- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

**Returns** The `set_union` algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. The `set_union` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate \( f \).

If some element is found \( m \) times in [first1, last1) and \( n \) times in [first2, last2), then all \( m \) elements will be copied from [first1, last1) to dest, preserving order, and then exactly \( \max(n-m, 0) \) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (sequenced_policy) or in a single new thread spawned from the current thread (for sequenced_task_policy).

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most \( 2^*(N1 + N2 - 1) \) comparisons, where \( N1 \) is the length of the first sequence and \( N2 \) is the length of the second sequence.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **Pred** – The type of an optional function/function object to use. Unlike its sequential
  form, the parallel overload of `set_union` requires `Pred` to meet the requirements of `Copy-
  Constructible`. This defaults to `std::less<>`

• **Proj1** – The type of an optional projection function applied to the first sequence. This
  defaults to `hpx::identity`

• **Proj2** – The type of an optional projection function applied to the second sequence. This
  defaults to `hpx::identity`

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.
• **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
• **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **op** – The binary predicate which returns true if the elements should be treated as equal.
  The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects
passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced
and then implicitly converted to `Type1`

• **proj1** – Specifies the function (or function object) which will be invoked for each of the
  elements of the first sequence as a projection operation before the actual predicate `op` is
  invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the
  elements of the second sequence as a projection operation before the actual predicate `op`
  is invoked.

**Returns**
The `set_union` algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>`
if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. where `Iter1` is range_iterator_t<Rng1> and `Iter2` is range_iterator_t<Rng2> The `set_union` algo-

```cpp
template<
    typename Iter1, typename Sent1, typename Iter2, typename Sent2,
    typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, 
    typename Proj2 = hpx::identity>

set_union_result<Iter1, Iter2, Iter3> tag_fallback_invoke(set_union_t, Iter1 first1, Sent1 last1, Iter2 
    first2, Sent2 last2, Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 
    &&proj2 = Proj2());
```

 Constructs a sorted range beginning at `dest` consisting of all elements present in one or both sorted
ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the
given binary predicate `f`.

If some element is found `m` times in `[first1, last1)` and `n` times in `[first2, last2)`, then all `m` elements will
be copied from `[first1, last1)` to `dest`, preserving order, and then exactly std::max(`n-m`, 0) elements will
be copied from `[first2, last2)` to `dest`, also preserving order.

The resulting range cannot overlap with either of the input ranges.

**Note:** Complexity: At most `2*(N1 + N2 - 1)` comparisons, where `N1` is the length of the first sequence
and `N2` is the length of the second sequence.
Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_union` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```cpp
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

Returns  The `set_union` algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. The `set_union` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

2.8. API reference
set_union_result<\texttt{hpx::traits::range_iterator_t<\texttt{Rng1}>}, \texttt{hpx::traits::range_iterator_t<\texttt{Rng2}>}, \texttt{Iter3}> \textbf{set_union(\texttt{Rng1} &&\texttt{rng1}, \texttt{Rng2} &&\texttt{rng2}, \texttt{Iter3} \texttt{dest}, \texttt{Pred} &&\texttt{op} = \texttt{Pred}(), \texttt{Proj1} &&\texttt{proj1} = \texttt{Proj1}(), \texttt{Proj2} &&\texttt{proj2} = \texttt{Proj2}())}

Constructs a sorted range beginning at \texttt{dest} consisting of all elements present in one or both sorted ranges \([\texttt{first1}, \texttt{last1})\) and \([\texttt{first2}, \texttt{last2})\). This algorithm expects both input ranges to be sorted with the given binary predicate \(f\).

If some element is found \(m\) times in \([\texttt{first1}, \texttt{last1})\) and \(n\) times in \([\texttt{first2}, \texttt{last2})\), then all \(m\) elements will be copied from \([\texttt{first1}, \texttt{last1})\) to \texttt{dest}, preserving order, and then exactly std::max\((n-m, 0)\) elements will be copied from \([\texttt{first2}, \texttt{last2})\) to \texttt{dest}, also preserving order.

The resulting range cannot overlap with either of the input ranges.

\textbf{Note:} Complexity: At most \(2*(N1 + N2 - 1)\) comparisons, where \(N1\) is the length of the first sequence and \(N2\) is the length of the second sequence.

\textbf{Template Parameters}

- \texttt{\texttt{Rng1}} – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \texttt{\texttt{Rng2}} – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \texttt{\texttt{Iter3}} – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- \texttt{\texttt{Pred}} – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of \texttt{set\_union} requires \texttt{Pred} to meet the requirements of \texttt{CopyConstructible}. This defaults to std::less<>
- \texttt{\texttt{Proj1}} – The type of an optional projection function applied to the first sequence. This defaults to \texttt{hpx::identity}
- \texttt{\texttt{Proj2}} – The type of an optional projection function applied to the second sequence. This defaults to \texttt{hpx::identity}

\textbf{Parameters}

- \texttt{\texttt{rng1}} – Refers to the first sequence of elements the algorithm will be applied to.
- \texttt{\texttt{rng2}} – Refers to the second sequence of elements the algorithm will be applied to.
- \texttt{\texttt{dest}} – Refers to the beginning of the destination range.
- \texttt{\texttt{op}} – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:
bool pred(const Type1 &a, const Type1 &b);

The signature does not need to have const &, but the function must not modify the objects passed to it. The type Type1 must be such that objects of type InIter can be dereferenced and then implicitly converted to Type1

• proj1 – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate op is invoked.

• proj2 – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate op is invoked.

Returns The set_union algorithm returns ranges::set_union_result<Iter1, Iter2, Iter3>, where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The set_union algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx/parallel/container_algorithms/shift_left.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges

Functions

template<typename FwdIter, typename Sent, typename Size>
FwdIter shift_left(FwdIter first, Sent last, Size n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first - n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel shift_left algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced FwdIter must meet the requirements of MoveAssignable.

Template Parameters
- FwdIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- Sent – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- Size – The type of the argument specifying the number of positions to shift by.

Parameters
- first – Refers to the beginning of the sequence of elements the algorithm will be applied to.
The **shift_left** algorithm shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first)
• n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel **shift_left** algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignment operations in the parallel **shift_left** algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most (last - first) - n assignments.

**Note:** The type of dereferenced `FwdIter` must meet the requirements of `MoveAssignable`.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

**Returns** The **shift_left** algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The **shift_left** algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> shift_left(ExPolicy &&policy, FwdIter first, Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first)
• n), moves the element originally at position first + n + i to position first + i.

```cpp
template<typename Rng, typename Size>
hpx::traits::range_iterator_t<Rng> shift_left(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first)
• n), moves the element originally at position first + n + i to position first + i.
The assignment operations in the parallel `shift_left` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: At most (last - first) - n assignments.

**Note:** The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

**Template Parameters**

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

**Returns** The `shift_left` algorithm returns `hpx::traits::range_iterator_t<Rng>`. The `shift_left` algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> shift_left(ExPolicy &&policy, Rng &&rng, Size n)
```

Shifts the elements in the range `[first, last)` by n positions towards the beginning of the range. For every integer i in `[0, last - first`

- n), moves the element originally at position `first + n + i` to position `first + i`.

The assignment operations in the parallel `shift_left` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignment operations in the parallel `shift_left` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most (last - first) - n assignments.

**Note:** The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.
**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

**Returns**
The `shift_left` algorithm returns a `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `hpx::traits::range_iterator_t<Rng>` otherwise. The `shift_left` algorithm returns an iterator to the end of the resulting range.

```cpp
namespace hpx
namespace ranges

Functions

template<typename FwdIter, typename Sent, typename Size>
FwdIter shift_right(FwdIter first, Sent last, Size n)

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first + n + i`.

The assignment operations in the parallel `shift_right` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: At most `(last - first) - n` assignments.

**Note:** The type of dereferenced `FwdIter` must meet the requirements of `MoveAssignable`.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

**Returns**
The `shift_right` algorithm returns `FwdIter`. The `shift_right` algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
```
**hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> shift_right(ExPolicy &&policy, FwdIter first, Sent last, Size n)**

Shifts the elements in the range \([\text{first}, \text{last})\) by \(n\) positions towards the end of the range. For every integer \(i\) in \([0, \text{last} - \text{first} - n)\), moves the element originally at position \(\text{first} + i\) to position \(\text{first} + n + i\).

The assignment operations in the parallel \(\text{shift}\_\text{right}\) algorithm invoked with an execution policy object of type \(\text{sequenced}\_\text{policy}\) execute in sequential order in the calling thread.

The assignment operations in the parallel \(\text{shift}\_\text{right}\) algorithm invoked with an execution policy object of type \(\text{parallel}\_\text{policy}\) or \(\text{parallel}\_\text{task}\_\text{policy}\) are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: At most \((\text{last} - \text{first}) - n\) assignments.

**Note:** The type of dereferenced \(\text{FwdIter}\) must meet the requirements of \(\text{MoveAssignable}\).

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \(\text{FwdIter}\).
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

**Returns** The \(\text{shift}\_\text{right}\) algorithm returns a \(\text{hpx}::\text{future}<\text{FwdIter}>\) if the execution policy is of type \(\text{sequenced}\_\text{task}\_\text{policy}\) or \(\text{parallel}\_\text{task}\_\text{policy}\) and returns \(\text{FwdIter}\) otherwise. The \(\text{shift}\_\text{right}\) algorithm returns an iterator to the end of the resulting range.

**template<typename Rng, typename Size>**

**hpx::traits::range_iterator_t<Rng> shift_right(Rng &&rng, Size n)**

Shifts the elements in the range \([\text{first}, \text{last})\) by \(n\) positions towards the end of the range. For every integer \(i\) in \([0, \text{last} - \text{first} - n)\), moves the element originally at position \(\text{first} + i\) to position \(\text{first} + n + i\).

The assignment operations in the parallel \(\text{shift}\_\text{right}\) algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: At most \((\text{last} - \text{first}) - n\) assignments.
Note: The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

Template Parameters
- `Rng` – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- `Size` – The type of the argument specifying the number of positions to shift by.

Parameters
- `rng` – Refers to the range in which the elements will be shifted.
- `n` – Refers to the number of positions to shift.

Returns
The `shift_right` algorithm returns `hpx::traits::range_iterator_t<Rng>`. The `shift_right` algorithm returns an iterator to the end of the resulting range.

```cpp
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> shift_right(ExPolicy &&policy, Rng &&rng, Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first + n + i`.

The assignment operations in the parallel `shift_right` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignment operations in the parallel `shift_right` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most `(last - first) - n` assignments.

Note: The type of dereferenced `hpx::traits::range_iterator_t<Rng>` must meet the requirements of `MoveAssignable`.

Template Parameters
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `Rng` – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- `Size` – The type of the argument specifying the number of positions to shift by.

Parameters
- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng` – Refers to the range in which the elements will be shifted.
- `n` – Refers to the number of positions to shift.

Returns
The `shift_right` algorithm returns a `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and re-
turns `hpx::traits::range_iterator_t<Rng>` otherwise. The `shift_right` algorithm returns an iterator to the end of the resulting range.

**hpx/parallel/container_algorithms/sort.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`

namespace `ranges`

### Functions

```cpp
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
RandomIt sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`. `comp` has to induce a strict weak ordering on the values.

The assignments in the parallel `sort` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: $O(N \log(N))$, where $N = \text{detail::distance(first, last)}$ comparisons.

### Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `RandomIt`.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – `comp` is a callable object. The return value of the `INVOKE` operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
Returns The sort algorithm returns RandomIt. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```cpp
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type sort(ExPolicy &&policy, RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator comp and a projection proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: O(N log(N)), where N = detail::distance(first, last) comparisons.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to hpx::identity

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate comp is invoked.

**Returns** The sort algorithm returns a hpx::future<RandomIt> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns RandomIt otherwise. The
algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```cpp
template<typename Rng, typename Comp, typename Proj>
    hpx::traits::range_iterator_t<Rng> sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range `rng` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

`comp` has to induce a strict weak ordering on the values.

The assignments in the parallel `sort` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: \(O(N \log(N))\), where \(N = \text{std::distance}(\text{begin(rng)}, \text{end(rng)})\) comparisons.

