to_all operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_to_all operation has been completed.

```cpp
template<typename T>
hpx::future<std::vector<std::decay_t<T>>> all_to_all(communicator comm, T &&result, 
this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg())
```

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from create_communicator
- **local_result** – The value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_to_all operation performed on the given base name. This is optional and needs to be supplied only if the all_to_all operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_to_all operation has been completed.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_to_all operation has been completed.
hpx/collectives/argument_types.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx
    Top level HPX namespace.

namespace collectives
    Top level HPX namespace.

**Typedefs**

using **num_sites_arg** = detail::argument_type<detail::num_sites_tag>
    The number of participating sites (default: all localities)

using **this_site_arg** = detail::argument_type<detail::this_site_tag>
    The local end of the communication channel.

using **that_site_arg** = detail::argument_type<detail::that_site_tag>
    The opposite end of the communication channel.

using **generation_arg** = detail::argument_type<detail::generation_tag>
    The generational counter identifying the sequence number of the operation performed on the given base name. It needs to be supplied only if the operation on the given base name has to be performed more than once. It must be a positive number greater than zero.

using **root_site_arg** = detail::argument_type<detail::root_site_tag, 0>
    The site that is responsible for creating the support object of the operation. It defaults to ‘0’ (zero).

using **tag_arg** = detail::argument_type<detail::tag_tag, 0>
    The tag identifying the concrete operation.

using **arity_arg** = detail::argument_type<detail::arity_tag>
    The number of children each of the communication nodes is connected to (default: picked based on num_sites).

hpx/collectives/barrier.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx
    Top level HPX namespace.

namespace distributed
Functions

explicit barrier(std::string const &base_name)

Creates a barrier, rank is locality id, size is number of localities

A barrier base_name is created. It expects that hpx::get_num_localities() participate and the local rank is hpx::get_locality_id().

Parameters base_name – The name of the barrier

barrier(std::string const &base_name, std::size_t num)

Creates a barrier with a given size, rank is locality id

A barrier base_name is created. It expects that num participate and the local rank is hpx::get_locality_id().

Parameters
• base_name – The name of the barrier
• num – The number of participating threads

barrier(std::string const &base_name, std::size_t num, std::size_t rank)

Creates a barrier with a given size and rank

A barrier base_name is created. It expects that num participate and the local rank is rank.

Parameters
• base_name – The name of the barrier
• num – The number of participating threads
• rank – The rank of the calling site for this invocation

barrier(std::string const &base_name, std::vector<std::size_t> const &ranks, std::size_t rank)

Creates a barrier with a vector of ranks

A barrier base_name is created. It expects that ranks.size() and the local rank is rank (must be contained in ranks).

Parameters
• base_name – The name of the barrier
• ranks – Gives a list of participating ranks (this could be derived from a list of locality ids
• rank – The rank of the calling site for this invocation

void wait() const

Wait until each participant entered the barrier. Must be called by all participants

If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.

Returns This function returns once all participants have entered the barrier (have called wait).

Throws Nothing.

hpx::future<void> wait(hpx::launch::async_policy) const

Wait until each participant entered the barrier. Must be called by all participants

Returns a future that becomes ready once all participants have entered the barrier (have called wait).
static void synchronize()

Perform a global synchronization using the default global barrier. The barrier is created once at startup and can be reused throughout the lifetime of an HPX application.

Note: This function currently does not support dynamic connection and disconnection of localities.

`hpx/collectives/broadcast.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.

namespace collectives

Top level HPX namespace.

Functions

template<typename T>
hpx::future<void> broadcast_to(char const *basename, T &&local_result, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(),
genration_arg generation = generation_arg())

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Parameters

- basename – The base name identifying the broadcast operation
- local_result – A value to transmit to all participating sites from this call site.
- num_sites – The number of participating sites (default: all localities).
- generation – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns  This function returns a future that will become ready once the broadcast operation has been completed.

template<typename T>
hpx::future<void> broadcast_to(communicator comm, T &&local_result, this_site_arg this_site = this_site_arg(),
genration_arg generation = generation_arg())

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note:  The generation values from corresponding broadcast_to and broadcast_from have to match.

Parameters

- comm – A communicator object returned from create_communicator
- **local_result** – A value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns** This function returns a future that will become ready once the broadcast operation has been completed.

```cpp
template<typename T>
hpx::future<T> broadcast_from(char const *basename, this_site_arg this_site = this_site_arg(),
                                 generation_arg generation = generation_arg())
```

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

**Parameters**
- **basename** – The base name identifying the broadcast operation
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

**Returns** This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

```cpp
template<typename T>
hpx::future<T> broadcast_from(communicator comm, this_site_arg this_site = this_site_arg(),
                                 generation_arg generation = generation_arg())
```

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.
Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

**Note:** The generation values from corresponding `broadcast_to` and `broadcast_from` have to match.

**Note:** The generation values from corresponding `broadcast_to` and `broadcast_from` have to match.

### Parameters

- **comm** – A communicator object returned from `create_communicator`
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from `create_communicator`
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

### Returns

This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```cpp
namespace hpx
{
    Top level HPX namespace.

    namespace lcos
    {

        Functions

        template<typename Action, typename ArgN, ...>
        hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...))>> > broadcast (std::vector< hpx::id_type > const &ids, ArgN argN,...)

        Perform a distributed broadcast operation.

        The function hpx::lcos::broadcast performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.
    }
}
```
The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

**Note:** If decltype(Action(…)) is void, then the result of this function is future<void>.

**Parameters**

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

**Returns**

This function returns a future representing the result of the overall reduction operation.

```cpp
template<typename Action, typename ArgN, ...
> void broadcast_post (std::vector< hpx::id_type > const &ids, ArgN argN,...)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function hpx::lcos::broadcast_post performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

**Parameters**

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```cpp
template<typename Action, typename ArgN, ...
> hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))>> > broadcast_with_index (std::vector< hpx::id_type > const &ids,
ArgN argN,...)
```

Perform a distributed broadcast operation.

The function hpx::lcos::broadcast_with_index performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Note:** If decltype(Action(…)) is void, then the result of this function is future<void>.

**Parameters**

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
• **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall reduction operation.

```cpp
template<typename Action, typename ArgN, ...>
void broadcast_post_with_index (std::vector< hpx::id_type > const &ids, ArgN argN,...)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function hpx::lcos::broadcast_post_with_index performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations. The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Parameters**

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

### hpx/collectives/channel_communicator.hpp

See [Public API](#) for a list of names and headers that are part of the public HPX API.

**namespace hpx**

Top level HPX namespace.

**namespace collectives**

Top level HPX namespace.

**Functions**

```cpp
hpx::future<channel_communicator> create_channel_communicator(char const *basename,
    num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg())
```

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

**Parameters**

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
**Returns** This function returns a future to a new communicator object usable with the collective operation.

```
channel_communicator create_channel_communicator(hpx::launch::sync_policy, char const
*basename, num_sites_arg num_sites =
num_sites_arg(), this_site_arg this_site =
this_site_arg())
```

Create a new communicator object usable with peer-to-peer channel-based operations

This function creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

**Parameters**
- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

**Returns** This function returns a new communicator object usable with the collective operation.

```
template<typename T>
channel_communicator set(channel_communicator comm, that_site_arg site, T &&value, tag_arg tag =
tag_arg())
```

Send a value to the given site

This function sends a value to the given site based on the given communicator.

**Parameters**
- **comm** – The channel communicator object to use for the data transfer
- **site** – The destination site
- **value** – The value to send
- **tag** – The (optional) tag identifying the concrete operation

**Returns** This function returns a future<void> that becomes ready once the data transfer operation has finished.

```
template<typename T>
future<T> get(channel_communicator comm, that_site_arg site, tag_arg tag = tag_arg())
```

Send a value to the given site

This function receives a value from the given site based on the given communicator.

**Parameters**
- **comm** – The channel communicator object to use for the data transfer
- **site** – The source site

**Returns** This function returns a future<T> that becomes ready once the data transfer operation has finished. The future will hold the received value.

```
channel_communicator
#include <channel_communicator.hpp> A handle identifying the communication channel to use for
get/set operations
```
namespace hpx
Top level HPX namespace.

namespace collectives
Top level HPX namespace.

Functions

communicator create_communication_set(char const *basename, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg(), arity_arg arity = arity_arg())

The function create_communication_set sets up a (distributed) tree-like communication structure that can be used with any of the collective APIs (such like all_to_all and similar).

Parameters

• basename – The base name identifying the all_to_all operation
• num_sites – The number of participating sites (default: all localities).
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
• generation – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
• arity – The number of children each of the communication nodes is connected to (default: picked based on num_sites).

Returns This function returns a new communicator object usable with the collective operation.

namespace hpx
Top level HPX namespace.

namespace collectives
Top level HPX namespace.
Functions

`communicator create_communicator(char const *basename, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg(), root_site_arg root_site = root_site_arg())`

Create a new communicator object usable with any collective operation

This function creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as `all_gather`, `all_reduce`, `all_to_all`, `broadcast`, etc.).

**Parameters**

- `basename` – The base name identifying the collective operation
- `num_sites` – The number of participating sites (default: all localities).
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- `generation` – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- `root_site` – The site that is responsible for creating the collective support object. This value is optional and defaults to '0' (zero).

**Returns** This function returns a new communicator object usable with the collective operation.

`communicator create_local_communicator(char const *basename, num_sites_arg num_sites,
this_site_arg this_site, generation_arg generation = generation_arg(), root_site_arg root_site = root_site_arg())`

Create a new communicator object usable with any local collective operation

This function creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as `all_gather`, `all_reduce`, `all_to_all`, `broadcast`, etc.).

**Parameters**

- `basename` – The base name identifying the collective operation
- `num_sites` – The number of participating sites
- `this_site` – The sequence number of this invocation (usually the sequence number of the object participating in the collective operation). This value must be in the range [0, `num_sites`).
- `generation` – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- `root_site` – The site that is responsible for creating the collective support object. This value is optional and defaults to '0' (zero).

**Returns** This function returns a new communicator object usable for all local collective operations.

```
#include <create_communicator.hpp>
```

A communicator instance represents the list of sites that participate in a particular collective operation.
Public Functions

void set_info(num_sites_arg num_sites, this_site_arg this_site) noexcept

Store the number of used sites and the index of the current site for this communicator instance.

Parameters
- num_sites – The number of participating sites (default: all localities).
- this_site – The sequence number of this site (usually the locality id).

std::pair<num_sites_arg, this_site_arg> get_info() const noexcept

Retrieve the number of used sites and the index of the current site for this communicator instance.

bool is_root() const

Return whether this communicator instance represents the root site of the communication operation.

hpx/collectives/exclusive_scan.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.

namespace collectives

Top level HPX namespace.

Functions

template<typename T, typename F>
hpx::future<std::decay_t<T>> exclusive_scan(char const *basename, T &&result, F &&op,
num_sites_arg num_sites = num_sites_arg(),
this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg(),
root_site_arg root_site = root_site_arg())

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Parameters
- basename – The base name identifying the exclusive_scan operation
- local_result – The value to transmit to all participating sites from this call site.
- op – Reduction operation to apply to all values supplied from all participating sites
- num_sites – The number of participating sites (default: all localities).
- this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- generation – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed.
more than once. The generation number (if given) must be a positive number greater than zero.

**Parameters**
- `comm` – A communicator object returned from `create_communicator`
- `local_result` – The value to transmit to all participating sites from this call site.
- `op` – Reduction operation to apply to all values supplied from all participating sites
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- `generation` – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns**
This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.
namespace hpx

    Top level HPX namespace.

namespace lcos

    Functions

    template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...
))> fold (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op, Init &&init,
ArgN argN,...)

    Perform a distributed fold operation.

    The function hpx::lcos::fold performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

    Note: The type of the initial value must be convertible to the result type returned from the invoked action.

    Parameters

    • ids – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
    • fold_op – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
    • init – [in] The initial value to be used for the folding operation
    • argN – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

    Returns This function returns a future representing the result of the overall folding operation.

    template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> fold_with_index (std::vector< hpx::id_type > const &ids,
FoldOp &&fold_op, Init &&init, ArgN argN,...)

    Perform a distributed folding operation.

    The function hpx::lcos::fold_with_index performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

    The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.
Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

• **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.

• **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.

• **init** – [in] The initial value to be used for the folding operation

• **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns

This function returns a future representing the result of the overall folding operation.

```cpp
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> inverse_fold_with_index (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op,
Init &init, ArgN argN,...)
```

Perform a distributed inverse folding operation.

The function hpx::lcos::inverse_fold_with_index performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

• **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.

• **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.

• **init** – [in] The initial value to be used for the folding operation

• **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns

This function returns a future representing the result of the overall folding operation.

```cpp
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...))> inverse_fold (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op,
Init &init, ArgN argN,...)
```

Perform a distributed inverse folding operation.

The function hpx::lcos::inverse_fold performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action. The function passes the index of the global identifier in the given list of identifiers as the last argument.
to the action.

**Note:** The type of the initial value must be convertible to the result type returned from the invoked action.

**Parameters**
- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall folding operation.

### hpx/collectives/gather.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

**Functions**

```cpp
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(char const *basename, T &&result,
    num_sites_arg num_sites = num_sites_arg(),
    this_site_arg this_site = this_site_arg(),
    generation_arg generation = generation_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Parameters**
- **basename** – The base name identifying the gather operation
- **result** – The value to transmit to the central gather point from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```cpp
template<typename T>
```
Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Note: The generation values from corresponding `gather_here` and `gather_there` have to match.

**Parameters**

- `comm` – A communicator object returned from `create_communicator`
- `result` – The value to transmit to the central gather point from this call site.
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- `generation` – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns**

This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```cpp
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(communicator comm, T &&result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Gather a given value at the given call site

This function transmits the value given by `result` to a central gather site (where the corresponding `gather_here` is executed)

**Parameters**

- `basename` – The base name identifying the gather operation
- `result` – The value to transmit to the central gather point from this call site.
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
• **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

• **root_site** – The sequence number of the central gather point (usually the locality id). This value is optional and defaults to 0.

**Returns** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```cpp
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_there(communicator comm, T &&result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Gather a given value at the given call site

This function transmits the value given by `result` to a central gather site (where the corresponding `gather_here` is executed)

---

**Note:** The generation values from corresponding `gather_here` and `gather_there` have to match.

---

**Note:** The generation values from corresponding `gather_here` and `gather_there` have to match.

---

**Parameters**

- **comm** – A communicator object returned from `create_communicator`
- **result** – The value to transmit to the central gather point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from `create_communicator`
- **result** – The value to transmit to the central gather point from this call site.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**Returns** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

namespace hpx
    Top level HPX namespace.

namespace collectives
    Top level HPX namespace.

Functions

template<typename T, typename F>
    hpx::future<std::decay_t<T>> inclusive_scan(char const *basename, T &&result, F &&op,
        num_sites_arg num_sites = num_sites_arg(),
        this_site_arg this_site = this_site_arg(),
        generation_arg generation = generation_arg(),
        root_site_arg root_site = root_site_arg())

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

• basename – The base name identifying the inclusive_scan operation
• local_result – The value to transmit to all participating sites from this call site.
• op – Reduction operation to apply to all values supplied from all participating sites
• num_sites – The number of participating sites (default: all localities).
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
• generation – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. `params root_site The site that is responsible for creating the inclusive_scan support object. This value is optional and defaults to ‘0’ (zero).

Returns
This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

template<typename T, typename F>
    hpx::future<std::decay_t<T>> inclusive_scan(communicator comm, T &&result, F &&op,
        this_site_arg this_site = this_site_arg(),
        generation_arg generation = generation_arg())

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

• basename – The base name identifying the inclusive_scan operation
• local_result – The value to transmit to all participating sites from this call site.
• op – Reduction operation to apply to all values supplied from all participating sites
• num_sites – The number of participating sites (default: all localities).
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
• generation – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. `params root_site The site that is responsible for creating the inclusive_scan support object. This value is optional and defaults to ‘0’ (zero).

Returns
This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

See Public API for a list of names and headers that are part of the public HPX API.
• **comm** – A communicator object returned from `create_communicator`
• **local_result** – The value to transmit to all participating sites from this call site.
• **op** – Reduction operation to apply to all values supplied from all participating sites
• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
• **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns
This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

```cpp
namespace hpx {
    namespace distributed {

        Functions

        explicit latch(std::ptrdiff_t count)
            Initialize the latch
            Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

        latch(hpx::id_type const &id)
            Extension: Create a client side representation for the existing server::latch instance with the given global id id.

        latch(hpx::future<hpx::id_type> &&f)
            Extension: Create a client side representation for the existing server::latch instance with the given global id id.

        latch(hpx::shared_future<hpx::id_type> const &id)
            Extension: Create a client side representation for the existing server::latch instance with the given global id id.

Functions

template<typename T, typename F>
hpx::future<std::decay_t<T>> reduce_here(char const *basename, T &result, F &op,
  num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())

Reduce a set of values from different call sites
This function receives a set of values from all call sites operating on the given base name.
Parameters

- **basename** – The base name identifying the all_reduce operation
- **local_result** – A value to reduce on the central reduction point from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```cpp
template<typename T, typename F>
hpx::future<decay_t<T>> reduce_here(communicator comm, T &local_result, F &op,
  this_site_arg this_site = this_site_arg(), generation_arg
generation = generation_arg())
```

Reduce a set of values from different call sites

This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

Note: The generation values from corresponding `reduce_here` and `reduce_there` have to match.

Note: The generation values from corresponding `reduce_here` and `reduce_there` have to match.

Parameters

- **comm** – A communicator object returned from `create_communicator`
- **local_result** – A value to reduce on the root_site from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**Returns** This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

**Returns** This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```cpp
template<typename T, typename F>
void reduce_here(char const *basename, T &&result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg(), root_site_arg root_site = root_site_arg())
```

This function transmits the value given by `result` to a central reduce site (where the corresponding `reduce_here` is executed)

**Parameters**

- **basename** – The base name identifying the reduction operation
- **result** – A future referring to the value to transmit to the central reduction point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **root_site** – The sequence number of the central reduction point (usually the locality id). This value is optional and defaults to 0.

**Returns** This function returns a future<void>. It will become ready once the reduction operation has been completed.

```cpp
void reduce_there(communicator comm, T &&local_result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Reduce a given value at the given call site

This function transmits the value given by `result` to a central reduce site (where the corresponding `reduce_here` is executed)

**Parameters**

- **comm** – A communicator object returned from `create_communicator`
• **local_result** – A value to reduce on the central reduction point from this call site.
• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
• **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• **comm** – A communicator object returned from `create_communicator`
• **local_result** – A value to reduce on the central reduction point from this call site.
• **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**Returns**
This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

**Returns**
This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

`hpx/collectives/reduce_direct.hpp`

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace `hpx`

Top level HPX namespace.

namespace `lcos`

**Functions**

```
template<typename Action, typename ReduceOp, typename ArgN, ...>
hpx::future< decltype(Action(hpx::id_type, ArgN,...))>
reduce (std::vector< hpx::id_type > const &ids, ReduceOp &reduce_op,
ArgN argN,...)
```

Perform a distributed reduction operation.

The function `hpx::lcos::reduce` performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

**Parameters**

• **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
• **reduce_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
• **argN** – [in] Any number of arbitrary arguments (passed by by const reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall reduction operation.

```cpp
template<typename Action, typename ReduceOp, typename ArgN, ...>
hpx::future< decltype(Action(hpx::id_type, ArgN,..., std::size_t))> reduce_with_index (std::vector< hpx::id_type > const &ids, ReduceOp &reduce_op, ArgN argN,...)
```

Perform a distributed reduction operation.

The function `hpx::lcos::reduce_with_index` performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Parameters**

• **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.

• **reduce_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.

• **argN** – [in] Any number of arbitrary arguments (passed by by const reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall reduction operation.

### hpx/collectives/scatter.hpp

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.

namespace collectives

Top level HPX namespace.

### Functions

```cpp
template<typename T>
hpx::future<T> scatter_from(char const *basename, this_site_arg this_site = this_site_arg(),
 generation_arg generation = generation_arg(), root_site_arg root_site =
 root_site_arg())
```

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

**Parameters**

• **basename** – The base name identifying the scatter operation

• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
 generation – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

 root_site – The sequence number of the central scatter point (usually the locality id). This value is optional and defaults to 0.

**Returns** This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```cpp
template<typename T>
hpx::future<T> scatter_from(communicator comm, this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg())
```

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

**Note:** The generation values from corresponding scatter_to and scatter_from have to match.

**Parameters**

- **comm** – A communicator object returned from create_communicator
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from create_communicator
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

**Returns** This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```cpp
template<typename T>
hpx::future<T> scatter_to(char const *basename, std::vector<T> &&result, num_sites_arg num_sites
= num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg
generation = generation_arg())
```

Scatter (send) a part of the value set at the given call site

Scatter (send) a part of the value set at the given call site
This function transmits the value given by `result` to a central scatter site (where the corresponding `scatter_from` is executed)

### Parameters
- **basename** – The base name identifying the scatter operation
- **result** – The value to transmit to the central scatter point from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

### Returns
This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```
template<typename T>
hpx::future<T> scatter_to(communicator comm, std::vector<T> &&result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Scatter (send) a part of the value set at the given call site

This function transmits the value given by `result` to a central scatter site (where the corresponding `scatter_from` is executed)

### Note:
The generation values from corresponding `scatter_to` and `scatter_from` have to match.

```
template<typename T>
```

Parameters
- **comm** – A communicator object returned from `create_communicator`
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

```
template<typename T>
```
**Returns**
This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

**Returns**
This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

**components**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/components/basename_registration.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace *hpx*

**Functions**

```cpp
template<typename Client>
std::vector<Client> find_all_from_basename(std::string base_name, std::size_t num_ids)
```

Return all registered clients from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Return all registered ids from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

**Note:** The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Note:** The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Template Parameters**

- **Client** – The client type to return

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **num_ids** – [in] The number of registered ids to expect.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **num_ids** – [in] The number of registered ids to expect.

**Returns**
A list of futures representing the ids which were registered using the given base name.
Returns A list of futures representing the ids which were registered using the given base name.

```cpp
template<typename Client>
std::vector<Client> find_from_basename(std::string base_name, std::vector<std::size_t> const &ids)
```

Return registered clients from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

Return registered ids from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

**Note:** The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Note:** The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Template Parameters**

**Client** – The client type to return

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **ids** – [in] The sequence numbers of the registered ids.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **ids** – [in] The sequence numbers of the registered ids.

**Returns** A list of futures representing the ids which were registered using the given base name and sequence numbers.

**Returns** A list of futures representing the ids which were registered using the given base name and sequence numbers.

```cpp
template<typename Client>
Client find_from_basename(std::string base_name, std::size_t sequence_nr)
```

Return registered id from the given base name and sequence number.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

**Note:** The future embedded in the returned client object will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve
ids from a name, even if the name was already registered.

Note: The future will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Template Parameters**

**Client** – The client type to return

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **sequence_nr** – [in] The sequence number of the registered id.

**Returns**

A representing the id which was registered using the given base name and sequence numbers.

```cpp
template<typename Client, typename Stub, typename Data>
bool register_with_basename(std::string base_name, components::client_base<Client, Stub, Data> &client, std::size_t sequence_nr)
```

Register the id wrapped in the given client using the given base name.

The function registers the object the given client refers to using the provided base name.

Note: The operation will fail if the given sequence number is not unique.

**Template Parameters**

**Client** – The client type to register

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **client** – [in] The client which should be registered using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

**Returns**

A future representing the result of the registration operation itself.

```cpp
template<typename Client>
Client unregister_with_basename(std::string base_name, std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Unregister the given id using the given base name.

Unregister the given base name.

The function unregisters the given ids using the provided base name.
The function unregisters the given ids using the provided base name.

**Template Parameters**  
*Client* – The client type to return

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **sequence_nr** – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with `register_with_basename` before.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **sequence_nr** – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with `register_with_basename` before.

**Returns**  
A future representing the result of the un-registration operation itself.

### hpx/components/basename_registration_fwd.hpp

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace hpx

#### Functions

```cpp
hpx::future<bool> register_with_basename(  
    std::string base_name,  
    hpx::id_type id,  
    std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Register the given id using the given base name.

The function registers the given ids using the provided base name.

**Note:** The operation will fail if the given sequence number is not unique.

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **id** – [in] The id to register using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

**Returns**  
A future representing the result of the registration operation itself.

```cpp
bool register_with_basename(  
    hpx::launch::sync_policy,  
    std::string base_name,  
    hpx::id_type id,  
    std::size_t sequence_nr = ~static_cast<std::size_t>(0),  
    error_code &ec = throws)
```
```
hpx::future<bool> register_with_basename(std::string base_name, hpx::future<hpx::id_type> f,
                           std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Register the id wrapped in the given future using the given base name.

The function registers the object the given future refers to using the provided base name.

**Note:** The operation will fail if the given sequence number is not unique.

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **f** – [in] The future which should be registered using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

**Returns** A future representing the result of the registration operation itself.

**hpx/components/components_fwd.hpp**

namespace hpx

    namespace components

        template<typename Derived, typename Stub, typename ClientData = void>
        class client_base

namespace components

**hpx/components/get_ptr.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx
Functions

```cpp
template<typename Component>
hpx::future<std::shared_ptr<Component>> get_ptr(hpx::id_type const &id)
```

Returns a future referring to the pointer to the underlying memory of a component.

The function `hpx::get_ptr` can be used to extract a future referring to the pointer to the underlying memory of a given component.

**Note:** This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise the function will raise an error.

**Note:** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

**Parameters**

- **id** – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.

**Template Parameters**

- **Component** – The type of the server side component.

**Returns**

This function returns a future representing the pointer to the underlying memory for the component instance with the given `id`.

```cpp
template<typename Derived, typename Stub, typename Data>
hpx::future<std::shared_ptr<typename components::client_base<Derived, Stub, Data>::server_component_type>> get_ptr(components::client_base<Derived, Stub, Data> const &c)
```

Returns a future referring to the pointer to the underlying memory of a component.

The function `hpx::get_ptr` can be used to extract a future referring to the pointer to the underlying memory of a given component.

**Note:** This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise the function will raise an error.

**Note:** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

**Parameters**

- **c** – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.

**Returns**

This function returns a future representing the pointer to the underlying memory for the component instance with the given `id`.

```cpp
template<typename Component>
std::shared_ptr<Component> get_ptr(launch::sync_policy p, hpx::id_type const &id, error_code &ec = throws)
```

2.8. API reference
Returns the pointer to the underlying memory of a component.

The function `hpx::get_ptr_sync` can be used to extract the pointer to the underlying memory of a given component.

**Note:** This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise the function will raise an error.

**Note:** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**

- `p` – [in] The parameter `p` represents a placeholder type to turn make the call synchronous.
- `id` – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.
- `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Template Parameters** The only template parameter has to be the type of the server side component.

**Returns** This function returns the pointer to the underlying memory for the component instance with the given `id`.

```cpp
template<typename Derived, typename Stub, typename Data>
std::shared_ptr<typename components::client_base<Derived, Stub, Data>::server_component_type> get_ptr(launch::sync_policy p, components::client_base<Stub, Data> const &c, error_code &ec = throws)
```

Returns the pointer to the underlying memory of a component.

The function `hpx::get_ptr_sync` can be used to extract the pointer to the underlying memory of a given component.
Note: This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise the function will raise an error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**

- `p` – [in] The parameter `p` represents a placeholder type to turn make the call synchronous.
- `c` – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.
- `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns the pointer to the underlying memory for the component instance with the given `id`.

#include <component_startup_shutdown.hpp> The component_startup_shutdown class provides a minimal implementation of a component’s startup/shutdown function provider.

Public Functions

inline bool get_startup_function(startup_function_type &startup, bool &pre_startup) override

Return any startup function for this component.

Parameters startup – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

Returns Returns true if the parameter startup has been successfully initialized with the startup function.

inline bool get_shutdown_function(shutdown_function_type &shutdown, bool &pre_shutdown) override

Return any startup function for this component.

Parameters shutdown – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

Returns Returns true if the parameter shutdown has been successfully initialized with the shutdown function.

class fixed_component_base
template<typename Component, typename Derived>

class managed_component
#include <managed_component_base.hpp> The managed_component template is used as a indirection layer for components allowing to gracefully handle the access to non-existing components.

Additionally it provides memory management capabilities for the wrapping instances, and it integrates the memory management with the AGAS service. Every instance of a managed_component gets assigned a global id. The provided memory management allocates the managed_component instances from a special heap, ensuring fast allocation and avoids a full network round trip to the AGAS service for each of the allocated instances.

Template Parameters
• Component – Component type
• Derived – Most derived component type

struct get_lva
#include <get_lva.hpp> The get_lva template is a helper structure allowing to convert a local virtual address as stored in a local address (returned from the function resolver_client::resolve) to the address of the component implementing the action.

The default implementation uses the template argument Component to deduce the type wrapping the component implementing the action. This is used to get the needed address.

Template Parameters Component – This is the type of the component implementing the action to execute.

namespace hpx

namespace components

Variables

cconstexpr char const *const default_binpacking_counter_name = "/runtime{locality/total}/count/component@

static const binpacking_distribution_policy binpacked = {}

A predefined instance of the binpacking distribution_policy. It will represent the local locality and will place all items to create here.

struct binpacking_distribution_policy

#include <binpacking_distribution_policy.hpp> This class specifies the parameters for a binpacking distribution policy to use for creating a given number of items on a given set of localities. The binpacking policy will distribute the new objects in a way such that each of the localities will equalize the number of overall objects of this type based on a given criteria (by default this criteria is the overall number of objects of this type).

Public Functions

inline binpacking_distribution_policy()

Default-construct a new instance of a binpacking_distribution_policy. This policy will represent one locality (the local locality).

inline binpacking_distribution_policy operator()(std::vector<id_type> const &locs, char const *perf_counter_name = default_binpacking_counter_name) const

Create a new default_distribution policy representing the given set of localities.

Parameters

- locs – [in] The list of localities the new instance should represent
- perf_counter_name – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).
inline `binpacking_distribution_policy operator()(`std::vector<id_type> &&locs, char const & *perf_counter_name =
  `default_binpacking_counter_name`) const

Create a new `default_distribution` policy representing the given set of localities.

**Parameters**
- `locs` – [in] The list of localities the new instance should represent
- `perf_counter_name` – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

inline `binpacking_distribution_policy operator()(`id_type const &loc, char const & *perf_counter_name =
  `default_binpacking_counter_name`) const

Create a new `default_distribution` policy representing the given locality

**Parameters**
- `loc` – [in] The locality the new instance should represent
- `perf_counter_name` – [in] The name of the performance counter that should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

template<typename Component, typename ...Ts>
inline `hpx::future<hpx::id_type> create(Ts&&... vs) const`

Create one object on one of the localities associated by this policy instance

**Parameters**
- `vs` – [in] The arguments which will be forwarded to the constructor of the new object.

**Returns** A future holding the global address which represents the newly created object

template<typename Component, typename ...Ts>
inline `hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const`

Create multiple objects on the localities associated by this policy instance

**Parameters**
- `count` – [in] The number of objects to create
- `vs` – [in] The arguments which will be forwarded to the constructors of the new objects.

**Returns** A future holding the list of global addresses which represent the newly created objects

inline `std::string const &get_counter_name() const`

Returns the name of the performance counter associated with this policy instance.

inline `std::size_t get_num_localities() const`

Returns the number of associated localities for this distribution policy

---

**Note:** This function is part of the creation policy implemented by this class.
namespace hpx

namespace components

Variables

static const colocating_distribution_policy colocated = {}
A predefined instance of the co-locating distribution_policy. It will represent the local locality and will place all items to create here.

struct colocating_distribution_policy
#include <colocating_distribution_policy.hpp> This class specifies the parameters for a distribution policy to use for creating a given number of items on the locality where a given object is currently placed.

Public Functions

constexpr colocating_distribution_policy() = default
Default-construct a new instance of a colocating_distribution_policy. This policy will represent the local locality.

inline colocating_distribution_policy operator()(id_type const &id) const
Create a new colocating_distribution_policy representing the locality where the given object is current located

Parameters id – [in] The global address of the object with which the new instances should be colocated on

inline colocating_distribution_policy operator()(client_base<client_base<Client, Stub, Data> const &client) const
Create a new colocating_distribution_policy representing the locality where the given object is current located

Parameters client – [in] The client side representation of the object with which the new instances should be colocated on

template<typename Component, typename ...Ts>
inline hpx::future<hpx::id_type> create(Ts... vs) const
Create one object on the locality of the object this distribution policy instance is associated with

Note: This function is part of the placement policy implemented by this class

Parameters vs – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

2.8. API reference
inline `hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const

Create multiple objects colocated with the object represented by this policy instance.

**Note:** This function is part of the placement policy implemented by this class

**Parameters**
- `count` – [in] The number of objects to create
- `vs` – [in] The arguments which will be forwarded to the constructors of the new objects.

**Returns** A future holding the list of global addresses which represent the newly created objects.

```cpp

### Variables

static const default_distribution_policy default_layout = {}

A predefined instance of the default distribution_policy. It will represent the local locality and will place all items to create here.

struct default_distribution_policy

#include <default_distribution_policy.hpp> This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

### Public Functions

constexpr default_distribution_policy() = default

Default-construct a new instance of a default_distribution_policy. This policy will represent one locality (the local locality).

inline default_distribution_policy operator()(std::vector<id_type> const &locs) const

Create a new default_distribution policy representing the given set of localities.

**Parameters**

- **locs** – [in] The list of localities the new instance should represent

inline default_distribution_policy operator()(std::vector<id_type> &&locs) const

Create a new default_distribution policy representing the given set of localities.

**Parameters**

- **locs** – [in] The list of localities the new instance should represent
inline default_distribution_policy operator()(id_type const &loc) const

Create a new default_distribution policy representing the given locality

Parameters loc – [in] The locality the new instance should represent

template<
Component, typename ...Ts>
inline hpx::future<hpx::id_type> create(Ts&&... vs) const

Create one object on one of the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters vs – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

template<
Component, typename ...Ts>
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const

Create multiple objects on the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

• count – [in] The number of objects to create

• vs – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses that represent the newly created objects

template<
Action, typename ...Ts>
inline async_result<Action>::type async(launch policy, Ts&&... vs) const

hpx/distribution_policies/target_distribution_policy.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace components

Variables

static const target_distribution_policy target = {};

A predefined instance of the target_distribution_policy. It will represent the local locality and will place all items to create here.

struct target_distribution_policy

#include <target_distribution_policy.hpp> This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.
Public Functions

**target_distribution_policy**() = default
Default-construct a new instance of a target_distribution_policy. This policy will represent one locality (the local locality).

```cpp
inline target_distribution_policy operator()(id_type const &id) const
Create a new target_distribution_policy representing the given locality.
```

**Parameters**
- loc – [in] The locality the new instance should represent

```cpp
template<typename Component, typename ...Ts>
inline hpx::future<hpx::id_type> create(Ts&&... vs) const
Create one object on one of the localities associated by this policy instance
```

**Note:** This function is part of the placement policy implemented by this class

**Parameters**
- vs – [in] The arguments which will be forwarded to the constructor of the new object.

**Returns**
A future holding the global address which represents the newly created object

```cpp
template<typename Component, typename ...Ts>
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(size_t count, Ts&&... vs) const
Create multiple objects on the localities associated by this policy instance
```

**Note:** This function is part of the placement policy implemented by this class

**Parameters**
- count – [in] The number of objects to create
- vs – [in] The arguments which will be forwarded to the constructors of the new objects.

**Returns**
A future holding the list of global addresses which represent the newly created objects

```cpp
template<typename Action, typename ...Ts>
inline async_result<Action>::type async(launch policy, Ts&&... vs) const
```

```cpp
template<typename Action, typename Callback, typename ...Ts>

namespace hpx

namespace parallel

namespace execution

Functions

template<typename DistPolicy>
distribution_policy_executor(DistPolicy&&) ->
distribution_policy_executor<std::decay_t<DistPolicy>>

Create a new distribution_policy_executor from the given distribution_policy.

Parameters policy – The distribution_policy to create an executor from

template<typename DistPolicy>
class distribution_policy_executor

#include <distribution_policy_executor.hpp> A distribution_policy_executor creates groups of parallel execution agents that execute in threads implicitly created by the executor and placed on any of the associated localities.

Template Parameters DistPolicy – The distribution policy type for which an executor should be created. The expression hpx::traits::is_distribution_policy_v<DistPolicy> must evaluate to true.

init_runtime

See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx

Functions

int finalize(double shutdown_timeout, double localwait = -1.0, error_code &ec = throws)

Main function to gracefully terminate the HPX runtime system.

The function hpx::finalize is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see hpx::init) on all localities.

The default value (-1.0) will try to find a globally set timeout value (can be set as the configuration parameter hpx::shutdown_timeout), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

The default value (-1.0) will try to find a globally set wait time value (can be set as the configuration parameter “hpx.finalize_wait_time”), and if this is not set or -1.0 as well, it will disable any addition local wait time before proceeding.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to hpx::disconnect, these functions do not need to be called both.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters

- shutdown_timeout – This parameter allows to specify a timeout (in microseconds), specifying how long any of the connected localities should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.

- localwait – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.

- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function will always return zero.
inline int finalize(error_code &ec = throws)

Main function to gracefully terminate the HPX runtime system.

The function hpx::finalize is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see hpx::init) on all localities.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to hpx::disconnect, these functions do not need to be called both.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters  
ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns  This function will always return zero.

void terminate()

Terminate any application non-gracefully.

The function hpx::terminate is the non-graceful way to exit any application immediately. It can be called from any locality and will terminate all localities currently used by the application.

Note: This function will cause HPX to call std::terminate() on all localities associated with this application. If the function is called not from an HPX thread it will fail and return an error using the argument ec.

int disconnect(double shutdown_timeout, double localwait = -1.0, error_code &ec = throws)

Disconnect this locality from the application.

The function hpx::disconnect can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see hpx::init) on this locality.

The default value ( -1.0) will try to find a globally set timeout value (can be set as the configuration parameter “hpx.shutdown_timeout”), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

The default value (-1.0) will try to find a globally set wait time value (can be set as the configuration parameter hpx.finalize_wait_time), and if this is not set or -1.0 as well, it will disable any addition local wait time before proceeding.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.
Note: As long as \( ec \) is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of \texttt{hpx::exception}.

### Parameters

- **shutdown\_timeout** – This parameter allows to specify a timeout (in microseconds), specifying how long this locality should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.

- **local\_wait** – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hpx::throws} the function will throw on error instead.

### Returns

This function will always return zero.

```cpp
inline int disconnect(error_code &ec = throws)
```

Disconnect this locality from the application.

The function \texttt{hpx::disconnect} can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see \texttt{hpx::init}) on this locality.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

Note: As long as \( ec \) is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of \texttt{hpx::exception}.

### Parameters

\( ec \) – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hpx::throws} the function will throw on error instead.

### Returns

This function will always return zero.

```cpp
int stop(error_code &ec = throws)
```

Stop the runtime system.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called on every locality. This function should be used only if the runtime system was started using \texttt{hpx::start}.

### Returns

The function returns the value, which has been returned from the user supplied main HPX function (usually \texttt{hpx\_main}).
### Variables

```cpp
std::function<int(hpx::program_options::variables_map&)> const &get_main_func()
```

### Functions

```cpp
inline int init(std::function<int(hpx::program_options::variables_map&)> f, int argc, char **argv,
                init_params const &params = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread.

**Note:** If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. Otherwise it will be executed as specified by the parameter `mode`.

### Parameters

- **f** – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- **argc** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **argv** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
• **params** – [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

**Returns** The function returns the value, which has been returned from the user supplied \( f \).

```cpp
inline int init(function<int(int, char**)> f, int argc, char **argv, init_params const &params = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by \( f \) as a HPX thread. This overload will not call `hpx_main`.

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc`/`argv`. Otherwise it will be executed as specified by the parameter `mode`.

**Parameters**

- \( f \) – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If \( f \) is `nullptr` the HPX runtime environment will be started without invoking \( f \).
- **argc** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **argv** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **params** – [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

**Returns** The function returns the value, which has been returned from the user supplied \( f \).

```cpp
inline int init(int argc, char **argv, init_params const &params = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by \( f \) as a HPX thread. This overload will not call `hpx_main`.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by \( f \) as a HPX thread.

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc`/`argv`. Otherwise it will be executed as specified by the parameter `mode`. 

1394 Chapter 2. What’s so special about **HPX**?
Parameters

- **argc** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **argv** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **params** – [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

Returns The function returns the value, which has been returned from the user supplied `f`.

```cpp
inline int init(std::nullptr_t f, int argc, char **argv, init_params const &params = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx::main`.

This is a simplified main entry point, which can be used to set up the runtime for an HPX application (the runtime system will be set up in console mode or worker mode depending on the command line settings).

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. Otherwise it will be executed as specified by the parameter `mode`.

Parameters

- **f** – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- **argc** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **argv** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **params** – [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

Returns The function returns the value, which has been returned from the user supplied `f`.

```cpp
inline int init(init_params const &params = init_params())
```

Main entry point for launching the HPX runtime system.

This is a simplified main entry point, which can be used to set up the runtime for an HPX application (the runtime system will be set up in console mode or worker mode depending on the command line settings).
Note: The created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in argc/argv. If not command line arguments are passed, console mode is assumed.

Note: If no command line arguments are passed the HPX runtime system will not support any of the default command line options as described in the section ‘HPX Command Line Options’.

Parameters params – [in] The parameters to the hpx::init function (See documentation of hpx::init_params)

Returns The function returns the value, which has been returned from hpx_main (or 0 when executed in worker mode).

hp/hpx_init_params.hpp

**Note:** If no command line arguments are passed the HPX runtime system will not support any of the default command line options as described in the section ‘HPX Command Line Options’.

**Parameters** `params` – [in] The parameters to the `hpx::start` function (See documentation of `hpx::init_params`)

**Returns** The function returns `true` if command line processing succeeded and the runtime system was started successfully. It will return `false` otherwise.

**hpx/hpx_suspend.hpp**

See Public API for a list of names and headers that are part of the public **HPX API**.

namespace `hpx`

**Functions**

```cpp
int suspend(error_code &ec = throws)
```

Suspend the runtime system.

The function `hpx::suspend` is used to suspend the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be empty. This function only be called when the runtime is running, or already suspended in which case this function will do nothing.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters** `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function will always return zero.

```cpp
int resume(error_code &ec = throws)
```

Resume the HPX runtime system.

The function `hpx::resume` is used to resume the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be resumed. This function only be called when the runtime suspended, or already running in which case this function will do nothing.
Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function will always return zero.

naming_base

See Public API for a list of names and headers that are part of the public HPX API.

hpx/naming_base/unmanaged.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

hpx::id_type unmanaged(hpx::id_type const &id)

The helper function hpx::unmanaged can be used to generate a global identifier which does not participate in the automatic garbage collection.

Note: This function allows to apply certain optimizations to the process of memory management in HPX. It however requires the user to take full responsibility for keeping the referenced objects alive long enough.

Parameters id – [in] The id to generated the unmanaged global id from This parameter can be itself a managed or a unmanaged global id.

Returns This function returns a new global id referencing the same object as the parameter id.

The only difference is that the returned global identifier does not participate in the automatic garbage collection.

namespace naming

parcelset

See Public API for a list of names and headers that are part of the public HPX API.
hpx/parcelset/connection_cache.hpp

namespace hpx

namespace parcelset

**Typedefs**

using parcel_write_handler_type = hpx::function<void(std::error_code const&, parcelset::parcel const&)>;

The type of a function that can be registered as a parcel write handler using the function hpx::set_parcel_write_handler.

**Note:** A parcel write handler is a function which is called by the parcel layer whenever a parcel has been sent by the underlying networking library and if no explicit parcel handler function was specified for the parcel.
Enums

enum parcelport_background_mode

Type of background work to perform.

Values:

enumerator parcelport_background_mode_flush_buffers
perform buffer flush operations

enumerator parcelport_background_mode_send
perform send operations (includes buffer flush)

enumerator parcelport_background_mode_receive
perform receive operations

enumerator parcelport_background_mode_all
perform all operations

Functions

char const *get_parcelport_background_mode_name(parcelport_background_mode mode)

Variables

parcel empty_parcel

hpx/parcelset_base/set_parcel_write_handler.hpp

See Public API for a list of names and headers that are part of the public HPX API.

performance_counters

See Public API for a list of names and headers that are part of the public HPX API.

hpx/performance_counters/counter_creators.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace performance_counters
Functions

bool default_counter_discoverer(counter_info const&, discover_counter_func const&,
                               discover_counters_mode, error_code&)

Default discovery function for performance counters; to be registered with the counter types. It will
pass the counter_info and the error_code to the supplied function.

bool locality_counter_discoverer(counter_info const&, discover_counter_func const&,
                                 discover_counters_mode, error_code&)

Default discoverer function for performance counters; to be registered with the counter types. It is
suitable to be used for all counters following the naming scheme:
/<objectname>(locality#<locality_id>/total)/<instancename>

bool locality_pool_counter_discoverer(counter_info const&, discover_counter_func const&,
                                      discover_counters_mode, error_code&)

Default discoverer function for performance counters; to be registered with the counter types. It is
suitable to be used for all counters following the naming scheme:
/<objectname>(locality#<locality_id>/pool#<pool_name>/total)/<instancename>

bool locality0_counter_discoverer(counter_info const&, discover_counter_func const&,
                                  discover_counters_mode, error_code&)

Default discoverer function for AGAS performance counters; to be registered with the counter types. It is
suitable to be used for all counters following the naming scheme:
/<objectname>{locality#0/total}/<instancename>

bool locality_thread_counter_discoverer(counter_info const&, discover_counter_func const&,
                                         discover_counters_mode, error_code&)

Default discoverer function for performance counters; to be registered with the counter types. It is
suitable to be used for all counters following the naming scheme:
/<objectname>(locality#<locality_id>/worker-thread#<threadnum>)/<instancename>

bool locality_pool_thread_counter_discoverer(counter_info const &info,
                                             discover_counter_func const &f,
                                             discover_counters_mode mode, error_code &ec)

Default discoverer function for performance counters; to be registered with the counter types. It is
suitable to be used for all counters following the naming scheme:
/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum>}/<instancename>

bool locality_pool_thread_no_total_counter_discoverer(counter_info const &info,
                                                     discover_counter_func const &f,
                                                     discover_counters_mode mode, error_code &ec)

Default discoverer function for performance counters; to be registered with the counter types. It is
suitable to be used for all counters following the naming scheme:
/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum>}/<instancename>

This is essentially the same as above just that locality#/total is not supported.

bool locality_numa_counter_discoverer(counter_info const&, discover_counter_func const&,
                                       discover_counters_mode, error_code&)

Chapter 2. What’s so special about HPX?
Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
<objectname>(locality#locality_id/numa-node#threadnum)/<instancename>
```

```cpp
naming::gid_type locality_raw_counter_creator(counter_info const&, 
  hpx::function<std::int64_t(bool)> const&, 
  error_code&)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

```
<objectname>(locality#locality_id/total)/<instancename>
```

```cpp
naming::gid_type locality_raw_values_counter_creator(counter_info const&, 
  hpx::function<std::vector<std::int64_t>(bool)> const&, 
  error_code&)
```

```cpp
naming::gid_type agas_raw_counter_creator(counter_info const&, error_code&, char const*const)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

```
<agas(objectinstance>/total)/<instancename>
```

```cpp
bool agas_counter_discoverer(counter_info const&, discover_counter_func const&, 
  discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
<agas(objectinstance>/total)/<instancename>
```

```cpp
naming::gid_type local_action_invocation_counter_creator(counter_info const&, 
  error_code&)
```

```cpp
bool local_action_invocation_counter_discoverer(counter_info const&, 
  discover_counter_func const&, 
  discover_counters_mode, error_code&)
```

**hppx/performance_counters/counters.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace performance_counters
```
**Typedefs**

typedef `hpx::function<naming::gid_type(const counter_info&, error_code&)> create_counter_func`  
This declares the type of a function, which will be called by HPX whenever a new performance counter instance of a particular type needs to be created.

typedef `hpx::function<bool(const counter_info&, error_code&)> discover_counter_func`  
This declares a type of a function, which will be passed to a `discover_counters_func` in order to be called for each discovered performance counter instance.

typedef `hpx::function<bool(const counter_info&, discover_counter_func const&, discover_counters_mode, error_code&)>> discover_counters_func`  
This declares the type of a function, which will be called by HPX whenever it needs to discover all performance counter instances of a particular type.

**Enums**

define `enum class counter_type`  
Values:

define `enumerator text`  
_text_ shows a variable-length text string. It does not deliver calculated values.  
Formula: None Average: None Type: Text

define `enumerator raw`  
_raw_ shows the last observed value only. It does not deliver an average.  
Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

define `enumerator monotonically_increasing`  
_monotonically_increasing_ shows the cumulatively accumulated observed value. It does not deliver an average.  
Formula: None. Shows cumulatively accumulated data as collected. Average: None Type: Instantaneous

define `enumerator average_base`  
_average_base_ is used as the base data (denominator) in the computation of time or count averages for the `counter_type::average_count` and `counter_type::average_timer` counter types. This counter type collects the last observed value only.  
Formula: None. This counter uses raw data in factional calculations without delivering an output. Average: SUM (N) / x Type: Instantaneous

define `enumerator average_count`  
_average_count_ shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.
Formula: \((N_1 - N_0) / (D_1 - D_0)\), where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average: \((N_x - N_0) / (D_x - D_0)\) Type: Average

enumerator **aggregating**

*aggregating* applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula: \(F(N_x)\)

enumerator **average_timer**

*average_timer* measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: \[((N_1 - N_0) / F) / (D_1 - D_0)\], where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval. Average: \[((N_x - N_0) / F) / (D_x - D_0)\) Type: Average

enumerator **elapsed_time**

*elapsed_time* shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: \((D_0 - N_0) / F\), where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average: \((D_x - N_0) / F\) Type: Difference

enumerator **histogram**

*histogram* exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a `counter_value_array` instead of a `counter_value`. Those will also not implement the `get_counter_value()` functionality. The results are exposed through a separate `get_counter_values_array()` function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

enumerator **raw_values**

*raw_values* exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a `counter_value_array` instead of a `counter_value`. Those will also not implement the `get_counter_value()` functionality. The results are exposed through a separate `get_counter_values_array()` function.

enumerator **text**

enumerator **raw**
enumerator **monotonically_increasing**

enumerator **average_base**

enumerator **average_count**

enumerator **aggregating**

enumerator **average_timer**

enumerator **elapsed_time**

enumerator **histogram**

enumerator **raw_values**

*raw_values* counter exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a *counter_value*. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

enum class **counter_status**

Status and error codes used by the functions related to performance counters.

*Values:*

enumerator **valid_data**

No error occurred, data is valid.

enumerator **new_data**

Data is valid and different from last call.

enumerator **invalid_data**

Some error occurred, data is not value.

enumerator **already_defined**

The type or instance already has been defined.

enumerator **counter_unknown**

The counter instance is unknown.

enumerator **counter_type_unknown**

The counter type is unknown.

enumerator **generic_error**

A unknown error occurred.
enumerator valid_data
enumerator new_data
enumerator invalid_data
enumerator already_defined
enumerator counter_unknown
enumerator counter_type_unknown
enumerator generic_error

**Functions**

inline `std::string &ensure_counter_prefix(std::string &name)`
inline `std::string ensure_counter_prefix(std::string const &counter)`
inline `std::string &remove_counter_prefix(std::string &name)`
inline `std::string remove_counter_prefix(std::string const &counter)`

char const *get_counter_type_name(counter_type state)
Return the readable name of a given counter type.
inline bool status_is_valid(counter_status s)
inline `counter_status add_counter_type(counter_info const &info, error_code &ec)`
inline `hpx::id_type get_counter(std::string const &name, error_code &ec)`
inline `hpx::id_type get_counter(counter_info const &info, error_code &ec)`

**Variables**

cconstexpr const char counter_prefix[] = "/counters"

cconstexpr std::size_t counter_prefix_len = std::size(counter_prefix) - 1

inline explicit counter_info(std::string const &name)
inline counter_info(counter_type type, std::string const &name, std::string const &helptext = "", std::uint32_t version = HPX_PERFORMANCE_COUNTER_V1, std::string const &uom = "")

Public Members

counter_type type_
    The type of the described counter.

std::uint32_t version_
    The version of the described counter using the 0xMMmmSSSS scheme

counter_status status_
    The status of the counter object.

std::string fullname_
    The full name of this counter.

std::string helptext_
    The full descriptive text for this counter.

std::string unit_of_measure_
    The unit of measure for this counter.

Functions

inline constexpr bool `operator<(counter_type lhs, counter_type rhs)` noexcept

inline constexpr bool `operator>(counter_type lhs, counter_type rhs)` noexcept

`std::ostream &operator<<(std::ostream &os, counter_status rhs)`

`counter_status get_counter_type_name(counter_type_path_elements const &path, std::string &result, error_code &ec = throws)`

Create a full name of a counter type from the contents of the given counter_type_path_elements instance. The generated counter type name will not contain any parameters.

`counter_status get_full_counter_type_name(counter_type_path_elements const &path, std::string &result, error_code &ec = throws)`

Create a full name of a counter type from the contents of the given counter_type_path_elements instance. The generated counter type name will contain all parameters.
counter_status get_counter_name(counter_path_elements const &path, std::string &result, error_code &ec = throws)

Create a full name of a counter from the contents of the given counter_path_elements instance.

counter_status get_counter_instance_name(counter_path_elements const &path, std::string &result, error_code &ec = throws)

Create a name of a counter instance from the contents of the given counter_path_elements instance.

counter_status get_counter_type_path_elements(std::string const &name, counter_type_path_elements &path, error_code &ec = throws)

Fill the given counter_type_path_elements instance from the given full name of a counter type.

counter_status get_counter_path_elements(std::string const &name, counter_path_elements &path, error_code &ec = throws)

Fill the given counter_path_elements instance from the given full name of a counter.

counter_status get_counter_name(std::string const &name, std::string &countername, error_code &ec = throws)

Return the canonical counter instance name from a given full instance name.

counter_status get_counter_type_name(std::string const &name, std::string &type_name, error_code &ec = throws)

Return the canonical counter type name from a given (full) instance name.

HPX_DEPRECATED_V (1, 9, HPX_DISCOVER_COUNTERS_MODE_UNSCOPED_ENUM_DEPRECATION_MSG) inline const expr discover_counters_mode discover_counters_minimal

counter_status complement_counter_info(counter_info &info, counter_info const &type_info, error_code &ec = throws)

Complement the counter info if parent instance name is missing.

counter_status complement_counter_info(counter_info &info, error_code &ec = throws)

counter_status add_counter_type(counter_info const &info, create_counter_func const &create_counter, discover_counter_func const &discover_counts, error_code &ec = throws)

counter_status discover_counter_types(discover_counter_func const &discover_counter, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

Call the supplied function for each registered counter type.

counter_status discover_counter_types(std::vector<counter_info> &counters, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

Return a list of all available counter descriptions.

counter_status discover_counter_type(discover_counter_func const &discover_counter, discover_counter_mode mode = discover_counter_mode::minimal, error_code &ec = throws)

Call the supplied function for the given registered counter type.
counter_status discover_counter_type(counter_info const &info, discover_counter_func const &discover_counter, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

counter_status discover_counter_type(std::string const &name, std::vector<counter_info> &counters, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

Return a list of matching counter descriptions for the given registered counter type.

counter_status discover_counter_type(counter_info const &info, std::vector<counter_info> &counters, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

bool expand_counter_info(counter_info const &, discover_counter_func const &, error_code &)

call the supplied function will all expanded versions of the supplied counter info.

This function expands all locality** and worker-thread** wild cards only.

counter_status remove_counter_type(counter_info const &info, error_code &ec = throws)

Remove an existing counter type from the (local) registry.

**Note:** This doesn’t remove existing counters of this type, it just inhibits defining new counters using this type.

counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec = throws)

Retrieve the counter type for the given counter name from the (local) registry.

hpx::future<hpx::id_type> get_counter_async(std::string name, error_code &ec = throws)

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter name.

hpx::future<hpx::id_type> get_counter_async(counter_info const &info, error_code &ec = throws)

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter info.

void get_counter_infos(counter_info const &info, counter_type &type, std::string &helptext, std::uint32_t &version, error_code &ec = throws)

Retrieve the meta data specific for the given counter instance.

void get_counter_infos(std::string name, counter_type &type, std::string &helptext, std::uint32_t &version, error_code &ec = throws)

Retrieve the meta data specific for the given counter instance.

hpx/performance_counters/manage_counter_type.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace performance_counters

Functions

counter_status install_counter_type(
    std::string const &name, hpx::function<std::int64_t(bool)>
    const &counter_value, std::string const &helptext = "",
    std::string const &uom = "", counter_type type =
    counter_type::raw, error_code &ec = throws)

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function install_counter_type will register a new generic counter type based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this this counter type will cause the provided function to be called and the returned value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: '/objectname/locality#/total/countername' where '##' is a zero based integer identifying the locality the counter is created on.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- name – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- counter_value – [in] The function to call whenever the counter value is requested by a consumer.
- helptext – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- type – [in] Type for the new performance counter type.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.
**Returns** If successful, this function returns `valid_data`, otherwise it will either throw an exception or return an error_code from the enum `counter_status` (also, see note related to parameter `ec`).

```cpp
counter_status install_counter_type(std::string const &name, 
    hpx::function<
        std::vector<std::int64_t>(bool)>
    const &counter_value, std::string const &helptext = 
    "", std::string const &uom = 
    "", error_code &ec = throws)
```

Install a new generic performance counter type returning an array of values in a way, that will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new generic counter type that returns an array of values based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this this counter type will cause the provided function to be called and the returned array value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: `'/objectname{locality#<*>/total}/countername'` where `'<*>'` is a zero based integer identifying the locality the counter is created on.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

**Parameters**

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format `/objectname/countername`.
- **counter_value** – [in] The function to call whenever the counter value (array of values) is requested by a consumer.
- **helptext** – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** If successful, this function returns `valid_data`, otherwise it will either throw an exception or return an error_code from the enum `counter_status` (also, see note related to parameter `ec`).

```cpp
void install_counter_type(std::string const &name, 
    counter_type type, error_code &ec = throws)
```

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new counter type based on the provided `counter_type_info`. The counter type will be automatically unregistered during system shutdown.

**Note:** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the
result code using the parameter \texttt{ec}. Otherwise it throws an instance of hpx::exception.

\textbf{Parameters}

- \texttt{name} – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- \texttt{type} – [in] The type of the counters of this \texttt{counter_type}.
- \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

\textbf{Returns} If successful, this function returns \texttt{valid_data}, otherwise it will either throw an exception or return an error code from the enum \texttt{counter_status} (also, see note related to parameter \texttt{ec}).

\begin{verbatim}
counter_status install_counter_type( std::string const &name, counter_type type, std::string const &helptext, std::string const &uom = "", std::uint32_t version = HPX_PERFORMANCE_COUNTER_V1, error_code &ec = hpx::throws )
\end{verbatim}

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function \texttt{install_counter_type} will register a new counter type based on the provided \texttt{counter_type_info}. The counter type will be automatically unregistered during system shutdown.

\textbf{Note:} The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

\begin{verbatim}
Note: As long as \texttt{ec} is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter \texttt{ec}. Otherwise it throws an instance of hpx::exception.
\end{verbatim}

\textbf{Parameters}

- \texttt{name} – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- \texttt{type} – [in] The type of the counters of this \texttt{counter_type}.
- \texttt{helptext} – [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- \texttt{uom} – [in] The unit of measure for the new performance counter type.
- \texttt{version} – [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

\textbf{Returns} If successful, this function returns \texttt{valid_data}, otherwise it will either throw an exception or return an error code from the enum \texttt{counter_status} (also, see note related to parameter \texttt{ec}).

\begin{verbatim}
counter_status install_counter_type( std::string const &name, counter_type type, std::string const &helptext, create_counter_func const &create_counter, discover_counters_func const &discover_counters, std::uint32_t version = HPX_PERFORMANCE_COUNTER_V1, std::string const &uom = "", error_code &ec = hpx::throws )
\end{verbatim}

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function \texttt{install_counter_type} will register a new generic counter type based on the provided
counter_type_info. The counter type will be automatically unregistered during system shutdown.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters
- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **helptext** – [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **version** – [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- **create_counter** – [in] The function which will be called to create a new instance of this counter type.
- **discover_counters** – [in] The function will be called to discover counter instances which can be created.
- **uom** – [in] The unit of measure of the counter type (default: ")"
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns If successful, this function returns valid_data, otherwise it will either throw an exception or return an error_code from the enum counter_status (also, see note related to parameter ec).

hpx/performance_counters/registry.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace performance_counters

class registry

Public Functions

registry() = default

void clear()

Reset registry by deleting all stored counter types.

counter_status add_counter_type(counter_info const &info, create_counter_func const &create_counter, discover_counters_func const &discover_counters, error_code &ec = throws)

Add a new performance counter type to the (local) registry.
counter_status discover_counter_types(discover_counter_func discover_counter,
                                     discover_counters_mode mode, error_code &ec = throws)

Call the supplied function for all registered counter types.

counter_status discover_counter_type(std::string const &fullname, discover_counter_func
                                     discover_counter, discover_counters_mode mode,
                                     error_code &ec = throws)

Call the supplied function for the given registered counter type.

inline counter_status discover_counter_type(counter_info const &info, discover_counter_func
                                          const &f, discover_counters_mode mode,
                                          error_code &ec = throws)

counter_status get_counter_create_function(counter_info const &info,
                                            create_counter_func &create_counter,
                                            error_code &ec = throws)

Retrieve the counter creation function which is associated with a given counter type.

counter_status get_counter_discovery_function(counter_info const &info,
                                               discover_counters_func &func,
                                               error_code &ec = throws)

Retrieve the counter discovery function which is associated with a given counter type.

counter_status remove_counter_type(counter_info const &info, error_code &ec = throws)

Remove an existing counter type from the (local) registry.

Note: This doesn’t remove existing counters of this type, it just inhibits defining new counters
using this type.

counter_status create_raw_counter_value(counter_info const &info, std::int64_t *countervalue,
                                         naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given counter value.

counter_status create_raw_counter(counter_info const &info, hpx::function<std::int64_t>(*>
                                   const &f, naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given function returning
the counter value.

counter_status create_raw_counter(counter_info const &info, hpx::function<std::int64_t(bool)>
                                   const &f, naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given function returning
the counter value.

counter_status create_raw_counter(counter_info const &info,
                                   hpx::function<std::vector<std::int64_t>()> const &f,
                                   naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given function returning
the counter value.

counter_status create_raw_counter(counter_info const &info,
                                   hpx::function<std::vector<std::int64_t>(bool)> const &f,
                                   naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given function returning
the counter value.
counter_status create_counter(counter_info const &info, naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance based on given counter info.

counter_status create_statistics_counter(counter_info const &info, std::string const &base_counter_name, std::vector<std::size_t> const &parameters, naming::gid_type &id, error_code &ec = throws)

Create a new statistics performance counter instance based on given base counter name and given base time interval (milliseconds).

counter_status create_arithmetics_counter(counter_info const &info, std::vector<std::string> const &base_counter_names, naming::gid_type &id, error_code &ec = throws)

Create a new arithmetics performance counter instance based on given base counter names.

counter_status create_arithmetics_counter_extended(counter_info const &info, std::vector<std::string> const &base_counter_names, naming::gid_type &id, error_code &ec = throws)

Create a new extended arithmetics performance counter instance based on given base counter names.

counter_status add_counter(hpx::id_type const &id, counter_info const &info, error_code &ec = throws)

Add an existing performance counter instance to the registry.

counter_status remove_counter(counter_info const &info, hpx::id_type const &id, error_code &ec = throws)

remove the existing performance counter from the registry

counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec = throws)

Retrieve counter type information for given counter name.

hpx/plugin_factories/binary_filter_factory.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_BINARY_FILTER_FACTORY(BinaryFilter, pluginname)

This macro is used create and to register a minimal component factory with Hpx.Plugin.

namespace hpx

namespace plugins

    template<typename BinaryFilter>
The `message_handler_factory` provides a minimal implementation of a message handler's factory. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a message handler's factory instance.

**Template Parameters**

- **BinaryFilter** – The message handler type this factory should be responsible for.

## Public Functions

### binary_filter_factory

```cpp
inline binary_filter_factory(
    util::section const *global,
    util::section const *local, bool isenabled)
```

Construct a new factory instance.

**Note:** The contents of both sections has to be cloned in order to save the configuration setting for later use.

### ~binary_filter_factory

```cpp
~binary_filter_factory() override = default
```

### create

```cpp
inline serialization::binary_filter *
create(bool compress, serialization::binary_filter *next_filter = nullptr) override
```

Create a new instance of a message handler

return Returns the newly created instance of the message handler supported by this factory

## Protected Attributes

- `util::section global_settings_`
- `util::section local_settings_`
- `bool isenabled_`
hpx/plugin_factories/message_handler_factory.hpp

Defines

HPX_REGISTER_PLUGIN_REGISTRY(…)

This macro is used create and to register a minimal plugin registry with Hpx.Plugin.

HPX_REGISTER_PLUGIN_REGISTRY_(…)

HPX_REGISTER_PLUGIN_REGISTRY_2(PluginType, pluginname)

HPX_REGISTER_PLUGIN_REGISTRY_4(PluginType, pluginname, pluginsection, pluginsuffix)

HPX_REGISTER_PLUGIN_REGISTRY_5(PluginType, pluginname, pluginstring, pluginsection, pluginsuffix)

namespace hpx

namespace plugins

template<typename Plugin, char const *const Name, char const *const Section, char const *const Suffix>
struct plugin_registry : public plugin_registry_base

#include <plugin_registry.hpp> The plugin_registry provides a minimal implementation of a plugin’s registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a plugin’s registry instance.

Template Parameters Plugin – The plugin type this registry should be responsible for.

Public Functions

inline bool get_plugin_info(std::vector<std::string> &fillini) override

Return the ini-information for all contained components.

Parameters fillini – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

Returns Returns true if the parameter fillini has been successfully initialized with the registry data of all implemented in this module.
runtime_components

See Public API for a list of names and headers that are part of the public HPX API.

hpx/runtime_components/component_factory.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_COMPONENT(type, name, mode)

Define a component factory for a component type.

This macro is used create and to register a minimal component factory for a component type which allows it to be remotely created using the hpx::new_<>() function.

This macro can be invoked with one, two or three arguments

Parameters

- **type** – The type parameter is a (fully decorated) type of the component type for which a factory should be defined.
- **name** – The name parameter specifies the name to use to register the factory. This should uniquely (system-wide) identify the component type. The name parameter must conform to the C++ identifier rules (without any namespace). If this parameter is not given, the first parameter is used.
- **mode** – The mode parameter has to be one of the defined enumeration values of the enumeration hpx::components::factory_state_enum. The default for this parameter is hpx::components::factory_enabled.

hpx/runtime_components/component_registry.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY(...)

This macro is used create and to register a minimal component registry with Hpx.Plugin.

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_2(ComponentType, componentname)

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_3(ComponentType, componentname, state)

namespace hpx

namespace components

template<typename Component, factory_state_enum state>
struct component_registry : public component_registry_base

#include <component_registry.hpp>
The component_registry provides a minimal implementation of a component’s registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a component’s registry instance.

Template Parameters

Component – The component type this registry should be responsible for.

Public Functions

inline bool get_component_info(std::vector<std::string> &fillini, std::string const &filepath, bool is_static = false) override

Return the ini-information for all contained components.

Parameters

fillini – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

Returns

Returns true if the parameter fillini has been successfully initialized with the registry data of all implemented in this module.

inline void register_component_type() override

Return the unique identifier of the component type this factory is responsible for.

Parameters

• locality – [in] The id of the locality this factory is responsible for.
• agas_client – [in] The AGAS client to use for component id registration (if needed).

Returns

Returns the unique identifier of the component type this factory instance is responsible for. This function throws on any error.

hpx/runtime_components/new.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

template<typename Component, typename... Ts> < unspecified > new_ (id_type const &locality, Ts &&... vs)

Create one or more new instances of the given Component type on the specified locality.

This function creates one or more new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:
```cpp
hpx::future<hpx::id_type> f =
    hpx::local_new<some_component>(...);
```

### Parameters

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

### Returns

The function returns different types depending on its use:

- If the explicit template argument `Component` represents a component type (`traits::is_component<Component>::value evaluates to true`), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument `Component` represents a client side object (`traits::is_client<Component>::value evaluates to true`), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```cpp
template<typename Component, typename... Ts> < unspecified > local_new (Ts &&... vs)
Create one new instance of the given Component type on the current locality.
```

This function creates one new instance of the given Component type on the current locality and returns a future object for the global address which can be used to reference the new component instance.

### Note:

This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```cpp
hpx::future<hpx::id_type> f =
    hpx::local_new<some_component>(...);
```

### Note:

The difference of this function to `hpx::new_` is that it can be used in cases where the supplied arguments are non-copyable and non-movable. All operations are guaranteed to be local only.

### Parameters

- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

### Returns

The function returns different types depending on its use:

- If the explicit template argument `Component` represents a component type (`traits::is_component<Component>::value evaluates to true`), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component. If the first argument is `hpx::launch::sync` the function will directly return an `hpx::id_type`. 

The explicit template argument `Component` represents a client side object (traits::is_client<Component>::value evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```cpp
template<typename Component, typename... Ts> < unspecified > new_ (id_type const &locality, std::size_t count, Ts &&... vs)
Create multiple new instances of the given Component type on the specified locality.
```

This function creates multiple new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```cpp
hpx::future<std::vector<hpx::id_type> > f =
   hpx::new_<some_component[]>(hpx::find_here(), 10, ...);
```

**Parameters**

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

**Returns** The function returns different types depending on its use:

- If the explicit template argument `Component` represents an array of a component type (i.e. `Component[]`, where traits::is_component<Component>::value evaluates to true), the function will return an hpx::future object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument `Component` represents an array of a client side object type (i.e. `Component[]`, where traits::is_client<Component>::value evaluates to true), the function will return an hpx::future object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

```cpp
template<typename Component, typename DistPolicy, typename... Ts> < unspecified > new_ (DistPolicy const &policy, Ts &&... vs)
Create one or more new instances of the given Component type based on the given distribution policy.
```

This function creates one or more new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for global address which can be used to reference the new component instance(s).

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:
hpx::future<hpx::id_type> f =
  hpx::new_<some_component>(hpx::default_layout, ...);
hpx::id_type id = f.get();

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns  The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (traits::is_component<Component>::value evaluates to true), the function will return an *hpx::future* object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (traits::is_client<Component>::value evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```cpp
template<typename Component, typename DistPolicy, typename... Ts> <unspecified> new_ (DistPolicy const &policy, std::size_t count, Ts &... vs)
```

Create multiple new instances of the given Component type on the localities as defined by the given distribution policy.

This function creates multiple new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for the global address which can be used to reference the new component instance.

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```cpp
hpx::future<std::vector<hpx::id_type> > f =
  hpx::new_<some_component[]>(hpx::default_layout, 10, ...);
hpx::id_type id = f.get();
```

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns  The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. *Component[]*, where traits::is_component<Component>::value evaluates to true), the function will return an *hpx::future* object instance which holds a
std::vector<hpx::id_type>, where each of the items in this vector is a global address of one of the newly created components.

- If the explicit template argument Component represents an array of a client side object type (i.e. Component[], where traits::is_client<Component>::value evaluates to true), the function will return an hpx::future object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

### runtime_distributed

See Public API for a list of names and headers that are part of the public HPX API.

### hpx/runtime_distributed.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

class runtime_distributed : public runtime

    #include <runtime_distributed.hpp> The runtime class encapsulates the HPX runtime system in a simple to use way. It makes sure all required parts of the HPX runtime system are properly initialized.

### Public Functions

explicit runtime_distributed(util::runtime_configuration &rtcfg, int (*pre_main)(runtime_mode) = nullptr, void (*post_main)() = nullptr)

Construct a new HPX runtime instance

- **Parameters**
  - locality_mode – [in] This is the mode the given runtime instance should be executed in.

~runtime_distributed() The destructor makes sure all HPX runtime services are properly shut down before exiting.

int start(hpx::function<hpx_main_function_type> const &func, bool blocking = false) override

Start the runtime system.

- **Parameters**
  - func – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef hpx_main_function_type.
  - blocking – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is true the function runtime::start will call runtime::wait internally.

- **Returns**
  - If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter func. Otherwise it will return zero.

int start(bool blocking = false) override

Start the runtime system.

- **Parameters**
  - blocking – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is true the function runtime::start will call runtime::wait internally.
**Returns** If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise it will return zero.

```cpp
int wait() override
```

Wait for the shutdown action to be executed.

**Returns** This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

```cpp
void stop(bool blocking = true) override
```

Initiate termination of the runtime system.

**Parameters**
- `blocking` – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is `false` then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to `true` to wait for all internal work to be completed.

```cpp
int finalize(double shutdown_timeout) override
```

**Parameters**

```cpp
void stop_helper(bool blocking, std::condition_variable &cond, std::mutex &mtx)
```

Stop the runtime system, wait for termination.

**Parameters**
- `blocking` – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is `false` then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to `true` to wait for all internal work to be completed.

```cpp
int suspend() override
```

Suspend the runtime system.

```cpp
int resume() override
```

Resume the runtime system.

```cpp
bool report_error(std::size_t num_thread, std::exception_ptr const &e, bool terminate_all = true) override
```

Report a non-recoverable error to the runtime system.

**Parameters**
- `num_thread` – [in] The number of the operating system thread the error has been detected in.
- `e` – [in] This is an instance encapsulating an exception which lead to this function call.
- `terminate_all` – [in] Kill all localities attached to the currently running application (default: true)

```cpp
bool report_error(std::exception_ptr const &e, bool terminate_all = true) override
```

Report a non-recoverable error to the runtime system.

**Note:** This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

**Parameters**
- `e` – [in] This is an instance encapsulating an exception which lead to this function call.
- `terminate_all` – [in] Kill all localities attached to the currently running application (default: true)

```cpp
int run(hpx::function<hpx_main_function_type> const &func) override
```

Run the HPX runtime system, use the given function for the main thread and block waiting for all threads to finish.
Note: The parameter `func` is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

**Parameters** `func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef `hpx_main_function_type`. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

**Returns** This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

```cpp
int run() override
```
Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

**Returns** This function will always return 0 (zero).

```cpp
bool is_networking_enabled() override
```

```cpp
template<typename F>
inline components::console_error_dispatcher::sink_type set_error_sink(F &&sink)
```

```cpp
performance_counters::registry &get_counter_registry()
```
Allow access to the registry counter registry instance used by the HPX runtime.

```cpp
performance_counters::registry const &get_counter_registry() const
```
Allow access to the registry counter registry instance used by the HPX runtime.

```cpp
void register_query_counters(std::shared_ptr<util::query_counters> const &active_counters)
```

```cpp
void start_active_counters(error_code &ec = throws) const
```

```cpp
void stop_active_counters(error_code &ec = throws) const
```

```cpp
void reset_active_counters(error_code &ec = throws) const
```

```cpp
void reinit_active_counters(bool reset = true, error_code &ec = throws) const
```

```cpp
void evaluate_active_counters(bool reset = false, char const *description = nullptr, error_code &ec = throws) const
```

```cpp
void stop_evaluating_counters(bool terminate = false) const
```

```cpp
naming::resolver_client &get_agas_client()
```
Allow access to the AGAS client instance used by the HPX runtime.

```cpp
hpx::threads::threadmanager &get_thread_manager()
```
Allow access to the thread manager instance used by the HPX runtime.

```cpp
applier::applier &get_applier()
```
Allow access to the applier instance used by the HPX runtime.

```cpp
std::string here() const override
```
Returns a string of the locality endpoints (usable in debug output)

```cpp
naming::address_type get_runtime_support_lva() const
```
naming::gid_type get_next_id(std::size_t count = 1)

void init_id_pool_range()

util::unique_id_ranges &get_id_pool()

void initialize_agas()

    Initialize AGAS operation.

void add_pre_startup_function(startup_function_type f) override

    Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with add_startup_function.

    **Note:** The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

    **Parameters** f – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void add_startup_function(startup_function_type f) override

    Add a function to be executed inside a HPX thread before hpx_main

    **Parameters** f – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void add_pre_shutdown_function(shutdown_function_type f) override

    Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

    **Note:** The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

    **Parameters** f – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

void add_shutdown_function(shutdown_function_type f) override

    Add a function to be executed inside a HPX thread during hpx::finalize

    **Parameters** f – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

hpx::util::io_service_pool *get_thread_pool(char const *name) override

    Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument name are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

bool register_thread(char const *name, std::size_t num = 0, bool service_thread = true, error_code &ec = throws) override

    Register an external OS-thread with HPX.
notification_policy_type `get_notification_policy` (char const *prefix, runtime_local::os_thread_type type) override

Generate a new notification policy instance for the given thread name prefix

`std::uint32_t get_locality_id(error_code &ec)` const override

`std::size_t get_num_worker_threads()` const override

`std::uint32_t get_num_localities(hpx::launch::sync_policy, error_code &ec)` const override

**hpx/runtime_distributed/applier.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace `hpx`

namespace `applier`

class `applier`

#include <applier.hpp>  The `applier` class is used to decide whether a particular action has to be issued on a local or a remote resource. If the target component is local a new `thread` will be created, if the target is remote a parcel will be sent.
Public Functions

**HPX_NON_COPYABLE**(applier)

applier()

void init(threads::threadmanager &tm)

~applier() = default

void initialize(std::uint64_t rts)

threads::threadmanager &get_thread_manager()

Access the thread-manager instance associated with this applier.

naming::gid_type const &get_raw_locality(error_code &ec = throws) const

Allow access to the locality of the locality this applier instance is associated with.

This function returns a reference to the locality this applier instance is associated with.

std::uint32_t get_locality_id(error_code &ec = throws) const

Allow access to the id of the locality this applier instance is associated with.

This function returns a reference to the id of the locality this applier instance is associated with.

bool get_raw_remote_localities(std::vector<naming::gid_type> &locality_ids, components::component_type type = components::component_invalid, error_code &ec = throws) const

Return list of localities of all remote localities registered with the AGAS service for a specific component type.

This function returns a list of all remote localities (all localities known to AGAS except the local one) supporting the given component type.

**Parameters**

- `locality_ids` – [out] The reference to a vector of id_types filled by the function.
- `type` – [in] The type of the component which needs to exist on the returned localities.

**Returns** The function returns `true` if there is at least one remote locality known to the AGAS service (!prefixes.empty()).

bool get_remote_localities(std::vector<hpx::id_type> &locality_ids, components::component_type type = components::component_invalid, error_code &ec = throws) const

bool get_raw_localities(std::vector<naming::gid_type> &locality_ids, components::component_type type = components::component_invalid) const

Return list of locality_ids of all localities registered with the AGAS service for a specific component type.

This function returns a list of all localities (all localities known to AGAS except the local one) supporting the given component type.

**Parameters**

- `locality_ids` – [out] The reference to a vector of id_types filled by the function.
- `type` – [in] The type of the component which needs to exist on the returned localities.

**Returns** The function returns `true` if there is at least one remote locality known to the AGAS service (!prefixes.empty()).
bool get_localities(const std::vector<hpx::id_type> &locality_ids, error_code &ec = throws) const

bool get_localities(const std::vector<hpx::id_type> &locality_ids, components::component_type type, error_code &ec = throws) const

inline naming::gid_type const &get_runtime_support_raw_gid() const

By convention the runtime_support has a gid identical to the prefix of the locality the runtime_support is responsible for

Private Members

threads::threadmanager *thread_manager_

hpx::id_type runtime_support_id_

namespace hpx

namespace applier

Functions

applier &get_applier()

The function get_applier returns a reference to the (thread specific) applier instance.

applier *get_applier_ptr()

The function get_applier returns a pointer to the (thread specific) applier instance. The returned pointer is NULL if the current thread is not known to HPX or if the runtime system is not active.

namespace applier

The namespace applier contains all definitions needed for the class hpx::applier::applier and its related functionality. This namespace is part of the HPX core module.
namespace hpx

namespace components

Functions

template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy)

Copy given component to the specified target locality.

The function copy<Component> will create a copy of the component referenced by to_copy on the locality specified with target_locality. It returns a future referring to the newly created component instance.

Note: The new component instance is created on the locality of the component instance which is to be copied.

Parameters to_copy – [in] The global id of the component to copy

Template Parameters The – only template argument specifies the component type to create.

Returns A future representing the global id of the newly (copied) component instance.

template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy, hpx::id_type const &target_locality)

Copy given component to the specified target locality.

The function copy<Component> will create a copy of the component referenced by to_copy on the locality specified with target_locality. It returns a future referring to the newly created component instance.

Parameters

• to_copy – [in] The global id of the component to copy

• target_locality – [in ] The locality where the copy should be created.

Template Parameters The – only template argument specifies the component type to create.

Returns A future representing the global id of the newly (copied) component instance.

template<typename Derived, typename Stub, typename Data>
Derived copy(client_base<Derived, Stub, Data> const &to_copy, hpx::id_type const &target_locality = hpx::invalid_id)

Copy given component to the specified target locality.

The function copy will create a copy of the component referenced by the client side object to_copy on the locality specified with target_locality. It returns a new client side object future referring to the newly created component instance.

Note: If the second argument is omitted (or is invalid_id) the new component instance is created on the locality of the component instance which is to be copied.

Parameters

• to_copy – [in] The client side object representing the component to copy
• **target_locality** – [in, optional] The locality where the copy should be created (default is same locality as source).

**Template Parameters** The – only template argument specifies the component type to create.

**Returns** A future representing the global id of the newly (copied) component instance.

### hpx/runtime_distributed/find_all_localities.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**namespace** hpx

### Functions

**hpx::id_type** find_root_locality(*error_code &ec = throws*)

Return the global id representing the root locality.

The function find_root_locality() can be used to retrieve the global id usable to refer to the root locality. The root locality is the locality where the main AGAS service is hosted.

**See also:**

hpx::find_all_localities(), hpx::find_locality()

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of hpx::exception.

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return `hpx::invalid_id` otherwise.

**Parameters** `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** The global id representing the root locality for this application.

**std::vector<hpx::id_type>** find_all_localities(*error_code &ec = throws*)

Return the list of global ids representing all localities available to this application.

The function find_all_localities() can be used to retrieve the global ids of all localities currently available to this application.

**See also:**

hpx::find_here(), hpx::find_locality()
Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns The global ids representing the localities currently available to this application.

\[
\text{std::vector<hpx::id_type> find_remote_localities(error_code &ec = throws)}
\]

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function find_remote_localities() can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one).

See also:

hpx::find_here(), hpx::find_locality()
namespace hpx

Functions

\texttt{hpx::id\_type \textbf{find\_here}(error\_code &ec = throws)}

Return the global id representing this locality.

The function \texttt{find\_here()} can be used to retrieve the global id usable to refer to the current locality.

See also:
\texttt{hpx::find\_all\_localities(), hpx::find\_locality()}

\textbf{Note:} Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

\textbf{Note:} As long as \texttt{ec} is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \texttt{ec}. Otherwise it throws an instance of \texttt{hpx::exception}.

\textbf{Note:} This function will return meaningful results only if called from an HPX-thread. It will return \texttt{hpx::invalid\_id} otherwise.

\textbf{Parameters} \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hpx::throws} the function will throw on error instead.

\textbf{Returns} The global id representing the locality this function has been called on.

hpx/runtime\_distributed/find\_localities.hpp

See \textit{Public API} for a list of names and headers that are part of the public \textit{HPX} API.

namespace hpx
Functions

\[
\text{std::vector<hpx::id_type> find_all_localities(components::component_type type, error_code &ec = throws)}
\]

Return the list of global ids representing all localities available to this application which support the given component type.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application which support the creation of instances of the given component type.

See also:

`hpx::find_here(), hpx::find_locality()`

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as \( ec \) is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of `hpx::exception`.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return the available localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The global ids representing the localities currently available to this application which support the creation of instances of the given component type. If no localities supporting the given component type are currently available, this function will return an empty vector.

\[
\text{std::vector<hpx::id_type> find_remote_localities(components::component_type type, error_code &ec = throws)}
\]

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function `find_remote_localities()` can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one) which support the creation of instances of the given component type.

See also:

`hpx::find_here(), hpx::find_locality()`
Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as \textit{ec} is not pre-initialized to \textit{hpx::throws} this function doesn’t throw but returns the result code using the parameter \textit{ec}. Otherwise it throws an instance of \textit{hpx::exception}.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

### Parameters

- \textbf{type} – [in] The type of the components for which the function should return the available remote localities.
- \textbf{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to \textit{hpx::throws} the function will throw on error instead.

### Returns

The global ids representing the remote localities currently available to this application.

\begin{verbatim}
\texttt{hpx::id_type \textbf{find_locality}(components::component_type type, error_code \& ec = \texttt{throws})}
\end{verbatim}

Return the global id representing an arbitrary locality which supports the given component type.

The function \texttt{find_locality()} can be used to retrieve the global id of an arbitrary locality currently available to this application which supports the creation of instances of the given component type.

See also:

\texttt{hpx::find_here(), hpx::find_all_localities()}

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as \textit{ec} is not pre-initialized to \textit{hpx::throws} this function doesn’t throw but returns the result code using the parameter \textit{ec}. Otherwise it throws an instance of \textit{hpx::exception}.

Note: This function will return meaningful results only if called from an HPX-thread. It will return \textit{hpx::invalid\_id} otherwise.

### Parameters

- \textbf{type} – [in] The type of the components for which the function should return any available locality.
- \textbf{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to \textit{hpx::throws} the function will throw on error instead.
**Returns** The global id representing an arbitrary locality currently available to this application which supports the creation of instances of the given component type. If no locality supporting the given component type is currently available, this function will return `hpx::invalid_id`.

### hpx/runtime_distributed/get_locality_name.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx {

    // Functions

    template<> future<std::string> get_locality_name(hpx::id_type const &id)
    {
        // Return the name of the referenced locality.
        // This function returns a future referring to the name for the locality of the given id.
        return future<std::string> {
            []() {
                return get_locality_name(id);
            }
        };
    }

    // Parameters
    id -- [in] The global id of the locality for which the name should be retrieved

    // Returns
    This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

```
Parameters $t$ – The component type for which the number of connected localities should be retrieved.

```cpp
std::uint32_t get_num_localities(launch::sync_policy, components::component_type t, error_code &ec = throws)
```

Synchronously return the number of localities which are currently registered for the running application. The function `get_num_localities` returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also:

- `hpx::find_all_localities`
- `hpx::get_num_localities`

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

### Parameters

- $t$ – The component type for which the number of connected localities should be retrieved.
- $ec$ – `[in,out]` this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**hpx/runtime_distributed/migrate_component.hpp**

See `Public API` for a list of names and headers that are part of the public HPX API.

namespace `hpx`

namespace `components`

### Functions

**template<
- `typename Component`,
- `typename DistPolicy`

```cpp
future<hpx::id_type> migrate(hpx::id_type const &to_migrate, [[maybe_unused]] DistPolicy const &policy)
```

Migrate the given component to the specified target locality

The function `migrate<Component>` will migrate the component referenced by `to_migrate` to the locality specified with `target_locality`. It returns a future referring to the migrated component instance.

**Parameters**

- `policy` – `[in]` A distribution policy which will be used to determine the locality to migrate this object to.

**Template Parameters**

- `Component` – Specifies the component type of the component to migrate.
- `DistPolicy` – Specifies the distribution policy to use to determine the destination locality.

**Returns** A future representing the global id of the migrated component instance. This should be the same as `migrate_to`.
Migrate the given component to the specified target locality

The function `migrate<Component>` will migrate the component referenced by `to_migrate` to the locality specified with `target_locality`. It returns a future referring to the migrated component instance.

**Parameters**
- `policy` – [in] A distribution policy which will be used to determine the locality to migrate this object to.

**Template Parameters**
- `Derived` – Specifies the component type of the component to migrate.
- `DistPolicy` – Specifies the distribution policy to use to determine the destination locality.

**Returns** A future representing the global id of the migrated component instance. This should be the same as `migrate_to`.

Migrate the component with the given id to the specified target locality

The function `migrate<Component>` will migrate the component referenced by `to_migrate` to the locality specified with `target_locality`. It returns a future referring to the migrated component instance.

**Parameters**
- `target_locality` – [in] The id of the locality to migrate this object to.

**Template Parameters**
- `Component` – Specifies the component type of the component to migrate.

**Returns** A future representing the global id of the migrated component instance. This should be the same as `migrate_to`.

Migrate the given component to the specified target locality

The function `migrate<Component>` will migrate the component referenced by `to_migrate` to the locality specified with `target_locality`. It returns a future referring to the migrated component instance.

**Parameters**
- `target_locality` – [in] The id of the locality to migrate this object to.

**Template Parameters**
- `Derived` – Specifies the component type of the component to migrate.

**Returns** A client side representation of representing of the migrated component instance. This should be the same as `migrate_to`.

class runtime_support

Public Types

typedef runtime_support type_holder

Public Functions

explicit runtime_support(hpx::util::runtime_configuration &cfg)

inline ~runtime_support()

void delete_function_lists()

void tidy()

template<
typename Component>
naming::gid_type create_component()  
Actions to create new objects.

template<typename Component, typename T, typename ...Ts>  
naming::gid_type create_component(T v, Ts... vs)

template<typename Component>  
std::vector<naming::gid_type> bulk_create_component(std::size_t count)

template<typename Component, typename T, typename ...Ts>  
std::vector<naming::gid_type> bulk_create_component(std::size_t count, T v, Ts... vs)

template<typename Component>  
naming::gid_type copy_create_component(std::shared_ptr<Component> const &p, bool)

template<typename Component>  
naming::gid_type migrate_component_to_here(std::shared_ptr<Component> const &p, hpx::id_type)

void shutdown(double timeout, hpx::id_type const &respond_to)  
Gracefully shutdown this runtime system instance.

void shutdown_all(double timeout)  
Gracefully shutdown runtime system instances on all localities.

void terminate(hpx::id_type const &respond_to)  
Shutdown this runtime system instance.

inline void terminate_act(hpx::id_type const &id)

void terminate_all()  
Shutdown runtime system instances on all localities.

inline void terminate_all_act()

util::section get_config()  
Retrieve configuration information.

int load_components()  
Load all components on this locality.

void call_startup_functions(bool pre_startup)

void call_shutdown_functions(bool pre_shutdown)

void garbage_collect()  
Force a garbage collection operation in the AGAS layer.

naming::gid_type create_performance_counter(performance_counters::counter_info const &info)

Create the given performance counter instance.

void remove_from_connection_cache(naming::gid_type const &gid,  
parcelset::endpoints_type const &eps)  
Remove the given locality from our connection cache.
HPX_DEFINE_COMPONENT_ACTION (runtime_support, terminate_act, terminate_action) HPX_DEFINE_COMPONENT_ACTION (runtime_support, termination_detection

terminate_all_act HPX_DEFINE_COMPONENT_ACTION (runtime_support, remove_from_connection_cache) void run()

Start the runtime_support component.

void wait()

Wait for the runtime_support component to notify the calling thread.

This function will be called from the main thread, causing it to block while the HPX functionality is executed. The main thread will block until the shutdown_action is executed, which in turn notifies all waiting threads.

void stop (double timeout, hpx::id_type const &respond_to, bool remove_from_remote_caches)

Notify all waiting (blocking) threads allowing the system to be properly stopped.

Note: This function can be called from any thread.

void stopped()

called locally only

void notify_waiting_main()

inline bool was_stopped() const

struct runtime_support

Subclassed by hpx::components::runtime_support
Public Static Functions

template<typename Component, typename ...Ts>
static inline hpx::future<hpx::id_type> create_component_async(hpx::id_type const &gid, 
  Ts&&... vs)

Create a new component type using the runtime_support with the given targetgid. This is a non-blocking call. The caller needs to call future::get on the result of this function to obtain the global id of the newly created object.

template<typename Component, typename ...Ts>
static inline hpx::id_type create_component(hpx::id_type const &gid, Ts&&... vs)

Create a new component type using the runtime_support with the given targetgid. Block for the creation to finish.

Create multiple new components type using the runtime_support collocated with the with the given targetgid. This is a non-blocking call.

Create multiple new components type using the runtime_support collocated with the with the given targetgid. Block for the creation to finish.

Create multiple new components type using the runtime_support on the given locality. This is a non-blocking call.

Create multiple new components type using the runtime_support on the given locality. Block for the creation to finish.
Create a new component type using the runtime_support with the given targetgid. This is a non-blocking call. The caller needs to call future::get on the result of this function to obtain the global id of the newly created object.

```cpp
template<typename Component, typename ...Ts>
static inline hpx::id_type create_component_colocated(hpx::id_type const &gid, Ts&&... vs)
```

Create a new component type using the runtime_support with the given targetgid. Block for the creation to finish.

```cpp
template<typename Component>
static inline hpx::future<hpx::id_type> copy_create_component_async(hpx::id_type const &gid,
  std::shared_ptr<Component> const &p, bool local_op)
```

```cpp
template<typename Component>
static inline hpx::id_type copy_create_component(hpx::id_type const &gid,
  std::shared_ptr<Component> const &p, bool local_op)
```

```cpp

parallel::util::detail::algorithm_result<ExPolicy, T>::type tag_invoke(hpx::transform_reduce_t, ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

2.9 Contributing to HPX

HPX development happens on Github. The following sections are a collection of useful information related to HPX development.
2.9.1 Contributing to HPX

The main source of information to understand the process of how to contribute to HPX can be found in this document\(^\text{553}\). This is a living document that is constantly updated with relevant information.

2.9.2 HPX governance model

The HPX project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. This document\(^\text{554}\) describes how that participation takes place and how to set about earning merit within the project community.

2.9.3 Release procedure for HPX

Below is a step by step procedure for making an HPX release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an HPX release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.

2. For minor and major releases: create and check out a new branch at an appropriate point on master with the name `release-major.minor.X`. major and minor should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.

3. Write release notes in `docs/sphinx/releases/whats_new_$VERSION.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.

4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
   - `$HPX_SOURCE/README.rst`
     - Update grant information
   - `docs/sphinx/releases/whats_new_$VERSION.rst`
   - `docs/sphinx/about_hpx/people.rst`
     - Update collaborators
     - Update grant information

5. This step does not apply to patch releases. For both APEX and libCDS:
   - Change the release branch to be the most current release tag available in the APEX/libCDS git_external section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the HPX release (APEX\(^\text{555}\), libCDS\(^\text{556}\)).

6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.

\(^\text{553}\) https://github.com/STEllAR-GROUP/hpx/blob/master/.github/CONTRIBUTING.md
\(^\text{554}\) http://hpx.stellar-group.org/documents/governance/
\(^\text{555}\) http://github.com/UO-OACISS/xpress-apex
\(^\text{556}\) https://github.com/STEllAR-GROUP/libcds
7. Change version references in CITATION.cff. There are two occurrences. Change year in the copyright file under /libs/core/version/src/version.cpp.

8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main CMakeLists.txt and also deleting all related code and tests from the main source tree.

   The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:
   
   a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
   
   b. Second release cycle: turn this build option OFF by default.
   
   c. Third release cycle: completely remove the old code.

   The main CMakeLists.txt contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don’t have a replacement yet, we keep them around in case (like Vc for example).

9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in prerequisites.rst.

10. Verify that the Jenkins setups for the release branch on Rostam and Piz Daint are running and do not display any errors.

11. Repeat the following steps until satisfied with the release.

   1. Change HPX_VERSION_TAG in CMakeLists.txt to -rcN, where N is the current iteration of this step. Start with -rc1.

   2. Create a pre-release on GitHub using the script tools/roll_release.sh. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.

   3. This step is not necessary for patch releases. Notify hpx-users@stellar-group.org and stellar@cct.lsu.edu of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.

   4. Allow at least a week for testing of the release candidate.

      • Use git merge when possible, and fall back to git cherry-pick when needed. For patch releases git cherry-pick is most likely your only choice if there have been significant unrelated changes on master since the previous release.

      • Go back to the first step when enough patches have been added.

      • If there are no more patches, continue to make the final release.

12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, quickstart.rst contains instructions to check out the latest stable tag. Make sure that refers to the new version.

13. Add a new entry to the RPM changelog (cmake/packaging/rpm/Changelog.txt) with the new version number and a link to the corresponding changelog.

14. Change HPX_VERSION_TAG in CMakeLists.txt to an empty string.

15. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of HPX_VERSION_DATE in CMakeLists.txt.

16. Create a release on GitHub using the script tools/roll_release.sh. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.

17. Update the websites (hpx.stellar-group.org557, stellar-group.org558 and stellar.cct.lsu.edu559). You can login on

---

557 https://hpx.stellar-group.org
558 https://stellar-group.org
559 https://stellar.cct.lsu.edu

2.9. Contributing to HPX 1477
wordpress through this page <https://hpx.stellar-group.org/wp-login.php>. You can update the pages with the following:

- Update links on the downloads page. Link to the release on GitHub.
- Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
- A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).

18. Merge release branch into master.

19. Post-release cleanup. Create a new pull request against master with the following changes:
   1. Modify the release procedure if necessary.
   2. Change `HPX_VERSION_TAG` in `CMakeLists.txt` back to `-trunk`.
   3. Increment `HPX_VERSION_MINOR` in `CMakeLists.txt`.

20. Update Vcpkg (https://github.com/Microsoft/vcpkg) to pull from latest release.
   - Update version number in `CONTROL`.
   - Update tag and SHA512 to that of the new release

   - Update version number in `hpx/package.py` and SHA256 to that of the new release

22. Announce the release on hpx-users@stellar-group.org, stellar@cct.lsu.edu, allcct@cst.lsu.edu, faculty@cse.lsu.edu, faculty@ece.lsu.edu, the HPX Slack channel, the IRC channel, our list of external collaborators, isocpp.org, reddit.com, HPC Wire, Inside HPC, Heise Online, and a CCT press release.

23. Beer and pizza.

2.9.4 Testing HPX

To ensure correctness of HPX, we ship a large variety of unit and regression tests. The tests are driven by the CTest tool and are executed automatically on each commit to the HPX Github repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our HPX Issues tracker with detailed information about the target system.

Running tests manually

Running the tests manually is as easy as typing `make tests` & `make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the CTest Documentation for further details.

---

561 https://github.com/STEllAR-GROUP/hpx/
562 https://github.com/STEllAR-GROUP/hpx/issues
Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under tools/perftests_ci/local_run.sh (to be run in the build directory specifying the HPX source directory as the argument to the script, default is $HOME/projects/hpx_perftests_ci).

Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with hpx::util::perftests_report, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call hpx::util::perftests_print_times. To see an example of use, see future_overhead_report.cpp. Finally, you can add the test to the CI report editing the hpx_targets variable for the executable name and the hpx_test_options variable for the corresponding options to use for the run in the performance test script .jenkins/cscs-perftests/launch_perftests.sh. And then run the tools/perftests_ci/local_run.sh script to get a reference json run (use the name of the test) to be added in the tools/perftests_ci/perftest/references/daint_default directory.

Issue tracker

If you stumble over a bug or missing feature in HPX, please submit an issue to our HPX Issues page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the Support Website page.

Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both CircleCI and a combination of CDash and pycicle. You can see the dashboards here: CircleCI HPX dashboard and CDash HPX dashboard.

2.9.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, Docker provides a convenient alternative to quickly get all the dependencies needed to start development of HPX. Our testing setup on CircleCI uses a docker image to run all tests.

To get started you need to install Docker using whatever means is most convenient on your system. Once you have Docker installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on Docker Hub. To start a container using the HPX build environment, run:

---

564 https://github.com/STEllAR-GROUP/hpx/issues
565 https://stellar.cct.lsu.edu/support/
566 https://circleci.com
567 https://www.kitware.com/cdash/project/about.html
568 https://github.com/biddisco/pycicle/
569 https://circleci.com/gb/STELLAR-GROUP/hpx
570 https://cdash.cscs.ch/index.php?project=HPX
571 https://www.docker.com
572 https://circleci.com
573 https://www.docker.com
574 https://www.docker.com
575 https://hub.docker.com/r/stellargroup/build_env/
You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the Docker Documentation for more information on using Docker.

**Warning:** All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see Docker Documentation (Bind mounts)).

### 2.9.6 Documentation

This documentation is built using Sphinx, and an automatically generated API reference using Doxygen and Breathe.

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

**Prerequisites**

To build the *HPX* documentation, you need recent versions of the following packages:

- python3
- sphinx 4.5.0 (Python package)
- sphinx-book-theme (Python package)
- breathe 4.33.1 (Python package)
- doxygen
- sphinxcontrib-bibtex
- sphinx-copybutton

If the Python dependencies are not available through your system package manager, you can install them using the Python package manager pip:

```shell
pip install --user "sphinx<5" sphinx-book-theme breathe sphinxcontrib-bibtex sphinx-copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

**Doxygen_ROOT:PATH**

Specifies where to look for the installation of the Doxygen tool.