**Template Parameters**
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**
- `rng` – Refers to the sequence of elements the algorithm will be applied to.
- `comp` – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

**Returns** The `sort` algorithm returns `hpx::traits::range_iterator_t<Rng>`. It returns `last`.

```cpp
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
    parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> sort(ExPolicy &&policy,
    Rng &&rng,
    Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range `rng` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing
to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

`comp` has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{begin(rng)}, \text{end(rng)})$ comparisons.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng` – Refers to the sequence of elements the algorithm will be applied to.
- `comp` – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

**Returns** The `sort` algorithm returns a `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `hpx::traits::range_iterator_t<Rng>` otherwise. It returns `last`.

`hpx/parallel/container_algorithms/stable_sort.hpp`

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace `hpx`

namespace `ranges`
Functions

\[
\text{template}\langle\text{typename RandomIt},\ \text{typename Sent},\ \text{typename Comp} = \text{ranges}::\lt,\ \text{typename Proj} = \text{hpx}::\text{identity}\rangle
\]

\[
\text{RandomIt} \ \text{stable_sort}(\text{RandomIt} \ \text{first},\ \text{Sent} \ \text{last},\ \text{Comp} \ \&\&\ \text{comp} = \text{Comp}(),\ \text{Proj} \ \&\&\ \text{proj} = \text{Proj}())
\]

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator\(<\)).

A sequence is sorted with respect to a comparator comp and a projection proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and \text{INVOKE}(\text{comp}, \text{INVOKE}(\text{proj}, *(i + n)), \text{INVOKE}(\text{proj}, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel stable_sort algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- \text{RandomIt} – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- \text{Sent} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- \text{Comp} – The type of the function/function object to use (deduced).
- \text{Proj} – The type of an optional projection function. This defaults to hpx::identity

Parameters

- \text{first} – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- \text{last} – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- \text{comp} – comp is a callable object. The return value of the \text{INVOKE} operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- \text{proj} – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate comp is invoked.

Returns The stable_sort algorithm returns RandomIt. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

\[
\text{template}\langle\text{typename ExPolicy},\ \text{typename RandomIt},\ \text{typename Sent},\ \text{typename Comp} = \text{ranges}::\lt,\ \text{typename Proj} = \text{hpx}::\text{identity}\rangle
\]

\[
\text{parallel}::\text{util}::\text{detail}::\text{algorithm_result}<\text{ExPolicy},\ \text{RandomIt}>::\text{type} \ \text{stable_sort}(\text{ExPolicy} \ \&\&\ \text{policy},\ \text{RandomIt} \ \text{first},\ \text{Sent} \ \text{last},\ \text{Comp} \ \&\&\ \text{comp} = \text{Comp}(),\ \text{Proj} \ \&\&\ \text{proj} = \text{Proj}())
\]

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator\(<\)).
A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and 

\[ \text{INVOKE}(\text{comp}, \text{INVOKE}(\text{proj}, *(i + n)), \text{INVOKE}(\text{proj}, *i)) = \text{false}. \]

`comp` has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: \(O(N \log(N))\), where \(N = \text{std::distance(first, last)}\) comparisons.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

**Returns** The stable_sort algorithm returns a `hpx::future<RandomIt>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `RandomIt` otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
hpx::traits::range_iterator_t<Rng> stable_sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing
to an element of the sequence, and \( \text{INVOKES}(\text{comp}, \text{INVOKES}(\text{proj}, *(i + n)), \text{INVOKES}(\text{proj}, *i)) \) == false.

\( \text{comp} \) has to induce a strict weak ordering on the values.

The assignments in the parallel \texttt{stable_sort} algorithm invoked without an execution policy object execute in sequential order in the calling thread.

\[ \text{Note: Complexity: } O(N \log(N)), \text{ where } N = \text{std::distance(first, last)} \text{ comparisons.} \]

\textbf{Template Parameters}

- \texttt{Rng} – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \texttt{Comp} – The type of the function/function object to use (deduced).
- \texttt{Proj} – The type of an optional projection function. This defaults to \texttt{hpx::identity}

\textbf{Parameters}

- \texttt{rng} – Refers to the sequence of elements the algorithm will be applied to.
- \texttt{comp} – \texttt{comp} is a callable object. The return value of the \texttt{INVOKES} operation applied to an object of type \texttt{Comp}, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that \texttt{comp} will not apply any non-constant function through the dereferenced iterator.
- \texttt{proj} – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate \texttt{comp} is invoked.

\textbf{Returns} The \texttt{stable_sort} algorithm returns \texttt{hpx::traits::range_iterator_t<Rng>}. It returns last.

template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> \texttt{stable_sort}(ExPolicy &&policy,  
Rng &&rng,  
Comp &&comp = Comp(),  
Proj &&proj = Proj())

Sorts the elements in the range \([\text{first}, \text{last})\) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object \texttt{comp} (defaults to using operator\(<())\).

A sequence is sorted with respect to a comparator \texttt{comp} and a projection \texttt{proj} if for every iterator \(i\) pointing to the sequence and every non-negative integer \(n\) such that \(i + n\) is a valid iterator pointing to an element of the sequence, and \( \text{INVOKES}(\text{comp}, \text{INVOKES}(\text{proj}, *(i + n)), \text{INVOKES}(\text{proj}, *i)) \) == false.

\( \text{comp} \) has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type \texttt{sequenced_policy} execute in sequential order in the calling thread.
The application of function objects in parallel algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: $O(N \log(N))$, where $N = \text{std::distance(first, last)}$ comparisons.

**Template Parameters**

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to `hpx::identity`.

**Parameters**

- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng` – Refers to the sequence of elements the algorithm will be applied to.
- `comp` – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate is invoked.

**Returns**

The `stable_sort` algorithm returns a `hpx::future<hpx::traits::range_iterator_t<Rng>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `hpx::traits::range_iterator_t<Rng>` otherwise. It returns `last`.

```cpp
namespace hpx

namespace ranges

Functions

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool starts_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel `starts_with` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.
Template Parameters
- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter1.
- **Iter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

Parameters
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns The `starts_with` algorithm returns bool. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
    hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> starts_with(ExPolicy &&policy, FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.
Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to \emph{hpx::identity}
- **Proj2** – The type of an optional projection function for the destination range. This defaults to \emph{hpx::identity}

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by \emph{proj1} and \emph{proj2} respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns
The \emph{starts_with} algorithm returns a \emph{hpx::future<bool>} if the execution policy is of type \emph{sequenced_task_policy} or \emph{parallel_task_policy} and returns \emph{bool} otherwise. The \emph{starts_with} algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```cpp
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool starts_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range \emph{rng2} matches the prefix of the first range \emph{rng1}.

The assignments in the parallel \emph{starts_with} algorithm invoked without an execution policy object execute in sequential order in the calling thread.

\textbf{Note:} Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.
this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

**Parameters**
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

**Returns** The `starts_with` algorithm returns `bool`. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type starts_with(ExPolicy &&policy, Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range `rng2` matches the prefix of the first range `rng1`.

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `starts_with` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
• **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

**Returns**

The `starts_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

### hpx/parallel/container_algorithms/swap_ranges.hpp

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

**Functions**

```cpp
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2>
swap_ranges_result<InIter1, InIter2> swap_ranges(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2)
```

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Linear in the distance between `first1` and `last1`.

**Template Parameters**

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements for the first range.
• **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
• **first2** – Refers to the beginning of the sequence of elements for the second range.
• **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

**Returns** The `swap_ranges` algorithm returns `swap_ranges_result<InIter1, InIter2>`. The `swap_ranges` algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<FwdIter1, FwdIter2>>::type swap_ranges(
    ExPolicy &&policy,
    FwdIter1 first1,
    Sent1 last1,
    FwdIter2 first2,
    Sent2 last2)
```

Exchanges elements between range [first1, last1) and another range starting at first2.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear in the distance between `first1` and `last1`

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.
**Returns** The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>` if the execution policy is of type `parallel_task_policy` and returns `FwdIter2` otherwise. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```cpp
template<typename Rng1, typename Rng2>
swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>> swap_ranges(Rng1 &&rng1, Rng2 &&rng2)
```

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Linear in the distance between `first1` and `last1`

**Template Parameters**

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

**Returns** The `swap_ranges` algorithm returns `swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>`. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>> swap_ranges(ExPolicy &&policy, Rng1 &&rng1, Rng2 &&rng2)
```

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.
Note: Complexity: Linear in the distance between first1 and last1

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns

The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>>` if the execution policy is of type `parallel_task_policy` and returns `swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>`. otherwise. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

Functions

template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename F = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<FwdIter1, FwdIter2>>::type transform(ExPolicy&& policy, FwdIter1 first, Sent1 last, FwdIter2 dest, F&& f, Proj&& proj = Proj())
Applies the given function $f$ to the given range $rng$ and stores the result in another range, beginning at dest.

The invocations of $f$ in the parallel transform algorithm invoked with an execution policy object of type $\text{sequenced\_policy}$ execute in sequential order in the calling thread.

The invocations of $f$ in the parallel transform algorithm invoked with an execution policy object of type $\text{parallel\_policy}$ or $\text{parallel\_task\_policy}$ are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Exactly $\text{size(rng)}$ applications of $f$

### Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of $f$.
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of transform requires $F$ to meet the requirements of $\text{Copy\_Constructible}$.
- **Proj** – The type of an optional projection function. This defaults to $\text{hpx::identity}$

### Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by $[\text{first, last})$. This is an unary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type &a);
  ```

  The signature does not need to have $\text{const&}$. The type $\text{Type}$ must be such that an object of type $\text{FwdIter1}$ can be dereferenced and then implicitly converted to $\text{Type}$. The type $\text{Ret}$ must be such that an object of type $\text{FwdIter2}$ can be dereferenced and assigned a value of type $\text{Ret}$.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate $f$ is invoked.

### Returns
The transform algorithm returns a $\text{hpx::future<ranges::unary_transform_result<FwdIter1, FwdIter2>}>$ if the execution policy is of type $\text{parallel\_task\_policy}$ and returns $\text{ranges::unary_transform_result<FwdIter1, FwdIter2>}$ otherwise. The transform algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.
template<typename ExPolicy, typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<hpx::traits::range_iterator_t<Rng>>, FwdIter>
transform(ExPolicy &&policy, Rng &&rng, FwdIter dest, F &&f, Proj &&proj = Proj())

Applies the given function $f$ to the given range $rng$ and stores the result in another range, beginning at $dest$.

The invocations of $f$ in the parallel transform algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The invocations of $f$ in the parallel transform algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Exactly $\text{size}(rng)$ applications of $f$

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of $f$.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of transform requires $F$ to meet the requirements of Copy-Constructible.
- **Proj** – The type of an optional projection function. This defaults to $\text{hpx::identity}$

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type &a);
```

The signature does not need to have const&. The type $Type$ must be such that an object of type $\text{range_iterator}<\text{Rng}>::\text{type}$ can be dereferenced and then implicitly converted to $Type$. The type $Ret$ must be such that an object of type $\text{OutIter}$ can be dereferenced and
assigned a value of type Ret.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate \( f \) is invoked.

**Returns** The `transform` algorithm returns a `hpx::future<ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>>` if the execution policy is of type `parallel_task_policy` and returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>` otherwise.

The `transform` algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3, typename F = hpx::identity, typename Proj1 = hpx::identity
hpx::util::detail::algorithm_result<ExPolicy, ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>> transform(ExPolicy&& policy, FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2, FwdIter3 dest, F&& f, Proj1&& proj1 = Proj1(), Proj2&& proj2 = Proj2())
```

Applies the given function \( f \) to pairs of elements from two ranges: one defined by \( rng \) and the other beginning at \( first2 \), and stores the result in another range, beginning at \( dest \).

The invocations of \( f \) in the parallel `transform` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The invocations of \( f \) in the parallel `transform` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Exactly `size(rng)` applications of \( f \)

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of \( f \).
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `Copy-Constructible`.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`

### Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter3` can be dereferenced and assigned a value of type `Ret`.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `f` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `f` is invoked.

### Returns
The `transform` algorithm returns a `hpx::future<ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>` if the execution policy is of type `parallel_task_policy` and returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>` otherwise. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng1, typename Rng2, typename FwdIter, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```
Applies the given function $f$ to pairs of elements from two ranges: one defined by $[\text{first1}, \text{last1})$ and the other beginning at $\text{first2}$, and stores the result in another range, beginning at $\text{dest}$.

The invocations of $f$ in the parallel `transform` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The invocations of $f$ in the parallel `transform` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Exactly $\min(\text{last2}-\text{first2}, \text{last1}-\text{first1})$ applications of $f$

**Note:** The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of $f$.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires $F$ to meet the requirements of `CopyConstructible`.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`
Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types `Type1` and `Type2` must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter` can be dereferenced and assigned a value of type `Ret`.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `f` is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `f` is invoked.

**Returns** The `transform` algorithm returns a `hpx::future<ranges::binary_transform_result<
    hpx::traits::range_iterator_t<Rng1>,
    hpx::traits::range_iterator_t<Rng2>,
    FwdIter>>` if the execution policy is of type `parallel_task_policy` and returns `ranges::binary_transform_result<
    hpx::traits::range_iterator_t<Rng1>,
    hpx::traits::range_iterator_t<Rng2>,
    FwdIter>` otherwise. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity>
ranges::unary_transform_result<FwdIter1, FwdIter2> transform(FwdIter1 first, Sent1 last, FwdIter2 dest, F &&f, Proj &&proj = Proj())
```

Applies the given function `f` to the given range `rng` and stores the result in another range, beginning at `dest`.

**Note:** Complexity: Exactly size(rng) applications of `f`

**Template Parameters**

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for `FwdIter1`.

- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `CopyConstructible`.

- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`
• **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
• **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have const&. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `Ret` must be such that an object of type `FwdIter2` can be dereferenced and assigned a value of type `Ret`.

• **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `f` is invoked.

**Returns** The `transform` algorithm returns `ranges::unary_transform_result<FwdIter1, FwdIter2>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
ranges::unary_transform_result<hpx::traits::range_iterator_t<Rng>, FwdIter> transform(Rng &&rng,
    FwdIter dest,
    F & &f, Proj
    &&proj = Proj())
```

Applies the given function `f` to the given range `rng` and stores the result in another range, beginning at `dest`.

**Note:** Complexity: Exactly `size(rng)` applications of `f`

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of Copy-Constructible.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have const&. The type `Type` must be such that an object of type `range_iterator_t<Rng>::type` can be dereferenced and then implicitly converted to `Type`. The type `Ret` must be such that an object of type `OutIter` can be dereferenced and assigned a value of type `Ret`. 
• **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate \( f \) is invoked.

**Returns** The `transform` algorithm returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3> transform(FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2, FwdIter3 dest, F &&f, Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Applies the given function \( f \) to pairs of elements from two ranges: one defined by \( rng \) and the other beginning at \( first2 \), and stores the result in another range, beginning at \( dest \).

**Note:** Complexity: Exactly `size(rng)` applications of \( f \)

**Template Parameters**
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for `FwdIter1`.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for `FwdIter2`.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires \( F \) to meet the requirements of `CopyConstructible`.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`.

**Parameters**
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([first, last)\). This is a binary predicate. The signature of this predicate should be equivalent to:
Ret fun(const Type1 &a, const Type2 &b);

The signature does not need to have const&. The types Type1 and Type2 must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to Type1 and Type2 respectively. The type Ret must be such that an object of type FwdIter3 can be dereferenced and assigned a value of type Ret.

• proj1 – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate \( f \) is invoked.

• proj2 – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate \( f \) is invoked.

**Returns** The transform algorithm returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>`. The transform algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

Applies the given function \( f \) to pairs of elements from two ranges: one defined by \([\text{first1}, \text{last1})\) and the other beginning at \( \text{first2} \), and stores the result in another range, beginning at \( \text{dest} \).

**Note:** Complexity: Exactly \( \min(\text{last2}-\text{first2}, \text{last1}-\text{first1}) \) applications of \( f \)

**Note:** The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

**Template Parameters**

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
• **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `CopyConstructible`.

• **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to `hpx::identity`.

• **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`.

**Parameters**

• **rng1** – Refers to the first sequence of elements the algorithm will be applied to.

• **rng2** – Refers to the second sequence of elements the algorithm will be applied to.

• **dest** – Refers to the beginning of the destination range.