---

576 [https://docs.docker.com/](https://docs.docker.com/)
577 [https://www.docker.com](https://www.docker.com)
578 [https://docs.docker.com/storage/bind-mounts/](https://docs.docker.com/storage/bind-mounts/)
579 [http://www.sphinx-doc.org](http://www.sphinx-doc.org)
580 [https://www.doxygen.org](https://www.doxygen.org)
582 [https://www.python.org](https://www.python.org)
583 [https://www.doxygen.org](https://www.doxygen.org)
Sphinx_ROOT:PATH

Specifies where to look for the installation of the Sphinx\textsuperscript{584} tool.

Breathe_APIDOC_ROOT:PATH

Specifies where to look for the installation of the Breathe\textsuperscript{585} tool.

Building documentation

Enable building of the documentation by setting HPX\_WITH\_DOCUMENTATION\_OUTPUT\_FORMATS CMake option.

Note: If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with =.
- Sub-headings use only underlines with characters in decreasing level of importance: =, - and ..
- Use sentence case in headings.
- Refer to common terminology using \texttt{:term:`Component`}.
- Indent content of directives (\texttt{.\ directive::}) by three spaces.
- For C++ code samples at the end of paragraphs, use :: and indent the code sample by 4 spaces.
  - For other languages (or if you don’t want a colon at the end of the paragraph), use \texttt{.\ code-block:: language} and indent by three spaces as with other directives.
- Use \texttt{.\ list-table::} to wrap tables with a lot of text in cells.

API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the doxygen_dependencies variable in docs/CMakeLists.txt.

\textsuperscript{584} \url{http://www.sphinx-doc.org}
\textsuperscript{585} \url{https://breathe.readthedocs.io/en/latest}
\textsuperscript{586} \url{https://www.cmake.org}
2.9.7 Module structure

This section explains the structure of an HPX module.

The tool create_library_skeleton.py\(^{587}\) can be used to generate a basic skeleton. To create a library skeleton, run the tool in the libs subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an HPX module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
  - README.rst
  - CMakeLists.txt
  - cmake
  - docs/
    * index.rst
  - examples/
    * CMakeLists.txt
  - include/
    * hpx/
      - `<lib_name>`
  - src/
    * CMakeLists.txt
  - tests/
    * CMakeLists.txt
  - unit/
    * CMakeLists.txt
  - regressions/
    * CMakeLists.txt
  - performance/
    * CMakeLists.txt

A README.rst should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main CMakeLists.txt is created in the root directory of the module. By default it contains a call to add_hpx_module which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

add_hpx_module requires a module name. Optional flags are:

Optional single-value arguments are:

- INSTALL_BINARIES: Install the resulting library.

\(^{587}\) https://github.com/STEllAR-GROUP/hpx/blob/master/libs/create_library_skeleton.py
Optional multi-value arguments are:

- **SOURCES**: List of source files.
- **HEADERS**: List of header files.
- **COMPAT_HEADERS**: List of compatibility header files.
- **DEPENDENCIES**: Libraries that this module depends on, such as other modules.
- **CMAKE_SUBDIRS**: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional CMake scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

### Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it’s not clear what is causing the circular dependency, running the `cpp-dependencies` tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See [Using docker for development](#) for details on how to use the docker image.

To produce the graph produced by CI run the following command (`HPX_SOURCE` is assumed to hold the path to the `HPX` source directory):

```bash
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a `.dot` file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```bash
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `.svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```bash
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

---

588 https://www.cmake.org
589 https://github.com/tomtom-international/cpp-dependencies

---

2.9. Contributing to `HPX`
cpp-dependencies --dir $HPX_SOURCE/libs --shortest algorithms config

The following should report that it can’t find a path between the two modules:

cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms

2.10 Releases

2.10.1 List of releases

HPX V1.10.0 (TBD)

General changes

Breaking changes

- The CMake configuration keys SOMELIB_ROOT (e.g., BOOST_ROOT) have been renamed to Somelib_ROOT (e.g., Boost_ROOT) to avoid warnings when using newer versions of CMake. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the CMake cache.

Closed issues

Closed pull requests

HPX V1.9.1 (August 4, 2023)

General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcelports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. `#include <thread>` now corresponds to `#include <hpx/thread.hpp>`. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcelport, but we have also cleaned up and improved the MPI parcelport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.
Breaking changes

None

Closed issues

- Issue #6155[^590] - hpxcxx and hpexrun.py do not work if HPX_WITH_TESTS=OFF
- Issue #6164[^591] - HPX_WITH_DATAPAR_BACKEND=EVE causes compile errors with C++17
- Issue #6175[^592] - Make sure all our parallel algorithms accept the predicates by value
- Issue #6194[^593] - tests.regressions.threads.threads_all_1422 failed at Perlmutter
- Issue #6198[^594] - set_intersection/set_difference fails when run with execution::par
- Issue #6214[^595] - Broken Links to the Documentation page in readme.rst
- Issue #6217[^596] - hpx::make_heap does not terminate when exPolicy is par (or par_unseq) and size of vector is 4
- Issue #6246[^597] - HPX fails to compile under cxx 20 (fresh system)
- Issue #6247[^598] - HPX 1.9.0 does not compile with GCC on Windows
- Issue #6282[^599] - The “attach-debugger” option is broken on the current master branch.

Closed pull requests

- PR #6219[^600] - Cleaning up #includes in hpx/ folder
- PR #6223[^601] - Move documentation from README.rst to index.rst files under libs directory
- PR #6229[^602] - Adding zero-copy support on the receiving end of the TCP and MPI parcel ports
- PR #6231[^603] - Remove deprecated email from release procedure
- PR #6235[^604] - Modernize more modules (levels 12-16)
- PR #6236[^605] - Attempt to resolve occasional shutdown hangs in distributed operation
- PR #6239[^606] - Fix Optimizing HPX applications page of Manual
- PR #6241[^607] - LCI parcelport: Refactor, add more variants, zero copy receives.

• PR #6278621 - Making sure the future’s shared state doesn’t go out of scope prematurely
• PR #6279622 - Re-expose error names
• PR #6281623 - Creating directory for file copy
• PR #6283624 - Consistently #include unistd.h for _POSIX_VERSION

**HPX V1.9.0 (May 2, 2023)**

**General changes**

• Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.

• LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.

• HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.
• Improvements took place on our parallel algorithms implementation.

• Our Senders/Receivers (P2300) integration was extended:
  – Coroutines were integrated with senders/receivers.
    - `get_completion_signatures` now works with awaitable senders. - `with_awaitable_senders` allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. - `when_all_vector` was added.

• `sync_wait` and `sync_wait_with_variant` sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the main() function until the result is retrieved.

• The combinators for futures (a.k.a. `async_combinators`) `when_*`, `wait_*`, `wait_*nothrow` were turned into CPOs allowing for end-user customization. For more information on the `async_combinators` refer to the documentation, https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators.

• The new datapar backend SVE allows simd and par_simd execution policies to exploit data parallelism in the processors that have SVE vector registers like A64FX and Neoverse V1.

• The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.

• Copy button shortkey was added at the top-right of code-blocks.

• Pragma directive that reports warnings as errors on MSVC was fixed.

• Command line argument `--hpx:loopback_network` was added to facilitate debugging with networks.

• We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

**Breaking changes**

• Stopped supporting Clang V8, the minimal version supported is now Clang V10.

• Stopped supporting gcc V8, the minimal version supported is now gcc V9.

• Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.

• `tag_policy_tag` et.al. were re-added after HPX V1.8.1 deprecation.

• `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.

• The list of all the namespace changes can be found here: [HPX V1.9.0 Namespace changes](https://github.com/STEllAR-GROUP/hpx/issues/6203).

**Closed issues**

• Issue #6203 - Compilation error with `-mcpu=a64fx` on Ookami

• Issue #6196 - Incorrect log destination

• Issue #6191 - installing HPX

Chapter 2. What’s so special about HPX?
- PR #6037 - Avoid performing parcel related background work if networking is disabled
- PR #6036 - Support new datapar backend : SVE
- PR #6035 - Simplify datapar replace copy if
- PR #6034 - Add/Fix documentation of Public API
- PR #6033 - Support for data-parallelism for replace, replace_if, replace_copy, replace_copy_if algorithms
- PR #6032 - Add/Fix documentation of Public API
- PR #6031 - Expose available cache sizes from topology object
- PR #6030 - Adding parcelport initialization hook for resource partitioner operation
- PR #6029 - Simplify startup code
- PR #6027 - Add/Fix documentation in Public API page
- PR #6026 - add option hpx:force_ipv4 to force resolving hostnames to ipv4 addresses
- PR #6025 - build(docs): remove leftover sections
- PR #6023 - Minor fixes on “How to build on Windows”
- PR #6022 - build(doxygen): don’t extract private members
- PR #6021 - Adding pu_mask to thread_pool_bulk_scheduler
- PR #6020 - docs: add cppref NamedRequirements support
- PR #6019 - Unseq adaptation for for_each, transform, reduce, transform_reduce, etc.
- PR #6017 - loop and transform_loop unseq adaptation
- PR #6016 - Config and structural updates to support unseq implementation

**HPX V1.8.1 (Aug 5, 2022)**

This is a bugfix release with a few minor additions and resolved problems.

**General changes**

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.

• More work was done towards full compatibility with the sender/receivers proposal P2300.
  • Fixing sync_wait to decay the result types
  • Fixed collective operations to properly avoid overlapping consecutive operations on the same communicator.
  • Simplified the implementation of our execution policies and added mapping functions between those.
  • Fixed performance issues with our implementation of `small_vector`.
  • Serialization now works with buffers of unsigned characters.
  • Fixing dangling reference in serialization of non-default constructible types
  • Fixed static linking on Windows.
  • Fixed support for M1/MacOS based architectures.
  • Fixed support for gentoo/musl.
  • Fixed `hpx::counting_semaphore_var`.
  • Properly check start and end bounds for `hpx::for_loop`.
  • A lot of changes and fixes to the documentation (see https://hpx-docs.stellar-group.org).

**Breaking changes**

• No breaking changes have been introduced.

**Closed issues**

• Issue #5964\(^{850}\) - component with multiple inheritance
• Issue #5946\(^{851}\) - dll_dlopen.hpp: error: RTLD_DI_ORIGIN was not declared in this scope with musl libc

2.10. Releases
- PR #5934 - Attempting to fix datapar issues on CircleCI
- PR #5933 - Fix documentation for ranges algorithms
- PR #5932 - Remove mimalloc version constraint
- PR #5931 - docs: fix & improve parallel algorithms documentation
- PR #5930 - Add boost to hip builder
- PR #5929 - Apply fixes to M1/MacOS related stack allocation to all relevant spots
- PR #5928 - updated context_generic_context to accommodate arm64_arch_8/Apple architecture
- PR #5927 - Public derivation for counting_semaphore_var
- PR #5926 - Fix doxygen warnings when building documentation
- PR #5923 - Fixing git checkout to reflect latest version tag
- PR #5922 - A couple of unrelated changes in support of implementing P1673
- PR #5920 - [P2300] enhancements: receiver_of, sender_of improvements
- PR #5917 - Fixing various ‘held lock while suspending’ problems
- PR #5916 - Fix minor doxygen parsing typo
- PR #5915 - docs: fix broken api algo links
- PR #5914 - Remove CSS rules - update sphinx version
- PR #5911 - Removed references to hpx::vector in comments
- PR #5909 - Remove stuff which is defined in the header
- PR #5906 - Use BUILD_SHARED_LIBS correctly
- PR #5905 - Fix incorrect usage of generator expressions
- PR #5904 - Delete FindBZip2.cmake
- PR #5901 - Fix #5900
- PR #5899 - Replace PMR based version of small_vector
• PR #5897\(^{906}\) - Add missing ""
• PR #5896\(^{907}\) - Docs: Add serialization tutorial.
• PR #5895\(^{908}\) - Update to V1.9.0 on master
• PR #5894\(^{909}\) - Fix executor_with_thread_hooks example
• PR #5890\(^{910}\) - Adding simple average power consumption performance counter
• PR #5889\(^{911}\) - Par unseq/unseq adding
• PR #5888\(^{912}\) - Support for data-parallelism for reduce, transform reduce, transform_binary_reduce algorithms
• PR #5887\(^{913}\) - Fixing dangling reference in serialization of non-default constructible types
• PR #5876\(^{914}\) - New performance counters related to zero-copy chunks.

**HPX V1.8.0 (May 18, 2022)**

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 ("std::execution") and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

**General changes**

• The new documentation can now be found on our webpage: https://hpx-docs.stellar-group.org. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the “Quick start”, “Manual” and “Examples” was improved, while the “Build system” page was adapted to include necessary information for newcomers.

• With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
  
  - copy, copy_n
  - generate
  - adjacent_difference, adjacent_find
  - all_of, any_of, none_of
  - equal, mismatch,
  - inner_product
  - count, count_if
  - fill, fill_n

\(^{906}\) https://github.com/STEllAR-GROUP/hpx/pull/5897
\(^{907}\) https://github.com/STEllAR-GROUP/hpx/pull/5896
\(^{908}\) https://github.com/STEllAR-GROUP/hpx/pull/5895
\(^{909}\) https://github.com/STEllAR-GROUP/hpx/pull/5894
\(^{910}\) https://github.com/STEllAR-GROUP/hpx/pull/5890
\(^{911}\) https://github.com/STEllAR-GROUP/hpx/pull/5889

\(^{913}\) https://github.com/STEllAR-GROUP/hpx/pull/5887
\(^{914}\) https://github.com/STEllAR-GROUP/hpx/pull/5879
- find, find_end, find_first_of, find_if, find_if_not
- for_each, for_each_n
- generate, generate_n.

- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.

- Several changes took place on the executors provided by HPX:
  
- The executors now support the num_cores options in order for the user to be able to specify the desired number of cores to be used in the corresponding execution.

- The scheduler executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, hpx::async, hpx::dataflow, etc.

- The performance of fork_join_executor was improved.

- The following algorithms have been added/adapted to be C++20 conformant:
  - min_element
  - max_element
  - minmax_element
  - starts_with
  - ends_with
  - swap_ranges
  - unique
  - unique_copy
  - rotate
  - rotate_copy
  - sort
  - shift_left
  - shift_right
  - stable_sort
  - partition
  - partition_copy
  - stable_partition
  - adjacent_difference
  - nth_element
  - partial_sort
  - partial_sort_copy.

- HPX_FORWARD/HPX_MOVE macros were introduced that replaced the std::move and std::forward facilities that in the library code.

- Hangs on distributed barrier were fixed.

- The performance of scan_partitioner was improved.
• Support was added for thread_priority to the parallel_execution_policy

• Regarding senders/receivers and the P2300 proposal various actions took place. stop_token was adapted to the recent proposal version (in_place_stop_token was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to when_all. Support for completion signatures was added. The following schedulers and algorithms were added:
  - get_completion_scheduler
  - any_sender and unique_any_sender
  - split sender
  - transform_mpi sender
  - transfer sender
  - let_error, let_stopped
  - get_env and related environment queries
  - schedule, set_value, set_error, set_done, start and connect are now proper customization points as defined in P2300.

• Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:
  - hpx::parallel::induction/reduction were moved into namespace hpx::experimental
  - for_loop and friends were moved into namespace hpx::experimental.
  - hpx::util::optional and friends were moved into namespace hpx.
  - hpx::lcos::barrier has been moved into the hpx::distributed namespace and hpx::lcos::local::cpp20_barrier has been renamed to barrier and moved into the hpx namespace.
  - hpx::lcos::latch has been moved into the hpx::distributed namespace and lcos::local::latch has been moved into the hpx namespace. The count_down_and_wait() functionality of latch has been renamed to arrive_and_wait().
  - hpx::util::unique_function_nonser has been renamed to hpx::move_only_function.
  - hpx::util::unique_function has been renamed to hpx::distributed::move_only_function.
  - hpx::util::function has been renamed to hpx::distributed::function.
  - hpx::util::function_nonser has been renamed to hpx::function.
  - hpx::util::function_ref have been moved to namespace hpx.
  - hpx::lcos::split_future changed namespace and is now used as hpx::split_future.
  - hpx::lcos::local::counting_semaphore has been deprecated and hpx::lcos::local::cpp20_counting_semaphore has been renamed to hpx::counting_semaphore.
  - hpx::lcos::local::cpp20_binary_semaphore has been renamed to hpx::binary_semaphore.
  - hpx::lcos::local::sliding_semaphore has been renamed to hpx::sliding_semaphore and hpx::lcos::local::sliding_semaphore_var has been renamed to hpx::sliding_semaphore_var.
  - hpx::lcos::local::spinlock has been renamed to hpx::spinlock.
  - hpx::lcos::local::mutex has been renamed to hpx::mutex.

2.10. Releases
– `hpx::lcos::local::timed_mutex` has been renamed to `hpx::timed_mutex`.
– `hpx::lcos::local::no_mutex` has been renamed to `hpx::no_mutex`.
– `hpx::lcos::local::recursive_mutex` has been renamed to `hpx::recursive_mutex`.
– `hpx::lcos::local::shared_mutex` has been renamed to `hpx::shared_mutex`.
– `hpx::lcos::local::upgrade_lock` has been renamed to `hpx::upgrade_lock`.
– `hpx::lcos::local::upgrade_to_unique_lock` has been renamed to `hpx::upgrade_to_unique_lock`.
– `hpx::lcos::local::condition_variable` has been renamed to `hpx::condition_variable`.
  `hpx::lcos::local::condition_variable_var` has been renamed to `hpx::condition_variable_var`.
– `hpx::lcos::local::once_flag` has been renamed to `hpx::once_flag`, and .
  `hpx::lcos::local::call_once` has been renamed to `hpx::call_once`.

• The new LCI (Lightweight Communication Interface) parcelport was added that supports irregular and asynchronous applications like graph analysis, sparse linear algebra, modern parallel architectures etc. Major features include:
  – Support for advanced communication primitives like two sided send/recv and one sided remote put.
  – Explicit user control of communication resource.
  – Flexible signaling mechanisms (synchronizer, completion queue, active message handler).

• The following CMake flags were added, mostly to support using HPX as a backend for SHAD (https://github.com/pnnl/SHAD). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you’re doing:
  – `HPX_SERIALIZATION_WITH_ALLOW_RAW_POINTER.Serialization`
  – `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`
  – `HPX_SERIALIZATION_WITH_ALLOW_CONST_TUPLE_MEMBERS`

Breaking changes

• Minimum required C++ standard library is C++17.
• Support for GCC 7 and Clang 8.0.0 and below has been removed.
• CUDA version required updated to 11.4.
• CMake version required updated to 3.18.
• The default version of Asio used was updated to 1.20.0.
• The default version of APEX used was updated to 2.5.1.
• APEX version was updated to 2.5.1.
• `tagged_pair` and `tagged_tuple` were removed.
• `tag_dispatch` was renamed to `tag_invoke`.
• `hpx.max_background_threads` was renamed to `hpx.parcel.max_background_threads`.
• The following CMake flags were removed after being deprecated for at least two releases:
- `HPX_SCHEDULER_MAX_TERMINATED_THREADS`
- `HPX_WITH_GOOGLE_PERFTOOLS`
- `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY`
- `HPX_HAVE_{COROUTINE,PLUGIN}_GCC_HIDDEN_VISIBILITY`
- `HPX_TOP_LEVEL`
- `HPX_WITH_COMPUTE_CUDA`
- `HPX_WITH_ASYNC_CUDA`

- `annotate_function` was renamed to `scoped_annotation`
- `execution::transform` was renamed to `execution::then`
- `execution::detach` was renamed to `execution::start_detached`
- `execution::on_sender` was renamed to `execution::schedule_on`
- `execution::just_on` was renamed to `execution::just_transfer`
- `execution::set_done` was renamed to `execution::set_stopped`

### Closed issues

- **Issue #5871**<sup>915</sup> - distributed::channel.register_as terminates the active task.
- **Issue #5856**<sup>916</sup> - Performance counters do not compile
- **Issue #5828**<sup>917</sup> - hpx::distributed::barrier errors
- **Issue #5812**<sup>918</sup> - OctoTiger does not compile with HPX master and CUDA 11.5
- **Issue #5784**<sup>919</sup> - HPX failing with co_await and hpx::when_all(futures)
- **Issue #5774**<sup>920</sup> - CMake can't find HPXCacheVariables.cmake
- **Issue #5764**<sup>921</sup> - Fix HIP problem
- **Issue #5724**<sup>922</sup> - Missing binary filter compression header
- **Issue #5721**<sup>923</sup> - Cleanup after repository split
- **Issue #5701**<sup>924</sup> - It seems that the tcp parcelport is running, and the MPI parcelport is ignored
- **Issue #5692**<sup>925</sup> - Kokkos compilation fails when using both HPX and CUDA execution spaces with gcc 9.3.0
- **Issue #5686**<sup>926</sup> - Rename `annotate_function`
- **Issue #5668**<sup>927</sup> - HPX does not detect the C++ 20 standard using gcc 11.2

• PR #5822 - Clang-format remaining files
• PR #5821 - Enable permissive-flag on Windows GitHub actions builders
• PR #5820 - Convert throwmode enum to enum class
• PR #5819 - Marking customization points for intrusive_ptr as noexcept
• PR #5818 - Unconditionally use C++17 attributes
• PR #5817 - Modernize naming modules
• PR #5816 - Modernize cache module
• PR #5815 - Reapply flyby changes from #5467
• PR #5814 - Avoid test timeouts by reducing test sizes
• PR #5813 - The CUDA problem is not fixed in V11.5 yet...
• PR #5811 - Make sure reduction value is properly moved, when possible
• PR #5810 - Improve error reporting during device initialization in HIP environments
• PR #5809 - Converting scheduler enums into enum class
• PR #5808 - Deprecate hpx::flush and friends
• PR #5807 - Use C++20 std::source_location, if available
• PR #5806 - Moving promise and packaged_task to new namespaces
• PR #5805 - Attempting to fix a test failure when using the LCI parcellor
• PR #5803 - Attempt to fix CUDA related OctoTiger problems
• PR #5802 - Add option to restrict MPI background work to subset of cores
• PR #5799 - Adding MPI as a dependency to APEX
• PR #5797 - Extend Sphinx role to support arbitrary text to display on a link
• PR #5796 - Disable CUDA tests that cause NVCC to silently fail without error messages
• PR #5795 - Avoid writing path and directories into HPXCacherVariables.cmake

1510 Chapter 2. What’s so special about HPX?
- PR #5793 - Remove features that are deprecated since V1.6
- PR #5792 - Making sure num_cores is properly handled by parallel_executor
- PR #5791 - Moving bind, bind_front, bind_back to namespace hpx
- PR #5790 - Moving serializable function/move_only_function into namespace hpx::distributed
- PR #5787 - Remove unneeded (and commented) tests
- PR #5786 - Attempting to fix hangs in distributed barrier
- PR #5785 - add cmake code to detect arm64 on macOS
- PR #5783 - Moving function and function_ref into namespace hpx
- PR #5781 - Updating used version of Visual Studio
- PR #5780 - Update Piz Daint Jenkins configurations from gcc/clang 7 to 8
- PR #5778 - Updated for_loop.hpp
- PR #5777 - Update reference for foreach benchmark
- PR #5775 - Move optional into namespace hpx
- PR #5773 - Moving barrier to consolidated namespaces
- PR #5772 - Adding missing docs for ranges::find_if and find_if_not algorithms
- PR #5771 - Moving for_loop into namespace hpx::experimental
- PR #5770 - Fixing HIP issues
- PR #5769 - Slight improvement of small_vector performance
- PR #5766 - Fixing a integral conversion warning
- PR #5765 - Adding a sphinx role allowing to link to a file directly in github
- PR #5763 - add num_cores facility
- PR #5762 - Fix Public API main page
- PR #5761 - Add missing inline to mpi_exception.hpp error_message function

- PR #5731 - Randomly delay execution of bash scripts launched by Jenkins
- PR #5729 - Workaround for CMake/Ninja generator OOM problem
- PR #5727 - Moving compression plugins to components directory
- PR #5726 - Moving/consolidating parcel coalescing plugin sources
- PR #5725 - Making sure headers for serialization filters are being installed
- PR #5723 - Moving more tests to modules
- PR #5722 - Removing superfluous semicolons
- PR #5720 - Moving parcelports into modules
- PR #5719 - Moving more files to parcelset module
- PR #5718 - build: refactor sphinx config file
- PR #5717 - Creating parcelset modules
- PR #5716 - Avoid duplicate definition error
- PR #5715 - The new LCI parcelport for HPX
- PR #5714 - Refine propagation of HPX_WITH... options
- PR #5713 - Significantly reduce CI jobs run on Piz Daint
- PR #5712 - Updating jenkins configuration for Rostam2.2
- PR #5711 - Refactor manual sections
- PR #5710 - Making task_group serializable
- PR #5709 - Update the MPI cmake setup
- PR #5707 - Better diagnose parcel bootstrap problems
- PR #5704 - Test with hwloc 2.7.0 with GCC 11
- PR #5703 - Fix counting_iterator container tests
- PR #5702 - Attempting to fix CircleCI timeouts

2.10. Releases
• PR #5699\textsuperscript{111} - Update CI to use Boost 1.78.0
• PR #5697\textsuperscript{112} - Adding fork\_join\_executor to foreach\_benchmark
• PR #5696\textsuperscript{113} - Modernize when\_all and friends (when\_any, when\_some, when\_each)
• PR #5693\textsuperscript{114} - Fix test errors with _GLIBCXX\_DEBUG defined
• PR #5691\textsuperscript{115} - Rename annotate\_function to scoped\_annotation
• PR #5690\textsuperscript{116} - Replace tag\_dispatch with tag\_invoke in minmax segmented
• PR #5688\textsuperscript{117} - Remove more deprecated macros
• PR #5687\textsuperscript{118} - Add most important CMake options
• PR #5685\textsuperscript{119} - Fix future API
• PR #5684\textsuperscript{120} - Move lock registration to separate module and remove global lock registration
• PR #5683\textsuperscript{121} - Make hpx::wait\_all etc. throw exceptions when waited futures hold exceptions and deprecate hpx::lcos::wait\_all\_n in favor of hpx::wait\_all\_n
• PR #5682\textsuperscript{122} - Fix macOS test exceptions
• PR #5681\textsuperscript{123} - docs: add links to hpx recepies
• PR #5680\textsuperscript{124} - Embed base execution policies to datapar execution policies
• PR #5679\textsuperscript{125} - Fix fork\_join\_executor with dynamic schedule
• PR #5678\textsuperscript{126} - Fix compilation of service executors with nvcc
• PR #5677\textsuperscript{127} - Remove compute\_cuda module
• PR #5676\textsuperscript{128} - Don’t require up-to-date approvals for bors
• PR #5675\textsuperscript{129} - Add default template type parameters for algorithms
• PR #5674\textsuperscript{130} - Allow using any\_sender in global variables
• PR #5671\textsuperscript{131} - Making sure task\_group can be reused
• PR #5670\textsuperscript{132} - Relax constraints on execution::when\_all
• PR #5669\textsuperscript{133} - Use HPX\_WITH\_CXX\_STANDARD for controlling C++ version

\textsuperscript{131} https://github.com/STEllAR-GROUP/hpx/pull/5671
\textsuperscript{132} https://github.com/STEllAR-GROUP/hpx/pull/5670
\textsuperscript{133} https://github.com/STEllAR-GROUP/hpx/pull/5669
• PR #5667 - Attempt to fix compilation issues with Boost V1.76
• PR #5664 - Change logging errors to warnings in schedulers
• PR #5663 - Use dynamic bitsets by default for CPU masks
• PR #5662 - Disambiguate namespace for MSVC
• PR #5660 - Replacing remaining std::forward and std::move with HPX_FORWARD and HPX_MOVE
• PR #5659 - Modernize hpx::future and related facilities
• PR #5658 - Replace HPX_INLINE_CONSTEXPR_VARIABLE with inline constexpr
• PR #5657 - Remove tagged, tagged_pair and tagged_tuple, remove tuple/pair specializations
• PR #5656 - Rename on execution::schedule_from, rename just_on to just_transfer, and add transfer
• PR #5655 - Avoid for module lists to grow indefinitely in cmake cache
• PR #5649 - build: replace usage of Python’s reserved words and functions as variable names
• PR #5648 - Modernize action modules and related code
• PR #5646 - Fix ends_with test
• PR #5645 - Add matrix multiplication example
• PR #5644 - Rename execution::transform to execution::then and execution::detach to execution::start_detached
• PR #5643 - Update performance test references
• PR #5642 - Adapting adjacent_difference to work with proxy iterators
• PR #5641 - Factorize perftests scripts
• PR #5640 - Fixed links to sources in Sphinx documentation
• PR #5639 - Fix generate datarpar tests for Vc
• PR #5638 - Simd all any none
• PR #5637 - Use bors for merging pull requests
• PR #5636 - Fix leftover std::holds_alternative usage

https://github.com/STEllAR-GROUP/hpx/pull/5637
https://github.com/STEllAR-GROUP/hpx/pull/5636
• PR #5635 - Update container image tag in GitHub actions HIP configuration
• PR #5633 - Moving packaged_task to module futures
• PR #5632 - Tell Asio to use std::aligned_new only if available
• PR #5631 - Adding tag parameter to channel communicator get/set
• PR #5630 - Add partial_sort_copy and adapt partial sort to c++ 20
• PR #5629 - Set HPX_WITH_FETCH_ASIO to OFF as available in the docker image
• PR #5628 - Add Clang 13 CI configuration
• PR #5627 - Replace alternative keyword
• PR #5626 - docs: add support for BibTeX references in Sphinx docs
• PR #5624 - Fix pkgconfig replacements involving CMAKE_INSTALL_PREFIX
• PR #5623 - build: remove unused import from conf.py.in
• PR #5622 - Remove HPX_WITH_VCPKG CMake option
• PR #5621 - Replacing boost::container::small_vector
• PR #5620 - Update Asio tag from 1.18.2 to 1.20.0
• PR #5619 - Fix block_os_threads_1036 test
• PR #5618 - Make sure condition variables are notified under a lock in the thread_pool_scheduler test
• PR #5617 - Use advance_and_get_distance where required
• PR #5616 - Remove separately building segmented algorithms on CircleCI
• PR #5615 - Fix Vc datapar adjacent_difference
• PR #5609 - docs: add anchor links to performance counter tables
• PR #5608 - Fix header test error by adding missing numeric
• PR #5607 - Fix simd adj diff
• PR #5605 - Fix usage of HPX_INVOKE macro

Chapter 2. What’s so special about HPX?
• PR #5604\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5604} - Make use of shell-session to allow non-copyable $

• PR #5603\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5603} - Suppress some MSVC warnings in C++20 mode

• PR #5602\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5602} - Test HPX\_DATASTRUCTURES\_WITH\_ADAPT\_STD\_TUPLE=OFF to one CI configuration

• PR #5601\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5601} - Test case for any\_sender should use hpx::tuple

• PR #5600\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5600} - Rename tag\_dispatch back to tag\_invoke

• PR #5599\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5599} - Change theme, fix Quickstart & Examples

• PR #5596\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5596} - Use precompiled headers in tests

• PR #5595\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5595} - Drop semicolons for macro calls

• PR #5594\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5594} - Adapt datapar generate

• PR #5593\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5593} - Update any\_sender to use tag\_dispatch for execution customizations

• PR #5592\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5592} - Add nth\_element

• PR #5591\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5591} - Remove unnecessary checks for C++17 for tests

• PR #5589\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5589} - Add HPX\_FORWARD/HPX\_MOVE macros

• PR #5588\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5588} - Fixing the output formatting for id\_types

• PR #5586\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5586} - Remove local functionality

• PR #5585\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5585} - Delete GitExternal\_cmake

• PR #5584\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5584} - Serialization of hpx::tuple must use hpx::get

• PR #5583\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5583} - fix coroutine\_traits allocate calls, add unhandled\_exception() implementation.

• PR #5582\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5582} - Make more examples work with local runtime

• PR #5581\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5581} - Add support for several performance tests in CI

• PR #5580\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5580} - Adapt simd adj diff

• PR #5579\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5579} - Split absolute paths for generated pkg-config files into -L/-l parts

• PR #5577\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5577} - fix unit fill test for datapar with Vc

• PR #5576\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5576} - Adapt simd adj diff

• PR #5575\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5575} - Remove local functionality

• PR #5574\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5574} - Update any\_sender to use tag\_dispatch for execution customizations

• PR #5573\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5573} - Add nth\_element

• PR #5572\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5572} - Remove unnecessary checks for C++17 for tests

• PR #5571\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5571} - Add HPX\_FORWARD/HPX\_MOVE macros

• PR #5570\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5570} - Fixing the output formatting for id\_types

• PR #5569\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5569} - Remove local functionality

• PR #5568\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5568} - Add support for several performance tests in CI

• PR #5567\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5567} - Adapt simd adj diff

• PR #5566\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5566} - Split absolute paths for generated pkg-config files into -L/-l parts

• PR #5565\footnote{https://github.com/STEllAR-GROUP/hpx/pull/5565} - fix unit fill test for datapar with Vc

2.10. Releases 1517
• PR #5576 - Update forgotten “Full” names
• PR #5575 - Change scan partitioner implementation
• PR #5574 - Remove a few deprecated and unused CMake options
• PR #5572 - Remove more guards for the distributed runtime
• PR #5571 - Add workaround for libstdc++ in string_util trim
• PR #5569 - Use no_unique_address in sender adaptors
• PR #5568 - Change try catch block to try_catch_exception_ptr
• PR #5567 - Make default_agent::yield actually yield
• PR #5564 - Adjacent
• PR #5562 - More changes to overcome build problems on Windows after recent module rearrangements
• PR #5560 - Update tests and examples
• PR #5559 - Fixing cmake folder names after module restructuring
• PR #5558 - Fixing wrong module dependencies
• PR #5557 - Adding an example for the new channel_communicator API
• PR #5556 - Remove leftover thread pool os executor tests
• PR #5555 - Add option enabling serializing raw pointers
• PR #5554 - Make sure command line aliasing is properly handled
• PR #5552 - Modernizing some of the async facilities
• PR #5551 - Fixing for local executions of actions to properly set task names
• PR #5550 - Update CUDA module in clang-cuda configuration
• PR #5549 - Fixing agent_ref::yield_k to actually call yield_k
• PR #5548 - Making get_action_name() noexcept
• PR #5547 - Fixing communication set
• PR #5546 - Fixing shutdown problems caused by missing ref-counting
• PR #5545 - Remove wrong move in thread_pool_scheduler_bulk.hpp
• PR #5543 - Extend launch policy to carry stack size and scheduling hint in addition to priority
• PR #5542 - Simplify execution CPOs
• PR #5540 - Adapt partition, partition_copy and stable_partition to C++ 20
• PR #5539 - Adapt mismatch to support sentinels
• PR #5538 - Document specific sphinx version required for the documentation
• PR #5537 - Test release and debug builds on Piz Daint
• PR #5536 - This fixes referencing stale iterators during the execution of binary mismatch
• PR #5535 - Rename simdpar to par_simd
• PR #5534 - Fix Quick start & Manual Docs
• PR #5533 - Fix annotate_function for std::string
• PR #5532 - Update two remaining apex links from khuck to UO-OACISS
• PR #5531 - Use contiguous_index_queue in thread_pool_scheduler
• PR #5530 - Eagerly initialize a configurable number of threads on scheduler/thread queue init
• PR #5529 - Update benchmarks and add support for scheduler_executor
• PR #5528 - Add missing properties to executors/schedulers
• PR #5527 - Set local thread/pool number in local/static_queue_scheduler
• PR #5526 - Update Rostam HIP configuration to use 4.3.0
• PR #5525 - Fix Building HPX in Quick start
• PR #5524 - Upload image on cdash
• PR #5523 - Modernize facilities related to hpx::sync
• PR #5522 - Add sender overloads for remaining algorithms
• PR #5521 - Minor changes that improve performance
• PR #5520 - Update reference as perftests failing regularly
• PR #5519 - Add transform_mpi sender adapter
• PR #5518 - Add sender overloads to rotate/rotate_copy
• PR #5517 - Fix coroutine integration
• PR #5515 - Avoid deadlock in ignore_while_locked_1485 test
• PR #5514 - Add split sender adapter
• PR #5512 - Update Rostam HIP configuration
• PR #5511 - Fix Asio target name for precompiled headers
• PR #5510 - Add any_sender and unique_any_sender
• PR #5509 - Test with Boost 1.77 on gcc/clang-newest configurations
• PR #5508 - Minor release changes from 1.7.1
• PR #5507 - Add missing commits from scheduler_executor PR
• PR #5506 - Fix condition for checking if we should use our own variant
• PR #5501 - Attempt to fix thread_pool_scheduler test
• PR #5493 - Update Jenkins GitHub token to use StellarBot GitHub account
• PR #5490 - Fix clang-format error on master
• PR #5487 - Add get_completion_scheduler CPO and customize bulk for thread_pool_scheduler
• PR #5484 - Add missing header to jacobi_component/server/solver.hpp
• PR #5481 - Changing the APEX repository to the new location
• PR #5479 - Fix version check for CUDA noexcept/result_of bug
• PR #5477 - Require cxx17 minor comments
• PR #5476 - Fix cmake format error
• PR #5475\textsuperscript{1272} - Require CMake 3.18 as it is already a requirement for CUDA
• PR #5474\textsuperscript{1273} - Make the cuda parameters of try_compile optional
• PR #5473\textsuperscript{1274} - Update cuda arch and change cuda version
• PR #5471\textsuperscript{1275} - Add corrected citation.cff
• PR #5470\textsuperscript{1276} - Adapt stable_sort to C++ 20
• PR #5468\textsuperscript{1277} - Experimentation to make the perftest report public
• PR #5466\textsuperscript{1278} - Add shift_left and shift_right algorithms
• PR #5465\textsuperscript{1279} - Adapt datarPar fill

2.10. Releases
HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value OFF corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by HPX is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of HPX relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

Breaking changes

- The experimental `hpx::execution::simdpar` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

1314 https://github.com/STEllAR-GROUP/hpx/pull/5440
1315 https://github.com/STEllAR-GROUP/hpx/pull/5439
1316 https://github.com/STEllAR-GROUP/hpx/pull/5436
General changes

- The following algorithms have been adapted to be C++20 conformant:
  - remove,
  - remove_if,
  - remove_copy,
  - remove_copy_if,
  - replace,
  - replace_if,
  - reverse, and
  - lexicographical_compare.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all HPX parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, HPX now experimentally supports GCC’s SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpar` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
  - detach,
  - ensure_started,
  - just,
  - just_on,
  - let_error,
  - let_value,
  - on,
  - transform, and
  - when_all.

Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.
- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nonser`. No changes should be required in user code to accommodate this change.

1524 Chapter 2. What’s so special about HPX?
• **hpx::util::unwrapping** and other related unwrapping functionality has been moved up into the hpx namespace. Names in hpx::util are still usable with a deprecation warning. This functionality can now be accessed through the hpx/unwrap.hpp and hpx/local/unwrap.hpp headers.

• The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.

• The dependency on Boost.Asio has been replaced with the standalone Asio available at https://github.com/chrischohlff/asio. By default, a system-installed Asio will be used. ASIO_ROOT can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake’s fetchcontent by setting HPX_WITH_FETCH_ASIO=ON. In general, dependencies on Boost have again been reduced.

• Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.

• hipBLAS is now optional when compiling with hipcc. A warning instead of an error will be printed if hipBLAS is not found during configuration.

• Previously HPX_COMPUTE_HOST_CODE was defined in host code only if HPX was configured with CUDA or HIP. In this release HPX_COMPUTE_HOST_CODE is always defined in host code.

• An experimental HPX_WITH_PRECOMPILED_HEADERS CMake option has been added to use precompiled headers when building HPX. This option should not be used on Windows.

• Numerous bug fixes.

**Breaking changes**

• The minimum required CMake version is now 3.17.

• The minimum required Boost version is now 1.71.0.

• The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from tag_invoke to tag_dispatch. All customization of sender functionality should be done by overloading tag_dispatch.

• The following compatibility options have been removed, along with their compatibility implementations:
  - HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAMOptions_COMPATIBILITY
  - HPX_WITH_ACTION_BASE_COMPATIBILITY
  - HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY
  - HPX_WITH_POOL_EXECUTOR_COMPATIBILITY
  - HPX_WITH_PROMISE_ALIAS_COMPATIBILITY
  - HPX_WITH_REGISTER_THREAD_COMPATIBILITY
  - HPX_WITH_THREAD_AWARE_TIMER_COMPATIBILITY
  - HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY
  - HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY

• The HPX_WITH_THREAD_SCHEDULERS CMake option has been removed. All schedulers are now enabled when possible.

• HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY has been turned off by default.
Closed issues

- Issue #5423 - Fix lvalue-ref qualified connect for when_all-sender
- Issue #5412 - Link error

2.10. Releases
- PR #5413 - Fixing sender/receiver code base to compile with MSVC
- PR #5407 - Handle exceptions thrown during initialization of parcel handler
- PR #5406 - Simplify dispatching to annotation handlers
- PR #5405 - Fetch Asio automatically in perftests CI
- PR #5403 - Create generic executor that adds annotations to any other executor
- PR #5402 - Adapt uninitialized_fill and uninitialized_fill_n to C++ 20
- PR #5401 - Modernize a variety of facilities related to parallel algorithms
- PR #5400 - Fix sliding semaphore test
- PR #5399 - Rename leftover tag_fallback_invoke to tag_fallback_dispatch
- PR #5398 - Improve logging in AGAS symbol namespace
- PR #5396 - Introduce compatibility layer for collective operations
- PR #5394 - Enable OTF2 in APEX CI configuration
- PR #5393 - Update APEX tag
- PR #5392 - Fixing wrong usage of std::forward
- PR #5391 - Fix forwarding in transform_receiver constructor
- PR #5390 - Make sure shared priority scheduler steals tasks on the current NUMA domain when (core) stealing is enabled
- PR #5389 - Adapt uninitialized_move and uninitialized_move_n to C++ 20
- PR #5388 - Fixing gather_there for used with lvalue reference argument
- PR #5387 - Extend thread state logging and change default stealing parameters
- PR #5386 - Attempt to fix the startup hang with nodes > 32
- PR #5384 - Remove HPX 1.5.0 deprecations
- PR #5382 - Prefer installed Asio before considering FetchContent
- PR #5379 - Allow using pre-downloaded (not installed) versions of Asio and/or Apex

• PR #5375 - Slight performance improvement for hpx::copy and hpx::move et.al.
• PR #5374 - Remove unnecessary moves from future sender implementations
• PR #5373 - More changes to clang-cuda Jenkins configuration
• PR #5372 - Slight improvements to min/max/minmax_element algorithms
• PR #5371 - Adapt uninitialized_copy and uninitialized_copy_n to C++ 20
• PR #5370 - Decay types in just_sender value_types to match stored types
• PR #5367 - Disable pkgconfig by default again on macOS
• PR #5365 - Use ccache for Jenkins builds on Piz Daint
• PR #5363 - Update cudatoolkit module name in clang-cuda Jenkins configuration
• PR #5362 - Adding channel_communicator
• PR #5361 - Fix compilation with MPI enabled
• PR #5360 - Update APEX and asio tags
• PR #5359 - Fix check for pu-step in single-core case
• PR #5358 - Making sure collective operations can be reused by preallocating communicator
• PR #5356 - Update API documentation
• PR #5355 - Make the sequenced_executor processing_units_count member function const
• PR #5354 - Making sure default_stack_size is defined whenever declared
• PR #5353 - Add CUDA timestamp support to HPX Hardware Clock
• PR #5352 - Adding missing includes
• PR #5351 - Adding enable_logging/disable_logging API functions
• PR #5350 - Adapt lexicographical_compare to C++20
• PR #5349 - Update minimum boost version needed on the docs
• PR #5348
  Rename tag_invoke and related facilities to tag_dispatch
• PR #5347
  Remove make_prefix for executor properties
• PR #5346
  Remove and disable compatibility options for 1.7.0
• PR #5343
  Fix timed_executor static cast conversion
• PR #5342
  Refactor CUDA event polling
• PR #5341
  Adding make_with_annotation and get_annotation properties
• PR #5339
  Making sure hpx::util::hardware::timestamp() is always defined
• PR #5338
  Fixing timed_executor specializations of customization points
• PR #5335
  Make partial_algorithm work with any number of arguments
• PR #5334
  Follow up iter_sent include on #5225
• PR #5332
  Simplify tag_invoke and friends
• PR #5331
  More work on cleaning up executor CPOs
• PR #5330
  Add option to disable pkgconfig generation
• PR #5328
  - Adapt data parallel support using std-simd
• PR #5327
  Fix missing ifdef HPX_SMT_PAUSE
• PR #5326
  Adding resize() to serialize_buffer allowing to shrink its size
• PR #5324
  Add get member functions to async_rwlock_mutex proxy objects for explicitly getting the wrapped value
• PR #5323
  Add keep_future algorithm
• PR #5322
  Replace executor customization point implementations with tag_invoke
• PR #5321
  Separate segmented algorithms for reduce
• PR #5320
  Fix is_sender trait and other small fixes to p0443 traits
• PR #5319
  gcc 11.1 c++20 build fixes
• PR #5318
  Make hipblas dependency optional as not always available

2.10. Releases

1531
• PR #5282 - Update Boost for daint 20.11 after update
• PR #5281 - Fix Segmentation fault on foreach_datapar_zipiter
• PR #5280 - Avoid modulo by zero in counting_iterator test
• PR #5279 - Fix more GCC 10 deprecation warnings
• PR #5277 - Small fixes and improvements to CUDA/MPI polling
• PR #5276 - Fix typo in docs
• PR #5274 - More P1897 algorithms
• PR #5273 - Retry CDash submissions on failure
• PR #5272 - Fix bogus deprecation warnings with GCC 10
• PR #5271 - Correcting target ids for symbol_namespace::iterate
• PR #5268 - Adding generic require, require_concept, and query properties
• PR #5267 - Support annotations in hpx::transform_reduce
• PR #5266 - Making late command line options available for local runtime
• PR #5265 - Leverage no_unique_address for member_pack
• PR #5264 - Adopt format in more places
• PR #5262 - Install HPX in Rostam Jenkins jobs
• PR #5261 - Limit Rostam Jenkins jobs to marvin partition temporarily
• PR #5260 - Separate segmented algorithms for transform_reduce
• PR #5259 - Making sure late command line options are recognized as configuration options
• PR #5258 - Allow for HPX algorithms being invoked with std execution policies
• PR #5256 - Separate segmented algorithms for transform
• PR #5254 - Future/sender adapters
• PR #5254 - Fixing datapar

https://github.com/STEllAR-GROUP/hpx/pull/5254
• PR #5253 - Add utility to format ranges
• PR #5252 - Remove uses of Boost.Bimap
• PR #5251 - Banish `<iostream>` from library headers
• PR #5250 - Try fixing vc circle ci
• PR #5249 - Adding missing header
• PR #5248 - Use old Piz Daint modules after upgrade
• PR #5247 - Significantly speedup simple `for_each`, `for_loop`, and `transform`
• PR #5245 - P1897 `operator|` overloads
• PR #5244 - P1897 `when_all`
• PR #5243 - Make sure `HPX_DEBUG` is set based on HPX’s build type, not consuming project’s build type
• PR #5242 - Moving last files unrelated to parcel layer to modules
• PR #5240 - change namespace for `transform_loop.hpp`
• PR #5238 - Make sure annotations are used in the binary transform
• PR #5237 - Add P1897 `just`, `just_on`, and `on` algorithms
• PR #5236 - Add an example demonstrating the use of the `invoke_function_action` facility
• PR #5235 - Attempting to fix datapar compilation issues
• PR #5234 - Fix small typo in `--hpx:local` option description
• PR #5233 - Only find Boost.Iostreams if required for plugins
• PR #5231 - Sort printed config options
• PR #5230 - Fix C++20 replace algo adaptation misses
• PR #5229 - Remove leftover Boost include from `sync_wait.hpp`
• PR #5228 - Print module name only if it has custom configuration settings
• PR #5227 - Update .codespell_whitelist
• PR #5226 - Use new docker image in all CircleCI steps
• PR #5225 - Adapt reverse to C++20
• PR #5224 - Separate segmented algorithms for none_of, any_of and all_of
• PR #5223 - Fixing build system for ittnotify
• PR #5221 - Moving LCO related files to modules
• PR #5220 - Separate segmented algorithms for count and count_if
• PR #5218 - Separate segmented algorithms for adjacent_find
• PR #5217 - Add a HIP github action
• PR #5215 - Update ROCm to 4.0.1 on Rostam
• PR #5214 - Fix clang-format error in sender.hpp
• PR #5213 - Removing ESSENTIAL option to the doc example
• PR #5212 - Separate segmented algorithms for for_each_n
• PR #5211 - Minor adapted algos fixes
• PR #5210 - Fixing is_invocable deprecation warnings
• PR #5209 - Moving more files into modules (actions, components, init_runtime, etc.)
• PR #5208 - Add examples and explanation on when tag_fallback/priority are useful
• PR #5207 - Always define HPX_COMPUTE_HOST_CODE for host code
• PR #5206 - Add formatting exceptions for libhpx to create_module_skeleton.py
• PR #5205 - Moving all distribution policies into modules
• PR #5203 - Move copy algorithms to tag_fallback_invoke
• PR #5202 - Make HPX_WITH_PSEUDO_DEPENDENCIES a cache variable
• PR #5201 - Replaced tag_invoke with tag_fallback_invoke for adjacent_find algorithm
• PR #5200 - Moving files to (distributed) runtime module
• PR #5199 - Update ICC module name on Piz Daint Jenkins configuration
• PR #5198 - Add doxygen documentation for thread_schedule_hint
• PR #5197 - Attempt to fix compilation of context implementations with unity build enabled
• PR #5196 - Re-enable component tests
• PR #5195 - Moving files related to colocation logic
• PR #5194 - Another attempt at fixing the Fedora 35 problem
• PR #5193 - Components module
• PR #5192 - Adapt replace(_if) to C++20
• PR #5190 - Set compatibility headers by default to on
• PR #5188 - Bump Boost minimum version to 1.71.0
• PR #5187 - Force CMake to set the -std=c++XX flag
• PR #5186 - Remove some minor unnecessary CMake options
• PR #5184 - Remove some leftover HPX_WITH_*_SCHEDULER uses
• PR #5183 - Remove dependency on boost/iterators/iterator_categories.hpp
• PR #5182 - Fixing Fedora 35 for Power architectures
• PR #5181 - Bump version number and tag post 1.6.0 release
• PR #5180 - Fix hts_v2 tests linking
• PR #5179 - Make sure --hpx:local command line option is respected with networking is off but distributed runtime is on
• PR #5177 - Remove module cmake options
• PR #5176 - Starting to separate segmented algorithms: for_each
• PR #5174 - Don’t run segmented algorithms twice on CircleCI
• PR #5173 - Fetching APEX using cmake FetchContent
• PR #5172 - Add separate local-only entry point
• PR #5171 - Remove HPX_WITH_THREAD_SCHEDULERS CMake option
• PR #5170 - Add HPX_WITH_PRECOMPILED_HEADERS option
• PR #5166 - Moving some action tests to modules
• PR #5165 - Require cmake 3.17
• PR #5164 - Move thread_pool_suspension_helper files to small utility module
• PR #5160 - Adding checks ensuring modules are not cross-referenced from other module categories
• PR #5158 - Replace boost::asio with standalone asio
• PR #5155 - Allow logging when distributed runtime is off
• PR #5153 - Components module
• PR #5152 - Move more files to performance counter module
• PR #5150 - Adapt remove_copy(_if) to C++20
• PR #5144 - AGAS module
• PR #5125 - Adapt remove and remove_if to C++20
• PR #5117 - Attempt to fix segfaults assumed to be caused by future_data instances going out of scope.
• PR #5099 - Allow mixing debug and release builds
• PR #5092 - Replace spirit.qi with x3
• PR #5053 - Add P0443r14 executor and a few P1897 algorithms
• PR #5044 - Add performance test in jenkins and reports

**HPX V1.6.0 (Feb 17, 2021)**

**General changes**

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with hipcc and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.

- Experimental HIP support can be enabled by compiling HPX with hipcc. All CUDA functionality in HPX can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.

- We have added `partial_sort` based on Francisco Tapia’s implementation.

- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.

- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.

- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.

- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.

- We have added experimental support for properties as proposed in P2220\(^\text{1564}\). Currently the only supported property is the scheduling hint on `parallel_executor`.

- `hpx::util::annotated_function` can now be passed a dynamically generated `std::string`.

- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.

- We have removed all support for C and Fortran from our build system.

- We have further reduced the use of Boost types within HPX (`boost::system::error_code` and `boost::detail::spinlock`).

- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

**Breaking changes**

- hpxMP support has been completely removed.

- The verbs parcelport has been removed.

- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_05_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come

\(^{1564}\) https://wg21.link/p2220

---

2.10. Releases 1537
with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPE_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

Closed issues

- Issue #5148 - `runtime_support.hpp` does not work with newer cling
- Issue #5147 - Wrong results with parallel reduce
- Issue #5129 - Missing specialization for `std::hash<hpx::thread::id>`
- Issue #5126 - Use `std::string` for task annotations
- Issue #5115 - Don’t expect hwloc to always report Cores
- Issue #5113 - Handle threadmanager exceptions during startup
- Issue #5112 - libatomic problems causing unexpected fails
- Issue #5089 - Remove non-BSL files
- Issue #5088 - Unwrapping problem
- Issue #5087 - Remove hpxMP support
- Issue #5077 - PAPI counters are not accessible when HPX is installed
- Issue #5075 - Make the structs in all `iter_sent.hpp` lower case
- Issue #5067 - Bug `string_util/split.hpp`
- Issue #5049 - Change back the hipcc jenkins config to the fury partition on rostam
- Issue #5038 - Not all examples link in the latest HPX master
- Issue #5035 - Build with `HPX_WITH_EXAMPLES` fails
- Issue #5019 - Broken help string for hpx
- Issue #5016 - `hpx::parallel::fill` fails compiling

2.10. Releases
• PR #5132\(^{1605}\) - Fixing spelling errors
• PR #5131\(^{1606}\) - Mark counting_iterator member functions as HPX_HOST_DEVICE
• PR #5130\(^{1607}\) - Adding specialization for std::hash<hpx::thread::id>
• PR #5128\(^{1608}\) - Fixing environment handling for FreeBSD
• PR #5127\(^{1609}\) - Fix typo in fibonacci documentation
• PR #5123\(^{1610}\) - Reduce vector sizes in partial sort benchmarks when running in debug mode
• PR #5122\(^{1611}\) - Making sure exceptions during runtime initialization are correctly reported
• PR #5121\(^{1612}\) - Working around hwloc limitation on certain platforms
• PR #5120\(^{1613}\) - Fixing compatibility warnings in hpx::transform implementation
• PR #5119\(^{1614}\) - Use sequential_find and friends from separate detail header
• PR #5116\(^{1615}\) - Fix compilation with timer pool off
• PR #5114\(^{1616}\) - Fix 5112 - make sure libatomic is used when needed
• PR #5109\(^{1617}\) - Remove default runtime mode argument from init overload, again
• PR #5108\(^{1618}\) - Refactor iter_sent.hpp to make structs lowercase
• PR #5107\(^{1619}\) - Relax dataflow internals
• PR #5106\(^{1620}\) - Change initialization of property CPOs to satisfy older nvcc versions
• PR #5104\(^{1621}\) - Fix regeneration of two files that trigger unnecessary rebuilds
• PR #5103\(^{1622}\) - Remove default runtime mode argument from start/init overloads
• PR #5102\(^{1623}\) - Untie deprecated thread enums from the CMake option
• PR #5101\(^{1624}\) - Update APEX tag for 1.6.0
• PR #5100\(^{1625}\) - Bump minimum required Boost version to 1.66 and update CI configurations
• PR #5098\(^{1626}\) - Minor fixes to public API listing
• PR #5097\(^{1627}\) - Remove hpxMP support

2.10. Releases
• PR #4999\(^{1697}\) - Attempt to fix MacOS Github action error
• PR #4997\(^{1698}\) - Fix unused variable and typedef warnings
• PR #4996\(^{1699}\) - Adapt adjacent_find to C++20
• PR #4995\(^{1700}\) - Test all schedulers in cross_pool_injection test except shared_priority_queue_scheduler
• PR #4993\(^{1701}\) - Fix deprecation warnings
• PR #4991\(^{1702}\) - Avoid unnecessarily including entire modules
• PR #4990\(^{1703}\) - Fixing some warnings from HPX complaining about use of obsolete types
• PR #4989\(^{1704}\) - add a *destroy* trait for ParcelPort plugins
• PR #4986\(^{1705}\) - Remove serialization to functional module dependency
• PR #4985\(^{1706}\) - Compatibility header generation
• PR #4980\(^{1707}\) - Add ranges overloads to for_loop (and variants)
• PR #4979\(^{1708}\) - Actually enable unity builds on Jenkins
• PR #4977\(^{1709}\) - Cleaning up debug::print functionalities
• PR #4976\(^{1710}\) - Remove indirection layer in at_index_impl
• PR #4975\(^{1711}\) - Remove indirection layer in at_index_impl
• PR #4973\(^{1712}\) - Avoid warnings/errors for older gcc complaining about multi-line comments
• PR #4970\(^{1713}\) - Making set algorithms conform to C++20
• PR #4969\(^{1714}\) - Moving is_execution_policy and friends into namespace hpx
• PR #4968\(^{1715}\) - Enable deprecation warnings for 1.6.0 and move any functionality to hpx namespace
• PR #4967\(^{1716}\) - Define deprecation macros conditionally
• PR #4966\(^{1717}\) - Add clang-format and cmake-format version prints
• PR #4965\(^{1718}\) - Making is_heap and is_heap_until conforming to C++20
• PR #4964\(^{1719}\) - Adding parallel make_heap

HPX Documentation, master

HPX V1.5.1 (Sep 30, 2020)

General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

Closed issues

- Issue #4971 - Parallel sort fails to compile with C++20
- Issue #4950 - Build with HPX_WITH_PARCELPORT_ACTION_COUNTERS ON fails
- Issue #4940 - Codespell report for “HPX” (on fossies.org)
- Issue #4937 - Allow suspension of runtime for multiple localities

Closed pull requests

- PR #4982 - Add page about citing HPX to documentation
- PR #4981 - Adding the missing include
- PR #4974 - Remove leftover format export hack
- PR #4972 - Removing use of get_temporary_buffer and return_temporary_buffer
- PR #4963 - Renaming files to avoid warnings from the vs build system
- PR #4951 - Fixing build if HPX_WITH_PARCELPORT_ACTION_COUNTERS=On
- PR #4946 - Allow suspension on multiple localities
- PR #4944 - Fix typos reported by fossies codespell report
- PR #4941 - Adding some explanation to README about how to cite HPX
- PR #4939 - Small changes

Chapter 2. What’s so special about HPX?
**General changes**

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of HPX in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in HPX. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`, `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of/any_of/none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the experimental namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below). An significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (Public API). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=ON` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in PR #4514 for more details).
- The underlying executor of `block_executor` has been updated to a newer one.
- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.

---

1753 [https://github.com/STEllAR-GROUP/hpx/pull/4514](https://github.com/STEllAR-GROUP/hpx/pull/4514)
• All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `with()` functionality on execution policies in the future. This is also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).

• We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.

• We have added performance counters type information (aggregating, monotonically increasing, average count, average timer, etc.).

• HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn’t prevent the thread from being stolen, however.

• We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).

• `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).

• New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).

• We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.

• We fixed task annotations for actions.

• The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.

• We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.

• We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.

• We have changed the CMake targets exposed to the user, it now includes `HPX::hpx`, `HPX::wrap_main` (int `main` as the first `HPX` thread of the application, see `Starting the HPX runtime`), `HPX::plugin`, `HPX::component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX::hpx` CMake target.

• A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)

• A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)

• We now require for our CMake build system configuration files to be formatted using cmake-format.

• We have removed more dependencies on various Boost libraries.

• We have added an experimental option enabling unity builds of HPX using the `--DHPX_WITH_UNITY_BUILD=On` CMake option.

• Many bug fixes.
## Breaking changes

- **HPX** now requires a C++14 capable compiler. We have set the **HPX** C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the `CMAKE_CXX_STANDARD` setting as mandated by CMake. The `HPX_WITH_CXX*` variables are now deprecated and will be removed in the future.

- Building and using HPX is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.

- We have added a `hpx::init_params` struct to pass parameters for **HPX** initialization e.g. the resource partitioner callback to initialize thread pools (Using the resource partitioner).

- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.

- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

## Closed issues

- **Issue #4918** - Rename distributed_executors module
- **Issue #4900** - Adding JOSS status badge to README
- **Issue #4897** - Compiler warning, deprecated header used by HPX itself
- **Issue #4886** - A future bound to an action executing on a different locality doesn’t capture exception state
- **Issue #4880** - Undefined reference to main build error when `HPX_WITH_DYNAMIC_HPX_MAIN=OFF`
- **Issue #4877** - `hpx_main` might not able to start hpx runtime properly
- **Issue #4850** - Issues creating templated component
- **Issue #4829** - Spack package & `HPX_WITH_GENERIC_CONTEXT_COROUTINES`
- **Issue #4820** - PAPI counters don’t work
- **Issue #4818** - HPX can’t be used with IO pool turned off
- **Issue #4816** - Build of HPX fails when `find_package(Boost)` is called before `FetchContent_MakeAvailable(hpx)`
- **Issue #4813** - HPX MPI Future failed
- **Issue #4811** - Remove `HPX::hpx_no_wrap_main` target before 1.5.0 release
- **Issue #4810** - In `hp::for_each::invoke_projected` the `hpx::util::decay` is misguided

2.10. Releases
• Issue #4507 - User-polling introduced by MPI futures module should be more generally usable
• Issue #4506 - Make sure force_linking.hpp is not included in main module header
• Issue #4501 - Fix compilation of PAPI tests
• Issue #4497 - Add modules CI checks
• Issue #4489 - Polymorphic executor
• Issue #4476 - Use CMake targets defined by FindBoost
• Issue #4473 - Add vcpkg installation instructions
• Issue #4470 - Adapt hpx::future to C++20 co_await
• Issue #4468 - Compile error on Raspberry Pi 4
• Issue #4466 - Compile error on Windows, current stable:
• Issue #4453 - Installing HPX on fedora with dnf is not adding cmake files
• Issue #4448 - New std::variant serialization broken
• Issue #4438 - Add performance counter flag is monotonically increasing
• Issue #4436 - Build problem: same code build and works with 1.4.0 but it doesn’t with 1.4.1
• Issue #4429 - Function descriptions not supported in distributed
• Issue #4423 - --hpx:ini=hpx.lock_detection=0 has no effect
• Issue #4422 - Add performance counter metadata
• Issue #4419 - Weird behavior for --hpx:print-counter-interval with large numbers
• Issue #4401 - Create module repository
• Issue #4400 - Command line options conflict related to performance counters
• Issue #4349 - --hpx:use-process-mask option throw an exception on OS X
• Issue #4345 - Move gh-pages branch out of hpx repo
• Issue #4323 - Const-correctness error in assignment operator of compute::vector

• PR #4868 - Fix miscellaneous header problems
• PR #4867 - Add COPs for for_each
• PR #4865 - Adapting count and count_if to be conforming to C++20
• PR #4864 - Release notes 1.5.0
• PR #4863 - Adding libcds-hpx tag to prepare for hpx1.5 release
• PR #4862 - Adding version specific deprecation options
• PR #4861 - Limiting executor improvements
• PR #4860 - Making fill and fill_n compatible with C++20
• PR #4859 - Adapting all_of, any_of, and none_of to C++20
• PR #4857 - Improve libCDS integration
• PR #4856 - Correct typos in the documentation of the hpx performance counters
• PR #4854 - Removing obsolete code

2.10. Releases
• PR #4853 - Adding test that derives component from two other components
• PR #4852 - Fix mpi_ring test in distributed mode by ensuring all ranks run hpx_main
• PR #4851 - Converting resiliency APIs to tag_invoke based CPOs
• PR #4849 - Enable use of future_overhead test when DISTRIBUTED_RUNTIME is OFF
• PR #4847 - Fixing ‘error prone’ constructs as reported by Codacy
• PR #4846 - Disable Boost.Asio concepts support
• PR #4845 - Fix PAPI counters
• PR #4843 - Remove dependency on various Boost headers
• PR #4841 - Rearrange public API headers
• PR #4840 - Fixing TSS problems during thread termination
• PR #4839 - Fix async_cuda build problems when distributed runtime is disabled
• PR #4837 - Restore compatibility for old (now deprecated) copy algorithms
• PR #4836 - Adding CPOs for hpx::reduce
• PR #4835 - Remove using util::result_of from namespace hpx
• PR #4834 - Fixing the calculation of the number of idle cores and the corresponding idle masks
• PR #4833 - Allow thread function destructors to yield
• PR #4832 - Fixing assertion in split_gids and memory leaks in 1d_stencil_7
• PR #4831 - Making sure MPI_CXX_COMPILE_FLAGS is interpreted as a sequence of options
• PR #4830 - Update documentation on using HPX::wrap_main
• PR #4827 - Update clang-newest configuration to use clang 10
• PR #4826 - Add Jenkins configuration for rostam
• PR #4825 - Move all CUDA functionality to hpx::cuda::experimental namespace
• PR #4824 - Add support for building master/release branches to Jenkins configuration

https://github.com/STEllAR-GROUP/hpx/pull/4825
https://github.com/STEllAR-GROUP/hpx/pull/4824
- PR #4821 - Implement customization point for hpx::copy and hpx::ranges::copy
- PR #4819 - Allow finding Boost components before finding HPX
- PR #4817 - Adding range version of stable sort
- PR #4815 - Fix a wrong #ifdef for IO/TIMER pools causing build errors
- PR #4814 - Replace hpx::function_nonser with std::function in error module
- PR #4809 - Foreach adapt
- PR #4808 - Make internal algorithms functions const
- PR #4807 - Add Jenkins configuration for running on Piz Daint
- PR #4806 - Update documentation links to new domain name
- PR #4805 - Applying changes that resolve time complexity issues in sort
- PR #4803 - Adding implementation of stable_sort
- PR #4802 - Fix datapar header paths
- PR #4801 - Replace boost::shared_array<T> with std::shared_ptr<T[]> if supported
- PR #4799 - Fixing #include paths in compatibility headers
- PR #4799 - Include the main module header (fixes partially #4488)
- PR #4797 - Change cmake targets
- PR #4794 - Removing 128bit integer emulation
- PR #4793 - Make sure global variable is handled properly
- PR #4792 - Replace enable_if with HPX_CONCEPT_REQUIRES_ and add is_sentinel_for constraint
- PR #4791 - Move deprecation warnings from base template to template specializations for result_of etc. structs
- PR #4789 - Fix hangs during assertion handling and distributed runtime construction
- PR #4788 - Fixing inclusive transform scan algorithm to properly handle initial value
- PR #4785 - Fixing barrier test

[Links to PRs]
• PR #4784 - Fixing deleter argument bindings in serialize_buffer
• PR #4783 - Add coveralls badge
• PR #4782 - Make header tests parallel again
• PR #4780 - Remove outdated comment about hpx::stop in documentation
• PR #4776 - debug print improvements
• PR #4775 - Checkpoint cleanup
• PR #4771 - Fix compilation with HPX_WITH_NETWORKING=OFF
• PR #4767 - Remove all force linking leftovers
• PR #4765 - Fix 1d stencil index calculation
• PR #4764 - Force some tests to run serially
• PR #4762 - Update pointees in compatibility headers
• PR #4761 - Fix running and building of execution module tests on CircleCI
• PR #4760 - Storing hpx_options in global property to speed up summary report
• PR #4759 - Reduce memory requirements for our main shared state
• PR #4757 - Fix mimalloc linking on Windows
• PR #4756 - Fix compilation issues
• PR #4753 - Re-adding API functions that were lost during merges
• PR #4751 - Revert “Create coverage reports and upload them to codecov.io”
• PR #4750 - Fixing possible race condition during termination detection
• PR #4749 - Deprecate result_of and friends
• PR #4748 - Create coverage reports and upload them to codecov.io
• PR #4747 - Changing #include for MPI parcelport
• PR #4745 - Add is_sentinel_for trait implementation and test

• PR #4743\textsuperscript{1972} - Fix init\_globally example after runtime mode changes
• PR #4742\textsuperscript{1973} - Update SUPPORT.md
• PR #4741\textsuperscript{1974} - Fixing a warning generated for unity builds with msvc
• PR #4740\textsuperscript{1975} - Rename local\_lcos and basic\_execution modules
• PR #4739\textsuperscript{1976} - Undeprecate a couple of hpx/modulename.hpp headers
• PR #4738\textsuperscript{1977} - Conditionally test schedulers in thread\_stacksize\_current test
• PR #4734\textsuperscript{1978} - Fixing a bunch of codacy warnings
• PR #4733\textsuperscript{1979} - Add experimental unity build option to CMake configuration
• PR #4730\textsuperscript{1980} - Fixing compilation problems with unordered map
• PR #4729\textsuperscript{1981} - Fix APEX build
• PR #4727\textsuperscript{1982} - Fix missing runtime includes for distributed runtime
• PR #4726\textsuperscript{1983} - Add more API headers
• PR #4725\textsuperscript{1984} - Add more compatibility headers for deprecated module headers
• PR #4724\textsuperscript{1985} - Fix 4723
• PR #4721\textsuperscript{1986} - Attempt to fixing migration tests
• PR #4717\textsuperscript{1987} - Make the compatibility headers macro conditional
• PR #4716\textsuperscript{1988} - Add hpx/runtime.hpp and hpx/distributed/runtime.hpp API headers
• PR #4714\textsuperscript{1989} - Add hpx/future.hpp header
• PR #4713\textsuperscript{1990} - Remove hpx/runtime/threads\_fwd.hpp and hpx/util\_fwd.hpp
• PR #4711\textsuperscript{1991} - Make module deprecation warnings overridable
• PR #4710\textsuperscript{1992} - Add compatibility headers and other fixes after module header renaming
• PR #4708\textsuperscript{1993} - Add termination handler for parallel algorithms
• PR #4707\textsuperscript{1994} - Use hpx::function\_nonser instead of std::function internally

2.10. Releases
• PR #4614 - Fix error message when HPX_IGNORE_CMAKE_BUILD_TYPE_COMPATIBILITY=OFF
• PR #4613 - Make partitioner constructor private
• PR #4611 - Making auto_chunk_size execute the given function using the given executor
• PR #4610 - Making sure the thread-local lock registration data is moving to the core the suspended HPX thread is resumed on
• PR #4609 - Adding an API function that exposes the number of idle cores
• PR #4608 - Fixing moodycamel namespace
• PR #4607 - Moving winsocket initialization to core library
• PR #4606 - Local runtime module etc.
• PR #4604 - Add config_registry module
• PR #4603 - Deal with distributed modules in their respective CMakeLists.txt
• PR #4602 - Small module fixes