• **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types `Type1` and `Type2` must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter` can be dereferenced and assigned a value of type `Ret`.

• **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `f` is invoked.

• **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `f` is invoked.

**Returns** The `transform` algorithm returns `ranges::binary_transform_result<
hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

### `hpx/parallel/container_algorithms/transform_exclusive_scan.hpp`

See *Public API* for a list of names and headers that are part of the public `HPX` API.

```cpp
namespace hpx
```

```cpp
namespace ranges
```
**Functions**

template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<InIter>::value_type>
transform_exclusive_scan_result<InIter, OutIter> transform_exclusive_scan(InIter first, Sent last,
OutIter dest, T init, BinOp &&binary_op, UnOp &&unary_op)

Assigns through each iterator \( i \) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op,init,conv(*first),...,conv(*first+(i-result)-1))).

The reduce operations in the parallel transform_exclusive_scan algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither \( \text{conv} \) nor \( \text{op} \) shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first},\text{last})\) or \([\text{result},\text{result} + (\text{last} - \text{first}))\).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \( O(\text{last} - \text{first}) \) applications of the predicates \( \text{op} \) and \( \text{conv} \).

**Note:** GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, \ldots, aN) is defined as:
- \( a1 \) when \( N = 1 \)
- \( \text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, \ a1, \ \ldots, \ aK), \ \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, \ aM, \ \ldots, \ aN)) \) where \( 1 < K+1 = M <= N \).

**Template Parameters**
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

**Parameters**
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret } \text{fun}(\text{const Type1 &a, const Type1 &b});
\]
The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1 and Ret must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

**Returns** The transform_exclusive_scan algorithm returns transform_exclusive_scan_result<InIter, OutIter>. The transform_exclusive_scan algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_result<FwdIter1, FwdIter2>>::type transform_exclusive_scan(ExPolicy &&policy, FwdIter1 first, Sent last, FwdIter2 dest, T init, BinOp &&binary_op, UnOp &&unary_op)
```

Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), \ldots, conv(*(first+(i-result)-1))).

The reduce operations in the parallel transform_exclusive_scan algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_exclusive_scan algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither \(\text{conv}\) nor \(\text{op}\) shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first},\text{last})\) or \([\text{result},\text{result} + (\text{last} - \text{first}))\).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \(O(\text{last} - \text{first})\) applications of the predicates \(\text{op}\) and \(\text{conv}\).
Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1 and Ret must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

Returns The transform_exclusive_scan algorithm returns a hpx::future<transform_exclusive_result<FwdIter1, FwdIter2>> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns transform_exclusive_result<FwdIter1, FwdIter2> otherwise. The transform_exclusive_scan algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>```
transform_exclusive_scan_result<

transform_exclusive_scan(<Rng>, <O> transform_exclusive_scan(<Rng>

Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))).

The reduce operations in the parallel transform_exclusive_scan algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither \(\text{conv}\) nor \(\text{op}\) shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first}, \text{last})\) or \([\text{result}, \text{result} + (\text{last} - \text{first}))\).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \(O(\text{last} - \text{first})\) applications of the predicates \(\text{op}\) and \(\text{conv}\).

**Note:** GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:
- \(a1\) when \(N\) is 1
- \(\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a1, ..., aK), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, aM, ..., aN))\) where \(1 < K+1 = M \leq N\).

**Template Parameters**
- \(\text{Rng}\) – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \(\text{O}\) – The type of the iterator representing the destination range (deduced).
- \(\text{T}\) – The type of the value to be used as initial (and intermediate) values (deduced).
- \(\text{BinOp}\) – The type of the binary function object used for the reduction operation.
- \(\text{UnOp}\) – The type of the unary function object used for the conversion operation.

**Parameters**
- \(\text{rng}\) – Refers to the sequence of elements the algorithm will be applied to.
- \(\text{dest}\) – Refers to the beginning of the destination range.
- \(\text{init}\) – The initial value for the generalized sum.
- \(\text{binary_op}\) – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types \(\text{Type1}\) and \(\text{Ret}\) must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
• ** unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

\[
R \text{ fun}(\text{const Type a});
\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

**Returns** The `transform-exclusive_scan` algorithm returns a returns `transform-exclusive_scan_result< traits::range_iterator_t<Rng>, O>`. The `transform-exclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform-exclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O>> parallel::util::transform-exclusive_scan(ExPolicy&& policy, Rng&& rng, O& dest, T init, BinOp&& binary_op, UnOp&& unary_op);
```

Assigns through each iterator \(i\) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first+(i-result)-1))).

The reduce operations in the parallel `transform-exclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform-exclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither \(\text{conv}\) nor \(\text{op}\) shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first},\text{last})\) or \([\text{result},\text{result} + (\text{last} - \text{first}))\).

The behavior of `transform-exclusive_scan` may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \(O(\text{last} - \text{first})\) applications of the predicates \(\text{op}\) and \(\text{conv}\).

**Note:** GENERALIZED_NONCOMMUTATIVE_SUM\(\text{op}, a_1, \ldots, a_N\) is defined as:

- \(a_1\) when \(N\) is 1
• \( \text{op} \text{(GENERALIZED_NONCOMMUTATIVE\_SUM}(\text{op, a1, \ldots, aK}), \text{GENERALIZED_NONCOMMUTATIVE\_SUM}(\text{op, aM, \ldots, aN}) \text{ where } 1 < K+1 = M \leq N. \)

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The function returns a `hpx::future<transform_exclusive_scan_result<traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_scan_result<traits::range_iterator_t<Rng>, O>` otherwise. The function returns an input iterator to the one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.
namespace hpx

namespace ranges

Functions

template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp>
transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last, OutIter dest, BinOp &&binary_op, UnOp &&unary_op)

Assigns through each iterator $i$ in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM($\text{op}$, conv(*first), ..., conv(*($\text{first} + (i - \text{result}))))).

The reduce operations in the parallel transform_inclusive_scan algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither conv nor op shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last})$ or $[\text{result}, \text{result} + (\text{last} - \text{first}))$.

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates op and conv.

Note: GENERALIZED_NONCOMMUTATIVE_SUM($\text{op}$, a1, ..., aN) is defined as:
- a1 when $N$ is 1
- $\text{op}$GENERALIZED_NONCOMMUTATIVE_SUM($\text{op}$, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM($\text{op}$, aM, ..., aN) where $1 < K+1 = M \leq N$.

Template Parameters
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
• **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

• **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The `transform_inclusive_scan` algorithm returns `transform_inclusive_scan_result<InIter, OutIter>`. The `transform_inclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp, typename UnOp>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type transform_inclusive_scan(ExPolicy &&policy, FwdIter1 first, Sent last, FwdIter2 dest, BinOp &&binary_op, UnOp &&unary_op)
```

Assigns through each iterator `i` in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.
Note: Complexity: \(O(\text{last} - \text{first})\) applications of the predicates \(\text{op}\) and \(\text{conv}\).

Note: \(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a_1, \ldots, a_N)\) is defined as:
- \(a_1\) when \(N = 1\)
- \(\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a_1, \ldots, a_K), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a_M, \ldots, a_N))\) where \(1 < K+1 = M <= N\).

Template Parameters
- \(\text{ExPolicy}\) – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- \(\text{FwdIter1}\) – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- \(\text{Sent}\) – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- \(\text{FwdIter2}\) – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- \(\text{BinOp}\) – The type of the binary function object used for the reduction operation.
- \(\text{UnOp}\) – The type of the unary function object used for the conversion operation.

Parameters
- \(\text{policy}\) – The execution policy to use for the scheduling of the iterations.
- \(\text{first}\) – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- \(\text{last}\) – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- \(\text{dest}\) – Refers to the beginning of the destination range.
- \(\text{binary_op}\) – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret fun}(const \ Type1 &a, const \ Type1 &b);
\]

The signature does not need to have \(\text{const}\&\), but the function must not modify the objects passed to it. The types \(\text{Type1}\) and \(\text{Ret}\) must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- \(\text{unary_op}\) – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is a unary predicate. The signature of this predicate should be equivalent to:

\[
\text{R fun}(const \ Type &a);
\]

The signature does not need to have \(\text{const}\&\), but the function must not modify the objects passed to it. The type \(\text{Type}\) must be such that an object of \(\text{FwdIter1}\) can be dereferenced and then implicitly converted to \(\text{Type}\). The type \(\text{R}\) must be such that an object of this type can be implicitly converted to \(T\).

Returns The \text{transform_inclusive_scan} algorithm returns a \text{hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>} if the execution policy is of type \text{sequenced_task_policy} or \text{parallel_task_policy} and returns \text{transform_inclusive_result<FwdIter1, FwdIter2>} otherwise. The \text{transform_inclusive_scan} algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.
template<typename Rng, typename O, typename BinOp, typename UnOp>
transform_inclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O> transform_inclusive_scan(Rng &&rng, O dest, BinOp &&binary_op, UnOp &&unary_op)

Assigns through each iterator \( i \) in \([\text{result}, \text{result} + (\text{last} - \text{first}))\) the value of GENERALIZED_NONCOMMUTATIVE_SUM\((\text{op}, \text{conv}(\ast \text{first}), \ldots, \text{conv}(\ast (\text{first} + (i - \text{result})))\).

The reduce operations in the parallel transform_inclusive_scan algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither \text{conv} nor \text{op} shall invalidate iterators or sub-ranges, or modify elements in the ranges \([\text{first}, \text{last})\) or \([\text{result}, \text{result} + (\text{last} - \text{first}))\).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

**Note:** Complexity: \(O((\text{last} - \text{first}))\) applications of the predicates \text{op} and \text{conv}.

**Note:** GENERALIZED_NONCOMMUTATIVE_SUM\((\text{op}, \text{a1}, \ldots, \text{aN})\) is defined as:
- \(\text{a1} \) when \(\text{N} = 1\)
- \(\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, \text{a1}, \ldots, \text{aK}), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, \text{aN}, \ldots, \text{aN}))\) where \(1 < \text{K} + 1 = \text{M} \leq \text{N}\).

**Template Parameters**
- \(\text{Rng}\) – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- \(\text{O}\) – The type of the iterator representing the destination range (deduced).
- \(\text{BinOp}\) – The type of the binary function object used for the reduction operation.
- \(\text{UnOp}\) – The type of the unary function object used for the conversion operation.

**Parameters**
- \(\text{rng}\) – Refers to the sequence of elements the algorithm will be applied to.
- \(\text{dest}\) – Refers to the beginning of the destination range.
- \(\text{binary\_op}\) – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have \text{const}\&, but the function must not modify the objects passed to it. The types \text{Type1} and \text{Ret} must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- \(\text{unary\_op}\) – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first}, \text{last})\). This is a unary predicate. The signature of this predicate should be equivalent to:
R fun(const Type &a);

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

Returns The transform_inclusive_scan algorithm returns a returns transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>. The transform_inclusive_scan algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O>>:

Assigns through each iterator i in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*first + (i - result))).

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither conv nor op shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(last - first) applications of the predicates op and conv.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:
  • a1 when N is 1
  • op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where 1 < K+1 = M <= N.

Template Parameters
  • ExPolicy – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it
executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1 and Ret must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```cpp
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

**Returns** The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp,
         typename T = typename std::iterator_traits<InIter>::value_type>
transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last, OutIter dest, BinOp &&binary_op, UnOp &&unary_op, T init)
```

Assigns through each iterator `i` in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result)))�)

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).
The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: \(O(last - first)\) applications of the predicates \(op\) and \(conv\).

Note: \(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_1, \ldots, a_N)\) is defined as:
• \(a_1\) when \(N\) is 1
• \(op(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_1, \ldots, a_K), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_M, \ldots, a_N))\) where \(1 < K+1 = M <= N\).

Template Parameters
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

\[
\text{Ret fun(const Type1 &a, const Type1 &b);}
\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The types \(\text{Type1}\) and \(\text{Ret}\) must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by \([\text{first, last})\]. This is a unary predicate. The signature of this predicate should be equivalent to:

\[
R \text{ fun(const Type &a);} \]

The signature does not need to have const&, but the function must not modify the objects passed to it. The type \(\text{Type}\) must be such that an object of type \(\text{FwdIter1}\) can be dereferenced and then implicitly converted to Type. The type \(R\) must be such that an object of this type can be implicitly converted to \(T\).

- **init** – The initial value for the generalized sum.

Returns The \(\text{transform\_inclusive\_scan}\) algorithm returns \(\text{transform\_inclusive\_scan\_result<InIter, OutIter>}\). The \(\text{transform\_inclusive\_scan}\) algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

\[
\text{template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>}
\]
Assigns through each iterator $i$ in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*first + (i - result))).

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first, last) or [result, result + (last - first))].

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

**Note:** Complexity: $O(last - first)$ applications of the predicates `op` and `conv`.

**Note:** GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:
- $a1$ when $N$ is 1
- $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))$ where $1 < K+1 = M <= N$.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- `BinOp` – The type of the binary function object used for the reduction operation.
- `UnOp` – The type of the unary function object used for the conversion operation.
• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to Type. The type `R` must be such that an object of this type can be implicitly converted to `T`.

- **init** – The initial value for the generalized sum.