• PR #4598 - Making sure current_executor and service_executor functions are linked into the core library
• PR #4597 - Adding broadcast_to/broadcast_from to collectives module
• PR #4596 - Fix performance regression in block_executor
• PR #4595 - Making sure main.cpp is built as a library if HPX_WITH_DYNAMIC_MAIN=OFF
• PR #4592 - Futures module
• PR #4591 - Adapting co_await support for C++20
• PR #4590 - Adding missing exception test for for_loop()
• PR #4587 - Move traits headers to hpx/modulename/traits directory
• PR #4586 - Remove Travis CI config
• PR #4585 - Update macOS test blacklist
• PR #4584 - Attempting to fix missing symbols in stack trace
• PR #4583 - Fixing bad static_cast

• PR #4582 - Changing download url for Windows prerequisites to circumvent bandwidth limitations
• PR #4581 - Adding missing using placeholder::_X
• PR #4579 - Move get_stack_size_name and related functions
• PR #4575 - Excluding unconditional definition of class backtrace from global header
• PR #4574 - Changing return type of hardware_concurrency() to unsigned int
• PR #4570 - Move tests to modules
• PR #4564 - Reshuffle internal targets and add HPX::hpx_no_wrap_main target
• PR #4563 - fix CMake option typo
• PR #4562 - Unregister lock earlier to avoid holding it while suspending
• PR #4561 - Adding test macros supporting custom output stream
• PR #4560 - Making sure hash_any::operator() is linked into core library
• PR #4559 - Fixing compilation if HPX_WITH_THREAD_BACKTRACE_ON_SUSPENSION=On
• PR #4557 - Improve spinlock implementation to perform better in high-contention situations
• PR #4555 - Fix a runtime_ptr problem at shutdown when apex is enabled
• PR #4552 - Add configuration option for making exceptions less noisy
• PR #4551 - Clean up thread creation parameters
• PR #4549 - Test FetchContent build on GitHub actions
• PR #4548 - Fix stack size
• PR #4545 - Fix header tests
• PR #4544 - Fix a typo in sanitizer build
• PR #4541 - Add API to check if a thread pool exists
• PR #4540 - Making sure MPI support is enabled if MPI futures are used but networking is disabled
• PR #4538 - Move channel documentation examples to examples directory

• PR #4536 - Add generic allocator for execution policies
• PR #4534 - Enable compatibility headers for thread_executors module
• PR #4532 - Fixing broken url in README.rst
• PR #4531 - Update scripts
• PR #4530 - Make sure module API docs show up in correct order
• PR #4529 - Adding missing template code to module creation script
• PR #4528 - Make sure version module uses HPX’s binary dir, not the parent’s
• PR #4527 - Creating actions_base and actions module
• PR #4526 - Shared state for cv
• PR #4525 - Changing sub-name sequencing for experimental namespace
• PR #4524 - Add API guarantee notes to API reference documentation
• PR #4522 - Enable and fix deprecation warnings in execution module
• PR #4521 - Moves more miscellaneous files to modules
• PR #4520 - Skip execution customization points when executor is known
• PR #4518 - Module distributed lcos
• PR #4516 - Fix various builds
• PR #4515 - Replace backslashes by slashes in windows paths
• PR #4514 - Adding polymorphic_executor
• PR #4512 - Adding C++20 jthread and stop_token
• PR #4510 - Attempt to fix APEX linking in external packages again
• PR #4508 - Only test pull requests (not all branches) with GitHub actions
• PR #4505 - Fix duplicate linking in tests (ODR violations)
• PR #4504 - Fix C++ standard handling
• PR #4503 - Add CMakelists file check
• PR #4500 - Fix .clang-format version requirement comment
• PR #4496 - Attempting to fix hpx_init linking on macOS
• PR #4498 - Fix compatibility of pool_executor
• PR #4496 - Removing superfluous SPDX tags
• PR #4494 - Module executors
• PR #4493 - Pack traversal module
• PR #4492 - Update copyright year in documentation
• PR #4491 - Add missing current_executor header
• PR #4490 - Update GitHub actions configs
• PR #4487 - Properly dispatch exceptions thrown from hpx_main to be rethrown from hpx::init/hpx::stop
• PR #4486 - Fixing an initialization order problem
• PR #4485 - Move miscellaneous files to their rightful modules
• PR #4483 - Clean up imported CMake target naming
• PR #4481 - Add vcpkg installation instructions
• PR #4479 - Add hints to allow to specify MIMALLOC_ROOT
• PR #4478 - Async modules
• PR #4475 - Fix rp init changes
• PR #4472 - Use #pragma once in headers
• PR #4474 - Add more descriptive error message when using x86 coroutines on non-x86 platforms
• PR #4467 - Add malloc find cmake script
• PR #4465 - Add thread_executors module
• PR #4464 - Include module
• PR #4462\textsuperscript{2133} - Merge hpx_init and hpx_wrap into one static library
• PR #4461\textsuperscript{2134} - Making thread_data test more realistic
• PR #4460\textsuperscript{2135} - Suppress MPI warnings in version.cpp
• PR #4459\textsuperscript{2136} - Make sure pkgconfig applications link with hpx_init
• PR #4458\textsuperscript{2137} - Added example demonstrating how to create and use a wrapping executor
• PR #4457\textsuperscript{2138} - Fixing execution of thread exit functions
• PR #4456\textsuperscript{2139} - Move backtrace files to debugging module
• PR #4455\textsuperscript{2140} - Move deadlock_detection and maintain_queue_wait_times source files into schedulers module
• PR #4450\textsuperscript{2141} - Fixing compilation with std::filesystem enabled
• PR #4449\textsuperscript{2142} - Fixing build system to actually build variant test
• PR #4447\textsuperscript{2143} - This fixes an obsolete #include
• PR #4446\textsuperscript{2144} - Resume tasks where they were suspended
• PR #4444\textsuperscript{2145} - Minor CUDA fixes
• PR #4443\textsuperscript{2146} - Add missing tests to CircleCI config
• PR #4442\textsuperscript{2147} - Adding a tag to all auto-generated files allowing for tools to visually distinguish those
• PR #4441\textsuperscript{2148} - Adding performance counter type information
• PR #4440\textsuperscript{2149} - Fixing MSVC build
• PR #4439\textsuperscript{2150} - Link HPX::plugin and component privately in hpx_setup_target
• PR #4437\textsuperscript{2151} - Adding a test that verifies the problem can be solved using a trait specialization
• PR #4434\textsuperscript{2152} - Clean up Boost dependencies and copy string algorithms to new module
• PR #4433\textsuperscript{2153} - Fixing compilation issues (!) if MPI parcelport is enabled
• PR #4431\textsuperscript{2154} - Ignore warnings about name mangling changing
• PR #4430\textsuperscript{2155} - Add performance_counters module

**HPX V1.4.1 (Feb 12, 2020)**

**General changes**

This is a bugfix release. It contains the following changes:

• Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
• Install missing pdb files on Windows
• Allow running tests using an installed version of HPX
• Skip MPI finalization if HPX has not initialized MPI
• Give a hard error when attempting to use IO counters on Windows

**Closed issues**

• Issue #4320\(^{2252}\) - HPX 1.4.0 does not compile with gcc 10
• Issue #4336\(^{2253}\) - Building HPX 1.4.0 with IO Counters breaks (Windows)
• Issue #4334\(^{2254}\) - HPX Debug and RelWithDebInfo builds on Windows not installing .pdb files
• Issue #4322\(^{2255}\) - Undefine VT1 and VT2 after boost includes
• Issue #4314\(^{2256}\) - Compile error on 1.4.0
• Issue #4307\(^{2257}\) - ld: error: duplicate symbol: freebsd_environ

**Closed pull requests**

• PR #4376\(^{2258}\) - Attempt to fix some test build errors on Windows
• PR #4357\(^{2259}\) - Adding missing #includes to fix gcc V10 linker problems
• PR #4353\(^{2260}\) - Skip MPI_Finalize if MPI_Init is not called from HPX
• PR #4343\(^{2261}\) - Give a hard error if IO counters are enabled on non-Linux systems

PR #4337 - Installing pdb files on Windows
PR #4335 - Adding capability to buildsystem to use an installed version of HPX
PR #4315 - Forcing exported symbols from composable_guard to be linked into core library
PR #4310 - Remove environment handling from exception.cpp

HPX V1.4.0 (January 15, 2020)

General changes

- We have added the collectives all_to_all and all_reduce.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the documentation for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size thread_stacksize_nostack.
- We have added an implementation of unique_any, which is a non-copyable version of any.
- The shared_priority_queue_scheduler has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option --hpx:queuing=shared-priority. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters background-receive-duration and background-receive-overhead for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when HPX_WITH_NETWORKING=OFF.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on Boost.Filesystem can explicitly be turned on with HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON (it is off by default if the standard library supports std::filesystem). Boost.ProgramOptions has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use Boost.ProgramOptions instead of the ProgramOptions provided by HPX. To remove the dependency HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY must be explicitly set to OFF. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.
- It is now possible to use the process affinity mask set by tools like numactl and various batch environments with the command line option --hpx:use-process-mask. Enabling this option implies --hpx:ignore-batch-env.
- It is now possible to create standalone thread pools without starting the runtime. See the standalone_thread_pool_executor.cpp test in the execution module for an example.

2262 https://github.com/STEllAR-GROUP/hpx/pull/4337
2263 https://github.com/STEllAR-GROUP/hpx/pull/4335
2264 https://github.com/STEllAR-GROUP/hpx/pull/4315
2265 https://github.com/STEllAR-GROUP/hpx/pull/4310
• Tasks annotated with `hpx::util::annotated_function` now have their correct name when using APEX to generate OTF2 files.

• Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.

• The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.

• We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.

• We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.

• We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.

• We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.

• We now enforce formatting with `clang-format` on the majority of our source files.

• We have added SPDX license tags to all files.

• Many bugfixes.

### Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.

- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.

- The `HPX_WITH_UNWRAPPED_COMPATIBILITY` option and the associated compatibility layer has been removed.

### Closed issues

- Issue #4282 - Build Issues with Release on Windows
- Issue #4278 - Build Issues with CMake 3.14.4
- Issue #4273 - Clients of HPX 1.4.0-rc2 with APEX ar not linked to libhpx-apex
- Issue #4269 - Building HPX 1.4.0-rc2 with support for APEX fails
- Issue #4263 - Compilation fail on latest master
- Issue #4232 - Configure of HPX project using CMake FetchContent fails
- Issue #4223 - “Re-using the main() function as the main HPX entry point” doesn’t work
- Issue #4220 - HPX won’t compile - error building `resource_partitioner`

2.10. Releases
• Issue #4215 - HPX 1.4.0rc1 does not link on s390x
• Issue #4204 - Trouble compiling HPX with Intel compiler
• Issue #4199 - Refactor APEX to eliminate circular dependency
• Issue #4187 - HPX can't build on OSX
• Issue #4185 - Simple debug output for development
• Issue #4182 - @HPX_CONF_PREFIX@ is the empty string
• Issue #4169 - HPX won't build with APEX
• Issue #4163 - Add back HPX_LIBRARIES and HPX_INCLUDE_DIRS
• Issue #4161 - It should be possible to call find_package(HPX) multiple times
• Issue #4155 - get_self_id() for stackless threads returns invalid_thread_id
• Issue #4151 - build error with MPI code
• Issue #4150 - hpx won't build on POWER9 with clang 8
• Issue #4148 - cacheline_data delivers poor performance with C++17 compared to C++14
• Issue #4144 - target general in HPX_LIBRARIES does not exist
• Issue #4134 - CMake Error when -DHPX_WITH_HPXML=ON
• Issue #4132 - parallel fill leaves elements unfilled
• Issue #4123 - PAPI performance counters are inaccessible
• Issue #4118 - static_chunk_size is not obeyed in scan algorithms
• Issue #4115 - dependency chaining error with APEX
• Issue #4107 - Initializing runtime without entry point function and command line arguments
• Issue #4105 - Bug in hpx:bind=numa-balanced
• Issue #4101 - Bound tasks
• Issue #4100 - Add SPDX identifier to all files

2295 https://github.com/STEllAR-GROUP/hpx/issues/4100
• Issue #4085 - hpx_topology library should depend on hwloc
• Issue #4067 - HPX fails to build on macOS
• Issue #4056 - Building without thread manager idle backoff fails
• Issue #4052 - Enforce clang-format style for modules
• Issue #4032 - Simple hello world fails to launch correctly
• Issue #4030 - Allow threads to skip context switching
• Issue #4029 - Add support for mimalloc
• Issue #4005 - Can’t link HPX when APEX enabled
• Issue #4002 - Missing header for algorithm module
• Issue #3989 - Conversion from long to unsigned int requires a narrowing conversion on MSVC
• Issue #3958 - /statistics/average@ perf counter can’t be created
• Issue #3953 - CMake errors from HPX_AddPseudoDependencies
• Issue #3941 - CMake error for APEX install target
• Issue #3940 - Convert pseudo-doxygen function documentation into actual doxygen documentation
• Issue #3935 - HPX compiler match too strict?
• Issue #3929 - Buildbot failures on latest HPX stable
• Issue #3912 - I recommend publishing a version that does not depend on the boost library
• Issue #3890 - hpx.ini not working
• Issue #3883 - cuda compilation fails because of --aligned-new
• Issue #3879 - HPX fails to configure with -DHPX_WITH_TESTS=OFF
• Issue #3871 - dataflow does not support void allocators
• Issue #3867 - Latest HTML docs placed in wrong directory on GitHub pages
• Issue #3866 - Make sure all tests use HPX_TEST* macros and not HPX_ASSERT
• Issue #3857 - CMake all-keyword or all-plain for target_link_libraries
• Issue #3856 - hpx_setup_target adds rogue flags
• Issue #3850 - HPX fails to build on POWER8 with Clang7
• Issue #3848 - Remove lva member from thread_init_data
• Issue #3838 - hpx::parallel::count/count_if failing tests
• Issue #3651 - hpx::parallel::transform_reduce with non const reference as lambda parameter
• Issue #3560 - Apex integration with HPX not working properly
• Issue #3322 - No warning when mixing debug/release builds

Closed pull requests

• PR #4300 - Checks for MPI_Init being called twice
• PR #4299 - Small CMake fixes
• PR #4298 - Remove extra call to annotate function that messes up traces
• PR #4296 - Fixing collectives locking problem
• PR #4295 - Do not check LICENSE_1_0.txt for inspect violations

Chapter 2. What’s so special about HPX?
• PR #4264 - Clean up compatibility header options
• PR #4262 - Cleanup modules CMakeLists.txt
• PR #4261 - Fixing HPX/APEX linking and dependencies for external projects like Phylanx
• PR #4260 - Fix docs compilation problems
• PR #4258 - Couple of minor changes
• PR #4257 - Fix apex annotation for async dispatch
• PR #4256 - Remove lambdas from assert expressions
• PR #4255 - Ignoring lock in all_to_all and all_reduce
• PR #4254 - Adding action specializations for noexcept functions
• PR #4253 - Move partlit.hpp to affinity module
• PR #4252 - Make mismatching build types a hard error in CMake
• PR #4251 - Scheduler improvement
• PR #4248 - update hpxmp tag to v0.3.0
• PR #4247 - Adding high performance channels
• PR #4246 - Ignore lock in ignore_while_locked_1485 test
• PR #4245 - Fix PAPI command line option documentation
• PR #4244 - Ignore lock in target_distribution_policy
• PR #4243 - Fix start_stop_callbacks test
• PR #4240 - Mostly fix clang CUDA compilation
• PR #4238 - Google Season of Docs updates to documentation; grammar edits.
• PR #4237 - fixing annotated task to use the name, not the desc
• PR #4236 - Move module print summary to modules
• PR #4235 - Don’t use alignas in cache_{aligned,line}_data

2.10. Releases
• PR #4234 - Add basic overview sentence to all modules
• PR #4230 - Add OS X builds to Travis CI
• PR #4229 - Remove leftover queue compatibility checks
• PR #4226 - Fixing APEX shutdown by explicitly shutting down throttling
• PR #4225 - Allow `CMAKE_INSTALL_PREFIX` to be a relative path
• PR #4224 - Deprecate verbs parcelport
• PR #4222 - Update register_{thread,work} namespaces
• PR #4221 - Changing `HPX_GCC_VERSION` check from 70000 to 70300
• PR #4218 - Google Season of Docs updates to documentation; grammar edits.
• PR #4217 - Google Season of Docs updates to documentation; grammar edits.
• PR #4216 - Fixing gcc warning on 32bit platforms (integer truncation)
• PR #4214 - Apex callback refactoring
• PR #4213 - Clean up allocator checks for dependent projects
• PR #4212 - Google Season of Docs updates to documentation; grammar edits.
• PR #4211 - Google Season of Docs updates to documentation; contributing to hpx
• PR #4210 - Attempting to fix Intel compilation
• PR #4209 - Fix CUDA 10 build
• PR #4205 - Making sure that differences in CMAKE_BUILD_TYPE are not reported on multi-configuration cmake generators
• PR #4203 - Deprecate Vc
• PR #4202 - Fix CUDA configuration
• PR #4200 - Making sure `hpx_wrap` is not passed on to linker on non-Linux systems
• PR #4198 - Fix `execution_agent.cpp` compilation with GCC 5
• PR #4197 - Remove deprecated options for 1.4.0 release

https://github.com/STEllAR-GROUP/hpx/pull/4168
• PR #4167 - Add a condition to setup the external libraries
• PR #4166 - Add an INTERNAL_FLAGS option to link to hpx_internal_flags
• PR #4165 - Forward HPX_* cmake cache variables to external projects
• PR #4164 - Affinity and batch environment modules
• PR #4162 - Handle quick exit
• PR #4160 - Using target_link_libraries for cmake versions >= 3.12
• PR #4159 - Make sure HPX_WITH_NATIVE_TLS is forwarded to dependent projects
• PR #4158 - Adding allocator imported target as a dependency of allocator module
• PR #4157 - Add hpx_memory as a dependency of parcelport plugins
• PR #4156 - Stackless coroutines now can refer to themselves (through get_self() and friends)
• PR #4154 - Added CMake policy CMP0060 for HPX applications.
• PR #4153 - add header omanip to tests and tool
• PR #4152 - Casting MPI tag value
• PR #4149 - Add back private m_desc member variable in program_options module
• PR #4147 - Resource partitioner and threadmanager modules
• PR #4146 - Google Season of Docs updates to documentation; creating hpx projects
• PR #4145 - Adding basic support for stackless threads
• PR #4143 - Exclude test_client_1950 from all target
• PR #4142 - Add a new thread_pool_executor
• PR #4140 - Google Season of Docs updates to documentation; why hpx
• PR #4139 - Remove runtime includes from coroutines module
• PR #4138 - Forking boost::intrusive_ptr and adding it as hpx::intrusive_ptr
• PR #4137 - Fixing TSS destruction
• PR #4136: HPX.Compute modules
• PR #4135: Fix block_executor
• PR #4131: Applying fixes based on reports from PVS Studio
• PR #4130: Adding missing header to build system
• PR #4129: Fixing compilation if HPX_WITH_DATAPAR_VC is enabled
• PR #4128: Renaming moveonly_any to unique_any
• PR #4126: Attempt to fix basic_any constructor for gcc 7
• PR #4125: Changing extra_archive_data implementation
• PR #4124: Don’t link to Boost.System unless required
• PR #4122: Add kernel launch helper utility (+saxpy demo) and merge in octotiger changes
• PR #4121: Fixing migration test if networking is disabled.
• PR #4120: Google Season of Docs updates to documentation; hpx build system v1
• PR #4119: Making sure chunk_size and max_chunk are actually applied to parallel algorithms if specified
• PR #4117: Make CircleCI formatting check store diff
• PR #4116: Fix automatically setting C++ standard
• PR #4114: Module serialization
• PR #4113: Module datastructures
• PR #4111: Fixing performance regression introduced earlier
• PR #4110: Adding missing SPDX tags
• PR #4109: Overload for start without entry point/argv.
• PR #4108: Making sure C++ standard is properly detected and propagated
• PR #4106: use std::round for guaranteed rounding without errors
• PR #4104: Extend scheduler_mode with new work_stealing and task assignment modes

2.10. Releases
• PR #4103\textsuperscript{2457} - Add this to lambda capture list
• PR #4102\textsuperscript{2458} - Add spdx license and check
• PR #4099\textsuperscript{2459} - Module coroutines
• PR #4098\textsuperscript{2460} - Fix append module path in module CMakeLists template
• PR #4097\textsuperscript{2461} - Function tests
• PR #4096\textsuperscript{2462} - Removing return of `thread_result_type` from functions not needing them
• PR #4095\textsuperscript{2463} - Stop-gap measure until cmake overhaul is in place
• PR #4094\textsuperscript{2464} - Deprecate `HPX_WITH_MORE_THAN_64_THREADS`
• PR #4093\textsuperscript{2465} - Fix initialization of `global_num_tasks` in `parallel_executor`
• PR #4092\textsuperscript{2466} - Add support for mi-malloc
• PR #4090\textsuperscript{2467} - Execution context
• PR #4089\textsuperscript{2468} - Make counters in coroutines optional
• PR #4087\textsuperscript{2469} - Making `hpx::util::any` compatible with C++17
• PR #4084\textsuperscript{2470} - Making sure destination array for `std::transform` is properly resized
• PR #4083\textsuperscript{2471} - Adapting `thread_queue_mc` to behave even if no 128bit atomics are available
• PR #4082\textsuperscript{2472} - Fix compilation on GCC 5
• PR #4081\textsuperscript{2473} - Adding option allowing to force using Boost.FileSystem
• PR #4080\textsuperscript{2474} - Updating module dependencies
• PR #4079\textsuperscript{2475} - Add missing tests for iterator_support module
• PR #4078\textsuperscript{2476} - Disable parcel-layer if networking is disabled
• PR #4077\textsuperscript{2477} - Add missing include that causes build fails
• PR #4076\textsuperscript{2478} - Enable compatibility headers for functional module
• PR #4075\textsuperscript{2479} - Coroutines module

• PR #4073 - Use `configure_file` for generated files in modules
• PR #4071 - Fixing MPI detection for PMIx
• PR #4070 - Fix macOS builds
• PR #4069 - Moving more facilities to the collectives module
• PR #4068 - Adding main HPX `#include` directory to modules
• PR #4066 - Switching the use of `message(STATUS "...")` to `hpx_info`
• PR #4065 - Move Boost.Filesystem handling to filesystem module
• PR #4064 - Fix program_options test with older boost versions
• PR #4062 - The `cpu_features` tool fails to compile on anything but x86 architectures
• PR #4061 - Add clang-format checking step for modules
• PR #4060 - Making sure `HPX_IDLE_BACKOFF_TIME_MAX` is always defined (even if its unused)
• PR #4059 - Renaming module `hpx_parallel_executors` into `hpx_execution`
• PR #4058 - Do not build networking tests when networking disabled
• PR #4057 - Printing configuration summary for modules as well
• PR #4055 - Google Season of Docs updates to documentation; hpx build systems
• PR #4054 - Add troubleshooting section to manual
• PR #4051 - Add more variations to `future_overhead` test
• PR #4050 - Creating plugin module
• PR #4049 - Move missing modules tests
• PR #4047 - Add boost/filesystem headers to inspect deprecated headers
• PR #4045 - Module functional
• PR #4043 - Fix preconditions and error messages for suspension functions
• PR #4041 - Pass `HPX_STANDARD` on to dependent projects via `HPXConfig.cmake`

• PR #3875\(^{2618}\) - Converted typedefs in actions submodule to using directives
• PR #3874\(^{2619}\) - Allow one to suppress target keywords in \texttt{hpx\_setup\_target} for backwards compatibility
• PR #3873\(^{2620}\) - Add scripts to create releases and generate lists of PRs and issues
• PR #3872\(^{2621}\) - Fix latest HTML docs location
• PR #3870\(^{2622}\) - Module cache
• PR #3869\(^{2623}\) - Post 1.3.0 version bumps
• PR #3868\(^{2624}\) - Replace the macro \texttt{HPX\_ASSERT} by \texttt{HPX\_TEST} in tests
• PR #3845\(^{2625}\) - Assertion module
• PR #3839\(^{2626}\) - Make tuple serialization non-intrusive
• PR #3832\(^{2627}\) - Config module
• PR #3799\(^{2628}\) - Remove compat namespace and its contents
• PR #3701\(^{2629}\) - MoodyCamel lockfree
• PR #3496\(^{2630}\) - Disabling MPI's (deprecated) C++ interface
• PR #3192\(^{2631}\) - Move type info into \texttt{hpx\_debug} namespace and add print helper functions
• PR #3159\(^{2632}\) - Support Checkpointing Components

\textit{HPX V1.3.0 (May 23, 2019)}

General changes

• Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.

• HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.

• Multiple issues reported by Clang sanitizers have been fixed.

• We have added (back) single-page HTML documentation and PDF documentation.

• We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.

• We have added an implementation of \texttt{function\_ref}.

\end{tabular}
• The barrier and latch classes have gained a few additional member functions.

Breaking changes

• Executable and library targets are now created without the _exe and _lib suffix respectively. For example, the target id_stencil_1_exe is now simply called id_stencil_1.

• We have removed the following deprecated functionality: queue, scoped_unlock, and support for input iterators in algorithms.

• We have turned off the compatibility layer for unwrapped by default. The functionality will be removed in the next release. The option can still be turned on using the CMake\textsuperscript{2633} option \texttt{HPX\_WITH\_UNWRAPPED\_SUPPORT}. Likewise, inclusive_scan compatibility overloads have been turned off by default. They can still be turned on with \texttt{HPX\_WITH\_INCLUSIVE\_SCAN\_COMPATIBILITY}.

• The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.

• The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting \texttt{HPX\_PREPROCESSOR\_WITH\_DEPRECATION\_WARNINGS=OFF} or turn off the compatibility headers completely with \texttt{HPX\_PREPROCESSOR\_WITH\_COMPATIBILITY\_HEADERS=OFF}.

Closed issues

• Issue #3863\textsuperscript{2634} - shouldn’t “-faligned-new” be a usage requirement?
• Issue #3841\textsuperscript{2635} - Build error with msvc 19 caused by SFINAE and C++17
• Issue #3836\textsuperscript{2636} - master branch does not build with idle rate counters enabled
• Issue #3819\textsuperscript{2637} - Add debug suffix to modules built in debug mode
• Issue #3817\textsuperscript{2638} - \texttt{HPX\_INCLUDE\_DIRS} contains non-existent directory
• Issue #3810\textsuperscript{2639} - Source groups are not created for files in modules
• Issue #3805\textsuperscript{2640} - HPX won’t compile with \texttt{-DHPX\_WITH\_APEX=TRUE}
• Issue #3792\textsuperscript{2641} - Barrier Hangs When Locality Zero not included
• Issue #3778\textsuperscript{2642} - Replace \texttt{throw()} with \texttt{noexcept}
• Issue #3763\textsuperscript{2643} - configurable sort limit per task
• Issue #3758\textsuperscript{2644} - dataflow doesn’t convert future\texttt{<future<T>>} to future\texttt{T>}

• Issue #3757 - When compiling undefined reference to `hpx::hpx_check_version_1_2` HPX V1.2.1, Ubuntu 18.04.01 Server Edition
• Issue #3753 - `-hpx:list-counters=full` crashes
• Issue #3746 - Detection of MPI with pmix
• Issue #3744 - Separate spinlock from same cacheline as internal data for all LCOs
• Issue #3743 - `hpxcxx`’s shebang doesn’t specify the python version
• Issue #3738 - Unable to debug parcelport on a single node
• Issue #3735 - Latest master: Can’t compile in MSVC
• Issue #3731 - `util::bound` seems broken on Clang with older libstdc++
• Issue #3724 - Allow to pre-set command line options through environment
• Issue #3723 - examples/resource_partitioner build issue on master branch / ubuntu 18
• Issue #3721 - faced a building error
• Issue #3720 - Hello World example fails to link
• Issue #3719 - `pkg-config` produces invalid output: `-l-pthread`
• Issue #3718 - Please make the python executable configurable through cmake
• Issue #3717 - interested to contribute to the organisation
• Issue #3699 - Remove ‘HPX runtime’ executable
• Issue #3698 - Ignore all locks while handling asserts
• Issue #3689 - Incorrect and inconsistent website structure [http://stellar.cct.lsu.edu/downloads/](http://stellar.cct.lsu.edu/downloads/).
• Issue #3681 - Broken links on [http://stellar.cct.lsu.edu/2015/05/hpx-archives-now-on-gmane/](http://stellar.cct.lsu.edu/2015/05/hpx-archives-now-on-gmane/)
• Issue #3676 - HPX master built from source, cmake fails to link main.cpp example in docs
• Issue #3673 - HPX build fails with `std::atomic` missing error
• Issue #3670 - Generate PDF again from documentation (with Sphinx)
• Issue #3643 - Warnings when compiling HPX 1.2.1 with gcc 9

2.10. Releases
• Issue #3641 - Trouble with using ranges-v3 and hpx::parallel::reduce
• Issue #3639 - util::unwrapping does not work well with member functions
• Issue #3634 - The build fails if shared_future<>::then is called with a thread executor
• Issue #3622 - VTune Amplifier 2019 not working with use_itt_notify=1
• Issue #3616 - HPX Fails to Build with CUDA 10
• Issue #3612 - False sharing of scheduling counters
• Issue #3609 - executor_parameters timeout with gcc <= 7 and Debug mode
• Issue #3601 - Misleading error message on power pc for rdtsc and rdtscp
• Issue #3598 - Build of some examples fails when using Vc
• Issue #3594 - Error: The number of OS threads requested (20) does not match the number of threads to bind (12): HPX(bad_parameter)
• Issue #3592 - Undefined Reference Error
• Issue #3589 - include could not find load file: HPX_Utils.cmake
• Issue #3587 - HPX won’t compile on POWER8 with Clang 7
• Issue #3583 - Fedora and openSUSE instructions missing on “Distribution Packages” page
• Issue #3578 - Build error when configuring with HPX_HAVE_ALGORITHM_INPUT_ITERATOR_SUPPORT=ON
• Issue #3575 - Merge openSUSE reproducible patch
• Issue #3570 - Update HPX to work with the latest VC version
• Issue #3567 - Build succeed and make failed for hpx:cout
• Issue #3565 - Polymorphic simple component destructor not getting called
• Issue #3559 - 1.2.0 is missing from download page
• Issue #3554 - Clang 6.0 warning of hiding overloaded virtual function
• Issue #3510 - Build on ppc64 fails
• Issue #3482 - Improve error message when HPX_WITH_MAX_CPU_COUNT is too low for given system
• Issue #3453  - Two HPX applications can’t run at the same time.
• Issue #3452  - Scaling issue on the change to 2 NUMA domains
• Issue #3443  - HPX `set_difference`, set_intersection` failure cases
• Issue #3437  - Ensure `parent_task` pointer when child task is created and child/parent are on same locality
• Issue #3255  - Suspension with lock for `--hpx:list-component-types`
• Issue #3034  - Use C++17 structured bindings for serialization
• Issue #2999  - Change thread scheduling use of `size_t` for thread indexing

Closed pull requests

• PR #3865  - adds `hpx_target_compile_option_if_available`
• PR #3864  - Helper functions that are useful in numa binding and testing of allocator
• PR #3862  - Temporary fix to local_dataflow_boost_small_vector test
• PR #3860  - Add cache line padding to intermediate results in for loop reduction
• PR #3859  - Remove HPX_TLL_PUBLIC and HPX_TLL_PRIVATE from CMake files
• PR #3858  - Add compile flags and definitions to modules
• PR #3851  - update hpxmp release tag to v0.2.0
• PR #3849  - Correct BOOST_ROOT variable name in quick start guide
• PR #3847  - Fix `attach_debugger` configuration option
• PR #3846  - Add tests for `libs` header tests
• PR #3844  - Fixing `source_groups` in preprocessor module to properly handle compatibility headers
• PR #3843  - This fixes the `launch_process/launched_process` pair of tests
• PR #3842  - Fix macro call with ITTNOTIFY enabled
• PR #3840  - Fixing SLURM environment parsing
• PR #3837  - Fixing misplaced `#endif`

2.10. Releases
• PR #3835 - make all latch members protected for consistency
• PR #3834 - Disable transpose_block_numa example on CircleCI
• PR #3833 - make latch counter_ protected for deriving latch in hpxmp
• PR #3831 - Fix CircleCI config for modules
• PR #3830 - minor fix: option HPX_WITH_TEST was not working correctly
• PR #3828 - Avoid for binaries that depend on HPX to directly link against internal modules
• PR #3827 - Adding shortcut for hpx::get_ptr<>(sync, id) for a local, non-migratable objects
• PR #3826 - Fix and update modules documentation
• PR #3825 - Updating default APEX version to 2.1.3 with HPX
• PR #3823 - Fix pkgconfig libs handling
• PR #3822 - Change includes in hpx_wrap.cpp to more specific includes
• PR #3821 - Disable barrier_3792 test when networking is disabled
• PR #3820 - Assorted CMake fixes
• PR #3819 - Removing left-over debug output
• PR #3814 - Allow setting default scheduler mode via the configuration database
• PR #3818 - Make the deprecation warnings issued by the old pp headers optional
• PR #3817 - Windows requires to handle symlinks to directories differently from those linking files
• PR #3816 - Clean up PP module and library skeleton
• PR #3806 - Moving include path configuration to before APEX
• PR #3804 - Fix latch
• PR #3803 - Update hpxcxx to look at lib64 and use python3
• PR #3802 - Numa binding allocator
• PR #3801 - Remove duplicated includes
• PR #3800 - Attempt to fix Posix context switching after lazy init changes
• PR #3798 - count and count_if accepts different iterator types
• PR #3797 - Adding a couple of override keywords to overloaded virtual functions
• PR #3796 - Re-enable testing all schedulers in shutdown_suspended_test
• PR #3795 - Change std::terminate to std::abort in SIGSEGV handler
• PR #3794 - Fixing #3792
• PR #3793 - Extending migrate_polymorphic_component unit test
• PR #3791 - Change throw() to noexcept
• PR #3790 - Remove deprecated options for 1.3.0 release
• PR #3789 - Remove Boost filesystem compatibility header
• PR #3788 - Disabled even more spots that should not execute if networking is disabled
• PR #3787 - Bump minimal boost supported version to 1.61.0
• PR #3786 - Bump minimum required versions for 1.3.0 release
• PR #3785 - Explicitly set number of jobs for all ninja invocations on CircleCI
• PR #3784 - Fix leak and address sanitizer problems
• PR #3783 - Disabled even more spots that should not execute is networking is disabled
• PR #3782 - Cherry-picked tuple and thread_init_data fixes from #3701
• PR #3781 - Fix generic context coroutines after lazy stack allocation changes
• PR #3780 - Rename hello world examples
• PR #3776 - Sort algorithms now use the supplied chunker to determine the required minimal chunk size
• PR #3775 - Disable Boost auto-linking
• PR #3774 - Tag and push stable builds
• PR #3773 - Enable migration of polymorphic components

• PR #3771\(^{2759}\) - Fix link to stackoverflow in documentation
• PR #3770\(^{2760}\) - Replacing constexpr if in brace-serialization code
• PR #3769\(^{2761}\) - Fix SIGSEGV handler
• PR #3768\(^{2762}\) - Adding flags to scheduler allowing to control thread stealing and idle back-off
• PR #3767\(^{2763}\) - Fix help formatting in hpxrun.py
• PR #3765\(^{2764}\) - Fix a couple of bugs in the thread test
• PR #3764\(^{2765}\) - Workaround for SFINAE regression in msvc14.2
• PR #3762\(^{2766}\) - Prevent MSVC from prematurely instantiating things
• PR #3761\(^{2767}\) - Update python scripts to work with python 3
• PR #3760\(^{2768}\) - Fix callable vtable for GCC4.9
• PR #3759\(^{2769}\) - Rename PAGE_SIZE to PAGE_SIZE_ because AppleClang
• PR #3755\(^{2770}\) - Making sure locks are not held during suspension
• PR #3754\(^{2771}\) - Disable more code if networking is not available/not enabled
• PR #3752\(^{2772}\) - Move util::format implementation to source file
• PR #3751\(^{2773}\) - Fixing problems with lcos::barrier and iostreams
• PR #3750\(^{2774}\) - Change error message to take into account use_guard_page setting
• PR #3749\(^{2775}\) - Fix lifetime problem in run_as_hpx_thread
• PR #3748\(^{2776}\) - Fixed unusable behavior of the clang code analyzer.
• PR #3747\(^{2777}\) - Added PMIX_RANK to the defaults of HPX_WITH_PARCELPORT_MPI_ENV.
• PR #3745\(^{2778}\) - Introduced cache_aligned_data and cache_line_data helper structure
• PR #3742\(^{2779}\) - Remove more unused functionality from util/logging
• PR #3740\(^{2780}\) - Fix includes in partitioned vector tests
• PR #3739\(^{2781}\) - More fixes to make sure that std::flush really flushes all output

- PR #3700 - Added `barrier::increment` function to increase total number of threads
- PR #3697 - One more attempt to fix migration...
- PR #3694 - Fixing component migration
- PR #3693 - Print thread state when getting disallowed value in `set_thread_state`
- PR #3692 - Only disable `constexpr` with clang-cuda, not nvcc+gcc
- PR #3691 - Link with `libsupc++` if needed for `thread_local`
- PR #3690 - Remove thousands separators in `set_operations_3442` to comply with C++11
- PR #3688 - Decouple serialization from function `vtbales`
- PR #3687 - Fix a couple of test failures
- PR #3686 - Make sure tests.unit.build are run after install on CircleCI
- PR #3685 - Revise quickstart `CMakeLists.txt` explanation
- PR #3684 - Provide concept emulation for Ranges-TS concepts
- PR #3683 - Ignore uninitialized chunks
- PR #3682 - Ignore uninitialized chunks. Check proper indices.
- PR #3681 - Ignore uninitialized chunks. Check proper range indices
- PR #3680 - Simplify basic action implementations
- PR #3679 - Making sure `HPX_HAVE_LIBATOMIC` is unset before checking
- PR #3678 - Fix generated full version number to be usable in expressions
- PR #3677 - Reduce functional utilities call depth
- PR #3676 - Change new build system to use existing macros related to pseudo dependencies
- PR #3675 - Remove indirect in `function_ref` when thread description is disabled
- PR #3674 - Unbreaking `async_*cb*` tests
- PR #3673 - Generate version.hpp

HPX V1.2.1 (Feb 19, 2019)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the future implementation.
- Fix several problems in the CMake configuration which affects external projects.
- Add support for Boost 1.69.0.

Closed issues

- Issue #3638 - Build HPX 1.2 with boost 1.69
- Issue #3635 - Non-deterministic crashing on Stampede2
- Issue #3550 - 1>e:000workhpxsrcthrow_exception.cpp(54): error C2440: ‘<function-style-cast>’: cannot convert from ‘boost::system::error_code’ to ‘hpx::exception’

PR #3543 - added Ubuntu dependency list to readme
PR #3531 - Warnings, warnings...
PR #3527 - Add CircleCI filter for building all tags
PR #3525 - Segmented algorithms
PR #3517 - Replace boost::regex with C++11 <regex>
PR #3514 - Cleaning up the build system
PR #3505 - Fixing type attribute warning for transfer_action
PR #3504 - Add support for rpm packaging
PR #3499 - Improving spinlock pools
PR #3498 - Remove thread specific ptr
PR #3486 - Fix comparison for expect_connecting_localities config entry
PR #3469 - Enable (existing) code for extracting stack pointer on Power platform
• Issue #3549<sup>2912</sup> - HPX 1.2.0 does not build on i686, but release candidate did
• Issue #3511<sup>2913</sup> - Build on s390x fails
• Issue #3509<sup>2914</sup> - Build on armv7l fails

• PR #3648<sup>2918</sup> - Adding timestamp option for S390x platform
• PR #3647<sup>2919</sup> - Blind attempt to fix warnings issued by gcc V9
• PR #3611<sup>2920</sup> - Include GNUInstallDirs earlier to have it available for subdirectories
• PR #3595<sup>2921</sup> - Use GNUInstallDirs lib path in pkgconfig config file
• PR #3593<sup>2922</sup> - Add include(GNUInstallDirs) to HPXM Macros.cmake
• PR #3591<sup>2923</sup> - Fix compilation error on arm7 architecture. Compiles and runs on Fedora 29 on Pi 3.
• PR #3558<sup>2924</sup> - Adding constructor exception(boost::system::error_code const&)
• PR #3555<sup>2925</sup> - cmake: make install locations configurable
• PR #3551<sup>2926</sup> - Fix uint64_t causing compilation fail on i686

HPX V1.2.0 (Nov 12, 2018)

General changes

Here are some of the main highlights and changes for this release:

• Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the CMake<sup>2927</sup> or pkg-config. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during CMake<sup>2928</sup> configuration. The implementation on Windows is unchanged.

2928 https://www.cmake.org
• We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for HPX threads to be pinned to a particular worker thread.

• We have significantly improved the performance of our futures implementation by making the shared state atomic.

• We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.

• We have added a new option to the --hpx:threads command line option. It is now possible to use cores to tell HPX to only use one worker thread per core, unlike the existing option all which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of --hpx:threads has also been changed to cores as this leads to better performance in most cases.

• All command line options can now be passed alongside configuration options when initializing HPX. This means that some options that were previously only available on the command line can now be set as configuration options.

• HPXMP is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. HPXMP can be enabled within HPX by setting DHPX_WITH_HPXMP=ON during CMake configuration.

• Two new performance counters were added for measuring the time spent doing background work. /threads/time/background-work-duration returns the time spent doing background on a given thread or locality, while /threads/time/background-overhead returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON during CMake configuration.

• The idling behaviour of HPX has been tweaked to allow for faster idling. This is useful in interactive applications where the HPX worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF during CMake configuration.

• It is now possible to register callback functions for HPX worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

### Breaking changes

• The implementation of hpx_main.hpp has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on using Makefiles for more details.

• The default value of --hpx:threads has changed from all to cores. The new option cores only starts one worker thread per core.

• We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.

• Our boost::format-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on hpx::util::format or hpx::util::format_to. The pull request for this change contains more information: PR #3266.

• The following deprecated options have now been completely removed: HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY, HPX_WITH_LOCAL_DATAFLOW, HPX_WITH_GENERIC_EXECUTION_POLICY, HPX_WITH_BOOST_CHRONO_COMPATIBILITY, HPX_WITH_EXECUTOR_COMPATIBILITY, HPX_WITH_EXECUTION_POLICY_COMPATIBILITY, and HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY.

- PR #3463 - cmake : create the parent directory before symlinking
- PR #3459 - Remove unused/incomplete functionality from util/logging
- PR #3458 - Fix a problem with scope of CMAKE_CXX_FLAGS and hpx_add_compile_flag
- PR #3457 - Fixing more size_t -> int16_t (and similar) warnings
- PR #3456 - Add #ifdefs to topology.cpp to support old hwloc versions again
- PR #3454 - Fixing warnings related to silent conversion of size_t -> int16_t
- PR #3451 - Add examples as unit tests
- PR #3450 - Constexpr-fying bind and other functional facilities
- PR #3446 - Fix some thread suspension timeouts
- PR #3445 - Fix various warnings
- PR #3443 - Only enable service pool config options if pools are enabled
- PR #3441 - Fix missing closing brackets in documentation

- PR #3439 - Use correct MPI CXX libraries for MPI parcelport
- PR #3436 - Add projection function to find_* (and fix very bad bug)
- PR #3435 - Fixing 1205
- PR #3434 - Fix threads cores
- PR #3433 - Add Heise Online to release announcement list
- PR #3432 - Don’t track task dependencies for distributed runs
- PR #3431 - Circle CI setting changes for hpxMP
- PR #3430 - Fix unused params warning
- PR #3429 - One thread per core
- PR #3428 - This suppresses a deprecation warning that is being issued by MSVC 19.15.26726
- PR #3427 - Fixes #3426
- PR #3426 - Use source cache and workspace between job steps on CircleCI
- PR #3421 - Add CDash timing output to future overhead test (for graphs)
- PR #3420 - Add guided_poolExecutor
- PR #3419 - Fix typo in CircleCI config
- PR #3418 - Add sphinx documentation
- PR #3417 - Scheduler NUMA hint and shared priority scheduler
- PR #3414 - Adding step to synchronize the APEX release
- PR #3413 - Fixing multiple defines of APEX_HAVE_HPX
- PR #3412 - Fixes linking with libhpx_wrap error with BSD and Windows based systems
- PR #3410 - Fix typo in CMakeLists.txt
- PR #3409 - Fix brackets and indentation in existing_performance_counters.qbk
- PR #3407 - Fix unused param and extra ; warnings emitted by gcc 8.x

• PR #3406 - Adding thread local allocator and use it for future shared states
• PR #3405 - Adding DHPX_HAVE_THREAD_LOCAL_STORAGE=ON to builds
• PR #3404 - fixing multiple definition of main() in linux
• PR #3402 - Allow debug option to be enabled only for Linux systems with dynamic main on
• PR #3401 - Fix cuda_future_helper.h when compiling with C++11
• PR #3400 - Fix floating point exception scheduler_base idle backoff
• PR #3398 - Atomic future state
• PR #3397 - Fixing code for older gcc versions
• PR #3396 - Allowing to register thread event functions (start/stop/error)
• PR #3394 - Fix small mistake in primary_namespace_server.cpp
• PR #3393 - Explicitly instantiate configured schedulers
• PR #3392 - Add performance counters background overhead and background work duration
• PR #3391 - Adapt integration of HPXMP to latest build system changes
• PR #3390 - Make AGAS measurements optional
• PR #3389 - Fix deadlock during shutdown
• PR #3388 - Add several functionalities allowing to optimize synchronous action invocation
• PR #3387 - Add cmake option to opt out of fail-compile tests
• PR #3386 - Adding support for boost::container::small_vector to dataflow
• PR #3385 - Adds Debug option for hpx initializing from main
• PR #3384 - This hopefully fixes two tests that occasionally fail
• PR #3383 - Making sure thread local storage is enable for hpXMP
• PR #3382 - Fix usage of HPX_CAPTURE together with default value capture [=]
• PR #3381 - Replace undefined instantiations of uniform_int_distribution

• PR #3380 - Add missing semicolons to uses of HPX_COMPILER_FENCE
• PR #3379 - Fixing #3378
• PR #3377 - Adding build system support to integrate hpxmp into hpx at the user’s machine
• PR #3375 - Replacing wrapper for __libc_start_main with main
• PR #3374 - Adds hpx_wrap to HPX_LINK_LIBRARIES which links only when specified.
• PR #3373 - Forcing cache settings in HPXConfig.cmake to guarantee updated values
• PR #3372 - Fix some more c++11 build problems
• PR #3371 - Adds HPX_LINKER_FLAGS to HPX applications without editing their source codes
• PR #3370 - util::format: add typeSpecifier<> specializations for %!s(MISSING) and %!l(MISSING)s
• PR #3369 - Adding configuration option to allow explicit disable of the new hpx_main feature on Linux
• PR #3368 - Updates doc with recent hpx_wrap implementation
• PR #3367 - Adds Mac OS implementation to hpx_main.hpp
• PR #3365 - Fix order of hpx libs in HPX_CONF_LIBRARIES.
• PR #3363 - Apex fixing null wrapper
• PR #3361 - Making sure all parcels get destroyed on an HPX thread (TCP pp)
• PR #3359 - Feature/improveerrorforcompiler
• PR #3357 - Static/dynamic executable implementation
• PR #3355 - Reverting changes introduced by #3283 as those make applications hang
• PR #3354 - Add external dependencies to HPX_LIBRARY_DIR
• PR #3353 - Fix libfabric tcp
• PR #3351 - Move obsolete header to tests directory.
• PR #3350 - Renaming two functions to avoid problem described in #3285
• PR #3349 - Make idle backoff exponential with maximum sleep time
• PR #3347\(^{3115}\) - Replace `simple_component` with `component` in the Documentation
• PR #3346\(^{3116}\) - Fix CMakeLists.txt example in quick start
• PR #3345\(^{3117}\) - Fix automatic setting of `HPX_MORE_THAN_64_THREADS`
• PR #3344\(^{3118}\) - Reduce amount of information printed for unknown command line options
• PR #3343\(^{3119}\) - Safeguard HPX against destruction in global contexts
• PR #3341\(^{3120}\) - Allowing for all command line options to be used as configuration settings
• PR #3340\(^{3121}\) - Always convert inspect results to JUnit XML
• PR #3336\(^{3122}\) - Only run docker push on master on CircleCI
• PR #3335\(^{3123}\) - Update description of `hpx.os_threads` config parameter.
• PR #3334\(^{3124}\) - Making sure early logging settings don't get mixed with others
• PR #3333\(^{3125}\) - Update CMake links and versions in documentation
• PR #3332\(^{3126}\) - Add notes on target suffixes to CMake documentation
• PR #3331\(^{3127}\) - Add quickstart section to documentation
• PR #3330\(^{3128}\) - Rename resource_partitioner test to avoid conflicts with pseudodependencies
• PR #3328\(^{3129}\) - Making sure object is pinned while executing actions, even if action returns a future
• PR #3327\(^{3130}\) - Add missing std::forward to tuple.hpp
• PR #3326\(^{3131}\) - Make sure logging is up and running while modules are being discovered.
• PR #3324\(^{3132}\) - Replace C++14 overload of std::equal with C++11 code.
• PR #3323\(^{3133}\) - Fix a missing apex thread data (wrapper) initialization
• PR #3320\(^{3134}\) - Adding support for -std=c++2a (define `HPX_WITH_CXX2A=On`)
• PR #3319\(^{3135}\) - Replacing C++14 feature with equivalent C++11 code
• PR #3317\(^{3136}\) - Fix compilation with VS 15.7.1 and /std:c++latest
• PR #3316\(^{3137}\) - Fix includes for 1d_stencil_*_omp examples

2.10. Releases

1613
HPX Documentation,  master

- PR #3314 - Remove some unused parameter warnings
- PR #3313 - Fix pu-step and pu-offset command line options
- PR #3312 - Add conversion of inspect reports to JUnit XML
- PR #3311 - Fix escaping of closing braces in format specification syntax
- PR #3310 - Don’t overwrite user settings with defaults in registration database
- PR #3309 - Fixing potential stack overflow for dataflow
- PR #3308 - This updates the .clang-format configuration file to utilize newer features
- PR #3306 - Marking migratable objects in their gid to allow not handling migration in AGAS
- PR #3305 - Add proper exception handling to run_as_hppx_thread
- PR #3303 - Changed std::rand to a better inbuilt PRNG Generator
- PR #3302 - All non-migratable (simple) components now encode their lva and component type in their gid
- PR #3301 - Add nullptr_t overloads to resource partitioner
- PR #3298 - Apex task wrapper memory bug
- PR #3299 - Fix mistakes after merge of CircleCI config
- PR #3294 - Fix partitioned vector include in partitioned_vector_find tests
- PR #3293 - Adding emplace support to promise and make_ready_future
- PR #3292 - Add new cuda kernel synchronization with hpx::future demo
- PR #3291 - Fixes #3290
- PR #3289 - Fixing Docker image creation
- PR #3288 - Avoid allocating shared state for wait_all
- PR #3287 - Fixing /scheduler/utilization/instantaneous performance counter
- PR #3286 - dataflow() and future::then() use sync policy where possible
- PR #3284 - Background thread can use relaxed atomics to manipulate thread state

- PR #3283\textsuperscript{3161} - Do not unwrap ready future
- PR #3282\textsuperscript{3162} - Fix virtual method override warnings in static schedulers
- PR #3281\textsuperscript{3163} - Disable set_area_membind_nodeset for OSX
- PR #3279\textsuperscript{3164} - Add two variations to the future\_overhead benchmark
- PR #3278\textsuperscript{3165} - Fix circleci workspace
- PR #3277\textsuperscript{3166} - Support external plugins
- PR #3276\textsuperscript{3167} - Fix missing parenthesis in hello\_compute.cu.
- PR #3274\textsuperscript{3168} - Reinit counters synchronously in reinit\_counters test
- PR #3273\textsuperscript{3169} - Splitting tests to avoid compiler OOM
- PR #3271\textsuperscript{3170} - Remove leftover code from context\_generic\_context.hpp
- PR #3269\textsuperscript{3171} - Fix bulk\_construct with count = 0
- PR #3268\textsuperscript{3172} - Replace constexpr with HPX\_CXX14\_CONSTEXPR and HPX\_CONSTEXPR
- PR #3266\textsuperscript{3173} - Replace boost::format with custom sprintf-based implementation
- PR #3265\textsuperscript{3174} - Split parallel tests on CircleCI
- PR #3262\textsuperscript{3175} - Making sure documentation correctly links to source files
- PR #3261\textsuperscript{3176} - Apex refactoring fix rebind
- PR #3260\textsuperscript{3177} - Isolate performance counter parser into a separate TU
- PR #3256\textsuperscript{3178} - Post 1.1.0 version bumps
- PR #3254\textsuperscript{3179} - Adding trait for actions allowing to make runtime decision on whether to execute it directly
- PR #3253\textsuperscript{3180} - Bump minimal supported Boost to 1.58.0
- PR #3251\textsuperscript{3181} - Adds new feature: changing interval used in interval\_timer (issue 3244)
- PR #3239\textsuperscript{3182} - Changing std::rand() to a better inbuilt PRNG generator.
- PR #3234\textsuperscript{3183} - Disable background thread when networking is off

HPX V1.1.0 (Mar 24, 2018)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

• We have changed the way HPX manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can be now be suspended/resumed independently. This functionality helps in running HPX concurrently to code that is directly relying on OpenMP\(^{3189}\) and/or MPI\(^{3190}\).

• We have continued to implement various parallel algorithms. HPX now almost completely implements all of the parallel algorithms as specified by the C++17 Standard\(^{3191}\). We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).

• Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The CMake\(^{3192}\) configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.

• The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake\(^{3193}\).

• The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to CMake.

• Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.

• Removed the (broken) component type `hpx::lcos::queue<T>`. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to CMake.

3193 https://www.cmake.org
• The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option -DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On on the CMake command line.

• We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.

• User defined components don’t have to be default-constructible anymore. Return types from actions don’t have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.

• We have added a new launch policy hpx::launch::lazy that allows one to defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

### Breaking changes

• We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of CMake is now V3.3.2.

• We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.

• We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.

• We have dropped support for the hpx::util::unwrapped API. hpx::util::unwrapped will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of hpx::util::unwrapped should be changed to the new hpx::util::unwrapping function whereas the immediate usage should be replaced to hpx::util::unwrap.

• The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.

• The overloads of hpx::async that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the first place. In this case hpx::async now returns a hpx::future<hpx::future<T>> making its behavior conforming to its local counterpart.

• We have replaced the use of boost::exception_ptr in our APIs with the equivalent std::exception_ptr. Please change your codes accordingly. No compatibility settings are provided.

• We have removed the compatibility settings for HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY and HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY as their life-cycle has reached its end.

• We have removed the experimental thread schedulers hierarchy_scheduler, periodic_priority_scheduler and throttling_scheduler in an effort to clean up and consolidate our thread schedulers.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- **PR #3250** - Apex refactoring with guids
- **PR #3249** - Updating People.qbk
- **PR #3246** - Assorted fixes for CUDA
- **PR #3245** - Apex refactoring with guids
- **PR #3242** - Modify task counting in thread_queue.hpp
- **PR #3240** - Fixed typos
- **PR #3238** - Readding accidentally removed std::abort
- **PR #3237** - Adding Pipeline example
- **PR #3236** - Fixing memory_block
- **PR #3233** - Make schedule_thread take suspended threads into account
- **Issue #3226** - memory_block is breaking, signaling SIGSEGV on a thread on creation and freeing
- **PR #3225** - Applying quick fix for hwloc-2.0
- **Issue #3224** - HPX counters crashing the application
- **PR #3223** - Fix returns when setting config entries
- **Issue #3222** - Errors linking libhpx.so
- **Issue #3221** - HPX on Mac OS X with HWLoc 2.0.0 fails to run
- **PR #3216** - Reorder a variadic array to satisfy VS 2017 15.6
- **PR #3214** - Changed prerequisites.qbk to avoid confusion while building boost
- **PR #3213** - Relax locks for thread suspension to avoid holding locks when yielding
- **PR #3212** - Fix check in sequenced_executor test
- **PR #3211** - Use preinit_array to set argc/argv in init_globally example

• PR #3210 - Adapted parallel::{search | search_n} for Ranges TS (see #1668)
• PR #3209 - Fix locking problems during shutdown
• Issue #3208 - init_globally throwing a run-time error
• PR #3206 - Addition of new arithmetic performance counter “Count”
• PR #3205 - Fixing return type calculation for bulk_then_execute
• PR #3204 - Changing std::rand() to a better inbuilt PRNG generator
• PR #3203 - Resolving problems during shutdown for VS2015
• PR #3202 - Making sure resource partitioner is not accessed if its not valid
• PR #3201 - Fixing optional::swap
• Issue #3200 - hpx::util::optional fails
• PR #3199 - Fix sliding_semaphore test
• PR #3198 - Set pre_main status before launching run_helper
• PR #3197 - Update README.rst
• PR #3194 - parallel::{fill|fill_n} updated for Ranges TS
• PR #3193 - Updating Runtime.cpp by adding correct description of Performance counters during register
• PR #3191 - Fix sliding_semaphore_2338 test
• PR #3190 - Topology improvements
• PR #3189 - Deleting one include of median from BOOST library to arithmetics_counter file
• PR #3188 - Optionally disable printing of diagnostics during terminate
• PR #3187 - Suppressing cmake warning issued by cmake > V3.11
• PR #3185 - Remove unused scoped_unlock, unlock_guard_try
• PR #3184 - Fix nqueen example
• PR #3183 - Add runtime start/stop, resume/suspend and OpenMP benchmarks

3239 https://github.com/STEllAR-GROUP/hpx/pull/3184
• Issue #3182 - bulk_then_execute has unexpected return type/does not compile
• Issue #3181 - hwloc 2.0 breaks topo class and cannot be used
• Issue #3180 - Schedulers that don’t support suspend/resume are unusable
• PR #3179 - Various minor changes to support FLeCSI
• PR #3178 - Fix #3124
• PR #3177 - Removed allgather
• PR #3176 - Fixed Documentation for “using_hpx_pkgconfig”
• PR #3174 - Add hpx::iostreams::ostream overload to format_to
• PR #3172 - Fix lifo queue backend
• PR #3171 - adding the missing unset() function to cpu_mask() for case of more than 64 threads
• PR #3170 - Add cmake flag -DHPX_WITH_FAULT_TOLERANCE=ON (OFF by default)
• PR #3169 - Adapted parallel::[count|count_if] for Ranges TS (see #1668)
• PR #3168 - Changing used namespace for seq execution policy
• Issue #3167 - Update GSoc projects
• Issue #3166 - Application (Octotiger) gets stuck on hpx::finalize when only using one thread
• Issue #3165 - Compilation of parallel algorithms with HPX_WITH_DATAPAR is broken
• PR #3164 - Fixing component migration
• PR #3162 - regex_from_pattern: escape regex special characters to avoid misinterpretation
• Issue #3161 - Building HPX with hwloc 2.0 fails
• PR #3160 - Fixing the handling of quoted command line arguments.
• PR #3158 - Fixing a race with timed suspension (second attempt)
• PR #3157 - Revert “Fixing a race with timed suspension”
• PR #3156 - Fixing serialization of classes with incompatible serialize signature

• PR #3106 - Add cmake test for std::decay_t to fix cuda build
• PR #3105 - Fixing refcount for async traversal frame
• PR #3104 - Local execution of direct actions is now actually performed directly
• PR #3103 - Adding support for generic counter_raw_values performance counter type
• Issue #3102 - Introduce generic performance counter type returning an array of values
• PR #3101 - Revert “Adapting stack overhead limit for gcc 4.9”
• PR #3100 - Fix #3068 (condition_variable deadlock)
• PR #3099 - Fixing lock held during suspension in papi counter component
• PR #3098 - Unbreak broadcast_wait_for_2822 test
• PR #3097 - Adapting stack overhead limit for gcc 4.9
• PR #3096 - fix detection of cxx11_std_atomic
• PR #3095 - Add ciso646 header to get _LIBCPP_VERSION for testing inplace merge
• PR #3094 - Relax atomic operations on performance counter values
• PR #3093 - Short-circuit all_of/any_of/have_of instantiations
• PR #3092 - Take advantage of C++14 lambda capture initialization syntax, where possible
• PR #3091 - Remove more references to Boost from logging code
• PR #3090 - Unify use of yield/yield_k
• PR #3089 -Fix a strange thing in parallel::detail::handle_exception. (Fix #2834.)
• Issue #3088 - A strange thing in parallel::sort.
• PR #3087 - Fixing assertion in default_distribution_policy
• PR #3086 - Implement parallel::remove and parallel::remove_if
• PR #3085 - Addressing breaking changes in Boost V1.66
• PR #3084 - Ignore build warnings round 2

• PR #3083 - Fix typo HPX_WITH_MM_PREFECTH
• PR #3081 - Pre-decay template arguments early
• PR #3080 - Suspend thread pool
• PR #3079 - Ignore build warnings
• PR #3078 - Don’t test inplace_merge with libc++
• PR #3076 - Fixing 3075: Part 1
• PR #3074 - Fix more build warnings
• PR #3073 - Suspend thread cleanup
• PR #3072 - Change existing symbol_namespace::iterate to return all data instead of invoking a callback
• PR #3071 - Fixing pack_traversal_async test
• PR #3070 - Fix dynamic_counters_loaded_1508 test by adding dependency to memory_component
• PR #3069 - Fix scheduling loop exit
• Issue #3068 - hpx::lcos::condition_variable could be suspect to deadlocks
• PR #3067 - #ifdef out random_shuffle deprecated in later c++
• PR #3066 - Make coalescing test depend on coalescing library to ensure it gets built
• PR #3065 - Workaround for minimal_timed_async_executor_test compilation failures, attempts to copy a deferred call (in unevaluated context)
• PR #3064 - Fixing wrong condition in wrapper_heap
• PR #3062 - Fix exception handling for execution::seq
• PR #3061 - Adapt MSVC C++ mode handling to VS15.5
• PR #3060 - Fix compiler problem in MSVC release mode
• PR #3059 - Fixing #2931
• Issue #3058 - minimal_timed_async_executor_test_exe fails to compile on master (d6f505c)
• PR #3057 - Fix stable_merge_2964 compilation problems

Issue #3057 - Fix stable_merge_2964 compilation problems
• PR #3056 - Fix some build warnings caused by unused variables/unnecessary tests
• PR #3055 - Update documentation for running tests
• Issue #3054 - Assertion failure when using bulk hpx::new in asynchronous mode
• PR #3052 - Do not bind test running to cmake test build rule
• PR #3051 - Fix HPX-Qt interaction in Qt example.
• Issue #3048 - nqueen example fails occasionally
• PR #3047 - Fixing #3044
• PR #3046 - Add OS thread suspension
• PR #3042 - PyCicle - first attempt at a build tool for checking PR’s
• PR #3041 - Fix a problem about asynchronous execution of parallel::merge and parallel::partition.
• PR #3040 - Fix a mistake about exception handling in asynchronous execution of scan_partitioner.
• PR #3039 - Consistently use executors to schedule work
• PR #3038 - Fixing local direct function execution and lambda actions perfect forwarding
• PR #3035 - Make parallel unit test names match build target/folder names
• PR #3033 - Fix setting of default build type
• Issue #3032 - Fix partitioner arg copy found in #2982
• Issue #3031 - Errors linking libhpx.so due to missing references (master branch, commit 6679a8882)
• PR #3030 - Revert “implement executor then interface with && forwarding reference”
• PR #3029 - Run CI inspect checks before building
• PR #3028 - Added range version of parallel::move
• Issue #3027 - Implement all scheduling APIs in terms of executors
• PR #3026 - implement executor then interface with && forwarding reference
• PR #3025 - Fix typo uninitialized to uninitialized

2.10. Releases
• PR #3024 - Inspect fixes
• PR #3023 - P0356 Simplified partial function application
• PR #3023 - Master fixes
• PR #3021 - Segfault fix
• PR #3020 - Disable command-line aliasing for applications that use user_main
• PR #3019 - Adding enable_elasticity option to pool configuration
• PR #3018 - Fix stack overflow detection configuration in header files
• PR #3017 - Speed up local action execution
• PR #3016 - Unify stack-overflow detection options, remove reference to libsigsegv
• PR #3015 - Speeding up accessing the resource partitioner and the topology info
• Issue #3014 - HPX does not compile on POWER8 with gcc 5.4
• Issue #3013 - hello_world occasionally prints multiple lines from a single OS-thread
• PR #3012 - Silence warning about casting away qualifiers in itt_notify.hpp
• PR #3011 - Fix cputset leak in hwloc_topology_info.cpp
• PR #3010 - Remove useless decay_copy
• PR #3009 - Fixing 2996
• PR #3008 - Remove unused internal function
• PR #3007 - Fixing wrapper_heap alignment problems
• Issue #3006 - hwloc memory leak
• PR #3004 - Silence C4251 (needs to have dll-interface) for future_data_void
• Issue #3003 - Suspension of runtime
• PR #3001 - Attempting to avoid data races in async_traversal while evaluating dataflow()
• PR #3000 - Adding hpx::util::optional as a first step to replace experimental::optional
• PR #2998[^3401] - Cleanup up and Fixing component creation and deletion
• Issue #2996[^3402] - Build fails with HPX_WITH_HWLOC=OFF
• PR #2995[^3403] - Push more future_data functionality to source file
• PR #2994[^3404] - WIP: Fix throttle test
• PR #2993[^3405] - Making sure –hpx:help does not throw for required (but missing) arguments
• PR #2992[^3406] - Adding non-blocking (on destruction) service executors
• Issue #2991[^3407] - run_as_os_thread locks up
• Issue #2990[^3408] - --help will not work until all required options are provided
• PR #2989[^3409] - Improve error messages caused by misuse of dataflow
• PR #2988[^3410] - Improve error messages caused by misuse of .then
• Issue #2987[^3411] - stack overflow detection producing false positives
• PR #2986[^3412] - Deduplicate non-dependent thread_info logging types
• PR #2985[^3413] - Adapted parallel::all_of|any_of|none_of for Ranges TS (see #1668)
• PR #2984[^3414] - Refactor one_size_heap code to simplify code
• PR #2983[^3415] - Fixing local_new_component
• PR #2982[^3416] - Clang tidy
• PR #2981[^3417] - Simplify allocator rebinding in pack traversal
• PR #2979[^3418] - Fixing integer overflows
• PR #2978[^3419] - Implement parallel::inplace_merge
• Issue #2977[^3420] - Make hwloc compulsory instead of optional
• PR #2976[^3421] - Making sure client_base instance that registered the component does not unregister it when being destructed
• PR #2975[^3422] - Change version of pulled APEX to master
• PR #2974[^3423] - Fix domain not being freed at the end of scheduling loop

[^3423]: https://github.com/STEllAR-GROUP/hpx/pull/2974
• PR #2973 - Fix small typos
• PR #2972 - Adding uintstd.h header
• PR #2971 - Fall back to creating local components using local_new
• PR #2970 - Improve is_tuple_like trait
• PR #2969 - Fix HPX_WITH_MORE_THAN_64_THREADS default value
• PR #2968 - Cleaning up dataflow overload set
• PR #2967 - Make parallel::merge is stable. (Fix #2964.)
• PR #2966 - Fixing a couple of held locks during exception handling
• PR #2965 - Adding missing #include
• Issue #2964 - parallel merge is not stable
• PR #2962 - Making sure any function object passed to dataflow is released after being invoked
• PR #2961 - Partially reverting #2891
• PR #2959 - Attempt to fix the gcc 4.9 problem with the async pack traversal
• Issue #2959 - Program terminates during error handling
• Issue #2958 - HPX_PLAIN_ACTION breaks due to missing include
• PR #2957 - Fixing errors generated by mixing different attribute syntaxes
• Issue #2956 - Mixing attribute syntaxes leads to compiler errors
• Issue #2955 - Fix OS-Thread throttling
• PR #2953 - Making sure any hpx.os_threads=N supplied through a --hpx::config file is taken into account
• PR #2952 - Removing wrong call to cleanup_terminated_locked
• PR #2951 - Revert “Make sure the function vtables are initialized before use”
• PR #2950 - Fix a namespace compilation error when some schedulers are disabled
• Issue #2949 - master branch giving lockups on shutdown
• Issue #2947 -HPX Documentation, master
  - hpx.ini is not used correctly at initialization
• PR #2946 - Adding explicit feature test for thread_local
• PR #2945 - Make sure the function vtables are initialized before use
• PR #2944 - Attempting to solve affinity problems on CircleCI
• PR #2943 - Changing channel actions to be direct
• PR #2942 - Adding std::vector
• PR #2941 - Add a feature test to test for CXX11 override
• Issue #2940 - Add split_future for future<vector<T>>
• PR #2939 - Making error reporting during problems with setting affinity masks more verbose
• PR #2938 - Fix this various executors
• PR #2937 - Fix some typos in documentation
• PR #2934 - Remove the need for “complete” SFINAE checks
• PR #2933 - Making sure parallel::for_loop is executed in parallel if requested
• PR #2932 - Classify chunk_size_iterator to input iterator tag. (Fix #2866)
• Issue #2931 - --hpx:help triggers unusual error with clang build
• PR #2930 - Add #include files needed to set _POSIX_VERSION for debug check
• PR #2929 - Fix a couple of deprecated c++ features
• PR #2928 - Fixing execution parameters
• Issue #2927 - CMake warning: ... cycle in constraint graph
• PR #2926 - Default pool rename
• Issue #2925 - Default pool cannot be renamed
• Issue #2924 - hpx:attach-debugger=startup does not work any more
• PR #2923 - Alloc membind

2.10. Releases

1629
• PR #2923470 - This fixes CircleCI errors when running with –hpx:bind=none
• PR #29213471 - Custom pool executor was missing priority and stacksize options
• PR #29203472 - Adding test to trigger problem reported in #2916
• PR #29193473 - Make sure the resource_partitioner is properly destructed on hpx::finalize
• Issue #29183474 - hpx::init calls wrong (first) callback when called multiple times
• PR #29173475 - Adding util::checkpoint
• Issue #29163476 - Weird runtime failures when using a channel and chained continuations
• PR #29153477 - Introduce executor parameters customization points
• Issue #29143478 - Task assignment to current Pool has unintended consequences
• PR #29133479 - Fix rp hang
• PR #29123480 - Update contributors
• PR #29113481 - Fixing CUDA problems
• PR #29103482 - Improve error reporting for process component on POSIX systems
• PR #2903483 - Fix typo in include path
• PR #29083484 - Use proper container according to iterator tag in benchmarks of parallel algorithms
• PR #29073485 - Optionally force-delete remaining channel items on close
• PR #29063486 - Making sure generated performance counter names are correct
• Issue #29053487 - collecting idle-rate performance counters on multiple localities produces an error
• Issue #29043488 - build broken for Intel 17 compilers
• PR #29033489 - Documentation Updates– Adding New People
• PR #29023490 - Fixing service_executor
• PR #29013491 - Fixing partitioned_vector creation
• PR #29003492 - Add numa-balanced mode to hpx::bind, spread cores over numa domains
- Issue #2899 - hpx::bind does not have a mode that balances cores over numa domains
- PR #2898 - Adding missing #include and missing guard for optional code section
- PR #2897 - Removing dependency on Boost.ICL
- Issue #2896 - Debug build fails without -fpermissive with GCC 7.1 and Boost 1.65
- PR #2895 - Fixing SLURM environment parsing
- PR #2894 - Fix incorrect handling of compile definition with value 0
- Issue #2893 - Disabling schedulers causes build errors
- PR #2892 - added list serializer
- PR #2891 - Resource Partitioner Fixes
- Issue #2890 - Destroying a non-empty channel causes an assertion failure
- PR #2889 - Add check for libatomic
- PR #2888 - Fix compilation problems if HPX_WITH_ITT_NOTIFY=ON
- PR #2887 - Adapt broadcast() to non-unwrapping async<Action>
- PR #2886 - Replace Boost.Random with C++11 <random>
- Issue #2885 - regression in broadcast?
- Issue #2884 - linking -latomic is not portable
- PR #2883 - Explicitly set -pthread flag if available
- PR #2882 - Wrap boost::format uses
- Issue #2881 - hpx not compiling with HPX_WITH_ITTNOTIFY=On
- Issue #2880 - hpx::bind scatter/balanced give wrong pu masks
- PR #2879 - Fix incorrect pool usage masks setup in RP/thread manager
- PR #2877 - Require std::array by default
- PR #2875 - Deprecate use of BOOST_ASSERT

https://github.com/STEllAR-GROUP/hpx/pull/2877
https://github.com/STEllAR-GROUP/hpx/pull/2875
• PR #2874 - Changed serialization of boost.variant to use variadic templates
• Issue #2873 - building with parcelport_mpi fails on cori
• PR #2871 - Adding missing support for throttling scheduler
• PR #2870 - Disambiguate use of base_lco_with_value macros with channel
• Issue #2869 - Difficulty compiling HPX_REGISTER_CHANNEL_DECLARATION(double)
• PR #2868 - Removing unneeded assert
• PR #2867 - Implement parallel::unique
• Issue #2866 - The chunk_size_iterator violates multipass guarantee
• PR #2865 - Only use sched_getcpu on linux machines
• PR #2864 - Create redistribution archive for successful builds
• PR #2863 - Replace casts/assignments with hard-coded memcpy operations
• Issue #2862 - sched_getcpu not available on MacOS
• PR #2861 - Fixing unmatched header defines and recursive inclusion of threadmanager
• Issue #2860 - Master program fails with assertion 'type == data_type_address' failed: HPX(assertion_failure)
• Issue #2852 - Support for ARM64
• PR #2858 - Fix misplaced #if #endif’s that cause build failure without THREAD_CUMULATIVE_COUNTS
• PR #2857 - Fix some listing in documentation
• PR #2856 - Fixing component handling for lcos
• PR #2855 - Add documentation for coarrays
• PR #2854 - Support ARM64 in timestamps
• PR #2853 - Update Table 17. Non-modifying Parallel Algorithms in Documentation
• PR #2851 - Allowing for non-default-constructible component types
• PR #2850 - Enable returning future<R> from actions where R is not default-constructible

https://github.com/STEllAR-GROUP/hpx/pull/2851
https://github.com/STEllAR-GROUP/hpx/pull/2850
• PR #2849  - Unify serialization of non-default-constructable types
• Issue #2848  - Components have to be default constructible
• Issue #2847  - Returning a future<R> where R is not default-constructable broken
• Issue #2846  - Unify serialization of non-default-constructible types
• PR #2845  - Add Visual Studio 2015 to the tested toolchains in Appveyor
• Issue #2844  - Change the appveyor build to use the minimal required MSVC version
• Issue #2843  - multi node hello_world hangs
• PR #2842  - Correcting Spelling mistake in docs
• PR #2841  - Fix usage of std::aligned_storage
• PR #2840  - Remove constexpr from a void function
• Issue #2839  - memcpy buffer overflow: load_construct_data() and std::complex members
• Issue #2835  - constexpr functions with void return type break compilation with CUDA 8.0
• Issue #2834  - One suspicion in parallel::detail::handle_exception
• PR #2833  - Implement parallel::merge
• PR #2832  - Fix a strange thing in parallel::util::detail::handle_local_exceptions. (Fix #2818)
• PR #2830  - Break the debugger when a test failed
• Issue #2831  - parallel/executors/execution_fwd.hpp causes compilation failure in C++11 mode.
• PR #2829  - Implement an API for asynchronous pack traversal
• PR #2828  - Split unit test builds on CircleCI to avoid timeouts
• Issue #2827  - failure to compile hello_world example with -Werror
• PR #2824  - Making sure promises are marked as started when used as continuations
• PR #2823  - Add documentation for partitioned_vector_view
• Issue #2823  - Yet another issue with wait_for similar to #2796

https://github.com/STEllAR-GROUP/hpx/issues/2822
• PR #2821 - Fix bugs and improve that about HPX_HAVE_CXX11_AUTO_RETURN_VALUE of CMake
• PR #2820 - Support C++11 in benchmark codes of parallel::partition and parallel::partition_copy
• PR #2819 - Fix compile errors in unit test of container version of parallel::partition
• Issue #2818 - A strange thing in parallel::util::detail::handle_local_exceptions
• Issue #2815 - HPX fails to compile with HPX_WITH_CUDA=ON and the new CUDA 9.0 RC
• Issue #2814 - Using `gmakeN` after `cmake` produces error in src/CMakeFiles/hpx.dir/runtime/agas/addressing_service.cpp.o
• PR #2813 - Properly support `[noret]urn` attribute if available
• Issue #2812 - Compilation fails with gcc 7.1.1
• PR #2811 - Adding hpx::launch::lazy and support for async, dataflow, and future::then
• PR #2810 - Add option allowing to disable deprecation warning
• PR #2809 - Disable throttling scheduler if HWLOC is not found/used
• PR #2808 - Fix compile errors on some environments of parallel::partition
• Issue #2807 - Difficulty building with HPX_WITH_HWLOC=Off
• PR #2806 - Partitioned vector
• PR #2805 - Serializing collections with non-default constructible data
• PR #2804 - Fix FreeBSD 11
• Issue #2801 - Rate limiting techniques in io_service
• Issue #2800 - New Launch Policy: async_if
• PR #2799 - Fix a unit test failure on GCC in tuple_cat
• PR #2798 - bump minimum required cmake to 3.0 in test
• PR #2797 - Making sure future::wait_for et.al. work properly for action results
• Issue #2796 - `wait_for` does always in “deferred” state for calls on remote localities
• Issue #2795 - Serialization of types without default constructor
- PR #2794 - Fixing test for partitioned_vector iteration
- PR #2792 - Implemented segmented find and its variations for partitioned vector
- PR #2791 - Circumvent scary warning about placement new
- PR #2790 - Fix OSX build
- PR #2780 - Resource partitioner
- PR #2788 - Adapt parallel::is_heap and parallel::is_heap_until to Ranges TS
- PR #2787 - Unwrap hotfixes
- PR #2786 - Update CMake Minimum Version to 3.3.2 (ref #2565)
- Issue #2785 - Issues with masks and cpuset
- PR #2784 - Error with reduce and transform reduce fixed
- PR #2783 - StackOverflow integration with libsigsegv
- PR #2782 - Replace boost::atomic with std::atomic (where possible)
- PR #2781 - Check for and optionally use [[deprecated]] attribute
- PR #2780 - Adding empty (but non-trivial) destructor to circumvent warnings
- PR #2779 - Exception info tweaks
- PR #2778 - Implement parallel::partition
- PR #2777 - Improve error handling in gather_here/gather_there
- PR #2776 - Fix a bug in compiler version check
- PR #2775 - Fix compilation when HPX_WITH_LOGGING is OFF
- PR #2774 - Removing dependency on Boost.Date_Time
- PR #2773 - Add sync_images() method to spmd_block class
- PR #2772 - Adding documentation for PAPI counters
- PR #2771 - Removing boost preprocessor dependency

• PR #2770 - Adding test, fixing deadlock in config registry
• PR #2769 - Remove some other warnings and errors detected by clang 5.0
• Issue #2768 - Is there iterator tag for HPX?
• PR #2767 - Improvements to continuation annotation
• PR #2765 - gcc split stack support for HPX threads #620
• PR #2764 - Fix some uses of begin/end, remove unnecessary includes
• PR #2763 - Bump minimal Boost version to 1.55.0
• PR #2762 - hpx::partitioned_vector serializer
• PR #2761 - Adding configuration summary to cmake output and --hpx:info
• PR #2760 - Removing 1d_hydro example as it is broken
• PR #2758 - Remove various warnings detected by clang 5.0
• Issue #2757 - In case of a “raw thread” is needed per core for implementing parallel algorithm, what is good practice in HPX?
• PR #2756 - Allowing for LCOs to be simple components
• PR #2755 - Removing make_index_pack_unrolled
• PR #2754 - Implement parallel::unique_copy
• PR #2753 - Fixing detection of [fallthrough] attribute
• PR #2752 - New thread priority names
• PR #2751 - Replace boost::exception with proposed exception_info
• PR #2750 - Replace boost::iterator_range
• PR #2749 - Fixing hdf5 examples
• Issue #2748 - HPX fails to build with enabled hdf5 examples
• Issue #2747 - Inherited task priorities break certain DAG optimizations
• Issue #2746 - HPX segfaulting with valgrind

• PR #2721[^3654] - Mind map
• PR #2720[^3655] - reorder forward declarations to get rid of C++14-only auto return types
• PR #2719[^3656] - Add documentation for partitioned_vector and add features in pack.hpp
• Issue #2718[^3657] - Some forward declarations in execution_fwd.hpp aren’t C++11-compatible
• PR #2717[^3658] - Config support for falthrough attribute
• PR #2716[^3659] - Implement parallel::partition_copy
• PR #2715[^3660] - initial import of icu string serializer
• PR #2714[^3661] - initial import of valarray serializer
• PR #2713[^3662] - Remove slashes before CMAKE_FILES_DIRECTORY variables
• PR #2712[^3663] - Fixing wait for 1751
• PR #2711[^3664] - Adjust code for minimal supported GCC having being bumped to 4.9
• PR #2710[^3665] - Adding code of conduct
• PR #2709[^3666] - Fixing UB in destroy tests
• PR #2708[^3667] - Add inline to prevent multiple definition issue
• Issue #2707[^3668] - Multiple defined symbols for task_block.hpp in VS2015
• PR #2706[^3669] - Adding .clang-format file
• PR #2704[^3670] - Add a synchronous mapping API
• Issue #2703[^3671] - Request: Add the .clang-format file to the repository
• Issue #2702[^3672] - STEllAR-GROUP/Vc slower than VCv1 possibly due to wrong instructions generated
• Issue #2701[^3673] - Datapar with STEllAR-GROUP/Vc requires obscure flag
• Issue #2700[^3674] - Naming inconsistency in parallel algorithms
• Issue #2699[^3675] - Iterator requirements are different from standard in parallel copy_if.
• PR #2698[^3676] - Properly releasing parcelport write handlers

https://github.com/STEllAR-GROUP/hpx/pull/2614
- We need to link with boost.thread and boost.chrono if we use boost.context
- Making sure for_loop_n(par, ...) is actually executed in parallel
- Add documentation to invoke_fused and friends NFC
- Added reduction templates using an identity value
- Fixing some unused vars in inspect
- Fixed build for mingw
- Supporting generic context for boost >= 1.61
- Parcelport libfabric3
- Adding allocator support to promise and friends
- Barrier hang
- Changes to scheduler to steal from one high-priority queue
- High priority tasks are not executed first
- Compnat fixes
- Compatibility layer for threading support
- V1.1
- Release V1.0
- First attempt to introduce spmd_block in hpx
- local_segment in segmented_iterator_traits
- Add allocator support to promise, packaged_task and friends
- Add missing dependencies of cuda based tests
- Remove warnings due to some captured variables
- MSVC 2015 Compiler crash when building HPX
- Remove throttle_scheduler as it has been abandoned
• Issue #2566 - Add an inline versioning namespace before 1.0 release
• Issue #2565 - Raise minimal cmake version requirement
• PR #2556 - Fixing scan partitioner
• PR #2546 - Broadcast async
• Issue #2543 - make install fails due to a non-existing .so file
• PR #2495 - wait_or_add_new returning thread_id_type
• Issue #2480 - Unable to register new performance counter
• Issue #2471 - no type named `fcontext_t` in namespace
• Issue #2456 - Re-implement hpx::util::unwrapped
• Issue #2455 - Add more arithmetic performance counters
• PR #2454 - Fix a couple of warnings and compiler errors
• PR #2453 - Timed executor support
• PR #2447 - Implementing new executor API (P0443)
• Issue #2439 - Implement executor proposal
• Issue #2408 - Stackoverflow detection for linux, e.g. based on libsigsegv
• PR #2377 - Add a customization point for put_parcel so we can override actions
• Issue #2368 - HPX_ASSERT problem
• Issue #2324 - Change default number of threads used to the maximum of the system
• Issue #2266 - hpx_0.9.99 make tests fail
• PR #2195 - Support for code completion in VIM

- Issue #1932 - hpx with PBS fails on multiple localities
- PR #1914 - Parallel heap algorithm implementations WIP
- Issue #1598 - Disconnecting a locality results in segfault using heartbeat example
- Issue #1404 - unwrapped doesn’t work with movable only types
- Issue #1406 - hpx::util::unwrapped doesn’t work with non-future types
- Issue #1205 - TSS is broken
- Issue #1126 - vector<future<T>> does not work gracefully with dataflow, when_all and unwrapped
- Issue #1056 - Thread manager cleanup
- Issue #863 - Futures should not require a default constructor
- Issue #856 - Allow runtimemode_connect to be used with security enabled
- Issue #726 - Valgrind
- Issue #701 - Add RCR performance counter component
- Issue #528 - Add support for known failures and warning count/comparisons to hpx_run_tests.py

**HPX V1.0.0 (Apr 24, 2017)**

**General changes**

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts...>>`. This functionality is not available when compiling HPX with VS2012.

- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.

- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.

- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see PR #2289 for more details).

- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.
• We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or [boost_simd]. Please see Issue #2333 for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this blog-post for more information.

• The parameter sequence for the hpx::parallel::transform_reduce overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying -DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On to CMake.

• The algorithm hpx::parallel::inner_product has been renamed to hpx::parallel::transform_reduce to match the changes this algorithm has undergone while being moved to C++17. The old inner_product names can be still enabled at configure time by specifying -DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On to CMake.

• Added versions of hpx::get_ptr taking client side representations for component instances as their parameter (instead of a global id).

• Added the helper utility hpx::performance_counters::performance_counter_set helping to encapsulate a set of performance counters to be managed concurrently.

• All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace hpx::parallel::execution. The old names can be still enabled at configure time by specifying -DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On to CMake.

• The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also improved the performance of creating hpx::future and of various facilities handling those.

• We have consolidated all of the code in HPX.Compute related to the integration of CUDA. hpx::partitioned_vector has been enabled to be usable with hpx::compute::vector which allows one to place the partitions on one or more GPU devices.

• Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.

• Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

Breaking changes

• We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.

• We have removed (default) support for boost::chrono in interfaces, uses of it have been replaced with std::chrono. This facility can be still enabled at configure time by specifying -DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On to CMake.

• The parameter sequence for the hpx::parallel::transform_reduce overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.

• The algorithm hpx::parallel::inner_product has been renamed to hpx::parallel::transform_reduce to match the changes this algorithm has undergone while being moved to C++17.

3806 https://github.com/STEllAR-GROUP/hpx/issues/2333
• the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release.

- PR #2596[^2596] - Adding apex data
- PR #2595[^2595] - Remove obsolete file
- Issue #2594[^2594] - FindOpenCL_cmake mismatch with the official cmake module
- PR #2592[^2592] - First attempt to introduce spmd_block in hpx
- Issue #2591[^2591] - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
- PR #2588[^2588] - Daint fixes
- PR #2587[^2587] - Fixing transfer_(continuation)_action::schedule
- PR #2585[^2585] - Work around MSVC having an ICE when compiling with -Ob2
- PR #2583[^2583] - changing 7zip command to 7za in roll_release.sh
- PR #2582[^2582] - First attempt to introduce spmd_block in hpx
- PR #2581[^2581] - Enable annotated function for parallel algorithms
- PR #2580[^2580] - First attempt to introduce spmd_block in hpx
- PR #2579[^2579] - Make thread NICE level setting an option
- PR #2578[^2578] - Implementing enqueue instead of busy wait when no sender is available
- PR #2577[^2577] - Retrieve -std=c++11 consistent nvcc flag
- PR #2576[^2576] - Add missing dependencies of cuda based tests
- PR #2575[^2575] - Remove warnings due to some captured variables
- PR #2573[^2573] - Attempt to resolve resolve_locality
- PR #2572[^2572] - Adding APEX hooks to background thread

• PR #2542 - Make HPX_WITH_MALLOC easier to use
• PR #2541 - avoid recompiles when enabling/disabling examples
• PR #2540 - Fixing usage of target_link_libraries()
• PR #2539 - fix RPATH behaviour
• Issue #2538 - HPX_WITH_CUDA corrupts compilation flags
• PR #2537 - Add output of a Bazel Skylark extension for paths and compile options
• PR #2536 - Add counter exposing total available memory to Windows as well
• PR #2535 - Remove obsolete support for security
• Issue #2534 - Remove command line option --hpx:run-agas-server
• PR #2533 - Pre-cache locality endpoints during bootstrap
• PR #2532 - Fixing handling of GIDs during serialization preprocessing
• PR #2531 - Amend uses of the term “functor”
• PR #2530 - added counter for reading available memory
• PR #2529 - Facilities to create actions from lambdas
• PR #2528 - Updated docs: HPX_WITH_EXAMPLES
• PR #2527 - Remove warnings related to unused captured variables
• Issue #2524 - CMAKE failed because it is missing: TCMALLOC_LIBRARY TCMALLOC_INCLUDE_DIR
• PR #2523 - Fixing composeCb stack overflow
• PR #2522 - Instead of unlocking, ignore the lock while creating the message handler
• PR #2521 - Create LPROGRESS logging macro to simplify progress tracking and timings
• PR #2520 - Intel 17 support
• PR #2519 - Fix components example
• PR #2518 - Fixing parcel scheduling
• Issue #2517[^3873] - Race condition during Parcel Coalescing Handler creation
• Issue #2516[^3874] - HPX locks up when using at least 256 localities
• Issue #2515[^3875] - error: Install cannot find “/lib/hpx/libparcel_coalescing.so.0.9.99” but I can see that file
• PR #2514[^3876] - Making sure that all continuations of a shared_future are invoked in order
• PR #2513[^3877] - Fixing locks held during suspension
• PR #2512[^3878] - MPI Parcelport improvements and fixes related to the background work changes
• PR #2511[^3879] - Fixing bit-wise (zero-copy) serialization
• Issue #2509[^3880] - Linking errors in hwloc_topology
• PR #2508[^3881] - Added documentation for debugging with core files
• PR #2506[^3882] - Fixing background work invocations
• PR #2505[^3883] - Fix tuple serialization
• Issue #2504[^3884] - Ensure continuations are called in the order they have been attached
• PR #2503[^3885] - Adding serialization support for Vc v2 (datapar)
• PR #2502[^3886] - Resolve various, minor compiler warnings
• PR #2501[^3887] - Some other fixes around cuda examples
• Issue #2500[^3888] - nvcc / cuda clang issue due to a missing -DHPX_WITH_CUDA flag
• PR #2499[^3889] - Adding support for std::array to wait_all and friends
• PR #2498[^3890] - Execute background work as HPX thread
• PR #2497[^3891] - Fixing configuration options for spinlock-deadlock detection
• PR #2496[^3892] - Accounting for different compilers in CrayKNL toolchain file
• PR #2494[^3893] - Adding component base class which ties a component instance to a given executor
• PR #2493[^3894] - Enable controlling amount of pending threads which must be available to allow thread stealing
• PR #2492[^3895] - Adding new command line option –hpx:print-counter-reset

• PR #2491 - Resolve ambiguities when compiling with APEX
• PR #2490 - Resuming threads waiting on future with higher priority
• Issue #2489 - nvcc issue because -std=c++11 appears twice
• PR #2488 - Adding performance counters exposing the internal idle and busy-loop counters
• PR #2487 - Allowing for plain suspend to reschedule thread right away
• PR #2486 - Only flag HPX code for CUDA if HPX_WITH_CUDA is set
• PR #2485 - Making thread-queue parameters runtime-configurable
• PR #2484 - Added atomic counter for parcel-destinations
• PR #2483 - Added priority-queue lifo scheduler
• PR #2482 - Changing scheduler to steal only if more than a minimal number of tasks are available
• PR #2481 - Extending command line option –hpx:print-counter-destination to support value ‘none’
• PR #2479 - Added option to disable signal handler
• PR #2478 - Making sure the sine performance counter module gets loaded only for the corresponding example
• Issue #2477 - Breaking at a throw statement
• PR #2476 - Annotated function
• PR #2475 - Ensure that using %osthread% during logging will not throw for non-hpx threads
• PR #2474 - Remove now superficial non_direct actions from base_lco and friends
• PR #2473 - Refining support for ITTNotify
• PR #2472 - Some fixes around hpx compute
• Issue #2470 - redefinition of boost::detail::spinlock
• Issue #2469 - Dataflow performance issue
• PR #2468 - Perf docs update
• PR #2466 - Guarantee to execute remote direct actions on HPX-thread

Chapter 2. What’s so special about HPX?
• PR #2465 - Improve demo: Async copy and fixed device handling
• PR #2464 - Adding performance counter exposing instantaneous scheduler utilization
• PR #2463 - Downcast to future<void>
• PR #2462 - Fixed usage of ITT-Notify API with Intel Amplifier
• PR #2461 - Cublas demo
• PR #2460 - Fixing thread bindings
• PR #2459 - Make -std=c++11 nvcc flag consistent for in-build and installed versions
• Issue #2457 - Segmentation fault when registering a partitioned vector
• PR #2452 - Properly releasing global barrier for unhandled exceptions
• PR #2451 - Fixing long shutdown times
• PR #2450 - Attempting to fix initialization errors on newer platforms (Boost V1.63)
• PR #2449 - Replace BOOST_COMPILER_FENCE with an HPX version
• PR #2448 - This fixes a possible race in the migration code
• PR #2445 - Fixing dataflow et.al. for futures or future-ranges wrapped into ref()
• PR #2444 - Fix segfaults
• PR #2443 - Issue 2442
• Issue #2442 - Mismatch between #if/#endif and namespace scope brackets in this_thread_executers.hpp
• Issue #2441 - undeclared identifier BOOST_COMPILER_FENCE
• PR #2440 - Knl build
• PR #2438 - Datapar backend
• PR #2437 - Adapt algorithm parameter sequence changes from C++17
• PR #2436 - Adapt execution policy name changes from C++17
• Issue #2435 - Trunk broken, undefined reference to hpx::thread::interrupt(hpx::thread::id, bool)

• Issue #2410 - undefined reference to opal_hwloc191_hwloc......
• PR #2409 - Fixing locking for channel and receive_buffer
• PR #2407 - Solving #2402 and #2403
• PR #2406 - Improve guards
• PR #2405 - Enable parallel::for_each for iterators returning proxy types
• PR #2404 - Forward the explicitly given result_type in the hpx invoke
• Issue #2403 - datapar_execution + zip iterator: lambda arguments aren’t references
• Issue #2402 - datapar algorithm instantiated with wrong type #2402
• PR #2401 - Added support for imported libraries to HPX_Libraries.cmake
• PR #2400 - Use CMake policy CMP0060
• Issue #2399 - Error trying to push back vector of futures to vector
• PR #2398 - Allow config #defines to be written out to custom config/defines.hpp
• Issue #2397 - CMake generated config defines can cause tedious rebuilds category
• Issue #2396 - BOOST_ROOT paths are not used at link time
• PR #2395 - Fix target_link_libraries() issue when HPX Cuda is enabled
• Issue #2394 - Template compilation error using HPX_WITH_DATAPAR_LIBFLATARRAY
• PR #2393 - Fixing lock registration for recursive mutex
• PR #2392 - Add keywords in target_link_libraries in hpx_setup_target
• PR #2391 - Clang goroutines
• Issue #2390 - Adapt execution policy name changes from C++17
• PR #2389 - Chunk allocator and pool are not used and are obsolete
• PR #2388 - Adding functionalities to datapar needed by octotiger
• PR #2387 - Fixing race condition for early parcels

2.10. Releases 1657
• PR #2279 - Child vs parent stealing
• Issue #2277 - master branch build failure (53c5b4f) with papi
• PR #2276 - Compile time launch policies
• PR #2275 - Replace boost::chrono with std::chrono in interfaces
• PR #2274 - Replace most uses of Boost.Assign with initializer list
• PR #2273 - Fixed typos
• PR #2272 - Inspect checks
• PR #2270 - Adding test verifying -hpx.os_threads=all
• PR #2269 - Added inspect check for now obsolete boost type traits
• PR #2268 - Moving more code into source files
• Issue #2267 - Add inspect support to deprecate Boost.TypeTraits
• PR #2265 - Adding channel LCO
• PR #2264 - Make support for std::ref mandatory
• PR #2263 - Constrain tuple_member forwarding constructor
• Issue #2262 - Test hpx.os_threads=all
• Issue #2261 - OS X: Error: no matching constructor for initialization of 'hpx::lcos::local::condition_variable_any'
• Issue #2260 - Make support for std::ref mandatory
• PR #2259 - Remove most of Boost.MPL, Boost.EnableIf and Boost.TypeTraits
• PR #2258 - Fixing #2256
• PR #2257 - Fixing launch process
• Issue #2256 - Actions are not registered if not invoked
• PR #2255 - Coalescing histogram
• PR #2254 - Silence explicit initialization in copy-constructor warnings
• PR #2253 - Drop support for GCC 4.6 and 4.7
• PR #2252 - Prepare V1.0
• PR #2251 - Convert to 0.9.99
• PR #2249 - Adding iterator_facade and iterator_adaptor
• Issue #2248 - Need a feature to yield to a new task immediately
• PR #2246 - Adding split_future
• PR #2245 - Add an example for handing over a component instance to a dynamically launched locality
• Issue #2243 - Add example demonstrating AGAS symbolic name registration
• Issue #2242 - pkgconfig test broken on CentOS 7 / Boost 1.61
• Issue #2241 - Compilation error for partitioned vector in hpx_compute branch
• PR #2240 - Fixing termination detection on one locality
• Issue #2239 - Create a new facility lcos::split_all
• Issue #2236 - hpx::cout vs. std::cout
• PR #2233 - Implement local-only primary namespace service
• Issue #2147 - would like to know how much data is being routed by particular actions
• Issue #2109 - Warning while compiling hpx
• Issue #1973 - Setting INTERFACE_COMPILE_OPTIONS for hpx_init in CMake taints Fortran_FLAGS
• Issue #1864 - run_guarded using bound function ignores reference
• Issue #1754 - Running with TCP parcelport causes immediate crash or freeze
• Issue #1655 - Enable zip_iterator to be used with Boost traversal iterator categories
• Issue #1591 - Optimize AGAS for shared memory only operation
• Issue #1401 - Need an efficient infiniband parcelport
• Issue #1125 - Fix the IPC parcelport

2.10. Releases
• Issue #839 - Refactor ibverbs and shmem parcelport
• Issue #702 - Add instrumentation of parcel layer
• Issue #668 - Implement ispc task interface
• Issue #533 - Thread queue/deque internal parameters should be runtime configurable
• Issue #475 - Create a means of combining performance counters into querysets

HPX V0.9.99 (Jul 15, 2016)

General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming HPX V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of HPX and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big ‘Thank you!’ to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move HPX components to a different compute node). Additionally, this release of HPX cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

• We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.

• We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges (N4560) proposal. This also includes the addition of projections to the existing algorithms. Please see Issue #1668 for a list of algorithms which have been adapted to N4560.

• We have implemented index-based parallel for-loops based on a corresponding standardization proposal (P0075R1). Please see Issue #2016 for a list of available algorithms.

• We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See Issue #1141 for an overview of which algorithms are available by now.

• We have started to implement a new prototypical functionality with HPX.Compute which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.

• We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.

Chapter 2. What’s so special about HPX?
• Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type `T` into a future of any other type `R`, either based on default conversion rules of the embedded types or using a given explicit conversion function.

• We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without 'stopping the world' for the object to migrate. HPX will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See Issue #559 and PR #1966 for more details.

• The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow<Action>(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see Issue #1265 and PR #1912 for more information.

• Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).

• We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of HPX itself and also of applications depending on it. We have further decreased the dependency of HPX on the Boost libraries by replacing part of those with facilities available from the standard libraries.

• Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.

• We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.

• We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.

• We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).

• We have extended the interfaces exposed from executors (as proposed by N4406) to accept an arbitrary number of arguments.

### Breaking changes

• In order to move the dataflow facility to `namespace hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to CMake is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.

• The adaptation of the C++ Extensions for Ranges proposal imposes some breaking changes related...
to the return types of some of the parallel algorithms. Please see Issue #1668\textsuperscript{4144} for a list of algorithms which have already been adapted.

• The facility \texttt{hpx::lcos::make_future\_void()} has been replaced by \texttt{hpx::make\_future<void>()}.

• We have removed support for Intel V13 and gcc 4.4.x.

• We have removed (default) support for the generic \texttt{hpx::parallel::execution\_policy} because it was removed from the Parallelism TS \texttt{(__cpp11\_n4104__)} while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying \texttt{-DHPX\_WITH\_GENERIC\_EXECUTION\_POLICY=On} to CMake.

• Uses of \texttt{boost::shared\_ptr} and related facilities have been replaced with \texttt{std::shared\_ptr} and friends. Uses of \texttt{boost::unique\_lock}, \texttt{boost::lock\_guard} etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.

• Facilities that used to expect an explicit \texttt{boost::unique\_lock} now take an \texttt{std::unique\_lock}. Additionally, \texttt{condition\_variable} no longer aliases \texttt{condition\_variable\_any}; its interface now only works with \texttt{std::unique\_lock<local::mutex>}

• Uses of \texttt{boost::function}, \texttt{boost::bind}, \texttt{boost::tuple} have been replaced by the corresponding facilities in HPX (\texttt{hpx::util::function}, \texttt{hpx::util::bind}, and \texttt{hpx::util::tuple}, respectively).

### Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2250\textsuperscript{4145} - change default chunker of parallel executor to static one
- PR #2247\textsuperscript{4146} - HPX on ppc64le
- PR #2244\textsuperscript{4147} - Fixing MSVC problems
- PR #2238\textsuperscript{4148} - Fixing small typos
- PR #2237\textsuperscript{4149} - Fixing small typos
- PR #2234\textsuperscript{4150} - Fix broken add test macro when extra args are passed in
- PR #2231\textsuperscript{4151} - Fixing possible race during future awaiting in serialization
- PR #2230\textsuperscript{4152} - Fix stream nvcc
- PR #2229\textsuperscript{4153} - Fixed run\_as\_hpx\_thread
- PR #2228\textsuperscript{4154} - On prefetching\_test branch : adding prefetching\_iterator and related tests used for prefetching containers within lambda functions
- PR #2227\textsuperscript{4155} - Support for HPXCL's opencl::event
- PR #2226\textsuperscript{4156} - Preparing for release of V0.9.99

2.10. Releases
- **PR #2200** - Fix hangs
- **PR #2199** - Deprecating hpx/traits.hpp
- **PR #2198** - Making explicit inclusion of external libraries into build
- **PR #2197** - Fix typo in QT CMakeLists
- **PR #2196** - Fixing a gcc warning about attributes being ignored
- **PR #2194** - Fixing partitioned_vector_spmd_foreach example
- **Issue #2193** - partitioned_vector_spmd_foreach seg faults
- **PR #2192** - Support Boost.Thread v4
- **PR #2191** - HPX.Compute prototype
- **PR #2190** - Spawning operation on new thread if remaining stack space becomes too small
- **PR #2189** - Adding callback taking index and future to when_each
- **PR #2188** - Adding new example demonstrating receive_buffer
- **PR #2187** - Mask 128-bit ints if CUDA is being used
- **PR #2186** - Make startup & shutdown functions unique_function
- **PR #2184** - Fixing logging output not to cause hang on shutdown
- **PR #2183** - Allowing component clients as action return types
- **Issue #2183** - Enabling logging output causes hang on shutdown
- **Issue #2182** - Setting small stack size does not change default
- **PR #2180** - Changing default bind mode to balanced
- **PR #2179** - adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- **PR #2177** - Fixing 2176
- **Issue #2176** - Launch process test fails on OSX

• PR #2160\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2160} - Add inspect check for missing #include <list>
• PR #2159\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2159} - Add missing finalize call to stop test hanging
• PR #2158\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2158} - Algo fixes
• PR #2157\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2157} - Stack check
• Issue #2156\footnote{https://github.com/STELLAR-GROUP/hpx/issues/2156} - OSX reports stack space incorrectly (generic context coroutines)
• Issue #2155\footnote{https://github.com/STELLAR-GROUP/hpx/issues/2155} - Race condition suspected in runtime
• PR #2154\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2154} - Replace boost::detail::atomic\_count with the new util::atomic\_count
• PR #2153\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2153} - Fix stack overflow on OSX
• PR #2152\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2152} - Define is\_bitwise\_serializable as is\_trivially\_copyable when available
• PR #2151\footnote{https://github.com/STELLAR-GROUP/hpx/pull/2151} - Adding missing <cstring> for std::mem* functions
• Issue #2150\footnote{https://github.com/STELLAR-GROUP/hpx/issues/2150} - Unable to use component clients as action return types

2.10. Releases

1665
- PR #2149\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2149} - std::memmove copies bytes, use bytes*sizeof(type) when copying larger types
- PR #2146\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2146} - Adding customization point for parallel copy/move
- PR #2145\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2145} - Applying changes to address warnings issued by latest version of PVS Studio
- Issue #2148\footnote{https://github.com/STEllAR-GROUP/hpx/issues/2148} - hpx::parallel::copy is broken after trivially copyable changes
- PR #2144\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2144} - Some minor tweaks to compute prototype
- PR #2143\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2143} - Added Boost version support information over OSX platform
- PR #2142\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2142} - Fixing memory leak in example
- PR #2141\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2141} - Add missing specializations in execution policies
- PR #2139\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2139} - This PR fixes a few problems reported by Clang’s Undefined Behavior sanitizer
- PR #2138\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2138} - Revert “Adding fedora docs”
- PR #2136\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2136} - Removed double semicolon
- PR #2135\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2135} - Add deprecated #include check for hpx_fwd.hpp
- PR #2134\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2134} - Resolved memory leak in stencil_8
- PR #2133\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2133} - Replace uses of boost pointer containers
- PR #2132\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2132} - Removing unused typedef
- PR #2131\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2131} - Add several include checks for std facilities
- PR #2130\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2130} - Fixing parcel compression, adding test
- PR #2129\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2129} - Fix invalid attribute warnings
- Issue #2128\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2128} - hpx::init seems to segfault
- PR #2127\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2127} - Making executor_traits N-nary
- PR #2126\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2126} - GCC 4.6 fails to deduce the correct type in lambda
- PR #2125\footnote{https://github.com/STEllAR-GROUP/hpx/pull/2125} - Making parcel coalescing test actually test something
- Issue #2124\footnote{https://github.com/STEllAR-GROUP/hpx/issues/2124} - Make a testcase for parcel compression

Chapter 2. What’s so special about HPX?
• Issue #2123\textsuperscript{4249} - hpx/hpx/runtime/applier_fwd.hpp - Multiple defined types
• Issue #2122\textsuperscript{4250} - Exception in primary_namespace::resolve_free_list
• Issue #2121\textsuperscript{4251} - Possible memory leak in 1d_stencil_8
• PR #2120\textsuperscript{4252} - Fixing 2119
• Issue #2119\textsuperscript{4253} - reduce_by_key compilation problems
• Issue #2118\textsuperscript{4254} - Premature unwrapping of boost::ref'ed arguments
• PR #2117\textsuperscript{4255} - Added missing initializer on last constructor for thread_description
• PR #2116\textsuperscript{4256} - Use a lightweight bind implementation when no placeholders are given
• PR #2115\textsuperscript{4257} - Replace boost::shared_ptr with std::shared_ptr
• PR #2114\textsuperscript{4258} - Adding hook functions for executor\_parameter\_traits supporting timers
• Issue #2113\textsuperscript{4259} - Compilation error with gcc version 4.9.3 (MacPorts gcc49 4.9.3\_0)
• PR #2112\textsuperscript{4260} - Replace uses of safe_bool with explicit operator bool
• Issue #2111\textsuperscript{4261} - Compilation error on QT example
• Issue #2110\textsuperscript{4262} - Compilation error when passing non-future argument to unwrapped continuation in dataflow
• Issue #2109\textsuperscript{4263} - Warning while compiling hpx
• Issue #2108\textsuperscript{4264} - Stack trace of last bug causing issues with octotiger
• Issue #2107\textsuperscript{4265} - Stack trace of last bug causing issues with octotiger
• PR #2107\textsuperscript{4266} - Making sure that a missing parcel\_coalescing module does not cause startup exceptions
• PR #2106\textsuperscript{4267} - Stop using hpx\_fwd.hpp
• Issue #2105\textsuperscript{4268} - coalescing plugin handler is not optional any more
• Issue #2104\textsuperscript{4269} - Make executor\_traits N-nary
• Issue #2103\textsuperscript{4270} - Build error with octotiger and hpx commit e657426d
• PR #2102\textsuperscript{4271} - Combining thread data storage

\textsuperscript{4271} https://github.com/STEllAR-GROUP/hpx/pull/2102
• PR #2101 - Added repartition version of 1d stencil that uses any performance counter
• PR #2100 - Drop obsolete TR1 result_of protocol
• PR #2099 - Replace uses of boost::bind with util::bind
• PR #2098 - Deprecated inspect checks
• PR #2097 - Reduce by key, extends #1141
• PR #2096 - Moving local cache from external to hpx/util
• PR #2095 - Bump minimum required Boost to 1.50.0
• PR #2094 - Add include checks for several Boost utilities
• Issue #2093 - /.../local_cache.hpp(89): error #303: explicit type is missing (“int” assumed)
• PR #2091 - Fix for Raspberry pi build
• PR #2090 - Fix storage size for util::function>
• PR #2089 - Fix #2088
• Issue #2088 - More verbose output from cmake configuration
• PR #2087 - Making sure init_globally always executes hpx_main
• Issue #2086 - Race condition with recent HPX
• PR #2085 - Adding #include checker
• PR #2084 - Replace boost lock types with standard library ones
• PR #2083 - Simplify packaged task
• PR #2082 - Updating APEX version for testing
• PR #2081 - Cleanup exception headers
• PR #2080 - Make call_once variadic
• Issue #2079 - With GNU C++, line 85 of hpx/config/version.hpp causes link failure when linking application
• Issue #2078 - Simple test fails with _GLIBCXX_DEBUG defined

• PR #2054\textsuperscript{4318} - Add a forwarding coroutine header
• PR #2053\textsuperscript{4319} - Replace uses of boost::unordered_map with std::unordered_map
• PR #2052\textsuperscript{4320} - Rewrite tuple unwrap
• PR #2051\textsuperscript{4321} - Replace uses of BOOST_SCOPED_ENUM with C++11 scoped enums
• PR #2049\textsuperscript{4322} - Attempt to narrow down split_credit problem
• PR #2048\textsuperscript{4323} - Fixing gcc startup hangs
• PR #2047\textsuperscript{4324} - Fixing when_xxx and wait_xxx for MSVC12
• PR #2046\textsuperscript{4325} - adding persistent_auto_chunk_size and related tests for for_each
• PR #2045\textsuperscript{4326} - Fixing HPX_HAVE_THREAD_BACKTRACE_DEPTH build time configuration
• PR #2044\textsuperscript{4327} - Adding missing service executor types
• PR #2043\textsuperscript{4328} - Removing ambiguous definitions for is_future_range and future_range_traits
• PR #2042\textsuperscript{4329} - Clarify that HPX builds can use (much) more than 2GB per process
• PR #2041\textsuperscript{4330} - Changing future_iterator_traits to support pointers
• Issue #2040\textsuperscript{4331} - Improve documentation memory usage warning?
• PR #2039\textsuperscript{4332} - Coroutine cleanup
• PR #2038\textsuperscript{4333} - Fix cmake policy CMP0042 warning MACOSX_RPATH
• PR #2037\textsuperscript{4334} - Avoid redundant specialization of [\texttt{unique} function_nonser
• PR #2036\textsuperscript{4335} - nvcc dies with an internal error upon pushing/popping warnings inside templates
• Issue #2035\textsuperscript{4336} - Use a less restrictive iterator definition in hpx::cos::detail::future_iterator_traits
• PR #2034\textsuperscript{4337} - Fixing compilation error with thread queue wait time performance counter
• Issue #2033\textsuperscript{4338} - Compilation error when compiling with thread queue waittime performance counter
• Issue #2032\textsuperscript{4339} - Ambiguous template instantiation for is_future_range and future_range_traits.
• PR #2031\textsuperscript{4340} - Don’t restart timer on every incoming parcel

2.10. Releases
• PR #1909\[4456\] - Fix mpirun with pbs
• PR #1908\[4457\] - Changing parallel::sort to return the last iterator as proposed by N4560
• PR #1907\[4458\] - Adding a minimum version for Open MPI
• PR #1906\[4459\] - Updates to the Release Procedure
• PR #1905\[4460\] - Fixing #1903
• PR #1904\[4461\] - Making sure std containers are cleared before serialization loads data
• Issue #1903\[4462\] - When running octotiger, I get: assertion '(*new_gids_)[gid].size() == 1' failed: HPX(assertion_failure)
• Issue #1902\[4463\] - Immediate crash when running hpx/octotiger with _GLIBCXX_DEBUG defined.
• PR #1901\[4464\] - Making non-serializable classes non-serializable
• Issue #1900\[4465\] - Two possible issues with std::list serialization
• PR #1899\[4466\] - Fixing a problem with credit splitting as revealed by #1898
• Issue #1898\[4467\] - Accessing component from locality where it was not created segfaults
• PR #1897\[4468\] - Changing parallel::sort to return the last iterator as proposed by N4560
• Issue #1896\[4469\] - version 1.0?
• Issue #1895\[4470\] - Warning comment on numa_allocator is not very clear
• PR #1894\[4471\] - Add support for compilers that have thread_local
• PR #1893\[4472\] - Fixing 1890
• PR #1892\[4473\] - Adds typed future_type for executor_traits
• PR #1891\[4474\] - Fix wording in certain parallel algorithm docs
• Issue #1890\[4475\] - Invoking papi counters give segfault
• PR #1889\[4476\] - Fixing problems as reported by clang-check
• PR #1888\[4477\] - WIP parallel is_heap
• PR #1887\[4478\] - Fixed resetting performance counters related to idle-rate, etc

2.10. Releases
• PR #1861 - Minor Corrections for Release
• PR #1860 - Fixing hpx gdb script
• Issue #1859 - reset_active_counters resets times and thread counts before some of the counters are evaluated
• PR #1858 - Release V0.9.11
• PR #1857 - removing diskperf example from 9.11 release
• PR #1856 - fix return in packaged_task_base::reset()
• Issue #1842 - Install error: file INSTALL cannot find libhpx_parcel_coalescing.so.0.9.11
• PR #1839 - Adding fedora docs
• PR #1824 - Changing version on master to V0.9.12
• PR #1818 - Fixing #1748
• Issue #1815 - seg fault in AGAS
• Issue #1803 - wait_all documentation
• Issue #1796 - Outdated documentation to be revised
• Issue #1759 - glibc munmap_chunk or free(): invalid pointer on SuperMIC
• Issue #1753 - HPX performance degrades with time since execution begins
• Issue #1748 - All public HPX headers need to be self contained
• PR #1719 - How to build HPX with Visual Studio
• Issue #1684 - Race condition when using –hpx:connect?
• PR #1658 - Add serialization for std::set (as there is for std::vector and std::map)
• PR #1641 - Generic client
• Issue #1632 - heartbeat example fails on separate nodes
• PR #1603 - Adds preferred namespace check to inspect tool
• Issue #1559 - Extend inspect tool
• Issue #1523 - Remote async with deferred launch policy never executes
• Issue #1472 - Serialization issues
• Issue #1457 - Implement N4392: C++ Latches and Barriers
• PR #1444 - Enabling usage of moveonly types for component construction
• Issue #1407 - The Intel 13 compiler has failing unit tests
• Issue #1405 - Allow component constructors to take movable only types
• Issue #1265 - Enable dataflow() to be usable with actions
• Issue #1236 - NUMA aware allocators
• Issue #802 - Fix Broken Examples
• Issue #559 - Add hpx::migrate facility
• Issue #449 - Make actions with template arguments usable and add documentation
• Issue #279 - Refactor addressing_service into a base class and two derived classes
• Issue #224 - Changing thread state metadata is not thread safe
• Issue #55 - Uniform syntax for enums should be implemented

**HPX V0.9.11 (Nov 11, 2015)**

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an executor, which can be used to customize the where and when of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choice of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (master) are prohibited. Any change has to go through a peer review before it will be merged to master. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the master branch since the last release.

General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.

- Added integration with the CircleCI hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.

- The compiler configuration subsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.

- The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_`only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.

- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
  - `hpx::components::default_distribution_policy` which tries to place multiple component instances as evenly as possible.
  - `hpx::components::colocating_distribution_policy` which will refer to the locality where a given component instance is currently placed.
  - `hpx::components::binpacking_distribution_policy` which will place multiple component instances as evenly as possible based on any performance counter.
  - `hpx::components::target_distribution_policy` which allows one to represent a given locality in the context of a distribution policy.

- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async collocated(id, ...) which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...`).

- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.

- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal N4411.

- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a task_block with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.

- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed std::latch (see N4399).

- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).

- Added performance counters allowing to track the number of action invocations (local and remote invocations).

- Added new command line options `--hpx:print-counter-at` and `--hpx:reset-counters`. 

4539 https://circleci.com/gh/STEllAR-GROUP/hpx
4540 http://wg21.link/n4411
4541 http://wg21.link/n4399
The hpx::vector component has been renamed to hpx::partitioned_vector to make it explicit that the underlying memory is not contiguous.

Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.

Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).

HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see https://github.com/UO-OACISS/xpress-apex. To enable APEX at configuration time, specify -DHPX_WITH_APEX=On. To also include support for TAU profiling, specify -DHPX_WITH_TAU=On and specify the -DTAU_ROOT, -DTAU_ARCH and -DTAU_OPTIONS cmake parameters.

We have implemented many more of the Using parallel algorithms. Please see Issue #1141 for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

**Breaking changes**

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a hpx::components::component_base instead of hpx::components::managed_component_base.

- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.

- The CMake project name has changed from ‘hpx’ to ‘HPX’ for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into <prefix>/lib/cmake/HPX and not <prefix>/lib/cmake/hpx.

- The macro HPX_REGISTER_MINIMAL_COMPONENT_FACTORY has been deprecated. Please use HPX_REGISTER_COMPONENT instead. The old macro will be removed in the next release.

- The obsolete distributing_factory and binpacking_factory components have been removed. The corresponding functionality is now provided by the hpx::new_ API function in conjunction with the hpx::default_layout and hpx::binpacking distribution policies (hpx::components::default_distribution_policy and hpx::components::binpacking_distribution_policy)

- The API function hpx::new_colocated has been deprecated. Please use the consolidated API hpx::new_ in conjunction with the new hpx::colocated distribution policy (hpx::components::colocating_distribution_policy) instead. The old API function will still be available for at least one release of HPX if the configuration variable HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY is enabled.

- The API function hpx::async_colocated has been deprecated. Please use the consolidated API hpx::async in conjunction with the new hpx::colocated distribution policy (hpx::components::colocating_distribution_policy) instead. The old API function will still be available for at least one release of HPX if the configuration variable HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY is enabled.

- The obsolete remote_object component has been removed.

4542 https://github.com/STEllAR-GROUP/hpx/issues/1141
• Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding announcement on the hpx-users@stellar.cct.lsu.edu mailing list.

• The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with HPX_WITH... while the preprocessor constant which is used at build time starts with HPX_HAVE... For instance, the former cmake command line -DHPX_MALLOC=... now has to be specified as -DHPX_WITH_MALLOC=... and will cause the preprocessor constant HPX_HAVE_MALLOC to be defined. The actual name of the constant (i.e. MALLOC) has not changed. Please see the corresponding documentation for more details (CMake options).

• The get_gid() functions exposed by the component base classes hpx::components::server::simple_component_base, hpx::components::server::managed_component_base, and hpx::components::server::fixed_component_base have been replaced by two new functions: get_unmanaged_id() and get_id(). To enable the old function name for backwards compatibility, use the cmake configuration option HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On.

• All functions which were named get_gid() but were returning hpx::id_type have been renamed to get_id(). To enable the old function names for backwards compatibility, use the cmake configuration option HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

• PR #1855 - Completely removing external/endian
• PR #1854 - Don’t pollute CMAKE_CXX_FLAGS through find_package()
• PR #1853 - Updating CMake configuration to get correct version of TAU library
• PR #1852 - Fixing Performance Problems with MPI Parcelport
• PR #1851 - Fixing hpx_add_link_flag() and hpx_remove_link_flag()
• PR #1850 - Fixing 1836, adding parallel::sort
• PR #1849 - Fixing configuration for use of more than 64 cores
• PR #1848 - Change default APEX version for release
• PR #1847 - Fix client_base::then on release
• PR #1846 - Removing broken lcos::local::channel from release
• PR #1845 - Adding example demonstrating a possible safe-object implementation to release
• PR #1844 - Removing stubs from accumulator examples

• PR #1793 - fix a wrong use of HPX_MAX_CPU_COUNT instead of HPX_HAVE_MAX_CPU_COUNT
• PR #1792 - Allow for default constructed parcel instances to be moved
• PR #1791 - Fix connect with hpx::runtime_mode_connect
• Issue #1790 - assertion action_.get() failed: HPX(assertion_failure) when running Octotiger with pull request 1786
• PR #1789 - Fixing discover_counter_types API function
• Issue #1788 - connect with hpx::runtime_mode_connect
• Issue #1787 - discover_counter_types not working
• PR #1786 - Changing addressing_service to use std::unordered_map instead of std::map
• PR #1785 - Fix is_iterator for container algorithms
• PR #1784 - Adding new command line options:
• PR #1783 - Minor changes for APEX support
• PR #1782 - Drop legacy forwarding action traits
• PR #1781 - Attempt to resolve the race between cv::wait_xxx and cv::notify_all
• PR #1780 - Removing serialize_sequence
• PR #1779 - Fixed #1501: hwloc configuration options are wrong for MIC
• PR #1778 - Removing ability to enable/disable parcel handling
• PR #1777 - Completely removing stackless threads
• PR #1776 - Cleaning up util/plugin
• PR #1775 - Agas fixes
• PR #1774 - Action invocation count
• PR #1773 - Replaced MSVC variable with WIN32
• PR #1772 - Fixing Problems in MPI parcelport and future serialization.
• PR #1771 - Fixing intel 13 compiler errors related to variadic template template parameters for lcos::when_tests
• PR #1770 - Forwarding decay to std::
• PR #1769 - Add more characters with special regex meaning to the existing patch
• PR #1768 - Adding test for receive_buffer
• PR #1767 - Making sure that uptime counter throws exception on any attempt to be reset
• PR #1766 - Cleaning up code related to throttling scheduler
• PR #1765 - Restricting thread_data to creating only with intrusive_pointers
• PR #1764 - Fixing 1763
• Issue #1763 - UB in thread_data::operator delete
• PR #1762 - Making sure all serialization registries/factories are unique
• PR #1761 - Fixed #1751: hpx::future::wait_for fails a simple test
• PR #1758 - Fixing #1757
• Issue #1757 - pinning not correct using –hpx:bind
• Issue #1756 - compilation error with MinGW
• PR #1755 - Making output serialization const-correct
• Issue #1753 - HPX performance degrades with time since execution begins
• Issue #1752 - Error in AGAS
• Issue #1751 - hpx::future::wait_for fails a simple test
• PR #1750 - Removing hpx_fwd.hpp includes
• PR #1749 - Simplify result_of and friends
• PR #1748 - Removed superfluous code from message_buffer.hpp
• PR #1746 - Tuple dependencies
• Issue #1745 - Broken when_some which takes iterators
• PR #1744 - Refining archive interface
• PR #1743 - Fixing when_all when only a single future is passed
• PR #1742 - Config includes
• PR #1741 - Os executors
• Issue #1740 - hpx::promise has some problems
• PR #1739 - Parallel composition with generic containers
• Issue #1738 - After building program and successfully linking to a version of hpx DHPX_DIR seems to be ignored

1686 Chapter 2. What’s so special about HPX?
- Issue #17374648 - Uptime problems
- PR #17364649 - added convenience c-tor and begin()/end() to serialize_buffer
- PR #17354650 - Config includes
- PR #17344651 - Fixed #1688: Add timer counters for tfunc_total and exec_total
- Issue #17334652 - Add unit test for hpx/lcos/local/receive_buffer.hpp
- PR #17324653 - Renaming get_os_thread_count
- PR #17314654 - Basename registration
- Issue #17304655 - Use after move of thread_init_data
- PR #17294656 - Rewriting channel based on new gate component
- PR #17284657 - Fixing #1722
- PR #17274658 - Fixing compile problems with apply_colocated
- PR #17264659 - Apex integration
- PR #17254660 - fixed test timeouts
- PR #17244661 - Renaming vector
- Issue #17234662 - Drop support for intel compilers and gcc 4.4. based standard libs
- Issue #17224663 - Add support for detecting non-ready futures before serialization
- PR #17214664 - Unifying parallel executors, initializing from launch policy
- PR #17204665 - dropped superfluous typedef
- Issue #17184666 - Windows 10 x64, VS 2015 - Unknown CMake command “add_hpx_pseudo_target”.
- PR #17174667 - Timed executor traits for thread-executors
- PR #17164668 - serialization of arrays didn’t work with non-pod types. fixed
- PR #17154669 - List serialization
- PR #17144670 - changing misspellings

2.10. Releases 1687
• PR #1713 - Fixed distribution policy executors
• PR #1712 - Moving library detection to be executed after feature tests
• PR #1711 - Simplify parcel
• PR #1710 - Compile only tests
• PR #1709 - Implemented timed executors
• PR #1708 - Implement parallel::executor_traits for thread-executors
• PR #1707 - Various fixes to threads::executors to make custom schedulers work
• PR #1706 - Command line option –hpx:cores does not work as expected
• Issue #1705 - command line option –hpx:cores does not work as expected
• PR #1704 - vector deserialization is speeded up a little
• PR #1703 - Fixing shared_mutes
• Issue #1702 - Shared_mutex does not compile with no_mutex cond_var
• PR #1701 - Add distribution_policy_executor
• PR #1700 - Executor parameters
• PR #1699 - Readers writer lock
• PR #1698 - Remove leftovers
• PR #1697 - Fixing held locks
• PR #1696 - Modified Scan Partitioner for Algorithms
• PR #1695 - This thread executors
• PR #1694 - Fixed #1688: Add timer counters for tfunc_total and exec_total
• PR #1693 - Fix #1691: is_executor template specification fails for inherited executors
• PR #1692 - Fixed #1662: Possible exception source in coalescing_message_handler
• Issue #1691 - is_executor template specification fails for inherited executors
• PR #1690[^1690] - added macro for non-intrusive serialization of classes without a default c-tor
• PR #1689[^1689] - Replace value_or_error with custom storage, unify future_data state
• Issue #1688[^1688] - Add timer counters for tfunc_total and exec_total
• PR #1687[^1687] - Fixed interval timer
• PR #1686[^1686] - Fixing cmake warnings about not existing pseudo target dependencies
• PR #1685[^1685] - Converts partitioners to use bulk async execute
• PR #1683[^1683] - Adds a tool for inspect that checks for character limits
• PR #1682[^1682] - Change project name to (uppercase) HPX
• PR #1681[^1681] - Counter shortnames
• PR #1680[^1680] - Extended Non-intrusive Serialization to Ease Usage for Library Developers
• PR #1679[^1679] - Working on 1544: More executor changes
• PR #1678[^1678] - Transpose fixes
• PR #1677[^1677] - Improve Boost compatibility check
• PR #1676[^1676] - 1d stencil fix
• Issue #1675[^1675] - hpx project name is not HPX
• PR #1674[^1674] - Fixing the MPI parcelport
• PR #1673[^1673] - added move semantics to map/vector deserialization
• PR #1672[^1672] - Vs2015 await
• PR #1671[^1671] - Adapt transform for #1668
• PR #1670[^1670] - Started to work on #1668
• PR #1669[^1669] - Add this_thread_executors
• Issue #1667[^1667] - Apple build instructions in docs are out of date
• PR #1666[^1666] - Apex integration

2.10. Releases
• PR #1665 - Fixes an error with the whitespace check that showed the incorrect location of the error
• Issue #1664 - Inspect tool found incorrect endline whitespace
• PR #1663 - Improve use of locks
• Issue #1662 - Possible exception source in coalescing_message_handler
• PR #1661 - Added support for 128bit number serialization
• PR #1660 - Serialization 128bits
• PR #1659 - Implemented inner_product and adjacent_diff algos
• PR #1658 - Add serialization for std::set (as there is for std::vector and std::map)
• PR #1657 - Use of shared_ptr in io_service_pool changed to unique_ptr
• Issue #1656 - 1dStencil codes all have wrong factor
• PR #1654 - When using runtime_mode_connect, find the correct localhost public ip address
• PR #1653 - Fixing 1617
• PR #1652 - Remove traits::action_may_require_id_splitting
• PR #1651 - Fixed performance counters related to AGAS cache timings
• PR #1650 - Remove leftovers of traits::type_size
• PR #1649 - Shorten target names on Windows to shorten used path names
• PR #1648 - Fixing problems introduced by merging #1623 for older compilers
• PR #1647 - Simplify running automatic builds on Windows
• Issue #1646 - Cache insert and update performance counters are broken
• Issue #1644 - Remove leftovers of traits::type_size
• Issue #1643 - Remove traits::action_may_require_id_splitting
• PR #1642 - Adds spell checker to the inspect tool for qbk and doxygen comments
• PR #1640 - First step towards fixing 688

2.10. Releases

- PR #1639 - Re-apply remaining changes from limit_dataflow_recursion branch
- PR #1638 - This fixes possible deadlock in the test ignore_while_locked_1485
- PR #1637 - Fixing hpx::wait_all() invoked with two vector<future<T>>
- PR #1636 - Partially re-apply changes from limit_dataflow_recursion branch
- PR #1635 - Adding missing test for #1572
- PR #1634 - Revert “Limit recursion-depth in dataflow to a configurable constant”
- PR #1633 - Add command line option to ignore batch environment
- PR #1631 - hpx::lcos::queue exhibits strange behavior
- PR #1630 - Fixed endline_whitespace_check.cpp to detect lines with only whitespace

- Issue #1629 - Inspect trailing whitespace checker problem
- PR #1628 - Removed meaningless const qualifiers. Minor icpc fix.
- PR #1627 - Fixing the queue LCO and add example demonstrating its use
- PR #1626 - Deprecating get_gid(), add get_id() and get_unmanaged_id()
- PR #1625 - Allowing to specify whether to send credits along with message

- Issue #1624 - Lifetime issue
- Issue #1623 - hpx::wait_all() invoked with two vector<future<T>> fails
- PR #1622 - Executor partitioners
- PR #1621 - Clean up coroutines implementation

- Issue #1620 - Revert #1535
- PR #1619 - Fix result type calculation for hpx::make_continuation
- PR #1618 - Fixing RDTSC on Xeon/Phi

- Issue #1617 - hpx cmake not working when run as a subproject
- Issue #1616 - cmake problem resulting in RDTSC not working correctly for Xeon Phi creates very strange results for duration counters

4759 https://github.com/STEllAR-GROUP/hpx/pull/1619
4760 https://github.com/STEllAR-GROUP/hpx/pull/1618
4761 https://github.com/STEllAR-GROUP/hpx/issues/1617
4762 https://github.com/STEllAR-GROUP/hpx/issues/1616
• Issue #1615 - hpx::make_continuation requires input and output to be the same
• PR #1614 - Fixed remove copy test
• Issue #1613 - Dataflow causes stack overflow
• PR #1612 - Modified foreach partitioner to use bulk execute
• PR #1611 - Limit recursion-depth in dataflow to a configurable constant
• PR #1610 - Increase timeout for CircleCI
• PR #1609 - Refactoring thread manager, mainly extracting thread pool
• PR #1608 - Fixed running multiple localities without localities parameter
• PR #1607 - More algorithm fixes to adjacentfind
• Issue #1606 - Running without localities parameter binds to bogus port range
• Issue #1605 - Too many serializations
• PR #1604 - Changes the HPX image into a hyperlink
• PR #1601 - Fixing problems with remove_copy algorithm tests
• PR #1600 - Actions with ids cleanup
• PR #1599 - Duplicate binding of global ids should fail
• PR #1598 - Fixing array access
• PR #1597 - Improved the reliability of connecting/disconnecting localities
• Issue #1596 - Duplicate id binding should fail
• PR #1595 - Fixing more cmake config constants
• PR #1594 - Fixing preprocessor constant used to enable C++11 chrono
• PR #1593 - Adding operator() for hpx::launch
• Issue #1592 - Error (typo) in the docs
• Issue #1590 - CMake fails when CMAKE_BINARY_DIR contains ‘+’.

1692 Chapter 2. What’s so special about HPX?
- Issue #1589 - Disconnecting a locality results in segfault using heartbeat example
- PR #1588 - Fix doc string for config option HPX_WITH_EXAMPLES
- PR #1586 - Fixing 1493
- PR #1585 - Additional Check for Inspect Tool to detect Endline Whitespace
- Issue #1584 - Clean up coroutines implementation
- PR #1583 - Adding a check for end line whitespace
- PR #1582 - Attempt to fix assert firing after scheduling loop was exited
- PR #1581 - Fixed adjacentfind_binary test
- PR #1580 - Prevent some of the internal cmake lists from growing indefinitely
- PR #1579 - Removing type_size trait, replacing it with special archive type
- Issue #1578 - Remove demangle_helper
- PR #1577 - Get ptr problems
- Issue #1576 - Refactor async, dataflow, and future::then
- PR #1575 - Fixing tests for parallel rotate
- PR #1574 - Cleaning up schedulers
- PR #1573 - Fixing thread pool executor
- PR #1572 - Fixing number of configured localities
- PR #1571 - Reimplement decay
- PR #1570 - Refactoring async, apply, and dataflow APIs
- PR #1569 - Changed range for mach-o library lookup
- PR #1568 - Mark decltype support as required
- PR #1567 - Removed const from algorithms
- Issue #1566 - CMAKE Configuration Test Failures for clang 3.5 on debian

2.10. Releases
• PR #1565
  - Dylib support
• PR #1564
  - Converted partitioners and some algorithms to use executors
• PR #1563
  - Fix several #includes for Boost.Preprocessor
• PR #1562
  - Adding configuration option disabling/enabling all message handlers
• PR #1561
  - Removed all occurrences of boost::move replacing it with std::move
• Issue #1560
  - Leftover HPX_REGISTER_ACTION_DECLARATION_2
• PR #1558
  - Revisit async/apply SFINAE conditions
• PR #1557
  - Removing type_size trait, replacing it with special archive type
• PR #1556
  - Executor algorithms
• PR #1555
  - Remove the necessity to specify archive flags on the receiving end
• PR #1554
  - Removing obsolete Boost.Serialization macros
• PR #1553
  - Properly fix HPX_DEFINE_*_ACTION macros
• PR #1552
  - Fixed algorithms relying on copy_if implementation
• PR #1551
  - Pxfs - Modifying FindOrangeFS.cmake based on OrangeFS 2.9.X
• Issue #1550
  - Passing plain identifier inside HPX_DEFINE_PLAIN_ACTION_1
• PR #1549
  - Fixing intel14/libstdc++4.4
• PR #1548
  - Moving raw_ptr to detail namespace
• PR #1547
  - Adding support for executors to future.then
• PR #1546
  - Executor traits result types
• PR #1545
  - Integrate executors with dataflow
• PR #1543
  - Fix potential zero-copy for primarynamespace::bulk_service_async et.al.
• PR #1542
  - Merging HPX0.9.10 into pxfs branch
• PR #1541
  - Removed stale cmake tests, unused since the great cmake refactoring

• Issue #1414 - Correct directory for dispatch_gcc46.hpp iteration
• Issue #1410 - Set operation algorithms
• Issue #1389 - Parallel algorithms relying on scan partitioner break for small number of elements
• Issue #1325 - Exceptions thrown during parcel handling are not handled correctly
• Issue #1315 - Errors while running performance tests
• Issue #1309 - `hpx::vector` partitions are not easily extendable by applications
• PR #1300 - Added serialization/de-serialization to examples.tuplespace
• Issue #1251 - `hpx::threads::get_thread_count` doesn’t consider pending threads
• Issue #1008 - Decrease in application performance overtime; occasional spikes of major slowdown
• Issue #1001 - Zero copy serialization raises assert
• Issue #721 - Make HPX usable for Xeon Phi
• Issue #524 - Extend scheduler to support threads which can’t be stolen

**HPX V0.9.10 (Mar 24, 2015)**

**General changes**

This is the 12th official release of HPX. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run HPX applications on up to ~24k cores. We have also shown that HPX can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of HPX. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel-ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies and to improve the available networking bandwidth. Please note that in this release we disabled the ibverbs and ipc parcel ports as those have not been ported to the new plugin system yet (see Issue #839).

Another cornerstone of this release is our work towards a complete implementation of __cpp11_n4104__ (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [link hpx.manual.parallel.parallel_algorithms Parallel Algorithms] for more details). We also implemented some extensions to __cpp11_n4104__ allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of hpx::vector which is a distributed data structure closely aligned to the functionality of std::vector. The difference is that hpx::vector stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with hpx::vector. At this point we have implemented only a few of the parallel algorithms to support distributed data structures (like hpx::vector) for testing purposes (see Issue #1338 for a documentation of our progress).

**Breaking changes**

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