**Returns**
The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_result<FwdIter1, FwdIter2>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>
transform_inclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O> transform_inclusive_scan(Rng &&rng, O dest, BinOp &&binary_op, UnOp &&unary_op, T init)
```

Assigns through each iterator `i` in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*first + (i - result)))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.
Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first, last)` or `[result, result + (last - first))`. The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

**Note:** Complexity: $O(last - first)$ applications of the predicates `op` and `conv`.

**Note:** `GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \ldots, a_N)` is defined as:
- $a_1$ when $N$ is 1
- $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \ldots, a_K), GENERALIZED_NONCOMMUTATIVE_SUM(op, a_M, \ldots, a_N))$ where $1 < K+1 = M <= N$.

**Template Parameters**
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `O` – The type of the iterator representing the destination range (deduced).
- `BinOp` – The type of the binary function object used for the reduction operation.
- `UnOp` – The type of the unary function object used for the conversion operation.
- `T` – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**
- `rng` – Refers to the sequence of elements the algorithm will be applied to.
- `dest` – Refers to the beginning of the destination range.
- `binary_op` – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- `unary_op` – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

- `init` – The initial value for the generalized sum.

**Returns** The `transform_inclusive_scan` algorithm returns a returns `transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>`. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.
Assigns through each iterator $i$ in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))).

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_inclusive_scan algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither $\text{conv}$ nor $\text{op}$ shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last})$ or $[\text{result}, \text{result} + (\text{last} - \text{first}))$.

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates $\text{op}$ and $\text{conv}$.

Note: GENERALIZED_NONCOMMUTATIVE_SUM($\text{op}, a_1, \ldots, a_N$) is defined as:

$\bullet$ $a_1$ when $N$ is 1

$\bullet$ $\text{op}$(GENERALIZED_NONCOMMUTATIVE_SUM($\text{op}, a_1, \ldots, a_K$), GENERALIZED_NONCOMMUTATIVE_SUM($\text{op}, a_M, \ldots, a_N$)) where $1 < K+1 = M <= N$. 

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.

- **BinOp** – The type of the binary function object used for the reduction operation.

- **UnOp** – The type of the unary function object used for the conversion operation.

- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
• **rng** – Refers to the sequence of elements the algorithm will be applied to.
• **dest** – Refers to the beginning of the destination range.
• **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

• **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

• **init** – The initial value for the generalized sum.

**Returns** The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result<traits::range_iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

**hpx/parallel/container_algorithms/transform_reduce.hpp**

See **Public API** for a list of names and headers that are part of the public HPX API.

**namespace hpx**

**Functions**

```
template<
    typename ExPolicy, typename Iter, typename Sent, typename T,
    typename Reduce, typename Convert
>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T>
transform_reduce(
    ExPolicy &&policy, Iter first, Sent last, T init,
    Reduce &&red_op, Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*first + (last - first) - 1))`.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

---

**2.8. API reference** 851
The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: $O(last - first)$ applications of the predicates `red_op` and `conv_op`.

**Note:** `GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:
- $a1$ when $N$ is 1
- $op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN))$, where:
  - $b1, ..., bN$ may be any permutation of $a1, ..., aN$ and
  - $1 < K + 1 = M <= N$.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter`.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of `conv_op`. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1`, `Type2`, and `Ret` must be such that an object of a type as returned from `conv_op` can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:
R fun(const Type &a);

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type Iter can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

Returns The transform_reduce algorithm returns a hpx::future<T> if the execution policy is of type parallel_task_policy and returns T otherwise. The transform_reduce algorithm returns the result of the generalized sum over the values returned from conv_op when applied to the elements given by the input range [first, last).

template<typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
T transform_reduce(Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between transform_reduce and accumulate is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(last - first) applications of the predicates red_op and conv_op.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:
• a1 when N is 1
• op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
  – b1, ..., bN may be any permutation of a1, ..., aN and
  – 1 < K+1 = M <= N.

Template Parameters
• Iter – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
• Sent – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
• T – The type of the value to be used as initial (and intermediate) values (deduced).
• Reduce – The type of the binary function object used for the reduction operation.
• Convert – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters
• first – Refers to the beginning of the first sorted range the algorithm will be applied to.
• last – Refers to the end of the second sorted range the algorithm will be applied to.
• init – The initial value for the generalized sum.
• red_op – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of conv_op. This is a binary predicate. The signature of this predicate should be equivalent to:
Ret fun(const Type1 &a, const Type2 &b);

The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1, Type2, and Ret must be such that an object of a type as returned from conv_op can be implicitly converted to any of those types.

- conv_op – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

R fun(const Type &a);

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type Iter can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

Returns The transform_reduce algorithm returns T. The transform_reduce algorithm returns the result of the generalized sum over the values returned from conv_op when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter first, Sent last, Iter2 first2, T init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*((first + (last - first) - 1)))).

The reduce operations in the parallel transform_reduce algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The reduce operations in the parallel transform_reduce algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between transform_reduce and accumulate is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: O(last - first) applications of the predicates red_op and conv_op.

**Note:** GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - 1 < K+1 = M <= N.

**Template Parameters**
• **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

• **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.

• **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.

• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.

• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.

• **last** – Refers to the end of the second sorted range the algorithm will be applied to.

• **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

• **init** – The initial value for the generalized sum.

**Returns**

The `transform_reduce` algorithm returns a `hpx::future<T>` if the execution policy is of type `parallel_task_policy` and returns `T` otherwise. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`.

```
template<typename Iter, typename Sent, typename Iter2, typename T>
T transform_reduce(Iter first, Sent last, Iter2 first2, T init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: $O(last - first)$ applications of the predicates `red_op` and `conv_op`.

**Note:** GENERALIZED_SUM(op, a₁, ..., aₙ) is defined as follows:

• a₁ when N is 1

• op(GENERALIZED_SUM(op, b₁, ..., bₖ), GENERALIZED_SUM(op, bₘ, ..., bₙ)), where:
  - b₁, ..., bₖ may be any permutation of a₁, ..., aₙ and
  - 1 < K+₁ = M <= N.

**Template Parameters**

• **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
• **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.

• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.

• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**

• **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.

• **last** – Refers to the end of the second sorted range the algorithm will be applied to.

• **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

• **init** – The initial value for the generalized sum.

**Returns** The `transform_reduce` algorithm returns `T`. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`.

```cpp
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*((first + (last - first) - 1))))`.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: \(O(last - first)\) applications of the predicates `red_op` and `conv_op`.

**Note:** `GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:

• \(a1\) when \(N\) is 1

• \(op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN))\), where:
  - \(b1, ..., bN\) may be any permutation of \(a1, ..., aN\) and
  - \(1 < K+1 = M <= N\).

**Template Parameters**
• **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

• **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.

• **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.

• **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.

• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

• **Reduce** – The type of the binary function object used for the reduction operation.

• **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.

• **last** – Refers to the end of the second sorted range the algorithm will be applied to.

• **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

• **init** – The initial value for the generalized sum.

• **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of conv_op. This is a binary predicate. The signature of this predicate should be equivalent to:

```cpp
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1, Type2, and Ret must be such that an object of a type as returned from conv_op can be implicitly converted to any of those types.

• **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type Iter can be dereferenced and then implicitly converted to Type. The type R must be such that an object of this type can be implicitly converted to T.

**Returns** The transform_reduce algorithm returns a hpx::future<T> if the execution policy is of type parallel_task_policy and returns T otherwise. The transform_reduce algorithm returns the result of the generalized sum over the values returned from conv_op when applied to the elements given by the input range [first, last).

```cpp
template<typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
```
\texttt{transform\_reduce(Iter first, Sent last, Iter2 first2, T init, Reduce \\&\&red\_op, Convert \\&\&conv\_op)}

Returns \texttt{GENERALIZED\_SUM(red\_op, init, conv\_op(*first), \ldots, conv\_op(*((first + (last - first) - 1))))}.

The difference between \texttt{transform\_reduce} and \texttt{accumulate} is that the behavior of \texttt{transform\_reduce} may be non-deterministic for non-associative or non-commutative binary predicate.

\textbf{Note:} Complexity: O(last - first) applications of the predicates \texttt{red\_op} and \texttt{conv\_op}.

\textbf{Note:} \texttt{GENERALIZED\_SUM(op, a1, \ldots, aN)} is defined as follows:

\begin{itemize}
  \item a1 when N is 1
  \item op(GENERALIZED\_SUM(op, b1, \ldots, bK), GENERALIZED\_SUM(op, bM, \ldots, bN)), where:
    \begin{itemize}
      \item b1, \ldots, bN may be any permutation of a1, \ldots, aN and
      \item 1 < K+1 = M <= N.
    \end{itemize}
\end{itemize}

\textbf{Template Parameters}

\begin{itemize}
  \item \texttt{Iter} – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
  \item \texttt{Sent} – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
  \item \texttt{Iter2} – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
  \item \texttt{T} – The type of the value to be used as initial (and intermediate) values (deduced).
  \item \texttt{Reduce} – The type of the binary function object used for the reduction operation.
  \item \texttt{Convert} – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{first} – Refers to the beginning of the first sorted range the algorithm will be applied to.
  \item \texttt{last} – Refers to the end of the second sorted range the algorithm will be applied to.
  \item \texttt{first2} – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
  \item \texttt{init} – The initial value for the generalized sum.
  \item \texttt{red\_op} – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of \texttt{conv\_op}. This is a binary predicate. The signature of this predicate should be equivalent to:

\begin{verbatim}
Ret fun(const Type1 &a, const Type2 &b);
\end{verbatim}

The signature does not need to have const &, but the function must not modify the objects passed to it. The types \texttt{Type1, Type2}, and \texttt{Ret} must be such that an object of a type as returned from \texttt{conv\_op} can be implicitly converted to any of those types.
• **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```cpp
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `Iter` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The `transform_reduce` algorithm returns `T`. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`.

```cpp
template<typename ExPolicy, typename Rng, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng &&rng, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*first + (last - first) - 1))`.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: \(O(last - first)\) applications of the predicates `red_op` and `conv_op`.

**Note:** `GENERALIZED_SUM(op, a1, \ldots, aN)` is defined as follows:

- \(a1\) when \(N\) is 1
- \(op(GENERALIZED_SUM(op, b1, \ldots, bK), GENERALIZED_SUM(op, bM, \ldots, bN))\), where:
  - \(b1, \ldots, bN\) may be any permutation of \(a1, \ldots, aN\) and
  - \(1 < K+1 = M <= N\).

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
• **T** – The type of the value to be used as initial (and intermediate) values (deduced).

• **Reduce** – The type of the binary function object used for the reduction operation.

• **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

• **policy** – The execution policy to use for the scheduling of the iterations.

• **rng** – Refers to the sequence of elements the algorithm will be applied to.

• **init** – The initial value for the generalized sum.

• **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

• **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

**Returns** The *transform_reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type `parallel_task_policy` and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range `[first, last)`.

```
template<typename Rng, typename T, typename Reduce, typename Convert>
T transform_reduce(Rng &&rng, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1)))`.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

**Note:** Complexity: \(O(last - first)\) applications of the predicates *red_op* and *conv_op*.

**Note:** `GENERALIZED_SUM(op, a_1, \ldots, a_N)` is defined as follows:

• *a*_1 when *N* is 1

• \(op(GENERALIZED_SUM(op, b_1, \ldots, b_K), GENERALIZED_SUM(op, b_M, \ldots, b_N))\), where:
  - \(b_1, \ldots, b_N\) may be any permutation of \(a_1, \ldots, a_N\) and

860 Chapter 2. What’s so special about HPX?
\[ 1 < K+1 = M \leq N. \]

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of `conv_op`. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types `Type1`, `Type2`, and `Ret` must be such that an object of a type as returned from `conv_op` can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `Iter` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

**Returns** The `transform_reduce` algorithm returns `T`. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

The operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.
Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.

- **init** – The initial value for the sum.

Returns

The `transform_reduce` algorithm returns a `hpx::future<T>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `T` otherwise.

```cpp
template<typename Rng, typename Iter2, typename T>
T transform_reduce(Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

Note: Complexity: $O(last - first)$ applications of the predicate $op2$. 

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.

- **init** – The initial value for the sum.

Returns

The `transform_reduce` algorithm returns `T`. 

Note: Complexity: $O(last - first)$ applications of the predicate $op2$. 

template<
typename ExPolicy, typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng &&rng, Iter2 &&first2, T init, Reduce &&red_op, Convert &&conv_op)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel transform_reduce algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The operations in the parallel transform_reduce algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: $O(last - first)$ applications of the predicate op2.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return) values (deduced).

- **Reduce** – The type of the binary function object used for the multiplication operation.

- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.

- **init** – The initial value for the sum.

- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of op2. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

  ```cpp
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type Ret must be such that it can be implicitly converted to a type of T.
• **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

\[
\text{Ret fun(const Type1 &a, const Type2 &b);}\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The type \( \text{Ret} \) must be such that it can be implicitly converted to an object for the second argument type of \( \text{op1} \).

**Returns** The `transform_reduce` algorithm returns a `hpx::future<T>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `T` otherwise.

```
template<typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
T transform_reduce(Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

**Note:** Complexity: \( O(last - first) \) applications of the predicate \( \text{op2} \).

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return values (deduced).

- **Reduce** – The type of the binary function object used for the multiplication operation.

- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.

- **init** – The initial value for the sum.

- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of \( \text{op2} \). This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

\[
\text{Ret fun(const Type1 &a, const Type1 &b);}\]

The signature does not need to have const&, but the function must not modify the objects passed to it. The type \( \text{Ret} \) must be such that it can be implicitly converted to a type of \( T \).

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

\[
\text{Ret fun(const Type1 &a, const Type2 &b);}\]
The signature does not need to have const&, but the function must not modify the objects passed to it. The type Ret must be such that it can be implicitly converted to an object for the second argument type of op1.

**Returns** The transform_reduce algorithm returns T.

`hpx/parallel/container_algorithms/uninitialized_copy.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges

**Functions**

template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
```cpp
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_copy(InIter first1, Sent1 last1,
                                                                   FwdIter first2, Sent2 last2)
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel uninitialized_copy algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The uninitialized_copy algorithm returns an in_out_result<InIter, FwdIter>. The uninitialized_copy algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<type ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>

Covers the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel `uninitialized_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The `uninitialized_copy` algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `in_out_result<InIter, FwdIter>` otherwise. The `uninitialized_copy` algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.
Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel uninitialized_copy algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- `Rng1` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `Rng2` – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**
- `rng1` – Refers to the range from which the elements will be copied from
- `rng2` – Refers to the range to which the elements will be copied to

**Returns** The uninitialized_copy algorithm returns an in_out_result<

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel uninitialized_copy algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_copy algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
• **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
• **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**
• **policy** – The execution policy to use for the scheduling of the iterations.
• **rng1** – Refers to the range from which the elements will be copied from
• **rng2** – Refers to the range to which the elements will be copied to

**Returns**
The *uninitialized_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `in_out_result<type-name hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized_copy* algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_copy_n(InIter first1, Size count, FwdIter first2, Sent2 last2)
```

Copies the elements in the range `[first, first + count)`, starting from first and proceeding to `first + count - 1`, to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters**
• **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
• **Size** – The type of the argument specifying the number of elements to apply `f` to.
• **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
• **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**
• **first1** – Refers to the beginning of the sequence of elements that will be copied from
• **count** – Refers to the number of elements starting at `first` the algorithm will be applied to.
• **first2** – Refers to the beginning of the destination range.
• **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns**
The *uninitialized_copy_n* algorithm returns `in_out_result<InIter, FwdIter>`. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```
Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel `uninitialized_copy_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_copy_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply \( f \) to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The `uninitialized_copy_n` algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter2` otherwise. The `uninitialized_copy_n` algorithm returns the output iterator to the element in the destination range, one past the last element copied.
namespace hpx

namespace ranges

## Functions

```c++
template<typename FwdIter, typename Sent>
FwdIter uninitialized_default_construct(FwdIter first, Sent last)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

### Returns

The `uninitialized_default_construct` algorithm returns a returns `FwdIter`. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

```c++
template<typename ExPolicy, typename FwdIter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_default_construct(ExPolicy &&policy, FwdIter first, Sent last)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.
The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

**Returns**
The `uninitialized_default_construct` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The `uninitialized_default_construct` algorithm returns the iterator to the element in the source range, one past the last element constructed.

```cpp
template<typename Rng>
hpx::traits::range_traits<Rng>::iterator_type uninitialized_default_construct(Rng &&rng)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `last - first` assignments.

**Template Parameters** `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters** `rng` – Refers to the range to which will be default constructed.

**Returns**
The `uninitialized_default_construct` algorithm returns a returns `hpx::traits::range_traits<Rng>::iterator_type`. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

```cpp
template<typename ExPolicy, typename Rng>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type uninitialized_default_construct(ExPolicy &&policy, Rng &&rng)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage...
designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_default_construct algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_default_construct algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be default constructed

**Returns**
The uninitialized_default_construct algorithm returns a hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>, if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns typename hpx::traits::range_traits<Rng>::iterator_type otherwise. The uninitialized_default_construct algorithm returns the output iterator to the element in the range, one past the last element constructed.

```cpp
template<typename FwdIter, typename Size>
FwdIter uninitialized_default_construct_n(FwdIter first, Size count)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_default_construct_n algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly count assignments, if count > 0, no assignments otherwise.

**Template Parameters**
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply f to.

**Parameters**
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.

**Returns**
The uninitialized_default_construct_n algorithm returns a returns FwdIter. The uninitialized_default_construct_n algorithm returns the iterator to the element in the source range, one past the last element constructed.
Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_default_construct_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_default_construct_n algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly count assignments, if count > 0, no assignments otherwise.

### Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply f to.

### Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.

### Returns
The uninitialized_default_construct_n algorithm returns a hpx::future<FwdIter> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns FwdIter otherwise. The uninitialized_default_construct_n algorithm returns the iterator to the element in the source range, one past the last element constructed.
Functions

template<typename FwdIter, typename Sent, typename T>
FwdIter uninitialized_fill(FwdIter first, Sent last, T const &value)

Copies the given value to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges uninitialized_fill algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between first and last

Template Parameters
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns The uninitialized_fill algorithm returns a returns FwdIter. The uninitialized_fill algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_fill(ExPolicy &&policy, FwdIter first, Sent last, T const &value)

Copies the given value to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_fill algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_fill algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between first and last

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it
executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

**Returns**

The `uninitialized_fill` algorithm returns a returns `FwdIter`. The `uninitialized_fill` algorithm returns the output iterator to the element in the range, one past the last element copied.

```cpp
template<typename Rng, typename T>
hpx::traits::range_traits<Rng>::iterator_type uninitialized_fill(Rng &&rng, T const &value)
```

Copies the given `value` to an uninitialized memory area, defined by the range `[first, last)`. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_fill` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Linear in the distance between `first` and `last`

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

**Returns**

The `uninitialized_fill` algorithm returns a returns `hpx::traits::range_traits<Rng>::iterator_type`. The `uninitialized_fill` algorithm returns the output iterator to the element in the range, one past the last element copied.

```cpp
template<typename ExPolicy, typename Rng, typename T>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type
uninitialized_fill(ExPolicy &&policy, Rng &&rng, T const &value)
```

Copies the given `value` to an uninitialized memory area, defined by the range `[first, last)`. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_fill` algorithm invoked with an execution policy object of
type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_fill` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Linear in the distance between `first` and `last`

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `T` – The type of the value to be assigned (deduced).

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng` – Refers to the range to which the value will be filled
- `value` – The value to be assigned.

**Returns** The `uninitialized_fill` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_fill` algorithm returns the iterator to one past the last element filled in the range.

```cpp
template<typename FwdIter, typename Size, typename T>
FwdIter uninitialized_fill_n(FwdIter first, Size count, T const &value)
```

Copies the given `value` value to the first `count` elements in an uninitialized memory area beginning at `first`. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_fill_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `count` assignments, if `count > 0`, no assignments otherwise.

**Template Parameters**
- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- `Size` – The type of the argument specifying the number of elements to apply `f` to.
- `T` – The type of the value to be assigned (deduced).

**Parameters**
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `count` – Refers to the number of elements starting at `first` the algorithm will be applied to.
- `value` – The value to be assigned.

**Returns** The `uninitialized_fill_n` algorithm returns a returns `FwdIter`. The `uninitialized_fill_n` algorithm returns the output iterator to the element in the range, one past the last element copied.

```cpp
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
FwdIter uninitialized_fill_n(ExPolicy policy, FwdIter first, Size count, T const &value)
```
Copies the given value value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_fill_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_fill_n algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly count assignments, if count > 0, no assignments otherwise.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns** The uninitialized_fill_n algorithm returns a hpx::future<FwdIter>, if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns FwdIter otherwise. The uninitialized_fill_n algorithm returns the output iterator to the element in the range, one past the last element copied.

hpx/parallel/container_algorithms/uninitialized_move.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace ranges
Functions

```cpp
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move(InIter first1, Sent1 last1,
FwdIter first2, Sent2 last2)
```

Moves the elements in the range, defined by \([\text{first}, \text{last})\), to an uninitialized memory area beginning at \(\text{dest}\). If an exception is thrown during the initialization, some objects in \([\text{first}, \text{last})\) are left in a valid but unspecified state.

The assignments in the parallel \(\text{uninitialized\_move}\) algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly \(\text{last} - \text{first}\) assignments.

**Template Parameters**
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \(\text{InIter}\).
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \(\text{InIter2}\).

**Parameters**
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The \(\text{uninitialized\_move}\) algorithm returns an \(\text{in\_out\_result}\langle\text{InIter}, \text{FwdIter}\rangle\). The \(\text{uninitialized\_move}\) algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```cpp
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized_move
```

Moves the elements in the range, defined by \([\text{first}, \text{last})\), to an uninitialized memory area beginning at \(\text{dest}\). If an exception is thrown during the initialization, some objects in \([\text{first}, \text{last})\) are left in a valid but unspecified state.
The assignments in the parallel \texttt{uninitialized\_move} algorithm invoked with an execution policy object of type \texttt{sequenced\_policy} execute in sequential order in the calling thread.

The assignments in the parallel \texttt{uninitialized\_move} algorithm invoked with an execution policy object of type \texttt{parallel\_policy} or \texttt{parallel\_task\_policy} are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

\textbf{Note:} Complexity: Performs exactly \texttt{last - first} assignments.

\textbf{Template Parameters}

- \texttt{ExPolicy} – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- \texttt{FwdIter1} – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- \texttt{Sent1} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \texttt{InIter}.
- \texttt{FwdIter2} – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- \texttt{Sent2} – The type of the source sentinel (deduced). This sentinel type must be a sentinel for \texttt{InIter2}.

\textbf{Parameters}

- \texttt{policy} – The execution policy to use for the scheduling of the iterations.
- \texttt{first1} – Refers to the beginning of the sequence of elements that will be moved from
- \texttt{last1} – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- \texttt{first2} – Refers to the beginning of the destination range.
- \texttt{last2} – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

\textbf{Returns} The \texttt{uninitialized\_move} algorithm returns a \texttt{hpx::future\textless\textit{in\_out\_result}\textless\textit{InIter, FwdIter}\textgreater\texttt{)}, if the execution policy is of type \texttt{sequenced\_task\_policy} or \texttt{parallel\_task\_policy} and returns \texttt{in\_out\_result\textless\textit{InIter, FwdIter}\textgreater\texttt{)} otherwise. The \texttt{uninitialized\_move} algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

\begin{verbatim}
template<typename Rng1, typename Rng2>
  hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>
  uninitialized_move(Rng1&& rng1, Rng2&& rng2)
\end{verbatim}

Moves the elements in the range, defined by \texttt{[first, last)}, to an uninitialized memory area beginning at \textit{dest}. If an exception is thrown during the initialization, some objects in \texttt{[first, last)} are left in a valid but unspecified state.

The assignments in the parallel \texttt{uninitialized\_move} algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

\textbf{Note:} Complexity: Performs exactly \texttt{last - first} assignments.

\textbf{Template Parameters}

2.8. API reference 879
**Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

**Returns**

The `uninitialized_move` algorithm returns an in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>. The `uninitialized_move` algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>>
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel `uninitialized_move` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_move` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

**Returns**

The `uninitialized_move` algorithm returns a hpx::future<std::in_out_result<Inter, FwdIter>>, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns std::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type> otherwise. The `uninitialized_move` algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move_n(InIter first1, Size count, FwdIter first2, Sent2 last2)

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel uninitialized_move_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly count movements, if count > 0, no move operations otherwise.

**Template Parameters**
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply \( f \) to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**
- **first1** – Refers to the beginning of the sequence of elements that will be moved from.
- **count** – Refers to the number of elements starting at first the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The uninitialized_move_n algorithm returns in_out_result<InIter, FwdIter>. The uninitialized_move_n algorithm returns the output iterator to the element in the destination range, one past the last element moved.

template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized_move_n(ExPolicy&& policy, FwdIter1 first1, Size count, FwdIter2 first2, Sent2 last2)

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel uninitialized_move_n algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.
The assignments in the parallel `uninitialized_move_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly `count` movements, if `count > 0`, no move operations otherwise.

**Template Parameters**
- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Size` – The type of the argument specifying the number of elements to apply `f` to.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter2`.

**Parameters**
- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements that will be moved from.
- `count` – Refers to the number of elements starting at `first` the algorithm will be applied to.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns** The `uninitialized_move_n` algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter2` otherwise. The `uninitialized_move_n` algorithm returns the output iterator to the element in the destination range, one past the last element moved.

---

### hpx/parallel/container_algorithms/uninitialized_value_construct.hpp

See **Public API** for a list of names and headers that are part of the public **HPX** API.

namespace **hpx**

namespace **ranges**

**Functions**

```cpp
template<typename FwdIter, typename Sent>
FwdIter uninitialized_value_construct(FwdIter first, Sent last)
```

Constructs objects of type `typename iterator_traits<FwdIter>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.
Note: Complexity: Performs exactly last - first assignments.

Template Parameters
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The uninitialized_value_construct algorithm returns a returns FwdIter. The uninitialized_value_construct algorithm returns the output iterator to the element in the range, one past the last element constructed.

```cpp
template<typename ExPolicy, typename FwdIter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct(ExPolicy &&policy, FwdIter first, Sent last)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_value_construct algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_value_construct algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly last - first assignments.

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
Returns The uninitialized_value_construct algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The uninitialized_value_construct algorithm returns the iterator to the element in the source range, one past the last element constructed.

```cpp
template<typename Rng>
    hpx::traits::range_traits<Rng>::iterator_type
        uninitialized_value_construct(Rng &&rng)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_value_construct algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- **rng** – Refers to the range to which will be value constructed.

**Returns** The uninitialized_value_construct algorithm returns a returns `hpx::traits::range_traits<Rng>::iterator_type`. The uninitialized_value_construct algorithm returns the output iterator to the element in the range, one past the last element constructed.

```cpp
template<typename ExPolicy, typename Rng>
    parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type
        uninitialized_value_construct(ExPolicy &&policy, Rng &&rng)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel uninitialized_value_construct algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel uninitialized_value_construct algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs exactly last - first assignments.

**Template Parameters**
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**
- **policy** – The execution policy to use for the scheduling of the iterations.
• **rng** – Refers to the range to which the value will be value constructed

**Returns** The `uninitialized_value_construct` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_value_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

```cpp
template<typename FwdIter, typename Size>
FwdIter uninitialized_value_construct_n(FwdIter first, Size count)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct_n` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Performs exactly `count` assignments, if `count > 0`, no assignments otherwise.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply `f` to.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at `first` the algorithm will be applied to.

**Returns** The `uninitialized_value_construct_n` algorithm returns a returns `FwdIter`. The `uninitialized_value_construct_n` algorithm returns the iterator to the element in the source range, one past the last element constructed.

```cpp
template<typename ExPolicy, typename FwdIter, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct_n(ExPolicy &&policy, FwdIter first, Size count)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_value_construct_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.
Note: Complexity: Performs exactly `count` assignments, if `count > 0`, no assignments otherwise.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply to.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at `first` the algorithm will be applied to.

**Returns**

The `uninitialized_value_construct_n` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The `uninitialized_value_construct_n` algorithm returns the iterator to the element in the source range, one past the last element constructed.

---

`hpx/parallel/container_algorithms/unique.hpp`

See **Public API** for a list of names and headers that are part of the public HPX API.

namespace `hpx`

namespace `ranges`

### Functions

```cpp
template<typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<FwdIter, Sent> unique(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `[first, last)` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel `unique` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note:** Complexity: Performs not more than `last - first` assignments, exactly `last - first - 1` applications of the predicate `pred` and no more than twice as many applications of the projection `proj`.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
The unique algorithm returns subrange_t<FwdIter, Sent>. The unique algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel unique algorithm invoked with an execution policy object of type sequenced_policy execute in sequential order in the calling thread.