• Move to Variadics- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (hpx:async_continue, hpx:apply_continue, hpx:when_each, hpx:wait_each, synchronous invocation of actions).

• Changes to Macros- We also removed the macros HPX_STD_FUNCTION and HPX_STD_TUPLE. This shouldn’t affect any user code as we replaced HPX_STD_FUNCTION with hpx::util::function_nonser which was the default expansion used for this macro. All HPX API functions which expect a hpx::util::function_nonser (or a hpx::util::unique_function_nonser) can now be transparently called with a compatible std::function instead. Similarly, HPX_STD_TUPLE was replaced by its default expansion as well: hpx::util::tuple.
• Changes to hpx::unique_future- hpx::unique_future, which was deprecated in the previous release for hpx::future is now completely removed from HPX. This completes the transition to a completely standards conforming implementation of hpx::future.

• Changes to Supported Compilers. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our Prerequisites page for more details.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

• Issue #1402 - Internal shared_future serialization copies
• Issue #1399 - Build takes unusually long time...
• Issue #1398 - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
• Issue #1397 - Completely remove hpx::unique_future
• Issue #1396 - Parallel scan algorithms with different initial values
• Issue #1395 - Race Condition - 1dStencil_8 - SuperMIC
• Issue #1394 - “suspending thread while at least one lock is being held” - 1dStencil_8 - SuperMIC
• Issue #1393 - SEGFAULT in 1dStencil_8 on SuperMIC
• Issue #1392 - Fixing #1168
• Issue #1391 - Parallel Algorithms for scan partitioner for small number of elements
• Issue #1387 - Failure with more than 4 localities
• Issue #1386 - Dispatching unhandled exceptions to outer user code
• Issue #1385 - Adding Copy algorithms, fixing parallel::copy_if
• Issue #1384 - Fixing 1325
• Issue #1383 - Fixed #504: Refactor Dataflow LCO to work with futures, this removes the dataflow component as it is obsolete
• Issue #1382 - is_sorted, is_sorted_until and is_partitioned algorithms
• Issue #1381 - fix for CMake versions prior to 3.1
• Issue #1380 - resolved warning in CMake 3.1 and newer
• Issue #1379 - Compilation error with papi
• Issue #1378 - Towards safer migration
• Issue #1377 - HPXConfig.cmake should include TCMALLOC_LIBRARY and TCMALLOC_INCLUDE_DIR
• Issue #1376 - Warning on uninitialized member
• Issue #1375 - Fixing 1163
• Issue #1374 - Fixing the MSVC 12 release builder
• Issue #1373 - Modifying parallel search algorithm for zero length searches
• Issue #1372 - Modifying parallel search algorithm for zero length searches
• Issue #1371 - Avoid holding a lock during agas::incref while doing a credit split
• Issue #1370 - --hpx:bind throws unexpected error
• Issue #1369 - Getting rid of (void) in loops
• Issue #1368 - Variadic templates support for tuple
• Issue #1367 - One last batch of variadic templates support
• Issue #1366 - Fixing symbolic namespace hang
• Issue #1365 - More held locks
• Issue #1364 - Add counters 1363
• Issue #1363 - Add thread overhead counters
• Issue #1362 - Std config removal
• Issue #1361 - Parcelport plugins
• Issue #1360 - Detuplify transfer_action
• Issue #1359 - Removed obsolete checks
• Issue #1358 - Fixing 1352
• Issue #1357 - Variadic templates support for runtime_support and components

• Issue #1332 - Variadic templates support for actions
• Issue #1331 - Some ambiguous calls of map::erase have been prevented by adding additional check in locality constructor.
• Issue #1330 - Defining Plain Actions does not work as described in the documentation
• Issue #1329 - Distributed vector cleanup
• Issue #1328 - Sync docs and comments with code in hello_world example
• Issue #1327 - Typos in docs
• Issue #1326 - Documentation and code diverged in Fibonacci tutorial
• Issue #1325 - Exceptions thrown during parcel handling are not handled correctly
• Issue #1324 - fixed bandwidth calculation
• Issue #1323 - mmap() failed to allocate thread stack due to insufficient resources
• Issue #1322 - HPX fails to build aa182cf
• Issue #1321 - Limiting size of outgoing messages while coalescing parcels
• Issue #1320 - passing a future with launch::deferred in remote function call causes hang
• Issue #1319 - An exception when tries to specify number high priority threads with abp-priority
• Issue #1318 - Unable to run program with abp-priority and numa-sensitivity enabled
• Issue #1317 - N4071 Search/Search_n finished, minor changes
• Issue #1316 - Add config option to make -hp::run_hpx_main!=1 the default
• Issue #1314 - Variadic support for async and apply
• Issue #1313 - Adjust when_any/some to the latest proposed interfaces
• Issue #1312 - Fixing #857: hp::naming::locality leaks parcelport specific information into the public interface
• Issue #1311 - Distributed get'er/set'er_values for distributed vector
• Issue #1310 - Crashing in hp::parcelset::policies::mpi::connection_handler::handle_messages() on SuperMIC

• Issue #1308 - Unable to execute an application with –hpx:threads
• Issue #1307 - merge_graph linking issue
• Issue #1306 - First batch of variadic templates support
• Issue #1305 - Create a compiler wrapper
• Issue #1304 - Provide a compiler wrapper for hpx
• Issue #1303 - Drop support for GCC44
• Issue #1302 - Fixing #1297
• Issue #1301 - Compilation error when tried to use boost range iterators with wait_all
• Issue #1298 - Distributed vector
• Issue #1297 - Unable to invoke component actions recursively
• Issue #1294 - HDF5 build error
• Issue #1275 - The parcelport implementation is non-optimal
• Issue #1267 - Added classes and unit tests for local_file, orangefs_file and pxfs_file
• Issue #1264 - Error “assertion ‘!m_fun’ failed” randomly occurs when using TCP
• Issue #1254 - thread binding seems to not work properly
• Issue #1220 - parallel::copy_if is broken
• Issue #1217 - Find a better way of fixing the issue patched by #1216
• Issue #1168 - Starting HPX on Cray machines using aprun isn’t working correctly
• Issue #1085 - Replace startup and shutdown barriers with broadcasts
• Issue #981 - With SLURM, –hpx:threads=8 should not be necessary
• Issue #857 - hpx::naming::locality leaks parcelport specific information into the public interface
• Issue #850 - “flush” not documented
• Issue #763 - Create buildbot instance that uses std::bind as HPX_STD_BIND

• Issue #680 - Convert parcel ports into a plugin system
• Issue #582 - Make exception thrown from HPX threads available from hpx::init
• Issue #504 - Refactor Dataflow LCO to work with futures
• Issue #196 - Don’t store copies of the locality network metadata in the gva table

HPX V0.9.9 (Oct 31, 2014, codename Spooky)

General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the HPX releases so far. We are especially happy about the large number of people who contributed for the first time to HPX.

• We completed the transition from the older (non-conforming) implementation of hpx::future to the new and fully conforming version by removing the old code and by renaming the type hpx::unique_future to hpx::future. In order to maintain backwards compatibility with existing code which uses the type hpx::unique_future we support the configuration variable HPX_UNIQUE_FUTURE_ALIAS. If this variable is set to ON while running cmake it will additionally define a template alias for this type.

• We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: Building HPX. Please revisit your build scripts to adapt to the changes. The most notable changes are:
  – HPX_NO_INSTALL is no longer necessary.
  – For external builds, you need to set HPX_DIR instead of HPX_ROOT as described here: Using HPX with CMake-based projects.
  – IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
  – Building HPX statically (without dynamic libraries) is now supported (-DHPX_STATIC_LINKING=On).
  – Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section CMake options for more information).
  – This also fixes a long list of issues, for more information see Issue #1204.

• We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably N4409 (Working Draft, Technical Specification for C++ Extensions for Parallelism), N4411 (Task Region Rev. 3), and N4313 (Working Draft, Technical Specification for C++ Extensions for Concurrency).

• We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at HPX Buildbot Website.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1296 - Rename make_error_future to make_exceptional_future, adjust to N4123
- Issue #1295 - building issue
- Issue #1293 - Transpose example
- Issue #1292 - Wrong abs() function used in example
- Issue #1291 - non-synchronized shift operators have been removed
- Issue #1290 - RDTSCP is defined as true for Xeon Phi build
- Issue #1289 - Fixing 1288
- Issue #1288 - Add new performance counters
- Issue #1287 - Hierarchy scheduler broken performance counters
- Issue #1286 - Algorithm cleanup
- Issue #1285 - Broken Links in Documentation
- Issue #1284 - Uninitialized copy
- Issue #1283 - missing boost::scoped_ptr includes
- Issue #1282 - Update documentation of build options for schedulers
- Issue #1281 - reset idle rate counter
- Issue #1280 - Bug when executing on Intel MIC
- Issue #1279 - Add improved when_all/wait_all
- Issue #1278 - Implement improved when_all/wait_all
- Issue #1277 - feature request: get access to argc argv and variables_map
- Issue #1276 - Remove merging map
- Issue #1274 - Weird (wrong) string code in papi.cpp
• Issue #1273 - Sequential task execution policy
• Issue #1272 - Avoid CMake name clash for Boost.Thread library
• Issue #1271 - Updates on HPX Test Units
• Issue #1270 - hpx/util/safe_lexical_cast.hpp is added
• Issue #1269 - Added default value for “LIB” cmake variable
• Issue #1268 - Memory Counters not working
• Issue #1266 - FindHPX.cmake is not installed
• Issue #1265 - apply_remote test takes too long
• Issue #1262 - Chrono cleanup
• Issue #1261 - Need make install for papi counters and this builds all the examples
• Issue #1260 - Documentation of Stencil example claims
• Issue #1259 - Avoid double-linking Boost on Windows
• Issue #1257 - Adding additional parameter to create_thread
• Issue #1256 - Added buildbot changes to release notes
• Issue #1255 - Cannot build MiniGhost
• Issue #1253 - hpx::thread defects
• Issue #1252 - HPX_PREFIX is too fragile
• Issue #1250 - switch_to_fiber_emulation does not work properly
• Issue #1249 - Documentation is generated under Release folder
• Issue #1248 - Fix usage of hpx_generic_coroutine_context and get tests passing on powerpc
• Issue #1247 - Dynamic linking error
• Issue #1246 - Make cpuid.cpp C++11 compliant
• Issue #1245 - HPX fails on startup (setting thread affinity mask)
• Issue #1244 - HPX_WITH_RDTSC configure test fails, but should succeed
• Issue #1243 - CTest dashboard info for CSCS CDash drop location
• Issue #1242 - Mac fixes
• Issue #1241 - Failure in Distributed with Boost 1.56
• Issue #1240 - fix a race condition in examples.diskperf
• Issue #1239 - fix wait_each in examples.diskperf
• Issue #1238 - Fixed #1237: hpx::util::portable_binary_iarchive failed
• Issue #1237 - hpx::util::portable_binary_iarchive faileds
• Issue #1235 - Fixing clang warnings and errors
• Issue #1234 - TCP runs fail: Transport endpoint is not connected
• Issue #1233 - Making sure the correct number of threads is registered with AGAS
• Issue #1232 - Fixing race in wait_xxx
• Issue #1231 - Parallel minmax
• Issue #1230 - Distributed run of 1d_stencil_8 uses less threads than spec. & sometimes gives errors
• Issue #1229 - Unstable number of threads
• Issue #1228 - HPX link error (cmake / MPI)
• Issue #1226 - Warning about struct/class thread_counters
• Issue #1225 - Adding parallel::replace etc
• Issue #1224 - Extending dataflow to pass through non-future arguments
• Issue #1223 - Remaining find algorithms implemented, N4071
• Issue #1222 - Merging all the changes
• Issue #1221 - No error output when using mpirun with hpx
• Issue #1219 - Adding new AGAS cache performance counters

2.10. Releases
• Issue #1216 - Fixing using futures (clients) as arguments to actions
• Issue #1215 - Error compiling simple component
• Issue #1214 - Stencil docs
• Issue #1213 - Using more than a few dozen MPI processes on SuperMikie results in a seg fault before getting to hpx_main
• Issue #1212 - Parallel rotate
• Issue #1211 - Direct actions cause the future’s shared_state to be leaked
• Issue #1210 - Refactored local::promise to be standard conformant
• Issue #1209 - Improve command line handling
• Issue #1208 - Adding parallel::reverse and parallel::reverse_copy
• Issue #1207 - Add copy_backward and move_backward
• Issue #1206 - N4071 additional algorithms implemented
• Issue #1204 - Cmake simplification and various other minor changes
• Issue #1203 - Implementing new launch policy for (local) async: hpx::launch::fork.
• Issue #1202 - Failed assertion in connection_cache.hpp
• Issue #1201 - pkg-config doesn’t add mpi link directories
• Issue #1200 - Error when querying time performance counters
• Issue #1199 - library path is now configurable (again)
• Issue #1198 - Error when querying performance counters
• Issue #1197 - tests fail with intel compiler
• Issue #1196 - Silence several warnings
• Issue #1195 - Rephrase initializers to work with VC++ 2012
• Issue #1194 - Simplify parallel algorithms
• Issue #1193 - Adding parallel::equal

5156 https://github.com/STEllAR-GROUP/hpx/issues/1194
5157 https://github.com/STEllAR-GROUP/hpx/issues/1193
• Issue #1192 - HPX(out_of_memory) on including <hpx/hpx.hpp>
• Issue #1191 - Fixing #1189
• Issue #1190 - Chrono cleanup
• Issue #1189 - Deadlock .. somewhere? (probably serialization)
• Issue #1188 - Removed future::get_status()
• Issue #1186 - Fixed FindOpenCL to find current AMD APP SDK
• Issue #1184 - Tweaking future unwrapping
• Issue #1183 - Extended parallel::reduce
• Issue #1182 - future::unwrap hangs for launch::deferred
• Issue #1181 - Adding all_of, any_of, and none_of and corresponding documentation
• Issue #1180 - hpx::cout defect
• Issue #1179 - hpx::async does not work for member function pointers when called on types with self-defined unary operator*
• Issue #1178 - Implemented variadic hpx::util::zip_iterator
• Issue #1177 - MPI parcelport defect
• Issue #1176 - HPX_DEFINE_COMPONENT_CONST_ACTION_TPL does not have a 2-argument version
• Issue #1175 - Create util::zip_iterator working with util::tuple<>
• Issue #1174 - Error Building HPX on linux, root_certificate_authority.cpp
• Issue #1173 - hpx::cout output lost
• Issue #1172 - HPX build error with Clang 3.4.2
• Issue #1171 - CMAKE_INSTALL_PREFIX ignored
• Issue #1170 - Close hpx_benchmarks repository on Github
• Issue #1169 - Buildbot emails have syntax error in url
• Issue #1167 - Merge partial implementation of standards proposal N3960

2.10. Releases
• Issue #1166 - Fixed several compiler warnings
• Issue #1165 - cmake warns: “tests.regressions.actions” does not exist
• Issue #1164 - Want my own serialization of hpx::future
• Issue #1162 - Segfault in hello_world example
• Issue #1161 - Use HPX_ASSERT to aid the compiler
• Issue #1160 - Do not put -DNDEBUG into hpx_application.pc
• Issue #1159 - Support Clang 3.4.2
• Issue #1158 - Fixed #1157: Rename when_n/wait_n, add when_xxx_n/wait_xxx_n
• Issue #1157 - Rename when_n/wait_n, add when_xxx_n/wait_xxx_n
• Issue #1156 - Force inlining fails
• Issue #1155 - changed header of printout to be compatible with python csv module
• Issue #1154 - Fixing iostreams
• Issue #1153 - Standard manipulators (like std::endl) do not work with hpx::ostream
• Issue #1152 - Functions revamp
• Issue #1151 - Suppressing cmake 3.0 policy warning for CMP0026
• Issue #1150 - Client Serialization error
• Issue #1149 - Segfault on Stampede
• Issue #1148 - Refactoring mini-ghost
• Issue #1147 - N3960 copy_if and copy_n implemented and tested
• Issue #1146 - Stencil print
• Issue #1145 - N3960 hpx::parallel::copy implemented and tested
• Issue #1144 - OpenMP examples 1d_stencil do not build
• Issue #1143 - 1d_stencil OpenMP examples do not build

https://github.com/STEllAR-GROUP/hpx/issues/1144
https://github.com/STEllAR-GROUP/hpx/issues/1143
• Issue #1142  - Cannot build HPX with gcc 4.6 on OS X
• Issue #1140  - Fix OpenMP lookup, enable usage of config tests in external CMake projects.
• Issue #1139  - hpx/hpx/config/compiler_specific.hpp
• Issue #1138  - clean up pkg-config files
• Issue #1137  - Improvements to create binary packages
• Issue #1136  - HPX_GCC_VERSION not defined on all compilers
• Issue #1135  - Avoiding collision between winsock2.h and windows.h
• Issue #1134  - Making sure, that hpx::finalize can be called from any locality
• Issue #1133  - 1d stencil examples
• Issue #1131  - Refactor unique_function implementation
• Issue #1130  - Unique function
• Issue #1129  - Some fixes to the Build system on OS X
• Issue #1128  - Action future args
• Issue #1127  - Executor causes segmentation fault
• Issue #1124  - Adding new API functions: register_id_with_basename, unregister_id_with_basename, find_ids_from_basename; adding test
• Issue #1123  - Reduce nesting of try-catch construct in encode_parcel?
• Issue #1122  - Client base fixes
• Issue #1121  - Update hpixrun.py.in
• Issue #1120  - HTTS2 tests compile errors on v110 (VS2012)
• Issue #1119  - Remove references to boost::atomic in accumulator example
• Issue #1118  - Only build test thread_pool_executor_1114_test if HPX_SCHEDULER is set
• Issue #1117  - local_queue_executor linker error on vc110
• Issue #1116  - Disabled performance counter should give runtime errors, not invalid data

• Issue #1115 - Compile error with Intel C++ 13.1
• Issue #1114 - Default constructed executor is not usable
• Issue #1113 - Fast compilation of logging causes ABI incompatibilities between different NDEBUG values
• Issue #1112 - Using thread_pool_executors causes segfault
• Issue #1111 - hpx::threads::get_thread_data always returns zero
• Issue #1110 - Remove unnecessary null pointer checks
• Issue #1109 - More tests adjustments
• Issue #1108 - Clarify build rules for “libboost_atomic-mt.so”?
• Issue #1107 - Remove unnecessary null pointer checks
• Issue #1106 - network_storage benchmark improvements, adding legends to plots and tidying layout
• Issue #1105 - Add more plot outputs and improve instructions doc
• Issue #1104 - Complete quoting for parameters of some CMake commands
• Issue #1103 - Work on test/scripts
• Issue #1102 - Changed minimum requirement of window install to 2012
• Issue #1101 - Changed minimum requirement of window install to 2012
• Issue #1100 - Changed readme to no longer specify using MSVC 2010 compiler
• Issue #1099 - Error returning futures from component actions
• Issue #1098 - Improve storage test
• Issue #1097 - data_actions quickstart example calls missing function decorate_action of data_get_action
• Issue #1096 - MPI parcelport broken with new zero copy optimization
• Issue #1095 - Warning C4005: _WIN32_WINNT: Macro redefinition
• Issue #1094 - Syntax error for -DHPX_UNIQUE_FUTURE_ALIAS in master
• Issue #1093 - Syntax error for -DHPX_UNIQUE_FUTURE_ALIAS
• Issue #1092 - Rename unique_future<> back to future<>  
• Issue #1091 - Inconsistent error message  
• Issue #1090 - On windows 8.1 the examples crashed if using more than one os thread  
• Issue #1089 - Components should be allowed to have their own executor  
• Issue #1088 - Add possibility to select a network interface for the ibverbs parcelport  
• Issue #1087 - ibverbs and ipc parcelport uses zero copy optimization  
• Issue #1083 - Make shell examples copyable in docs  
• Issue #1082 - Implement proper termination detection during shutdown  
• Issue #1081 - Implement thread_specific_ptr for hpx::threads  
• Issue #1072 - make install not working properly  
• Issue #1070 - Complete quoting for parameters of some CMake commands  
• Issue #1059 - Fix more unused variable warnings  
• Issue #1051 - Implement when_each  
• Issue #973 - Would like option to report hwloc bindings  
• Issue #970 - Bad flags for Fortran compiler  
• Issue #941 - Create a proper user level context switching class for BG/Q  
• Issue #935 - Build error with gcc 4.6 and Boost 1.54.0 on hpx trunk and 0.9.6  
• Issue #934 - Want to build HPX without dynamic libraries  
• Issue #927 - Make hpx/lcos/reduce.hpp accept futures of id_type  
• Issue #926 - All unit tests that are run with more than one thread with CTest/hpx_run_test should configure hpx.os_threads  
• Issue #925 - regression_dataflow_791 needs to be brought in line with HPX standards  
• Issue #899 - Fix race conditions in regression tests  
• Issue #879 - Hung test leads to cascading test failure; make tests should support the MPI parcelport

2.10. Releases
• Issue #865\textsuperscript{5273} - future<T> and friends shall work for movable only Ts
• Issue #847\textsuperscript{5274} - Dynamic libraries are not installed on OS X
• Issue #816\textsuperscript{5275} - First Program tutorial pull request
• Issue #799\textsuperscript{5276} - Wrap lexical_cast to avoid exceptions
• Issue #720\textsuperscript{5277} - broken configuration when using ccmake on Ubuntu
• Issue #622\textsuperscript{5278} - --hpx:hpx and --hpx:debug-hpx-log is nonsensical
• Issue #525\textsuperscript{5279} - Extend barrier LCO test to run in distributed
• Issue #515\textsuperscript{5280} - Multi-destination version of hpx::apply is broken
• Issue #509\textsuperscript{5281} - Push Boost.Atomic changes upstream
• Issue #503\textsuperscript{5282} - Running HPX applications on Windows should not require setting %PATH%
• Issue #461\textsuperscript{5283} - Add a compilation sanity test
• Issue #456\textsuperscript{5284} - hpx_run_tests.py should log output from tests that timeout
• Issue #454\textsuperscript{5285} - Investigate threadmanager performance
• Issue #345\textsuperscript{5286} - Add more versatile environmental/cmake variable support to hpx_find_* CMake macros
• Issue #209\textsuperscript{5287} - Support multiple configurations in generated build files
• Issue #190\textsuperscript{5288} - hpx::cout should be a std::ostream
• Issue #189\textsuperscript{5289} - iostreams component should use startup/shutdown functions
• Issue #183\textsuperscript{5290} - Use Boost.ICL for correctness in AGAS
• Issue #44\textsuperscript{5291} - Implement real futures

HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.). With the changes below, HPX is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, HPX insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using HPX:

- HPX is solidly rooted in a sophisticated theoretical execution model – ParalleX
- HPX exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of HPX.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today’s mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

General changes

- A major API breaking change for this release was introduced by implementing hpx::future and hpx::shared_future fully in conformance with the C++11 Standard\(^ {5292}\). While hpx::shared_future is new and will not create any compatibility problems, we revised the interface and implementation of the existing hpx::future. For more details please see the mailing list archive\(^ {5293}\). To avoid any incompatibilities for existing code we named the type which implements the std::future interface as hpx::unique_future. For the next release this will be renamed to hpx::future, making it full conforming to C++11 Standard\(^ {5294}\).
- A large part of the code base of HPX has been refactored and partially re-implemented. The main changes were related to
  - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
  - The parcel subsystem: these changes improve the performance of the HPX networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
  - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
  - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.

\(^ {5292}\) http://www.open-std.org/jtc1/sc22/wg21
\(^ {5293}\) http://mail.cct.lsu.edu/pipermail/hpx-users/2014-January/000141.html
\(^ {5294}\) http://www.open-std.org/jtc1/sc22/wg21
• We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.

• We removed the use of C++11 move emulation (using Boost.Move), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.

• We improved the reference counting scheme used by HPX which helps managing distributed objects and memory. This improves the overall stability of HPX and further simplifies writing real world applications.

• The minimal Boost version required to use HPX is now V1.49.0.

• This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the XPI specification\(^\text{5295}\).

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release.

• **Issue #1086\(^\text{5296}\) -** Expose internal `boost::shared_array` to allow user management of array lifetime

• **Issue #1083\(^\text{5297}\) -** Make shell examples copyable in docs

• **Issue #1080\(^\text{5298}\) -** `/threads{locality#/total}/count/cumulative broken`

• **Issue #1079\(^\text{5299}\) -** Build problems on OS X

• **Issue #1078\(^\text{5300}\) -** Improve robustness of component loading

• **Issue #1077\(^\text{5301}\) -** Fix a missing enum definition for ‘take’ mode

• **Issue #1076\(^\text{5302}\) -** Merge Jb master

• **Issue #1075\(^\text{5303}\) -** Unknown CMake command “add_hpx_pseudo_target”

• **Issue #1074\(^\text{5304}\) -** Implement `apply_continue_callback` and `apply_colocated_callback`

• **Issue #1073\(^\text{5305}\) -** The new `apply_colocated` and `async_colocated` functions lead to automatic registered functions

• **Issue #1071\(^\text{5306}\) -** Remove `deferred_packaged_task`

• **Issue #1069\(^\text{5307}\) -** `serialize_buffer` with allocator fails at destruction

• **Issue #1068\(^\text{5308}\) -** Coroutine include and forward declarations missing

• **Issue #1067\(^\text{5309}\) -** Add allocator support to `util::serialize_buffer`

- Issue #1066 - Allow for MPI_Init being called before HPX launches
- Issue #1065 - AGAS cache isn’t used/populated on worker localities
- Issue #1064 - Reorder includes to ensure ws2 includes early
- Issue #1063 - Add hpx::runtime::suspend and hpx::runtime::resume
- Issue #1062 - Fix async_continue to properly handle return types
- Issue #1061 - Implement async_colocated and apply_colocated
- Issue #1060 - Implement minimal component migration
- Issue #1058 - Remove HPX_UTIL_TUPLE from code base
- Issue #1057 - Add performance counters for threading subsystem
- Issue #1055 - Thread allocation uses two memory pools
- Issue #1053 - Work stealing flawed
- Issue #1052 - Fix a number of warnings
- Issue #1049 - Fixes for TLS on OSX and more reliable test running
- Issue #1048 - Fixing after 588 hang
- Issue #1047 - Use port ‘0’ for networking when using one locality
- Issue #1046 - composable_guard test is broken when having more than one thread
- Issue #1045 - Security missing headers
- Issue #1044 - Native TLS on FreeBSD via __thread
- Issue #1043 - async et.al. compute the wrong result type
- Issue #1042 - async et.al. implicitly unwrap reference_wrappers
- Issue #1041 - Remove redundant costly Kleene stars from regex searches
- Issue #1040 - CMake script regex match patterns has unnecessary kleenes
- Issue #1039 - Remove use of Boost.Move and replace with std::move and real rvalue refs
• Issue #1038 - Bump minimal required Boost to 1.49.0
• Issue #1037 - Implicit unwrapping of futures in async broken
• Issue #1036 - Scheduler hangs when user code attempts to “block” OS-threads
• Issue #1035 - Idle-rate counter always reports 100% idle rate
• Issue #1034 - Symbolic name registration causes application hangs
• Issue #1033 - Application options read in from an options file generate an error message
• Issue #1032 - hpx::id_type local reference counting is wrong
• Issue #1031 - Negative entry in reference count table
• Issue #1030 - Implement condition_variable
• Issue #1029 - Deadlock in thread scheduling subsystem
• Issue #1028 - HPX-thread cumulative count performance counters report incorrect value
• Issue #1027 - Expose hpx::thread_interrupted error code as a separate exception type
• Issue #1026 - Exceptions thrown in asynchronous calls can be lost if the value of the future is never queried
• Issue #1025 - future::wait_for/wait_until do not remove callback
• Issue #1024 - Remove dependence to boost assert and create hpx assert
• Issue #1023 - Segfaults with tmalloc
• Issue #1022 - prerequisites link in readme is broken
• Issue #1020 - HPX Deadlock on external synchronization
• Issue #1019 - Convert using BOOST_ASSERT to HPX_ASSERT
• Issue #1018 - compiling bug with gcc 4.8.1
• Issue #1017 - Possible crash in io_pool executor
• Issue #1016 - Crash at startup
• Issue #1014 - Implement Increment/Decrement Merging

Chapter 2. What’s so special about HPX?
• Issue #1013 - Add more logging channels to enable greater control over logging granularity
• Issue #1012 - --hpx:debug-hpx-log and --hpx:debug-agas-log lead to non-thread safe writes
• Issue #1011 - After installation, running applications from the build/staging directory no longer works
• Issue #1010 - Mergeable decrement requests are not being merged
• Issue #1009 - --hpx:list-symbolic-names crashes
• Issue #1007 - Components are not properly destroyed
• Issue #1006 - Segfault/hang in set_data
• Issue #1005 - Performance counter naming issue
• Issue #982 - Race condition during startup
• Issue #912 - OS X: component type not found in map
• Issue #663 - Create a buildbot slave based on Clang 3.2/OSX
• Issue #636 - Expose this_locality::apply<act>(p1, p2); for local execution
• Issue #197 - Add --console=address option for PBS runs
• Issue #175 - Asynchronous AGAS API

**HPX V0.9.7 (Nov 13, 2013)**

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

**General changes**

• Ported HPX to BlueGene/Q
• Improved HPX support for Xeon/Phi accelerators
• Reimplemented hpx::bind, hpx::tuple, and hpx::function for better performance and better compliance with the C++11 Standard. Added hpx::mem_fn.
• Reworked hpx::when_all and hpx::when_any for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added hpx::when_any_swapped.
• Added hpx::copy as a precursor for a migrate functionality
• Added hpx::get_ptr allowing to directly access the memory underlying a given component
• Added the hpx::lcos::broadcast, hpx::lcos::reduce, and hpx::lcos::fold collective operations

5367 https://github.com/STEllAR-GROUP/hpx/issues/636
5368 https://github.com/STEllAR-GROUP/hpx/issues/197
5369 https://github.com/STEllAR-GROUP/hpx/issues/175
• Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
• Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind (balanced, scattered, compact)`, improved default settings when running multiple localities on the same node.
• Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
• Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
• General performance improvements of the code related to threads and futures.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

• Issue #1005[5370] - Allow one to disable array optimizations and zero copy optimizations for each parcelport
• Issue #1004[5371] - Generate new HPX logo image for the docs
• Issue #1002[5372] - If MPI parcelport is not available, running HPX under mpirun should fail
• Issue #1001[5373] - Zero copy serialization raises assert
• Issue #1000[5374] - Can’t connect to a HPX application running with the MPI parcelport from a non MPI parcelport locality
• Issue #999[5375] - Optimize `hpx::when_n`
• Issue #998[5376] - Fixed const-correctness
• Issue #997[5377] - Making `serialize_buffer::data()` type save
• Issue #996[5378] - Memory leak in `hpx::lcos::promise`
• Issue #995[5379] - Race while registering pre-shutdown functions
• Issue #994[5380] - thread_rescheduling regression test does not compile
• Issue #992[5381] - Correct comments and messages
• Issue #991[5382] - setcap cap_sys_rawio=ep for power profiling causes an HPX application to abort
• Issue #989[5383] - Jacobi hangs during execution
• Issue #988[5384] - multiple_init test is failing

• Issue #986\(^{5385}\) - Can’t call a function called “init” from “main” when using `<hpx/hpx_main.hpp>`
• Issue #984\(^{5386}\) - Reference counting tests are failing
• Issue #983\(^{5387}\) - thread\_suspension\_executor test fails
• Issue #980\(^{5388}\) - Terminating HPX threads don’t leave stack in virgin state
• Issue #979\(^{5389}\) - Static scheduler not in documents
• Issue #978\(^{5390}\) - Preprocessing limits are broken
• Issue #977\(^{5391}\) - Make tests\_regressions\_lcos\_future\_hang\_on\_get shorter
• Issue #976\(^{5392}\) - Wrong library order in pkgconfig
• Issue #975\(^{5393}\) - Please reopen #963
• Issue #974\(^{5394}\) - Option pu\_offset ignored in fixing\_588 branch
• Issue #972\(^{5395}\) - Cannot use MKL with HPX
• Issue #969\(^{5396}\) - Non-existent INI files requested on the command line via `--hpx:config` do not cause warnings or errors.
• Issue #968\(^{5397}\) - Cannot build examples in fixing\_588 branch
• Issue #967\(^{5398}\) - Command line description of `--hpx:queuing` seems wrong
• Issue #966\(^{5399}\) - `--hpx:print\_bind` physical core numbers are wrong
• Issue #965\(^{5400}\) - Deadlock when building in Release mode
• Issue #963\(^{5401}\) - Not all worker threads are working
• Issue #962\(^{5402}\) - Problem with SLURM integration
• Issue #961\(^{5403}\) - `--hpx:print\_bind` outputs incorrect information
• Issue #960\(^{5404}\) - Fix cut and paste error in documentation of get\_thread\_priority
• Issue #959\(^{5405}\) - Change link to boost.atomic in documentation to point to boost.org
• Issue #958\(^{5406}\) - Undefined reference to intrusive\_ptr\_release
• Issue #957\(^{5407}\) - Make tuple standard compliant

• Issue #956 - Segfault with a3382fb
• Issue #955 - --hpx:nodes and --hpx:nodefiles do not work with foreign nodes
• Issue #954 - Make order of arguments for hpx::async and hpx::broadcast consistent
• Issue #953 - Cannot use MKL with HPX
• Issue #952 - register_[pre_]shutdown_function never throw
• Issue #951 - Assert when number of threads is greater than hardware concurrency
• Issue #948 - HPX_HAVE_GENERIC_CONTEXT_COROUTINES conflicts with HPX_HAVE_FIBER_BASED_COROUTINES
• Issue #947 - Need MPI_THREAD_MULTIPLE for backward compatibility
• Issue #946 - HPX does not call MPI_Finalize
• Issue #945 - Segfault with hpx::lcos::broadcast
• Issue #944 - OS X: assertion pu_offset_ < hardware_concurrency failed
• Issue #943 - #include <hpx/hpx_main.hpp> does not work
• Issue #942 - Make the BG/Q work with -O3
• Issue #940 - Use separator when concatenating locality name
• Issue #939 - Refactor MPI parcelport to use MPI_Wait instead of multiple MPI_Test calls
• Issue #938 - Want to officially access client_base::gid_
• Issue #937 - client_base::gid_ should be private
• Issue #936 - Want doxygen-like source code index
• Issue #935 - Build error with gcc 4.6 and Boost 1.54.0 on hpx trunk and 0.9.6
• Issue #933 - Cannot build HPX with Boost 1.54.0
• Issue #932 - Components are destructed too early
• Issue #931 - Make HPX work on BG/Q
• Issue #930 - make git-docs is broken

https://github.com/STEllAR-GROUP/hpx/issues/930
• Issue #929 - Generating index in docs broken
• Issue #928 - Optimize hpx::util::static_ for C++11 compilers supporting magic statics
• Issue #924 - Make kill_process_tree (in process.py) more robust on Mac OSX
• Issue #923 - Correct BLAS and RNPL cmake tests
• Issue #922 - Cannot link against BLAS
• Issue #921 - Implement hpx::mem_fn
• Issue #920 - Output locality with --hpx:print-bind
• Issue #919 - Correct grammar; simplify boolean expressions
• Issue #918 - Link to hello_world.cpp is broken
• Issue #917 - adapt cmake file to new boostbook version
• Issue #916 - fix problem building documentation with xsltproc >= 1.1.27
• Issue #915 - Add another TBBMalloc library search path
• Issue #914 - Build problem with Intel compiler on Stampede (TACC)
• Issue #913 - fix error messages in fibonacci examples
• Issue #911 - Update OS X build instructions
• Issue #910 - Want like to specify MPI_ROOT instead of compiler wrapper script
• Issue #909 - Warning about void* arithmetic
• Issue #908 - Buildbot for MIC is broken
• Issue #906 - Can't use --hpx:bind=balanced with multiple MPI processes
• Issue #905 - --hpx:bind documentation should describe full grammar
• Issue #904 - Add hpx::lcos::fold and hpx::lcos::inverse_fold collective operation
• Issue #903 - Add hpx::when_any_swapped()
• Issue #902 - Add hpx::lcos::reduce collective operation

• Issue #901[^5454] - Web documentation is not searchable
• Issue #900[^5455] - Web documentation for trunk has no index
• Issue #898[^5456] - Some tests fail with GCC 4.8.1 and MPI parcel port
• Issue #897[^5457] - HWLOC causes failures on Mac
• Issue #896[^5458] - pu-offset leads to startup error
• Issue #895[^5459] - `hpx::get_locality_name` not defined
• Issue #894[^5460] - Race condition at shutdown
• Issue #893[^5461] - `--hpx:print-bind` switches std::cout to hexadecimal mode
• Issue #892[^5462] - `hwloc_topology_load` can be expensive - don’t call multiple times
• Issue #891[^5463] - The documentation for `get_locality_name` is wrong
• Issue #890[^5464] - `--hpx:print-bind` should not exit
• Issue #889[^5465] - `--hpx:debug-hpx-log=FILE` does not work
• Issue #888[^5466] - MPI parcelport does not exit cleanly for `--hpx:print-bind`
• Issue #887[^5467] - Choose thread affinities more cleverly
• Issue #886[^5468] - Logging documentation is confusing
• Issue #885[^5469] - Two threads are slower than one
• Issue #884[^5470] - is_callable failing with member pointers in C++11
• Issue #883[^5471] - Need help with is_callable_test
• Issue #882[^5472] - tests.regressions.lcos.future_hang_on_get does not terminate
• Issue #881[^5473] - tests/regressions/block_matrix/matrix.hh won’t compile with GCC 4.8.1
• Issue #880[^5474] - HPX does not work on OS X
• Issue #878[^5475] - `future::unwrap` triggers assertion
• Issue #877[^5476] - “make tests” has build errors on Ubuntu 12.10

• Issue #876 - tcmalloc is used by default, even if it is not present
• Issue #875 - global_fixture is defined in a header file
• Issue #874 - Some tests take very long
• Issue #873 - Add block-matrix code as regression test
• Issue #872 - HPX documentation does not say how to run tests with detailed output
• Issue #871 - All tests fail with “make test”
• Issue #870 - Please explicitly disable serialization in classes that don’t support it
• Issue #869 - boost_any test failing
• Issue #867 - Reduce the number of copies of hpx::function arguments
• Issue #863 - Futures should not require a default constructor
• Issue #862 - value_or_error shall not default construct its result
• Issue #861 - HPX_UNUSED macro
• Issue #860 - Add functionality to copy construct a component
• Issue #859 - hpx::endl should flush
• Issue #858 - Create hpx::get_ptr<> allowing to access component implementation
• Issue #855 - Implement hpx::INVOKE
• Issue #854 - hpx/hpx.hpp does not include hpx/include/iostreams.hpp
• Issue #853 - Feature request: null future
• Issue #852 - Feature request: Locality names
• Issue #851 - hpx::cout output does not appear on screen
• Issue #849 - All tests fail on OS X after installing
• Issue #848 - Update OS X after installing
• Issue #846 - Update hpx_external_example

• Issue #845 - Issues with having both debug and release modules in the same directory
• Issue #844 - Create configuration header
• Issue #843 - Tests should use CTest
• Issue #842 - Remove buffer_pool from MPI parcelport
• Issue #841 - Add possibility to broadcast an index with hpx::cos::broadcast
• Issue #838 - Simplify util::tuple
• Issue #837 - Adopt boost::tuple tests for util::tuple
• Issue #836 - Adopt boost::function tests for util::function
• Issue #835 - Tuple interface missing pieces
• Issue #833 - Partially preprocessing files not working
• Issue #832 - Native papi counters do not work with wild cards
• Issue #831 - Arithmetics counter fails if only one parameter is given
• Issue #830 - Convert hpx::util::function to use new scheme for serializing its base pointer
• Issue #829 - Consistently use decay<T> instead of remove_const<remove_reference<T>>
• Issue #828 - Update future implementation to N3721 and N3722
• Issue #827 - Enable MPI parcelport for bootstrapping whenever application was started using mpirun
• Issue #826 - Support command line option --hpx:print-bind even if --hpx::bind was not used
• Issue #825 - Memory counters give segfault when attempting to use thread wild cards or numbers only total works
• Issue #824 - Enable lambda functions to be used with hpx::async/hpx::apply
• Issue #823 - Using a hashing filter
• Issue #822 - Silence unused variable warning
• Issue #821 - Detect if a function object is callable with given arguments
• Issue #820 - Allow wildcards to be used for performance counter names

• Issue #819\textsuperscript{5523} - Make the AGAS symbolic name registry distributed
• Issue #818\textsuperscript{5524} - Add future::then() overload taking an executor
• Issue #817\textsuperscript{5525} - Fixed typo
• Issue #815\textsuperscript{5526} - Create an lco that is performing an efficient broadcast of actions
• Issue #814\textsuperscript{5527} - Papi counters cannot specify thread\#* to get the counts for all threads
• Issue #813\textsuperscript{5528} - Scoped unlock
• Issue #811\textsuperscript{5529} - simple_central_tuplespace_client run error
• Issue #810\textsuperscript{5530} - ostream error when \textless\textless any objects
• Issue #809\textsuperscript{5531} - Optimize parcel serialization
• Issue #808\textsuperscript{5532} - HPX applications throw exception when executed from the build directory
• Issue #807\textsuperscript{5533} - Create performance counters exposing overall AGAS statistics
• Issue #795\textsuperscript{5534} - Create timed make\_ready\_future
• Issue #794\textsuperscript{5535} - Create heterogeneous when\_all/when\_any/etc.
• Issue #721\textsuperscript{5536} - Make HPX usable for Xeon Phi
• Issue #694\textsuperscript{5537} - CMake should complain if you attempt to build an example without its dependencies
• Issue #692\textsuperscript{5538} - SLURM support broken
• Issue #683\textsuperscript{5539} - python/hpx/process.py imports epoll on all platforms
• Issue #619\textsuperscript{5540} - Automate the doc building process
• Issue #600\textsuperscript{5541} - GTC performance broken
• Issue #577\textsuperscript{5542} - Allow for zero copy serialization/networking
• Issue #551\textsuperscript{5544} - Change executable names to have debug postfix in Debug builds
• Issue #544\textsuperscript{5544} - Write a custom .lib file on Windows pulling in hpx\_init and hpx.dll, phase out hpx\_init
• Issue #534\textsuperscript{5545} - hpx::init should take functions by std::function and should accept all forms of hpx\_main

2.10. Releases
• Issue #508 - FindPackage fails to set FOO_LIBRARY_DIR
• Issue #506 - Add cmake support to generate ini files for external applications
• Issue #470 - Changing build-type after configure does not update boost library names
• Issue #453 - Document hpx_run_tests.py
• Issue #445 - Significant performance mismatch between MPI and HPX in SMP for allgather example
• Issue #443 - Make docs viewable from build directory
• Issue #421 - Support multiple HPX instances per node in a batch environment like PBS or SLURM
• Issue #316 - Add message size limitation
• Issue #249 - Clean up locking code in big boot barrier
• Issue #136 - Persistent CMake variables need to be marked as cache variables

**HPX V0.9.6 (Jul 30, 2013)**

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

**General changes**

The major new features in this release are:

• We further consolidated the API exposed by HPX. We aligned our APIs as much as possible with the existing C++11 Standard and related proposals to the C++ standardization committee (such as N3632 and N3857).

• We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.

• We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.

• We successfully ported HPX to the Xeon Phi platform.

• Support for the SLURM scheduling system was implemented.

• Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.

• We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).

5546 https://github.com/STEllAR-GROUP/hpx/issues/508
5547 https://github.com/STEllAR-GROUP/hpx/issues/506
5548 https://github.com/STEllAR-GROUP/hpx/issues/470
5549 https://github.com/STEllAR-GROUP/hpx/issues/453
5550 https://github.com/STEllAR-GROUP/hpx/issues/445
5551 https://github.com/STEllAR-GROUP/hpx/issues/443
5552 https://github.com/STEllAR-GROUP/hpx/issues/421
5553 https://github.com/STEllAR-GROUP/hpx/issues/316
5554 https://github.com/STEllAR-GROUP/hpx/issues/249
5555 https://github.com/STEllAR-GROUP/hpx/issues/136
5556 http://www.open-std.org/jtc1/sc22/wg21
5557 http://wg21.link/n3632
5558 http://wg21.link/n3857
• We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.

• Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal N3562\textsuperscript{5559}. This API is bound to change in the future, though.

• Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.

• We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.

• We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance The Linda Coordination Language\textsuperscript{5560}).

### Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

• Issue #806\textsuperscript{5561} - make (all) in examples folder does nothing

• Issue #805\textsuperscript{5562} - Adding the introduction and fixing DOCBOOK dependencies for Windows use

• Issue #804\textsuperscript{5563} - Add stackless (non-suspendable) thread type

• Issue #803\textsuperscript{5564} - Create proper serialization support functions for util::tuple

• Issue #800\textsuperscript{5565} - Add possibility to disable array optimizations during serialization

• Issue #798\textsuperscript{5566} - HPX\_LIMIT does not work for local dataflow

• Issue #797\textsuperscript{5567} - Create a parcelport which uses MPI

• Issue #796\textsuperscript{5568} - Problem with Large Numbers of Threads

• Issue #793\textsuperscript{5569} - Changing dataflow test case to hang consistently

• Issue #792\textsuperscript{5570} - CMake Error

• Issue #791\textsuperscript{5571} - Problems with local::dataflow

• Issue #790\textsuperscript{5572} - wait\_for() doesn’t compile

• Issue #789\textsuperscript{5573} - HPX with Intel compiler segfaults

• Issue #788\textsuperscript{5574} - Intel compiler support

\textsuperscript{5574} \url{https://github.com/STEllAR-GROUP/hpx/issues/788}
- Issue #787 - Fixed SFINAEd specializations
- Issue #786 - Memory issues during benchmarking.
- Issue #785 - Create an API allowing to register external threads with HPX
- Issue #784 - util::plugin is throwing an error when a symbol is not found
- Issue #783 - How does hpx::bind work?
- Issue #782 - Added quotes around STRING REPLACE potentially empty arguments
- Issue #781 - Make sure no exceptions propagate into the thread manager
- Issue #780 - Allow arithmetics performance counters to expand its parameters
- Issue #779 - Test case for 778
- Issue #778 - Swapping futures segfaults
- Issue #777 - hpx::icos::details::when_xxx don’t restore completion handlers
- Issue #776 - Compiler chokes on dataflow overload with launch policy
- Issue #775 - Runtime error with local dataflow (copying futures?)
- Issue #774 - Using local dataflow without explicit namespace
- Issue #773 - Local dataflow with unwrap: functor operators need to be const
- Issue #772 - Allow (remote) actions to return a future
- Issue #771 - Setting HPX_LIMIT gives huge boost MPL errors
- Issue #770 - Add launch policy to (local) dataflow
- Issue #769 - Make compile time configuration information available
- Issue #768 - Const correctness problem in local dataflow
- Issue #767 - Add launch policies to async
- Issue #766 - Mark data structures for optimized (array based) serialization
- Issue #765 - Align hpx::any with N3508: Any Library Proposal (Revision 2)
- Issue #764\textsuperscript{5598} - Align hpx::future with newest N3558: A Standardized Representation of Asynchronous Operations
- Issue #762\textsuperscript{5599} - added a human readable output for the ping pong example
- Issue #761\textsuperscript{5600} - Ambiguous typename when constructing derived component
- Issue #760\textsuperscript{5601} - Simple components can not be derived
- Issue #759\textsuperscript{5602} - make install doesn’t give a complete install
- Issue #758\textsuperscript{5603} - Stack overflow when using locking\_hook<>
- Issue #757\textsuperscript{5604} - copy paste error; unsupported function overloading
- Issue #756\textsuperscript{5605} - GTCX runtime issue in Gordon
- Issue #755\textsuperscript{5606} - Papi counters don’t work with reset and evaluate API’s
- Issue #753\textsuperscript{5607} - cmake bugfix and improved component action docs
- Issue #752\textsuperscript{5608} - hpx simple component docs
- Issue #750\textsuperscript{5609} - Add hpx::util::any
- Issue #749\textsuperscript{5610} - Thread phase counter is not reset
- Issue #748\textsuperscript{5611} - Memory performance counter are not registered
- Issue #747\textsuperscript{5612} - Create performance counters exposing arithmetic operations
- Issue #745\textsuperscript{5613} - apply\_callback needs to invoke callback when applied locally
- Issue #744\textsuperscript{5614} - CMake fixes
- Issue #743\textsuperscript{5615} - Problem Building github version of HPX
- Issue #742\textsuperscript{5616} - Remove HPX\_STD\_BIND
- Issue #741\textsuperscript{5617} - assertion ‘px != 0’ failed: HPX(assertion\_failure) for low numbers of OS threads
- Issue #739\textsuperscript{5618} - Performance counters do not count to the end of the program or evaluation
- Issue #738\textsuperscript{5619} - Dedicated AGAS server runs don’t work; console ignores -a option.
- Issue #737\textsuperscript{5620} - Missing bind overloads

\textsuperscript{5620} https://github.com/STEllAR-GROUP/hpx/issues/737
• Issue #736 - Performance counter wildcards do not always work
• Issue #735 - Create native ibverbs parcelport based on rdma operations
• Issue #734 - Threads stolen performance counter total is incorrect
• Issue #733 - Test benchmarks need to be checked and fixed
• Issue #732 - Build fails with Mac, using mac ports clang-3.3 on latest git branch
• Issue #731 - Add global start/stop API for performance counters
• Issue #730 - Performance counter values are apparently incorrect
• Issue #729 - Unhandled switch
• Issue #728 - Serialization of hpx::util::function between two localities causes seg faults
• Issue #727 - Memory counters on Mac OS X
• Issue #725 - Restore original thread priority on resume
• Issue #724 - Performance benchmarks do not depend on main HPX libraries
• Issue #723 - [teletype]–hpx:nodes=`cat $PBS_NODEFILE` works; --hpx:nodefile=$PBS_NODEFILE does not.[c++]
• Issue #722 - Fix binding const member functions as actions
• Issue #719 - Create performance counter exposing compression ratio
• Issue #718 - Add possibility to compress parcel data
• Issue #717 - strip_credit_from_gid has misleading semantics
• Issue #716 - Non-option arguments to programs run using pbsdsh must be before --hpx:node, contrary to directions
• Issue #715 - Re-thrown exceptions should retain the original call site
• Issue #714 - failed assertion in debug mode
• Issue #713 - Add performance counters monitoring connection caches
• Issue #712 - Adjust parcel related performance counters to be connection type specific

Chapter 2. What’s so special about HPX?
• Issue #711\textsuperscript{5643} - configuration failure
• Issue #710\textsuperscript{5644} - Error “timed out while trying to find room in the connection cache” when trying to start multiple localities on a single computer
• Issue #709\textsuperscript{5645} - Add new thread state ‘staged’ referring to task descriptions
• Issue #708\textsuperscript{5646} - Detect/mitigate bad non-system installs of GCC on Redhat systems
• Issue #707\textsuperscript{5647} - Many examples do not link with Git HEAD version
• Issue #706\textsuperscript{5648} - \texttt{hpx::init} removes portions of non-option command line arguments before last = sign
• Issue #705\textsuperscript{5649} - Create rolling average and median aggregating performance counters
• Issue #704\textsuperscript{5650} - Create performance counter to expose thread queue waiting time
• Issue #703\textsuperscript{5651} - Add support to HPX build system to find librctool.a and related headers
• Issue #699\textsuperscript{5652} - Generalize instrumentation support
• Issue #698\textsuperscript{5653} - compilation failure with hwloc absent
• Issue #697\textsuperscript{5654} - Performance counter counts should be zero indexed
• Issue #696\textsuperscript{5655} - Distributed problem
• Issue #695\textsuperscript{5656} - Bad perf counter time printed
• Issue #693\textsuperscript{5657} - --help doesn’t print component specific command line options
• Issue #692\textsuperscript{5658} - SLURM support broken
• Issue #691\textsuperscript{5659} - exception while executing any application linked with hwloc
• Issue #690\textsuperscript{5660} - thread_id_test and thread_launcher_test failing
• Issue #689\textsuperscript{5661} - Make the buildbots use hwloc
• Issue #687\textsuperscript{5662} - compilation error fix (hwloc_topology)
• Issue #686\textsuperscript{5663} - Linker Error for Applications
• Issue #684\textsuperscript{5664} - Pinning of service thread fails when number of worker threads equals the number of cores
• Issue #682\textsuperscript{5665} - Add performance counters exposing number of stolen threads

\textsuperscript{5659} https://github.com/STEllAR-GROUP/hpx/issues/691
\textsuperscript{5660} https://github.com/STEllAR-GROUP/hpx/issues/690
\textsuperscript{5661} https://github.com/STEllAR-GROUP/hpx/issues/689
\textsuperscript{5662} https://github.com/STEllAR-GROUP/hpx/issues/687
\textsuperscript{5663} https://github.com/STEllAR-GROUP/hpx/issues/686
\textsuperscript{5664} https://github.com/STEllAR-GROUP/hpx/issues/684
\textsuperscript{5665} https://github.com/STEllAR-GROUP/hpx/issues/682
• Issue #681 - Add apply_continue for asynchronous chaining of actions
• Issue #679 - Remove obsolete async_callback API functions
• Issue #678 - Add new API for setting/triggering LCOs
• Issue #677 - Add async_continue for true continuation style actions
• Issue #676 - Buildbot for gcc 4.4 broken
• Issue #675 - Partial preprocessing broken
• Issue #674 - HPX segfaults when built with gcc 4.7
• Issue #673 - use_guard_pages has inconsistent preprocessor guards
• Issue #672 - External build breaks if library path has spaces
• Issue #671 - release tarballs are tarbombs
• Issue #670 - CMake won’t find Boost headers in layout=versioned install
• Issue #669 - Links in docs to source files broken if not installed
• Issue #667 - Not reading ini file properly
• Issue #664 - Adapt new meanings of ‘const’ and ‘mutable’
• Issue #661 - Implement BTL Parcel port
• Issue #655 - Make HPX work with the “decltype” result_of
• Issue #647 - documentation for specifying the number of high priority threads
  --hpx:high-priority-threads
• Issue #643 - Error parsing host file
• Issue #642 - HWLoc issue with TAU
• Issue #639 - Logging potentially suspends a running thread
• Issue #634 - Improve error reporting from parcel layer
• Issue #627 - Add tests for async and apply overloads that accept regular C++ functions
• Issue #626 - hpx/future.hpp header

Chapter 2. What’s so special about HPX?
• Issue #601\(^{5689}\) - Intel support
• Issue #557\(^{5690}\) - Remove action codes
• Issue #531\(^{5691}\) - AGAS request and response classes should use switch statements
• Issue #529\(^{5692}\) - Investigate the state of hwloc support
• Issue #526\(^{5693}\) - Make HPX aware of hyper-threading
• Issue #518\(^{5694}\) - Create facilities allowing to use plain arrays as action arguments
• Issue #473\(^{5695}\) - hwloc thread binding is broken on CPUs with hyperthreading
• Issue #383\(^{5696}\) - Change result type detection for hpx::util::bind to use result_of protocol
• Issue #341\(^{5697}\) - Consolidate route code
• Issue #219\(^{5698}\) - Only copy arguments into actions once
• Issue #177\(^{5699}\) - Implement distributed AGAS
• Issue #43\(^{5700}\) - Support for Darwin (Xcode + Clang)

**HPX V0.9.5 (Jan 16, 2013)**

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

**General changes**

This release is continuing along the lines of code and API consolidation, and overall usability improvements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported HPX to the Android platform. HPX applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported HPX to Mac OSX (using the Clang compiler). Thanks to Pyry Jahkola for contributing the corresponding patches. Please see the section macos_installation for more details.

We made a special effort to make HPX usable in highly concurrent use cases. Many of the HPX API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. HPX actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like hpx::bind.

---

5697 https://github.com/STEllAR-GROUP/hpx/issues/341
5698 https://github.com/STェLLAR-GROUP/hpx/issues/219
5699 https://github.com/STェLLAR-GROUP/hpx/issues/177
5700 https://github.com/STェLLAR-GROUP/hpx/issues/43
All of the API has been aligned as much as possible with established paradigms. HPX now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of HPX we perform after the move to Github. This step has enabled a wider participation from the community and further encourages us in our decision to release HPX as a true open source library (HPX is licensed under the very liberal Boost Software License).

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX releases so far.

- **Issue #666** - Segfault on calling `hpx::finalize` twice
- **Issue #665** - Adding declaration `num_of_cores`
- **Issue #662** - `pkgconfig` is building wrong
- **Issue #660** - Need uninterrupt function
- **Issue #659** - Move our logging library into a different namespace
- **Issue #658** - Dynamic performance counter types are broken
- **Issue #657** - HPX v0.9.5 (RC1) `hello_world` example segfaulting
- **Issue #656** - Define the affinity of parcel-pool, io-pool, and timer-pool threads
- **Issue #654** - Integrate the Boost `auto_index` tool with documentation
- **Issue #653** - Make HPX build on OS X + Clang + libc+
- **Issue #651** - Add fine-grained control for thread pinning
- **Issue #650** - Command line no error message when using `-hpx:(anything)`
- **Issue #645** - Command line aliases don’t work in [teletype]/grave.ts1/grave.ts1 [c++]
- **Issue #644** - Terminated threads are not always properly cleaned up
- **Issue #640** - `future_data<T>::set_on_completed_` used without locks
- **Issue #638** - `hpx` build with intel compilers fails on linux

• Issue #637 - `--copy-dt-needed-entries` breaks with gold
• Issue #635 - Boost V1.53 will add Boost.Lockfree and Boost.Atomic
• Issue #633 - Re-add examples to final 0.9.5 release
• Issue #632 - Example `thread_aware_timer` is broken
• Issue #631 - FFT application throws error in parcellayer
• Issue #630 - Event synchronization example is broken
• Issue #629 - Waiting on futures hangs
• Issue #628 - Add an HPX_ALWAYS_ASSERT macro
• Issue #625 - Port coroutines context switch benchmark
• Issue #621 - New INI section for stack sizes
• Issue #618 - pkg_config support does not work with a HPX debug build
• Issue #617 - hpx/external/logging/boost/logging/detail/cache_before_init.hpp:139:67: error: ‘get_thread_id’ was not declared in this scope
• Issue #616 - Change wait_xxx not to use locking
• Issue #615 - Revert visibility ‘fix’ (fb0b6b8245dad1127b0c25ebafdf9380b3945cc9)
• Issue #614 - Fix Dataflow linker error
• Issue #613 - `find_here` should throw an exception on failure
• Issue #612 - Thread phase doesn’t show up in debug mode
• Issue #611 - Make stack guard pages configurable at runtime (initialization time)
• Issue #610 - Co-Locate Components
• Issue #609 - `future_overhead`
• Issue #608 - `-hpx:list-counter-infos` problem
• Issue #607 - Update Boost.Context based backend for coroutines
• Issue #606 - `1d_wave_equation` is not working

5740 https://github.com/STEllAR-GROUP/hpx/issues/607
5741 https://github.com/STEllAR-GROUP/hpx/issues/606
• Issue #605\(^{5742}\) - Any C++ function that has serializable arguments and a serializable return type should be remotable
• Issue #604\(^{5743}\) - Connecting localities isn’t working anymore
• Issue #603\(^{5744}\) - Do not verify any ini entries read from a file
• Issue #602\(^{5745}\) - Rename argument_size to type_size/added implementation to get parcel size
• Issue #599\(^{5746}\) - Enable locality specific command line options
• Issue #598\(^{5747}\) - Need an API that accesses the performance counter reporting the system uptime
• Issue #597\(^{5748}\) - compiling on ranger
• Issue #595\(^{5749}\) - I need a place to store data in a thread self pointer
• Issue #594\(^{5750}\) - 32/64 interoperability
• Issue #593\(^{5751}\) - Warn if logging is disabled at compile time but requested at runtime
• Issue #592\(^{5752}\) - Add optional argument value to --hpx:list-counters and --hpx:list-counter-infos
• Issue #591\(^{5753}\) - Allow for wildcards in performance counter names specified with --hpx:print-counter
• Issue #590\(^{5754}\) - Local promise semantic differences
• Issue #589\(^{5755}\) - Create API to query performance counter names
• Issue #587\(^{5756}\) - Add get_num_localities and get_num_threads to AGAS API
• Issue #586\(^{5757}\) - Adjust local AGAS cache size based on number of localities
• Issue #585\(^{5758}\) - Error while using counters in HPX
• Issue #584\(^{5759}\) - counting argument size of actions, initial pass.
• Issue #581\(^{5760}\) - Remove RemoteResult template parameter for future<> 
• Issue #580\(^{5761}\) - Add possibility to hook into actions
• Issue #578\(^{5762}\) - Use angle brackets in HPX error dumps
• Issue #576\(^{5763}\) - Exception incorrectly thrown when --help is used
• Issue #575\(^{5764}\) - HPX(bad_component_type) with gcc 4.7.2 and boost 1.51

• Issue #574<sup>5765</sup> - --hpx:connect command line parameter not working correctly
• Issue #571<sup>5766</sup> - hpx::wait() (callback version) should pass the future to the callback function
• Issue #570<sup>5767</sup> - hpx::wait should operate on boost::arrays and std::lists
• Issue #569<sup>5768</sup> - Add a logging sink for Android
• Issue #568<sup>5769</sup> - 2-argument version of HPX_DEFINE_COMPONENT_ACTION
• Issue #567<sup>5770</sup> - Connecting to a running HPX application works only once
• Issue #565<sup>5771</sup> - HPX doesn’t shutdown properly
• Issue #564<sup>5772</sup> - Partial preprocessing of new component creation interface
• Issue #563<sup>5773</sup> - Add hpx::start/hpx::stop to avoid blocking main thread
• Issue #562<sup>5774</sup> - All command line arguments swallowed by hpx
• Issue #561<sup>5775</sup> - Boost.Tuple is not move aware
• Issue #558<sup>5776</sup> - boost::shared_ptr<> style semantics/syntax for client classes
• Issue #556<sup>5777</sup> - Creation of partially preprocessed headers should be enabled for Boost newer than V1.50
• Issue #555<sup>5778</sup> - BOOST_FORCEINLINE does not name a type
• Issue #554<sup>5779</sup> - Possible race condition in thread get_id()
• Issue #552<sup>5780</sup> - Move enable client_base
• Issue #550<sup>5781</sup> - Add stack size category ‘huge’
• Issue #549<sup>5782</sup> - ShenEOS run seg-faults on single or distributed runs
• Issue #545<sup>5783</sup> - AUTOGLOB broken for add_hpx_component
• Issue #542<sup>5784</sup> - FindHPX_HDF5 still searches multiple times
• Issue #541<sup>5785</sup> - Quotes around application name in hpx::init
• Issue #539<sup>5786</sup> - Race condition occurring with new lightweight threads
• Issue #535<sup>5787</sup> - hpx_run_tests.py exits with no error code when tests are missing

2.10. Releases

1741
• Issue #530\(^{5788}\) - Thread description<unknown> in logs
• Issue #523\(^{5789}\) - Make thread objects more lightweight
• Issue #521\(^{5790}\) - hpx::error_code is not usable for lightweight error handling
• Issue #520\(^{5791}\) - Add full user environment to HPX logs
• Issue #519\(^{5792}\) - Build succeeds, running fails
• Issue #517\(^{5793}\) - Add a guard page to linux coroutine stacks
• Issue #516\(^{5794}\) - hpx::thread::detach suspends while holding locks, leads to hang in debug
• Issue #514\(^{5795}\) - Preprocessed headers for <hpx/apply.hpp> don’t compile
• Issue #513\(^{5796}\) - Buildbot configuration problem
• Issue #512\(^{5797}\) - Implement action based stack size customization
• Issue #511\(^{5798}\) - Move action priority into a separate type trait
• Issue #510\(^{5799}\) - trunk broken
• Issue #507\(^{5800}\) - no matching function for call to boost::scoped_ptr<hpx::threads::topology>::scoped_ptr(hpx::threads::topology*)
• Issue #505\(^{5801}\) - undefined_symbol regression test currently failing
• Issue #502\(^{5802}\) - Adding OpenCL and OCLM support to HPX for Windows and Linux
• Issue #501\(^{5803}\) - find_package(HPX) sets cmake output variables
• Issue #500\(^{5804}\) - wait_any/wait_all are badly named
• Issue #499\(^{5805}\) - Add support for disabling pbs support in pbs runs
• Issue #498\(^{5806}\) - Error during no-cache runs
• Issue #496\(^{5807}\) - Add partial preprocessing support to cmake
• Issue #495\(^{5808}\) - Support HPX modules exporting startup/shutdown functions only
• Issue #494\(^{5809}\) - Allow modules to specify when to run startup/shutdown functions
• Issue #493\(^{5810}\) - Avoid constructing a string in make_success_code
• Issue #492 - Performance counter creation is no longer synchronized at startup
• Issue #491 - Performance counter creation is no longer synchronized at startup
• Issue #490 - Sheneos on_completed_bulk seg fault in distributed
• Issue #489 - compiling issue with g++44
• Issue #488 - Adding OpenCL and OCLM support to HPX for the MSVC platform
• Issue #487 - FindHPX.cmake problems
• Issue #485 - Change distributing_factory and binpacking_factory to use bulk creation
• Issue #484 - Change HPX\_DONT\_USE\_PREPROCESSED\_FILES to HPX\_USE\_PREPROCESSED\_FILES
• Issue #483 - Memory counter for Windows
• Issue #479 - strange errors appear when requesting performance counters on multiple nodes
• Issue #477 - Create (global) timer for multi-threaded measurements
• Issue #472 - Add partial preprocessing using Wave
• Issue #471 - Segfault stack traces don’t show up in release
• Issue #468 - External projects need to link with internal components
• Issue #462 - Startup/shutdown functions are called more than once
• Issue #458 - Consolidate hpx::util::high_resolution_timer and hpx::util::high_resolution_clock
• Issue #457 - index out of bounds in allgather_and_gate on 4 cores or more
• Issue #448 - Make HPX compile with clang
• Issue #447 - ‘make tests’ should execute tests on local installation
• Issue #446 - Remove SVN-related code from the codebase
• Issue #444 - race condition in smp
• Issue #441 - Patched Boost.Serialization headers should only be installed if needed
• Issue #439 - Components using \texttt{HPX\_REGISTER\_STARTUP\_MODULE} fail to compile with MSVC

2.10. Releases
• Issue #436<sup>5834</sup> - Verify that no locks are being held while threads are suspended
• Issue #435<sup>5835</sup> - Installing HPX should not clobber existing Boost installation
• Issue #434<sup>5836</sup> - Logging external component failed (Boost 1.50)
• Issue #433<sup>5837</sup> - Runtime crash when building all examples
• Issue #432<sup>5838</sup> - Dataflow hangs on 512 cores/64 nodes
• Issue #430<sup>5839</sup> - Problem with distributing factory
• Issue #424<sup>5840</sup> - File paths referring to XSL-files need to be properly escaped
• Issue #417<sup>5841</sup> - Make dataflow LCOs work out of the box by using partial preprocessing
• Issue #413<sup>5842</sup> - hpx_svnversion.py fails on Windows
• Issue #412<sup>5843</sup> - Make hpx::error_code equivalent to hpx::exception
• Issue #395<sup>5844</sup> - HPX clobbers out-of-tree application specific CMake variables (specifically CMAKE_BUILD_TYPE)
• Issue #394<sup>5845</sup> - Remove code generating random port numbers for network
• Issue #378<sup>5846</sup> - ShenEOS scaling issues
• Issue #354<sup>5847</sup> - Create a coroutines wrapper for Boost.Context
• Issue #349<sup>5848</sup> - Commandline option --localities=N/-1N should be necessary only on AGAS locality
• Issue #334<sup>5849</sup> - Add auto_index support to cmake based documentation toolchain
• Issue #318<sup>5850</sup> - Network benchmarks
• Issue #317<sup>5851</sup> - Implement network performance counters
• Issue #310<sup>5852</sup> - Duplicate logging entries
• Issue #230<sup>5853</sup> - Add compile time option to disable thread debugging info
• Issue #171<sup>5854</sup> - Add an INI option to turn off deadlock detection independently of logging
• Issue #170<sup>5855</sup> - OSHL internal counters are incorrect
• Issue #103<sup>5856</sup> - Better diagnostics for multiple component/action registrations under the same name
• Issue #48 - Support for Darwin (Xcode + Clang)
• Issue #21 - Build fails with GCC 4.6

**HPX V0.9.0 (Jul 5, 2012)**

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

**General changes**

• Significant improvements made to the usability of HPX in large-scale, distributed environments.

• Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a packed_task as defined by the C++11 Standard.

• HPX now exposes `hpx::thread` which is compliant to the C++11 std::thread type except that it (purely locally) represents an HPX thread. This new type does not expose any of the remote capabilities of the underlying HPX-thread implementation.

• The type `hpx::lcos::future` is now compliant to the C++11 std::future<> type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will 'return' to the future in order to trigger any continuation.

• The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 std::promise<> and std::packaged_task<> types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.

• `hpx::thread` and `hpx::lcos::future` are now cancelable.

• Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.

• HPX now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.

• HPX now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.

• HPX continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write is own types of continuations. It can be used to execute any function as an continuation of a particular action.

• Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.

• Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.

---

5857 https://github.com/STEllAR-GROUP/hpx/issues/48
5858 https://github.com/STEllAR-GROUP/hpx/issues/21
5859 http://www.open-std.org/jtc1/sc22/wg21
This removes the immediate dependency on the Boost.Program_options\textsuperscript{5860} library.

Note: This minimal version of an HPX program does not support any of the default command line arguments (such as –help, or command line options related to PBS). It is suggested to always pass argc and argv to HPX as shown in the example below.

• In order to support those, but still not to depend on Boost.Program_options\textsuperscript{5861}, the minimal program can be written as:

```cpp
#include <hpx/hpx_init.hpp>

// The arguments for hpx_main can be left off, which very similar to the
// behavior of `main()` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

• Added performance counters exposing the number of component instances which are alive on a given locality.

• Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.

• Added a new component: hpx::components::binpacking_factory which is equivalent to the existing hpx::components::distributing_factory component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to create, and one based on an arbitrary performance counter which will be queried for all relevant localities.

• Added API functions allowing to access elements of the diagnostic information embedded in the given exception: hpx::get_locality_id, hpx::get_host_name, hpx::get_process_id, hpx::get_function_name, hpx::get_file_name, hpx::get_line_number, hpx::get_os_thread, hpx::get_thread_id, and hpx::get_thread_description.

\textsuperscript{5861} https://www.boost.org/doc/html/program_options.html
Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #71\textsuperscript{5862} - GIDs that are not serialized via `handle_gid<>` should raise an exception
- Issue #105\textsuperscript{5863} - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
- Issue #107\textsuperscript{5864} - Nasty threadmanger race condition (reproducible in sheneos_test)
- Issue #108\textsuperscript{5865} - Add millisecond resolution to HPX logs on Linux
- Issue #110\textsuperscript{5866} - Shutdown hang in distributed with release build
- Issue #116\textsuperscript{5867} - Don't use TSS for the applier and runtime pointers
- Issue #162\textsuperscript{5868} - Move local synchronous execution shortcut from `hpx::function` to the applier
- Issue #172\textsuperscript{5869} - Cache sources in CMake and check if they change manually
- Issue #178\textsuperscript{5870} - Add an INI option to turn off ranged-based AGAS caching
- Issue #187\textsuperscript{5871} - Support for disabling performance counter deployment
- Issue #202\textsuperscript{5872} - Support for sending performance counter data to a specific file
- Issue #218\textsuperscript{5873} - boost.coroutines allows different stack sizes, but stack pool is unaware of this
- Issue #231\textsuperscript{5874} - Implement movable `boost::bind`
- Issue #232\textsuperscript{5875} - Implement movable `boost::function`
- Issue #236\textsuperscript{5876} - Allow binding `hpx::util::function` to actions
- Issue #239\textsuperscript{5877} - Replace `hpx::function` with `hpx::util::function`
- Issue #240\textsuperscript{5878} - Can't specify RemoteResult with `lcos::async`
- Issue #242\textsuperscript{5879} - REGISTER_TEMPLATE support for plain actions
- Issue #243\textsuperscript{5880} - `handle_gid<>` support for `hpx::util::function`
- Issue #245\textsuperscript{5881} - `*_c_cache` code throws an exception if the queried GID is not in the local cache
- Issue #246\textsuperscript{5882} - Undefined references in dataflow/adaptive1d example

• Issue #376 - Find_HPX.cmake should set CMake variable HPX_FOUND for out of tree builds
• Issue #377 - ShenEOS interpolate bulk and interpolate_one_bulk are broken
• Issue #379 - Add support for distributed runs under SLURM
• Issue #382 - _Unwind_Word not declared in boost.backtrace
• Issue #387 - Doxygen should look only at list of specified files
• Issue #388 - Running make install on an out-of-tree application is broken
• Issue #391 - Out-of-tree application segfaults when running in qsub
• Issue #392 - Remove HPX_NO_INSTALL option from cmake build system
• Issue #396 - Pragma related warnings when compiling with older gcc versions
• Issue #399 - Out of tree component build problems
• Issue #400 - Out of source builds on Windows: linker should not receive compiler flags
• Issue #401 - Out of source builds on Windows: components need to be linked with hpx_serialization
• Issue #404 - gfortran fails to link automatically when fortran files are present
• Issue #405 - Inability to specify linking order for external libraries
• Issue #406 - Adapt action limits such that dataflow applications work without additional defines
• Issue #415 - locality_results is not a member of hpx::components::server
• Issue #425 - Breaking changes to traits::*result wrt std::vector<id_type>
• Issue #426 - AUTOGLOB needs to be updated to support fortran

HPX V0.8.1 (Apr 21, 2012)

This is a point release including important bug fixes for HPX V0.8.0 (Mar 23, 2012).
General changes

- HPX does not need to be installed anymore to be functional.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- Issue #295\[5924\] - Don’t require install path to be known at compile time.
- Issue #371\[5925\] - Add hpx iostreams to standard build.
- Issue #384\[5926\] - Fix compilation with GCC 4.7.
- Issue #390\[5927\] - Remove keep_factory_alive startup call from ShenEOS; add shutdown call to H5close.
- Issue #393\[5928\] - Thread affinity control is broken.

Bug fixes (commits)

Here is a list of the important commits included in this point release:

- r7642 - External: Fix backtrace memory violation.
- r7775 - Components: Fix symbol visibility bug with component startup providers. This prevents one components providers from overriding another components.
- r7778 - Components: Fix startup/shutdown provider shadowing issues.

HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added ‘local’ futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.

\[5924\] https://github.com/STEllAR-GROUP/hpx/issues/295
\[5925\] https://github.com/STEllAR-GROUP/hpx/issues/371
\[5926\] https://github.com/STEllAR-GROUP/hpx/issues/384
\[5927\] https://github.com/STEllAR-GROUP/hpx/issues/390
\[5928\] https://github.com/STEllAR-GROUP/hpx/issues/393
• Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.

• Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.

• Added more automated tests to verify proper functioning of HPX.

• Started to create documentation for HPX and its API.

• Added documentation toolchain to the build system.

• Added dataflow LCO.

• Changed default HPX command line options to have hpx: prefix. For instance, the former option --threads is now --hpx:threads. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section HPX Command Line Options for a full list of available options.

• Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section HPX Command Line Options for a detailed description of command line option aliasing.

• Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.

• Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).

• Improved support for Windows builds with CMake.

• Added support for components to register their own command line options.

• Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an HPX thread.

• Added two new experimental thread schedulers: hierarchy_scheduler and periodic_priority_scheduler. These can be activated by using the command line options --hpx:queuing=hierarchy or --hpx:queuing=periodic.

Example applications

• Graph500 performance benchmark5929 (thanks to Matthew Anderson for contributing this application).

• GTC (Gyrokinetic Toroidal Code)5930: a skeleton for particle in cell type codes.

• Random Memory Access: an example demonstrating random memory accesses in a large array

• ShenEOS example5931, demonstrating partitioning of large read-only data structures and exposing an interpolation API.

• Sine performance counter demo.

• Accumulator examples demonstrating how to write and use HPX components.

• Quickstart examples (like hello_world, fibonacci, quicksort, factorial, etc.) demonstrating simple HPX concepts which introduce some of the concepts in HPX.

• Load balancing and work stealing demos.

5929 http://www.graph500.org/
5931 http://stellarcollapse.org/equationofstate
API changes

- Moved all local LCOs into a separate namespace hpx::lcos::local (for instance, hpx::lcos::local_mutex is now hpx::lcos::local::mutex).
- Replaced hpx::actions::function with hpx::util::function. Cleaned up related code.
- Removed hpx::traits::handle_gid and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: prefix is now called locality_id, renamed the corresponding API functions (such as hpx::get_prefix, which is now called hpx::get_locality_id).
- Adding hpx::find_remote_localities, and hpx::get_num_localities.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now /object{parentname#parentindex/instance#index}/counter#parameters
- Added hpx::get_worker_thread_num replacing hpx::threadmanager_base::get_thread_num.
- Renamed hpx::get_num_os_threads to hpx::get_os_threads_count.
- Added hpx::threads::get_thread_count.
- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #31\(^{5932}\) - Specialize handle_gid<> for examples and tests
- Issue #72\(^{5933}\) - Fix AGAS reference counting
- Issue #104\(^{5934}\) - heartbeat throws an exception when decrefing the performance counter it’s watching
- Issue #111\(^{5935}\) - throttle causes an exception on the target application
- Issue #142\(^{5936}\) - One failed component loading causes an unrelated component to fail
- Issue #165\(^{5937}\) - Remote exception propagation bug in AGAS reference counting test
- Issue #186\(^{5938}\) - Test credit exhaustion/splitting (e.g. prepare_gid and symbol NS)
- Issue #188\(^{5939}\) - Implement remaining AGAS reference counting test cases
- Issue #258\(^{5940}\) - No type checking of GIDs in stubs classes
- Issue #271\(^{5941}\) - Seg fault/shared pointer assertion in distributed code

2.10. Releases
• Issue #323\(^{5965}\) - Credit exhaustion causes object to stay alive
• Issue #324\(^{5966}\) - Duplicate exception messages
• Issue #326\(^{5967}\) - Integrate Quickbook with CMake
• Issue #329\(^{5968}\) - --help and --version should still work
• Issue #330\(^{5969}\) - Create pkg-config files
• Issue #337\(^{5970}\) - Improve usability of performance counter timestamps
• Issue #338\(^{5971}\) - Non-std exceptions deriving from std::exceptions in tfunc may be sliced
• Issue #339\(^{5972}\) - Decrease the number of send_pending_parcel threads
• Issue #343\(^{5973}\) - Dynamically setting the stack size doesn’t work
• Issue #351\(^{5974}\) - ‘make install’ does not update documents
• Issue #353\(^{5975}\) - Disable FIXMEs in the docs by default; add a doc developer CMake option to enable FIXMEs
• Issue #355\(^{5976}\) - ‘make’ doesn’t do anything after correct configuration
• Issue #356\(^{5977}\) - Don’t use hpx::util::static_ in topology code
• Issue #359\(^{5978}\) - Infinite recursion in hpx::tuple serialization
• Issue #361\(^{5979}\) - Add compile time option to disable logging completely
• Issue #364\(^{5980}\) - Installation seriously broken in r7443

**HPX V0.7.0 (Dec 12, 2011)**

We have had roughly 1000 commits since the last release and we have closed approximately 120 tickets (bugs, feature requests, etc.).

General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see ‘API changes’ below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal HPX parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running HPX applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os_thread_num, balancing/px_thread_phase, examples demonstrating load balancing and work stealing.

API changes

- Added hpx::find_all_localities.
- Added hpx::terminate for non-graceful termination of applications.
- Added hpx::lcos::async functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (hpx::agas::*).
- Renamed hpx::components::wait to hpx::lcos::wait.
- Renamed hpx::lcos::future_value to hpx::lcos::promise.
- Renamed hpx::lcos::recursive_mutex to hpx::lcos::local_recursive_mutex, hpx::lcos::mutex to hpx::lcos::local_mutex
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.
• Removed `hpx::process` (this will be replaced by a real process implementation in the future).

• Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).

• Removed deprecated `hpx::naming::full_address`.

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release:

• Issue #28\(^{5981}\) - Integrate Windows/Linux CMake code for HPX core

• Issue #32\(^{5982}\) - `hpx::cout()` should be `hpx::cout`

• Issue #33\(^{5983}\) - AGAS V2 legacy client does not properly handle `error_code`

• Issue #60\(^{5984}\) - AGAS: allow for `registerid` to optionally take ownership of the gid

• Issue #62\(^{5985}\) - adaptive1d compilation failure in Fusion

• Issue #64\(^{5986}\) - Parcel subsystem doesn’t resolve domain names

• Issue #83\(^{5987}\) - No error handling if no console is available

• Issue #84\(^{5988}\) - No error handling if a hosted locality is treated as the bootstrap server

• Issue #90\(^{5989}\) - Add general commandline option `-N`

• Issue #91\(^{5990}\) - Add possibility to read command line arguments from file

• Issue #92\(^{5991}\) - Always log exceptions/errors to the log file

• Issue #93\(^{5992}\) - Log the command line/program name

• Issue #95\(^{5993}\) - Support for distributed launches

• Issue #97\(^{5994}\) - Attempt to create a bad component type in AMR examples

• Issue #100\(^{5995}\) - factorial and factorial_get examples trigger AGAS component type assertions

• Issue #101\(^{5996}\) - Segfault when `hpx::process::here()` is called in fibonacci2

• Issue #102\(^{5997}\) - `unknown_component_address` in `int_object_semaphore_client`

• Issue #114\(^{5998}\) - marduk raises assertion with default parameters

\(^{5998}\) https://github.com/STEllAR-GROUP/hpx/issues/114
• Issue #115: Logging messages for SMP runs on the console shouldn’t be buffered
• Issue #119: marduk linking strategy breaks other applications
• Issue #121: pbsdsh problem
• Issue #123: marduk, dataflow and adaptive1d fail to build
• Issue #124: Lower default preprocessing arity
• Issue #125: Move hpx::detail::diagnostic_information out of the detail namespace
• Issue #126: Test definitions for AGAS reference counting
• Issue #128: Add averaging performance counter
• Issue #129: Error with endian.hpp while building adaptive1d
• Issue #130: Bad initialization of performance counters
• Issue #131: Add global startup/shutdown functions to component modules
• Issue #132: Avoid using auto_ptr
• Issue #133: On Windows hpx.dll doesn’t get installed
• Issue #134: HPX_LIBRARY does not reflect real library name (on Windows)
• Issue #135: Add detection of unique_ptr to build system
• Issue #137: Add command line option allowing to repeatedly evaluate performance counters
• Issue #139: Logging is broken
• Issue #140: CMake problem on windows
• Issue #141: Move all non-component libraries into $PREFIX/lib/hpx
• Issue #143: adaptive1d throws an exception with the default command line options
• Issue #146: Early exception handling is broken
• Issue #147: Sheneos doesn’t link on Linux
• Issue #149: sheneos_test hangs

https://github.com/STEllAR-GROUP/hpx/issues/149
- Issue #154 6022 - Compilation fails for r5661
- Issue #155 6023 - Sine performance counters example chokes on chrono headers
- Issue #156 6024 - Add build type to --version
- Issue #157 6025 - Extend AGAS caching to store gid ranges
- Issue #158 6026 - r5691 doesn’t compile
- Issue #160 6027 - Re-add AGAS function for resolving a locality to its prefix
- Issue #168 6028 - Managed components should be able to access their own GID
- Issue #169 6029 - Rewrite AGAS future pool
- Issue #179 6030 - Complete switch to request class for AGAS server interface
- Issue #182 6031 - Sine performance counter is loaded by other examples
- Issue #185 6032 - Write tests for symbol namespace reference counting
- Issue #191 6033 - Assignment of read-only variable in point_geometry
- Issue #200 6034 - Seg faults when querying performance counters
- Issue #204 6035 - --ifnames and suffix stripping needs to be more generic
- Issue #205 6036 - --list-* and --print-counter-* options do not work together and produce no warning
- Issue #207 6037 - Implement decrement entry merging
- Issue #208 6038 - Replace the spinlocks in AGAS with hpx::lcos::local_mutexes
- Issue #210 6039 - Add an --ifprefix option
- Issue #214 6040 - Performance test for PX-thread creation
- Issue #216 6041 - VS2010 compilation
- Issue #222 6042 - r6045 context_linux_x86.hpp
- Issue #223 6043 - fibonacci hangs when changing the state of an active thread
- Issue #225 6044 - Active threads end up in the FEB wait queue

• Issue #229<sup>6047</sup> - Invalid initialization of reference in thread_init_data
• Issue #235<sup>6048</sup> - Invalid GID in iostreams
• Issue #238<sup>6049</sup> - Demangle type names for the default implementation of get_action_name
• Issue #241<sup>6050</sup> - C++11 support breaks GCC 4.5
• Issue #247<sup>6051</sup> - Reference to temporary with GCC 4.4
• Issue #248<sup>6052</sup> - Seg fault at shutdown with GCC 4.4
• Issue #253<sup>6053</sup> - Default component action registration kills compiler
• Issue #272<sup>6054</sup> - G++ unrecognized command line option
• Issue #273<sup>6055</sup> - quicksort example doesn’t compile
• Issue #277<sup>6056</sup> - Invalid CMake logic for Windows

2.10.2 Namespace changes

**HPX V1.9.0 Namespace changes**

The latest release includes amongst others changes in the namespaces so that *HPX* facilities correspond to the C++ Standard Library. The old namespaces are deprecated. Below is a comprehensive list of the namespace changes.

<table>
<thead>
<tr>

A list of institutions and projects using **HPX** can be found on the **HPX** Users[4] page.

2.13 About **HPX**

2.13.1 History

The development of High Performance ParalleX (**HPX**) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the Center for Computation and Technology (CCT)[5], a multi-disciplinary research institute at Louisiana State University (LSU)[6]. The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of **HPX**. In 2011 we decided to formalize our collective research efforts by creating the STE||AR[7] group (Systems Technology, Emergent Parallelism, and Algorithm Research). Over time, the team grew to include researchers around the country and the world. In 2014, the STE||AR[8] Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the **HPX** project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by **HPX** is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the Boost[9] collection of C++ libraries. We steer the development of **HPX** with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about STE||AR[10] and ParalleX, see People and Why **HPX**?.

2.13.2 People

The STE||AR\textsuperscript{6067} Group (pronounced as stellar) stands for “Systems Technology, Emergent Parallelism, and Algorithm Research”. We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the STE||AR\textsuperscript{6068} Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. HPX, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use HPX for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

HPX is based on Parallel\textsuperscript{X} which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- **Starvation**: due to lack of usable application parallelism and means of managing it,
- **Overhead**: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- **Latency**: from remote access across system or to local memories,
- **Contention**: due to multicore chip I/O pins, memory banks, and system interconnects.

The Parallel\textsuperscript{X} model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on HPX is centered around implementing the concepts as defined by the Parallel\textsuperscript{X} model. HPX is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of HPX (and Parallel\textsuperscript{X}) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

Acknowledgements

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Panos Syskakis for benchmarking and optimizing our parallel algorithms.
- Shreyas Atre, for contributing fixes to our implementation of senders/receivers and extending our coroutines integration with senders/receivers.
- Alexander Neumann, for contributing fixes to the cmake build system.
- Dimitra Karatza, for her work on refactoring the documentation and providing a new user-friendly environment during and after Google Season of Docs 2021.
• Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
• Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
• Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
• Brice Goglin, for reporting and helping fix issues related to the integration of hwloc in HPX.
• Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
• Auriane Reverdell (Swiss National Supercomputing Centre\textsuperscript{6098}), for her tireless work on refactoring our CMake setup and modularizing HPX.
• Christopher Hinz, for his work on refactoring our CMake setup.
• Weile Wei, for fixing HPX builds with CUDA on Summit.
• Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the HPX runtime.
• Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
• Jan Melech, for adding automatic serialization of simple structs.
• Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
• Marco Diers, reporting and fixing issues related PMIx.
• Maximilian Bremer, for reporting multiple issues and extending the component migration tests.
• Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
• Grant Rostig, for reporting several deficiencies on our web pages.
• Jakub Golinowski, for implementing an HPX backend for OpenCV and in the process improving documentation and reporting issues.
• Mikael Simberg (Swiss National Supercomputing Centre\textsuperscript{6099}), for his tireless help cleaning up and maintaining HPX.
• Tianyi Zhang, for his work on HPXMP.
• Shahrzad Shirzad, for her contributions related to Phylanx.
• Christopher Ogle, for his contributions to the parallel algorithms.
• Surya Priy, for his work with statistic performance counters.
• Anushi Maheshwari, for her work on random number generation.
• Bruno Pitrus, for his work with parallel algorithms.
• Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
• Christopher Taylor, for his interest in HPX and the fixes he provided. Chris also contributed support for RISC-V architectures.
• Shoshana Jakobovits, for her work on the resource partitioner.
• Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
• Ajai V. George, who implemented several of the parallel algorithms.

\textsuperscript{6098} https://www.cscs.ch
\textsuperscript{6099} https://www.cscs.ch
• Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.

• Zach Byerly (Louisiana State University (LSU)\textsuperscript{6100}), who in his work developing applications on top of HPX opened tickets and contributed to the HPX examples.

• Daniel Estermann, for his work porting HPX to the Raspberry Pi.

• Alireza Kheirkhahan (Louisiana State University (LSU)\textsuperscript{6101}), who built and administered our local cluster as well as his work in distributed IO.

• Abhimanyu Rawat, who worked on stack overflow detection.

• David Pfander, who improved signal handling in HPX, provided his optimization expertise, and worked on incorporating the Vc vectorization into HPX.

• Denis Demidov, who contributed his insights with VexCL.

• Khalid Hasanov, who contributed changes which allowed to run HPX on 64Bit power-pc architectures.

• Zahra Khatami (Louisiana State University (LSU)\textsuperscript{6102}), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.

• Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for HPX::Compute.

• Minh-Khanh Do, who contributed the implementation of several segmented algorithms.

• Bibek Wagle (Louisiana State University (LSU)\textsuperscript{6103}), who worked on fixing and analyzing the performance of the parcel coalescing plugin in HPX.

• Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.

• Andreas Schaefer, who worked on integrating his library (LibGeoDecomp\textsuperscript{6104}) with HPX. He reported various problems and submitted several patches to fix issues allowing for a better integration with LibGeoDecomp\textsuperscript{6105}.

• Satyaki Upadhyay, who contributed several examples to HPX.

• Brandon Cordes, who contributed several improvements to the inspect tool.

• Harris Brakmic, who contributed an extensive build system description for building HPX with Visual Studio.

• Parsa Amini (Louisiana State University (LSU)\textsuperscript{6106}), who refactored and simplified the implementation of AGAS in HPX and who works on its implementation and optimization.

• Luis Martinez de Bartolome who implemented a build system extension for HPX integrating it with the Conan\textsuperscript{6107} C/C++ package manager.

• Vinay C Amatya (Louisiana State University (LSU)\textsuperscript{6108}), who contributed to the documentation and provided some of the HPX examples.

• Kevin Huck and Nick Chaimov (University of Oregon\textsuperscript{6109}), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with HPX.

• Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for HPX.

• Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs (HPXCL).

• Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.

• Nidhi Makhijani who helped cleaning up some enum consistencies in HPX and contributed to the resource manager used in the thread scheduling subsystem. She also worked on HPX in the context of the Google Summer of Code 2015.

• Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on HPX in the context of the Google Summer of Code program 2015.

• Daniel Bourgeois (Center for Computation and Technology (CCT)) who contributed to HPX the implementation of several parallel algorithms (as proposed by N4313).

• Anuj Sharma and Christopher Bross (Department of Computer Science 3 - Computer Architecture), who worked on HPX in the context of the Google Summer of Code program 2014.

• Martin Stumpf (Department of Computer Science 3 - Computer Architecture), who rebuilt our contiguous testing infrastructure (see the HPX Buildbot Website). Martin is also working on HPXCL (mainly all work related to OpenCL) and implementing an HPX backend for POCL, a portable computing language solution based on OpenCL.

• Grant Mercer (University of Nevada, Las Vegas), who helped creating many of the parallel algorithms (as proposed by N4313).

• Damond Howard (Louisiana State University (LSU)), who works on HPXCL (mainly all work related to CUDA).

• Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.

• Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating HPX as a backend for NT2. He also contributed an implementation of an API similar to Fortran co-arrays on top of HPX.

• John Biddiscombe (Swiss National Supercomputing Centre), who helped with the BlueGene/Q port of HPX, implemented the parallel sort algorithm, and made several other contributions.

• Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make HPX more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.

• Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling HPX.

• Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.

• Patricia Grubel (New Mexico State University\textsuperscript{6128}), who contributed the description of the different HPX thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.

• Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.

• Agustin Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.

• Anton Bikineev for contributing changes to make using boost::lexical_cast safer, he also contributed a thread safety fix to the iostreams module. He also contributed a complete rewrite of the serialization infrastructure replacing Boost.Serialization inside HPX.

• Pyry Jahkola, who contributed the Mac OS build system and build documentation on how to build HPX using Clang and libc++.

• Mario Mulansky, who created an HPX backend for his Boost.Odeint library, and who submitted several test cases allowing us to reproduce and fix problems in HPX.

• Rekha Raj, who contributed changes to the description of the Windows build instructions.

• Jeremy Kemp how worked on an HPX OpenMP backend and added regression tests.

• Alex Nagelberg for his work on implementing a C wrapper API for HPX.

• Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in HPX.

• Joseph Kleinhenz, Markus Elfring, Kirill Kropivyansky, Alexander Neundorf, Bryant Lam, and Alex Hirsch who improved our CMake.

• Tapaswi Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, Islada, Alex Myczko, and Avyav Kumar who improved the documentation.

• Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikel Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penu-chot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Dais who contributed to the general improvement of HPX.

\textit{HPX Funding Acknowledgements}\textsuperscript{6129} lists current and past funding sources for HPX. Special thanks to Google Summer of Code\textsuperscript{6130} and Google Season of Docs\textsuperscript{6131} for the continuous support they provide which helps us enhance both our code and our documentation.