The assignments in the parallel unique algorithm invoked with an execution policy object of type parallel_policy or parallel_task_policy are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than last - first assignments, exactly last - first - 1 applications of the predicate pred and no more than twice as many applications of the projection proj.
**ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

**FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

**Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of unique requires Pred to meet the requirements of Copy-Constructible. This defaults to std::equal_to<>

**Proj** – The type of an optional projection function. This defaults to hpx::identity

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns true for the required elements. The signature of this predicate should be equivalent to:

  ```cpp
def pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types Type1 and Type2 must be such that objects of types FwdIter can be dereferenced and then implicitly converted to both Type1 and Type2.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

### Returns

The unique algorithm returns subrange_t<FwdIter, Sent>. The unique algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```cpp
subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>> unique(Rng &&rng, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range rng and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel unique algorithm invoked without an execution policy object execute in sequential order in the calling thread.

---

**Note:** Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate pred and no more than twice as many applications of the projection proj, where N = std::distance(begin(rng), end(rng)).

---

**Template Parameters**
• **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

• **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `Copy-Constructible`. This defaults to `std::equal_to<>`

• **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

• **rng** – Refers to the sequence of elements the algorithm will be applied to.

• **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
def pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.

• **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `pred` is invoked.

**Returns** The `unique` algorithm returns `subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>`. The `unique` algorithm returns an object `{ret, last}`, where `ret` is a past-the-end iterator for a new subrange.

```cpp
template<typename ExPolicy, typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>> unique(ExPolicy &&policy, Rng &&rng, Pred &&pred = Pred(), Proj &&proj = Proj());
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `rng` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate `pred` and no more than twice as many applications of the projection `proj`, where N = `std::distance(begin(rng), end(rng))`.  

---

2.8. API reference

889
Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

Returns

The `unique` algorithm returns a `hpx::future < subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>, hpx::traits::range_iterator_t<Rng>>` otherwise. The `unique` algorithm returns an object `{ret, last}`, where `ret` is a past-the-end iterator for a new subrange.

```cpp
template<typename InIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
unique_copy_result<InIter, O> unique_copy(InIter first, Sent last, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest` in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel `unique_copy` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note:** Complexity: Performs not more than `last - first` assignments, exactly `last - first - 1` applications of the predicate `pred` and no more than twice as many applications of the projection `proj`.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **O** – The type of the iterator representing the destination range (deduced).
• **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique_copy` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`.

• **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `InIter1` can be dereferenced and then implicitly converted to `Type`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns** The `unique_copy` algorithm returns a returns `unique_copy_result<InIter, O>`. The `unique_copy` algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the `dest` range.

```cpp
template<typename ExPolicy, typename FwdIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<FwdIter, O>>::type unique_copy(ExPolicy &&policy, FwdIter first, Sent last, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest` in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified
threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than last - first assignments, exactly last - first - 1 applications of the predicate pred and no more than twice as many applications of the projection proj

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **0** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of unique_copy requires Pred to meet the requirements of CopyConstructible. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to hpx::identity

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns true for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

### Returns

The unique_copy algorithm returns returns a hpx::future<unique_copy_result<FwdIter, O>> if the execution policy is of type sequenced_task_policy or parallel_task_policy and returns unique_copy_result<FwdIter, O> otherwise. The unique_copy algorithm returns an in_out_result with the source iterator to one past the last element and out containing the destination iterator to the end of the dest range.

```cpp
template<typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
unique_copy_result<hpx::traits::range_iterator_t<Rng>, O> unique_copy(Rng &&rng, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range rng, to another range beginning at dest in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel unique_copy algorithm invoked without an execution policy object
Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate pred, where N = std::distance(begin(rng), end(rng)).

Template Parameters
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of unique_copy requires Pred to meet the requirements of CopyConstructible. This defaults to std::equal_to<>.
- **Proj** – The type of an optional projection function. This defaults to hpx::identity

Parameters
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range rng. This is an binary predicate which returns true for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type Type must be such that an object of type FwdIter1 can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

Returns The unique_copy algorithm returns unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>. The unique_copy algorithm returns the pair of the source iterator to last, and the destination iterator to the end of the dest range.

```
template<typename ExPolicy, typename Rng, typename O, typename Pred = ranges::equal_to,
         typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>> unique_copy
```

Copies the elements from the range rng, to another range beginning at dest in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.
The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note:** Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate `pred`, where N = std::distance(begin(rng), end(rng)).

---

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique_copy` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range `rng`. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```cpp
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

**Returns** The `unique_copy` algorithm returns a `hpx::future<unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>` otherwise. The `unique_copy` algorithm returns the pair of the source iterator to `last`, and the destination iterator to the end of the `dest` range.

namespace parallel

namespace util

### Typedefs

template<typename Iterator, typename Sentinel = Iterator>
using range = hpx::util::iterator_range<Iterator, Sentinel>

### Functions

template<typename Iter, typename Sent>
range<Iter, Sent> concat(range<Iter, Sent> const &it1, range<Iter, Sent> const &it2)

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
range<Iter2, Iter2> init_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const &src)

Move objects from the range src to dest.

**Parameters**
- `dest` – [in]: range where move the objects
- `src` – [in]: range from where move the objects

**Returns** range with the objects moved and the size adjusted

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
range<Iter2, Sent2> uninit_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const &src)

Move objects from the range src creating them in dest.

**Parameters**
- `dest` – [in]: range where move and create the objects
- `src` – [in]: range from where move the objects

**Returns** range with the objects moved and the size adjusted

template<typename Iter, typename Sent>
void destroy_range(range<Iter, Sent> r)

destroy a range of objects

**Parameters** `r` – [in]: range to destroy

template<typename Iter, typename Sent>
range<Iter, Sent> init(range<Iter, Sent> const &r, typename std::iterator_traits<Iter>::value_type &val)

initialize a range of objects with the object val moving across them

**Parameters**
- `r` – [in]: range of elements not initialized
- `val` – [in]: object used for the initialization

**Returns** range initialized
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
bool is_mergeable(range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, Compare comp)

: indicate if two ranges have a possible merge

---

**Remark**

**Parameters**
- **src1** – [in]: first range
- **src2** – [in]: second range
- **comp** – [in]: object for to compare elements

**Returns** true: they can be merged false: they can’t be merged

---

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Sent3, typename Compare>
range<Iter3, Sent3> full_merge(range<Iter3, Sent3> const &dest, range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, Compare comp)

Merge two contiguous ranges src1 and src2, and put the result in the range dest, returning the range merged.

**Parameters**
- **dest** – [in]: range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2
- **src1** – [in]: first range to merge
- **src2** – [in]: second range to merge
- **comp** – [in]: comparison object

**Returns** range with the elements merged and the size adjusted

---

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Value, typename Compare>
range<Value*> uninit_full_merge(range<Value*> const &dest, range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, Compare comp)

Merge two contiguous ranges src1 and src2, and create and move the result in the uninitialized range dest, returning the range merged.

**Parameters**
- **dest** – [in]: range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2. Initially is un-initialize memory
- **src1** – [in]: first range to merge
- **src2** – [in]: second range to merge
- **comp** – [in]: comparison object

**Returns** range with the elements merged and the size adjusted

---

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
range<Iter2, Sent2> half_merge(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, Compare comp)

: Merge two buffers. The first buffer is in a separate memory

**Parameters**
- **dest** – [in]: range where finish the two buffers merged
- **src1** – [in]: first range to merge in a separate memory
• **src2** – [in]: second range to merge, in the final part of the range where deposit the final results
• **comp** – [in]: object for compare two elements of the type pointed by the Iter1 and Iter2

**Returns**: range with the two buffers merged

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Sent3, typename Compare>
bool in_place_merge_uncontiguous(range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, range<Iter3, Sent3> &aux, Compare comp)

: merge two non contiguous buffers src1, src2, using the range aux as auxiliary memory

---

**Remark**

---

**Parameters**

• **src1** – [in]: first range to merge
• **src2** – [in]: second range to merge
• **aux** – [in]: auxiliary range used in the merge
• **comp** – [in]: object for to compare elements

**Returns** true : not changes done false : changes in the buffers

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
range<Iter1, Sent1> in_place_merge(range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, range<Iter2, Sent2> &buf, Compare comp)

: merge two contiguous buffers (src1, src2) using buf as auxiliary memory

---

**Remark**

---

**Parameters**

• **src1** – [in]: first range to merge
• **src2** – [in]: second range to merge
• **buf** – [in]: auxiliary memory used in the merge
• **comp** – [in]: object for to compare elements

**Returns** true : not changes done false : changes in the buffers

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
void merge_flow(range<Iter1, Sent1> rng1, range<Iter2, Sent2> rbuf, range<Iter1, Sent1> rng2, Compare cmp)

Defines

HPX_CURRENT_SOURCE_LOCATION()

namespace hpx

Functions

std::ostream &operator<<(std::ostream &os, source_location const &loc)

struct source_location

    #include <source_location.hpp> This contains the location information where HPX_ASSERT has been called The source_location class represents certain information about the source code, such as file names, line numbers, and function names. Previously, functions that desire to obtain this information about the call site (for logging, testing, or debugging purposes) must use macros so that predefined macros like and are expanded in the context of the caller. The source_location class provides a better alternative. source_location meets the DefaultConstructible, CopyConstructible, CopyAssignable and Destructible requirements. Lvalue of source_location meets the Swappable requirement. Additionally, the following conditions are true:

* std::is_nothrow_move_constructible_v<std::source_location>

* std::is_nothrow_move_assignable_v<std::source_location>

* std::is_nothrow_swappable_v<std::source_location>
It is intended that `source_location` has a small size and can be copied efficiently. It is unspecified whether the copy/move constructors and the copy/move assignment operators of `source_location` are trivial and/or constexpr.

**Public Functions**

**hpx/modules/assertion.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.
Defines

**HPX_ASSERT**(expr)

This macro asserts that `expr` evaluates to true.

If `expr` evaluates to false, The source location and `msg` is being printed along with the expression and additional. Afterwards the program is being aborted. The assertion handler can be customized by calling `hpx::assertion::set_assertion_handler()`.

Asserts are enabled if `HPX_DEBUG` is set. This is the default for `CMAKE_BUILD_TYPE=Debug`

**Parameters**

- `expr` – The expression to assert on. This can either be an expression that’s convertible to `bool` or a callable which returns `bool`
- `msg` – The optional message that is used to give further information if the assert fails. This should be convertible to a `std::string`

**HPX_ASSERT_MSG**(expr, msg)

See also:

HPX_ASSERT

namespace **hpx**

namespace **assertion**

Typedefs

```cpp
using assertion_handler = void (*)(hpx::source_location const &loc, const char *expr, std::string const &msg)
```

The signature for an assertion handler.

Functions

```cpp
void set_assertion_handler(assertion_handler handler)
```

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

**Note:** This function is not thread safe
async_base

See Public API for a list of names and headers that are part of the public HPX API.

hpx/async_base/async.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

template<typename F, typename ...Ts>
dcltype(auto) async(F &&f, Ts&&... ts)

The function template async runs the function f asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns an hpx::future that will eventually hold the result of that function call. If no policy is defined, async behaves as if it is called with policy being hpx::launch::async | hpx::launch::deferred. Otherwise, it calls a function f with arguments ts according to a specific launch policy.

- If the async flag is set (i.e. (policy & hpx::launch::async) != 0), then async executes the callable object f on a new thread of execution (with all thread-locals initialized) as if spawned by hpx::thread(std::forward<F>(f), std::forward<Ts>(ts)...), except that if the function f returns a value or throws an exception, it is stored in the shared state accessible through the hpx::future that async returns to the caller.

- If the deferred flag is set (i.e. (policy & hpx::launch::deferred) != 0), then async converts f and ts... the same way as by hpx::thread constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the hpx::future that async returned to the caller will cause the copy of f to be invoked (as an rvalue) with the copies of ts... (also passed as rvalues) in the current thread (which does not have to be the thread that originally called hpx::async). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same hpx::future will return the result immediately.

- If neither hpx::launch::async nor hpx::launch::deferred, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the hpx::launch::async and hpx::launch::deferred flags are set in policy), standard recommends (but doesn’t require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to hpx::async synchronizes-with (as defined in std::memory_order) the call to f, and the completion of f is sequenced-before making the shared state ready. If the async policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<Ts>::type is not constructible from its corresponding argument, the program is ill-formed.

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to f

Returns hpx::future referring to the shared state created by this call to hpx::async.
namespace hpx

Functions

template<typename F, typename ...Ts>
decltype(auto) dataflow(F &&f, Ts &&... ts)
    The function template dataflow runs the function f asynchronously (potentially in a separate thread which
might be a part of a thread pool) and returns a hpx::future that will eventually hold the result of that
function call. Its behavior is similar to hpx::async with the exception that if one of the arguments is a
future, then hpx::dataflow will wait for the future to be ready to launch the thread. Hence, the operation
is delayed until all the arguments are ready.

namespace hpx

struct launch : public detail::policy_holder<>
    #include <launch_policy.hpp> Launch policies for hpx::async etc.

Public Functions

inline constexpr launch() noexcept
    Default constructor. This creates a launch policy representing all possible launch modes

inline constexpr launch(detail::async_policy p) noexcept
    Create a launch policy representing asynchronous execution.

inline constexpr launch(detail::fork_policy p) noexcept
    Create a launch policy representing asynchronous execution. The new thread is executed in a preferred
way

inline constexpr launch(detail::sync_policy p) noexcept
    Create a launch policy representing synchronous execution.

inline constexpr launch(detail::deferred_policy p) noexcept
    Create a launch policy representing deferred execution.

inline constexpr launch(detail::apply_policy p) noexcept
    Create a launch policy representing fire and forget execution.

template<typename F>
inline constexpr launch(detail::select_policy<F> const &p) noexcept
    Create a launch policy representing fire and forget execution.

template<typename Launch, typename Enable = std::enable_if_t<hpx::traits::is_launch_policy_v<Launch>>>
inline constexpr launch(Launch l, threads::thread_priority priority, threads::thread_stacksize stacksize, threads::thread_schedule_hint hint) noexcept

**Public Static Attributes**

static const detail::async_policy async
Predefined launch policy representing asynchronous execution.

static const detail::fork_policy fork
Predefined launch policy representing asynchronous execution. The new thread is executed in a preferred way.

static const detail::sync_policy sync
Predefined launch policy representing synchronous execution.

static const detail::deferred_policy deferred
Predefined launch policy representing deferred execution.

static const detail::apply_policy apply
Predefined launch policy representing fire and forget execution.

static const detail::select_policy_generator select
Predefined launch policy representing delayed policy selection.

**Friends**

inline friend launch tag_invoke(hpx::execution::experimental::with_priority_t, launch const &policy, threads::thread_priority priority) noexcept

inline friend constexpr friend hpx::threads::thread_priority tag_invoke(hpx::execution::experimental::get_priority_t, launch const &policy) noexcept

inline friend launch tag_invoke(hpx::execution::experimental::with_stacksize_t, launch const &policy, threads::thread_stacksize stacksize) noexcept

inline friend constexpr friend hpx::threads::thread_stacksize tag_invoke(hpx::execution::experimental::get_stacksize_t, launch const &policy) noexcept

inline friend launch tag_invoke(hpx::execution::experimental::with_hint_t, launch const &policy, threads::thread_schedule_hint hint) noexcept

inline friend constexpr friend hpx::threads::thread_schedule_hint tag_invoke(hpx::execution::experimental::get_hint_t, launch const &policy) noexcept
namespace hpx

**Functions**

template<typename F, typename ...Ts>
bool post(F&& f, Ts&&... ts)
Run the function `f` asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an `hpx::future` that would hold the result of that function call).

`hpx::post` is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the post function enables the launch of a new thread without the overhead of creating a future.

**Note:** `hpx::post` is similar to `hpx::async` but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

namespace hpx

**Functions**

template<typename F, typename ...Ts>
decltype(auto) sync(F &&f, Ts&&... ts)
The function template `sync` runs the function `f` synchronously and returns an `hpx::future` that will eventually hold the result of that function call.

**async_combinators**

See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx

Top level HPX namespace.

## Functions

### template<typename ...Ts>

```cpp
inline tuple<future<Ts>...> split_future(future<tuple<Ts>...> &&f)
```

The function `split_future` is an operator allowing to split a given future of a sequence of values (any tuple, `std::pair`, or `std::array`) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of `when_all`.

**Note:** The following cases are special:

```cpp
tuple<future<void>> > split_future(future<tuple<> > && f);
array<future<void>, 1> split_future(future<array<T, 0> > && f);
```

here the returned futures are directly representing the futures which were passed to the function.

**Parameters**
- `f` – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports `hpx::tuple<>`, `std::pair<T1, T2>`, and `std::array<T, N>`

**Returns** Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

### template<typename T>

```cpp
inline std::vector<future<T>> split_future(future<std::vector<T>> &&f, std::size_t size)
```

The function `split_future` is an operator allowing to split a given future of a sequence of values (any `std::vector`) into a `std::vector` of futures where each future represents one of the values from the original `std::vector`. In some sense this function provides the inverse operation of `when_all`.

**Parameters**
- `f` – [in] A future holding an arbitrary sequence of values stored in a `std::vector`
- `size` – [in] The number of elements the vector will hold once the input future has become ready

**Returns** Returns a `std::vector` of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.
See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx
    Top level HPX namespace.

### Functions

**template<typename InputIter>**
**void wait_all(InputIter first, InputIter last)**

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note:** The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

**Note:** The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters**

- **first** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all` should wait.
- **last** – The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `wait_all` should wait.

**template<typename R>**
**void wait_all(std::vector<future<R>> &&futures)**

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note:** The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

**Note:** The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters futures** – A vector or array holding an arbitrary amount of `future` or `shared_future` objects for which `wait_all` should wait.

**template<typename R, std::size_t N>**
**void wait_all(std::array<future<R>, N> &&futures)**

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.
**Note:** The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

**Note:** The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters** `futures` – A vector or array holding an arbitrary amount of `future` or `shared_future` objects for which `wait_all` should wait.

```cpp
template<typename T>
void wait_all(hpx::future<T> const &f)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note:** The function `wait_all` returns after the future has become ready. The input future is still valid after `wait_all` returns.

**Note:** The function `wait_all` will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters** `f` – A `future` or `shared_future` for which `wait_all` should wait.

```cpp
template<typename ...T>
void wait_all(T&&... futures)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note:** The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

**Note:** The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters** `futures` – An arbitrary number of `future` or `shared_future` objects, possibly holding different types for which `wait_all` should wait.

```cpp
template<typename InputIter>
void wait_all_n(InputIter begin, std::size_t count)
```

The function `wait_all_n` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.
Note: The function `wait_all_n` returns after all futures have become ready. All input futures are still valid after `wait_all_n` returns.

Note: The function `wait_all_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_n_nothrow` instead.

Parameters

- `begin` – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_n` should wait.
- `count` – The number of elements in the sequence starting at `first`.

Returns The function `wait_all_n` will return an iterator referring to the first element in the input sequence after the last processed element.

`hpx/async_combinators/wait_any.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`  
Top level HPX namespace.

Functions

```cpp
template<typename InputIter>
void wait_any(InputIter first, InputIter last)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

Note: The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

Parameters

- `first` – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_any` should wait.
- `last` – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `wait_any` should wait.
void \texttt{wait}\_\texttt{any} (\texttt{std::vector<future<R>>} \&\texttt{futures})

The function \texttt{wait\_any} is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

\textbf{Note:} The function \texttt{wait\_any} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any} returns.

\textbf{Note:} The function \texttt{wait\_any} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_nothrow} instead.

\textbf{Parameters} \texttt{futures} – \texttt{[in]} A vector holding an arbitrary amount of \textit{future} or \textit{shared\_future} objects for which \texttt{wait\_any} should wait.

\textbf{Note:} The function \texttt{wait\_any} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any} returns.

\textbf{Note:} The function \texttt{wait\_any} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_nothrow} instead.

\textbf{Parameters} \texttt{futures} – \texttt{[in]} Amn array holding an arbitrary amount of \textit{future} or \textit{shared\_future} objects for which \texttt{wait\_any} should wait.

\textbf{Note:} The function \texttt{wait\_any} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any} returns.

\textbf{Note:} The function \texttt{wait\_any} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_nothrow} instead.

\textbf{Parameters} \texttt{futures} – \texttt{[in]} An arbitrary number of \textit{future} or \textit{shared\_future} objects, possibly holding different types for which \texttt{wait\_any} should wait.

\textbf{Note:} The function \texttt{wait\_any} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any} returns.

\textbf{Note:} The function \texttt{wait\_any} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_nothrow} instead.
void \textbf{wait\_any\_n}(\texttt{InputIter} \ first, \ \texttt{std::size\_t} \ \texttt{count})

The function \texttt{wait\_any\_n} is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

\begin{center}
\textbf{Note:} The function \texttt{wait\_any\_n} returns after at least one future has become ready. All input futures are still valid after \texttt{wait\_any\_n} returns.
\end{center}

\begin{center}
\textbf{Note:} The function \texttt{wait\_any\_n} will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use \texttt{wait\_any\_n\_nothrow} instead.
\end{center}

**Parameters**

- \texttt{first} – [in] The iterator pointing to the first element of a sequence of \texttt{future} or \texttt{shared\_future} objects for which \texttt{wait\_any\_n} should wait.
- \texttt{count} – [in] The number of elements in the sequence starting at \texttt{first}.

\texttt{hpx/async\_combinators/wait\_each.hpp}

See Public API for a list of names and headers that are part of the public HPX API.

namespace \texttt{hpx}

Top level HPX namespace.

**Functions**

template<\texttt{typename F}, \texttt{typename Future}>
void \textbf{wait\_each}(\texttt{F} &&\texttt{f}, \ \texttt{std::vector<Future>} &&\texttt{futures})

The function \texttt{wait\_each} is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. \texttt{wait\_each} returns after all futures have become ready.

\begin{center}
\textbf{Note:} This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a \texttt{future} to be processed or a type that \texttt{std::size\_t} is implicitly convertible to as the first parameter and the \texttt{future} as the second parameter. The first parameter will correspond to the index of the current \texttt{future} in the collection.
\end{center}

**Parameters**

- \texttt{f} – The function which will be called for each of the input futures once the future has become ready.
- \texttt{futures} – A vector holding an arbitrary amount of \texttt{future} or \texttt{shared\_future} objects for which \texttt{wait\_each} should wait.

template<\texttt{typename F}, \texttt{typename Iterator}>
void \texttt{wait\_each}(F \&\&f, \texttt{Iterator} begin, \texttt{Iterator} end)

The function \texttt{wait\_each} is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. \texttt{wait\_each} returns after all futures have been become ready.

\textbf{Note:} This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that \texttt{std::size\_t} is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

\textbf{Parameters}

- \texttt{f} – The function which will be called for each of the input futures once the future has become ready.
- \texttt{begin} – The iterator pointing to the first element of a sequence of future or shared\_future objects for which \texttt{wait\_each} should wait.
- \texttt{end} – The iterator pointing to the last element of a sequence of future or shared\_future objects for which \texttt{wait\_each} should wait.

template<
\texttt{typename F, typename ...T}>
void \texttt{wait\_each}(F \&\&f, T \&\&... futures)

The function \texttt{wait\_each} is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. \texttt{wait\_each} returns after all futures have been become ready.

\textbf{Note:} This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that \texttt{std::size\_t} is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

\textbf{Parameters}

- \texttt{f} – The function which will be called for each of the input futures once the future has become ready.
- \texttt{futures} – An arbitrary number of future or shared\_future objects, possibly holding different types for which \texttt{wait\_each} should wait.

template<
\texttt{typename F, typename Iterator}>
void \texttt{wait\_each\_n}(F \&\&f, \texttt{Iterator} begin, \texttt{std::size\_t} count)

The function \texttt{wait\_each\_n} is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready.

\textbf{Note:} This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that \texttt{std::size\_t} is
implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

**Parameters**

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of future or shared_future objects for which wait_each_n should wait.
- **count** – The number of elements in the sequence starting at first.

**hpx/async_combinators/wait_some.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

```
namespace hpx

Top level HPX namespace.
```

**Functions**

```
template<typename InputIter>
void wait_some(std::size_t n, InputIter first, InputIter last)
```

The function wait_some is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The function wait_some returns after n futures have become ready. All input futures are still valid after wait_some returns.

**Note:** The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use wait_some_nothrow instead.

```
template<typename R>
void wait_some(std::size_t n, std::vector<future<R>> &&futures)
```

The function wait_some is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.
Note: The function `wait_some` returns after `n` futures have become ready. All input futures are still valid after `wait_some` returns.

Note: The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

Parameters

- `n` – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- `futures` – [in] A vector holding an arbitrary amount of `future` or `shared_future` objects for which `wait_some` should wait.

```cpp
template<typename R, std::size_t N>
void wait_some(std::size_t n, std::array<future<R>, N> &&futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after `n` of them finished executing.

Note: The function `wait_some` returns after `n` futures have become ready. All input futures are still valid after `wait_some` returns.

Note: The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

Parameters

- `n` – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- `futures` – [in] An array holding an arbitrary amount of `future` or `shared_future` objects for which `wait_some` should wait.

```cpp
template<typename ...T>
void wait_some(std::size_t n, T&&... futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after `n` of them finished executing.

Note: The function `wait_all` returns after `n` futures have become ready. All input futures are still valid after `wait_some` returns.

Note: The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.
Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.

- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_some* should wait.

- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
template<typename InputIter>
void wait_some_n(std::size_t n, InputIter first, std::size_t count)
```

The function *wait_some_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

**Note:** The function *wait_some_n* returns after *n* futures have become ready. All input futures are still valid after *wait_some_n* returns.

**Note:** The function *wait_some_n* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_n_nothrow* instead.

```
namespace hpx
{
    template<typename InputIter, typename Container = vector<future<typename std::iterator_traits<InputIter>::value_type>>> hpx::future<Container> when_all(InputIter first, InputIter last)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.
**Note:** Calling this version of `when_all` where first == last, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

### Parameters
- **first** – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.

### Returns
Returns a future holding the same list of futures as has been passed to `when_all`.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the input container will be the same as given by the input iterator.

```cpp
template<typename Range>
hpx::future<Range> when_all(Range &&values)
```

Note: Calling this version of `when_all` where the input container is empty, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

### Parameters
- **values** – [in] A range holding an arbitrary amount of `future` or `shared_future` objects for which `when_all` should wait.

### Returns
Returns a future holding the same list of futures as has been passed to `when_all`.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type.

```cpp
template<typename ...T>
hpx::future<hpx::tuple<hpx::future<T>...>> when_all(T &&... futures)
```

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

### Parameters
- **futures** – [in] An arbitrary number of `future` or `shared_future` objects, possibly holding different types for which `when_all` should wait.
Returns

Returns a future holding the same list of futures as has been passed to `when_all`.

- `future<tuple<future<T0>, future<T1>, future<T2>, ...>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.

- `future<tuple<>>` if `when_all` is called with zero arguments. The returned future will be initially ready.

```cpp
template<typename InputIter, typename Container = vector<future<typename std::iterator_traits<InputIter>::value_type>>> hpx::future<Container> when_all_n(InputIter begin, std::size_t count)
```

Function `when_all` creates a future object that becomes ready when all elements in a set of future and shared_future objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** None of the futures in the input sequence are invalidated.

Parameters

- `begin` – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which `wait_all_n` should wait.

- `count` – [in] The number of elements in the sequence starting at `first`.

**Throws**

This – function will throw errors which are encountered while setting up the requested operation only. Errors encountered while executing the operations delivering the results to be stored in the futures are reported through the futures themselves.

**Returns**

Returns a future holding the same list of futures as has been passed to `when_all_n`.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output vector will be the same as given by the input iterator.

**hpx/async_combinators/when_any.hpp**

See **Public API** for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.
**Functions**

```cpp
template<typename InputIter, typename Container = vector<future<typename \_\_\_std::iterator_traits<InputIter>::value_type>>> future<when_any_result<Container>>> when_any(InputIter first, InputIter last)
```

Function `when_any` creates a future object that becomes when at least one element in a set of `future` and `shared_future` objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

**Parameters**

- `first` – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_any` should wait.
- `last` – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `when_any` should wait.

**Returns** Returns a `when_any_result` holding the same list of futures as has been passed to `when_any` and an index pointing to a ready future.

- `future<when_any_result<Container<future<\_\_\_R>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```cpp
template<typename Range>
future<when_any_result<Range>>> when_any(Range &values)
```

Function `when_any` creates a future object that becomes when at least one element in a set of `future` and `shared_future` objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

**Parameters** `values` – [in] A range holding an arbitrary amount of `future` or `shared_future` objects for which `when_any` should wait.

**Returns** Returns a `when_any_result` holding the same list of futures as has been passed to `when_any` and an index pointing to a ready future.

- `future<when_any_result<Container<future<\_\_\_R>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```cpp
template<typename ... \_\_\_T>
future<when_any_result<\_\_\_tuple<future<\_\_\_T>...>>> when_any(\_\_\_T&&... futures)
```

Function `when_any` creates a future object that becomes when at least one element in a set of `future` and `shared_future` objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

**Parameters** `futures` – [in] An arbitrary number of `future` or `shared_future` objects, possibly holding different types for which `when_any` should wait.

**Returns** Returns a `when_any_result` holding the same list of futures as has been passed to `when_any` and an index pointing to a ready future.

- `future<when_any_result<\_\_\_tuple<future<\_\_\_T0>, future<\_\_\_T1>...>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
future<when_any_result<tuple<>>> if when_any is called with zero arguments. The returned future will be initially ready.

template<typename InputIter, typename Container = vector<future<typename std::iterator_traits<InputIter>::value_type>>> future<when_any_result<Container>> when_any_n(InputIter first, std::size_t count)

function when_any_n creates a future object that becomes when at least one element in a set of future and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Note: None of the futures in the input sequence are invalidated.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of future or shared_future objects for which when_any_n should wait.
- **count** – [in] The number of elements in the sequence starting at first.

Returns

Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<when_any_result<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename Sequence>

struct when_any_result

#include <when_any.hpp> Result type for when_any, contains a sequence of futures and an index pointing to a ready future.

Public Members

std::size_t index

The index of a future which has become ready.

Sequence futures

The sequence of futures as passed to hpx::when_any

hpx/async_combinators/when_each.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.
Functions

template<typename F, typename Future>
future< void > when_each(F &&f, std::vector< Future > &&futures)

The function when_each is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that std::size_t is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

Parameters

• f – The function which will be called for each of the input futures once the future has become ready.

• futures – A vector holding an arbitrary amount of future or shared_future objects for which wait_each should wait.

Returns: Returns a future representing the event of all input futures being ready.

template<typename F, typename Iterator>
future< Iterator > when_each(F &&f, Iterator begin, Iterator end)

The function when_each is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a future to be processed or a type that std::size_t is implicitly convertible to as the first parameter and the future as the second parameter. The first parameter will correspond to the index of the current future in the collection.

Parameters

• f – The function which will be called for each of the input futures once the future has become ready.

• begin – The iterator pointing to the first element of a sequence of future or shared_future objects for which wait_each should wait.

• end – The iterator pointing to the last element of a sequence of future or shared_future objects for which wait_each should wait.

Returns: Returns a future representing the event of all input futures being ready.

template<typename F, typename ...Ts>
future< void > when_each(F &&f, Ts &&... futures)

The function when_each is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.
Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a `future` to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the `future` as the second parameter. The first parameter will correspond to the index of the current `future` in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of `future` or `shared_future` objects, possibly holding different types for which `wait_each` should wait.

Returns Returns a future representing the event of all input futures being ready.

template<
    typename `F`, typename `Iterator`
>
future<
    `Iterator`
>
when_each_n(
    `F` &&`f`,
    `Iterator` `begin`,
    `std::size_t` `n`
)

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a `future` to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the `future` as the second parameter. The first parameter will correspond to the index of the current `future` in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_each_n` should wait.
- **count** – The number of elements in the sequence starting at `first`.

Returns Returns a future holding the iterator pointing to the first element after the last one.

`hpx/async_combinators/when_some.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`

    Top level HPX namespace.
Functions

```cpp
template<typename InputIter, typename Container = std::vector<
    future<typename std::iterator_traits<InputIter>::value_type>>>
future<when_some_result<Container>> when_some(
    std::size_t n, Iterator first, Iterator last)
```

The function `when_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The future returned by the function `when_some` becomes ready when at least n argument futures have become ready.

**Note:** Calling this version of `when_some` where `first == last`, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some` will not throw an exception, but the futures held in the output collection may.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.

**Returns** Returns a `when_some_result` holding the same list of futures as has been passed to `when_some` and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```cpp
template<typename Range>
future<when_some_result<Range>> when_some(
    std::size_t n, Range &&futures)
```

The function `when_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The future returned by the function `when_some` becomes ready when at least n argument futures have become ready.

**Note:** Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some` will not throw an exception, but the futures held in the output collection may.

**Parameters**
• **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.

• **futures** – [in] A container holding an arbitrary amount of future or shared_future objects for which when_some should wait.

**Returns** Returns a when_some_result holding the same list of futures as has been passed to when_some and indices pointing to ready futures.

• future<when_some_result<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```cpp
template<typename ...Ts>
future<when_some_result<tuple<future<T>...>>> when_some(
std::size_t n,
Ts&&... futures)
```

The function when_some is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The future returned by the function when_some becomes ready when at least n argument futures have become ready.

**Note:** Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by when_some will not throw an exception, but the futures held in the output collection may.

**Parameters**

• **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.

• **futures** – [in] An arbitrary number of future or shared_future objects, possibly holding different types for which when_some should wait.

**Returns** Returns a when_some_result holding the same list of futures as has been passed to when_some and an index pointing to a ready future..

• future<when_some_result<tuple<future<T0>, future<T1>...>>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.

• future<when_some_result<tuple<>>> if when_some is called with zero arguments. The returned future will be initially ready.

```cpp
template<typename InputIter, typename Container = vector<
future<typename std::iterator_traits<InputIter>::value_type>>>>
future<when_some_result<Container>> when_some_n(
std::size_t n, Iterator first, std::size_t count)
```

The function when_some_n is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

**Note:** The future returned by the function when_some_n becomes ready when at least n argument futures have become ready.
Note: Calling this version of `when_some_n` where `count == 0`, returns a future with the same elements as the arguments that is immediately ready. Possibly none of the futures in that container are ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some_n` will not throw an exception, but the futures held in the output collection may.

### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- **count** – [in] The number of elements in the sequence starting at `first`.

### Returns

Returns a `when_some_result` holding the same list of futures as has been passed to `when_some` and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```cpp
template<typename Sequence>
struct when_some_result
    #include <when_some.hpp> Result type for `when_some`, contains a sequence of futures and indices pointing to ready futures.

Public Members

std::vector<std::size_t> indices
    List of indices of futures that have become ready.

Sequence futures
    The sequence of futures as passed to `hpx::when_some`.

template<typename... Params>
using queue_function_ptr_t = cl::sycl::event
(cl::sycl::queue::*)(std::conditional_t<std::is_trivial_v<remove_reference_t<Params>>, decay_t<Params>, Params>...)

Default Implementation without the extra intel code_location parameter. Removes the reference for trivial types to make the function matching easier (see sycl_stream.cpp test)
Public Functions

inline explicit sycl_executor(cl::sycl::default_selector selector)

Create a SYCL executor (based on a sycl queue)

~sycl_executor() = default

inline future_type get_future()

Get future for this command_queue (NOTE will be more efficient if an event is provided &amp;#8212; otherwise a dummy kernel must be submitted to get an event)

inline future_type get_future(cl::sycl::event event)

Get future for that becomes ready when the given event completes.

template<typename ...Params>
inline void post(queue_function_ptr_t<Params...> &amp;queue_member_function, Params&amp;... args)

Invoke queue member function given queue and parameters &amp;#8212; do not use event to return a hpx::future (One way)

template<typename ...Params>
inline hpx::future<void> async_execute(queue_function_ptr_t<Params...> &amp;queue_member_function, Params&amp;... args)

Invoke queue member function given queue and parameters &amp;#8212; hpx::future tied to the sycl event / (two way)

template&lt;typename F, typename ...Ts&gt;
inline decltype(auto) friend tag_invoke(hpx::parallel::execution::post_t, sycl_executor &amp;exec, F &amp;&amp;f, Ts&amp;... ts)

inline decltype(auto) friend tag_invoke(hpx::parallel::execution::async_execute_t, sycl_executor &amp;exec, F &amp;&amp;f, Ts&amp;... ts)

inline cl::sycl::device get_device() const

Return the device used by the underlying SYCL queue.

inline cl::sycl::context get_context() const

Return the context used by the underlying SYCL queue.

Protected Attributes

cl::sycl::queue command_queue

cache

See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx

namespace util

namespace cache

template<typename Key, typename Entry, typename UpdatePolicy = std::less<Entry>, typename InsertPolicy = policies::always<Entry>, typename CacheStorage = std::map<Key, Entry>, typename Statistics = statistics::no_statistics>
class local_cache

#include <hpx/cache/local_cache.hpp> The local_cache implements the basic functionality needed for a local (non-distributed) cache.

Template Parameters
- Key – The type of the keys to use to identify the entries stored in the cache
- Entry – The type of the items to be held in the cache, must model the CacheEntry concept
- UpdatePolicy – A (optional) type specifying a (binary) function object used to sort the cache entries based on their ‘age’. The ‘oldest’ entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is std::less<Entry>. The function object will be invoked using 2 entry instances of the type Entry. This type must model the UpdatePolicy model.
- InsertPolicy – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is policies::always, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the InsertPolicy model.
- CacheStorage – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container. The default is a std::map<Key, Entry>.
- Statistics – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using key_type = Key
using entry_type = Entry
using update_policy_type = UpdatePolicy
using insert_policy_type = InsertPolicy
using `storage_type = CacheStorage`

using `statistics_type = Statistics`

using `value_type = typename entry_type::value_type`

using `size_type = typename storage_type::size_type`

using `storage_value_type = typename storage_type::value_type`

**Public Functions**

```cpp
inline explicit local_cache(size_type max_size = 0, update_policy_type const &up = update_policy_type(), insert_policy_type const &ip = insert_policy_type())
```

Construct an instance of a `local_cache`.

**Parameters**
- `max_size` – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry’s `get_size` function.
- `up` – [in] An instance of the `UpdatePolicy` to use for this cache. The default is to use a default constructed instance of the type as defined by the `UpdatePolicy` template parameter.
- `ip` – [in] An instance of the `InsertPolicy` to use for this cache. The default is to use a default constructed instance of the type as defined by the `InsertPolicy` template parameter.

```cpp
local_cache(local_cache const &other) = default
```

```cpp
local_cache(local_cache &&other) = default
```

```cpp
local_cache &operator=(local_cache const &other) = default
```

```cpp
local_cache &operator=(local_cache &&other) = default
```

```cpp
~local_cache() = default
```

```cpp
inline constexpr size_type size() const noexcept
```

Return current size of the cache.

**Returns** The current size of this cache instance.

```cpp
inline constexpr size_type capacity() const noexcept
```

Access the maximum size the cache is allowed to grow to.

**Note:** The unit of this value is usually determined by the unit of the return values of the entry’s function `entry::get_size`.

**Returns** The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.
inline bool \texttt{reserve} (\texttt{size\_type} \texttt{max\_size})

Change the maximum size this cache can grow to.

\textbf{Parameters} \texttt{max\_size} – [in] The new maximum size this cache will be allowed to grow to.

\textbf{Returns} This function returns \texttt{true} if successful. It returns \texttt{false} if the new \texttt{max\_size} is smaller than the current limit and the cache could not be shrunk to the new maximum size.

inline bool \texttt{holds\_key} (\texttt{key\_type} \texttt{const \&k}) \texttt{const}

Check whether the cache currently holds an entry identified by the given key.

\textbf{Note:} This function does not call the entry’s function \texttt{entry::touch}. It just checks if the cache contains an entry corresponding to the given key.

\textbf{Parameters} \texttt{k} – [in] The key for the entry which should be looked up in the cache.

\textbf{Returns} This function returns \texttt{true} if the cache holds the referenced entry, otherwise it returns \texttt{false}.

inline bool \texttt{get\_entry} (\texttt{key\_type} \texttt{const \&k}, \texttt{key\_type} \texttt{\&real\_key}, \texttt{entry\_type} \texttt{\&val})

Get a specific entry identified by the given key.

\textbf{Note:} The function will call the entry’s \texttt{entry::touch} function if the value corresponding to the provided key is found in the cache.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{k} – [in] The key for the entry which should be retrieved from the cache.
  \item \texttt{real\_key[\texttt{out}]} – Return the full real key found in the cache
  \item \texttt{val} – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.
\end{itemize}

\textbf{Returns} This function returns \texttt{true} if the cache holds the referenced entry, otherwise it returns \texttt{false}.

inline bool \texttt{get\_entry} (\texttt{key\_type} \texttt{const \&k}, \texttt{entry\_type} \texttt{\&val})

Get a specific entry identified by the given key.

\textbf{Note:} The function will call the entry’s \texttt{entry::touch} function if the value corresponding to the provided key is found in the cache.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{k} – [in] The key for the entry which should be retrieved from the cache.
  \item \texttt{val} – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.
\end{itemize}

\textbf{Returns} This function returns \texttt{true} if the cache holds the referenced entry, otherwise it returns \texttt{false}.

inline bool \texttt{get\_entry} (\texttt{key\_type} \texttt{const \&k}, \texttt{value\_type} \texttt{\&val})

Get a specific entry identified by the given key.

\textbf{Note:} The function will call the entry’s \texttt{entry::touch} function if the value corresponding to the provided is found in the cache.
Parameters
- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```cpp
inline bool insert(key_type const &k, value_type const &val)
```

Insert a new element into this cache.

**Note:** This function invokes both, the insert policy as provided to the constructor and the function `entry::insert` of the newly constructed entry instance. If either of these functions returns false the key/value pair doesn’t get inserted into the cache and the `insert` function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters
- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

Returns This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```cpp
inline bool insert(key_type const &k, value_type &&val)
```

```cpp
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool insert(key_type const &k, Entry_ &&e)
```

Insert a new entry into this cache.

**Note:** This function invokes both, the insert policy as provided to the constructor and the function `entry::insert` of the provided entry instance. If either of these functions returns false the key/value pair doesn’t get inserted into the cache and the `insert` function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters
- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

Returns This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```cpp
template<typename Value, std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>, int> = 0>
inline bool update(key_type const &k, Value &&val)
```

Update an existing element in this cache.

**Note:** The function will call the entry’s `entry::touch` function if the indexed value is found in the cache.
Note: The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- `k` – [in] The key for the value which should be updated in the cache.
- `val` – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

Returns This function returns `true` if the entry has been successfully updated, otherwise it returns `false`. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```cpp
template<typename F, typename Value, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>>>
inline bool update_if(key_type const &k, Value &&val, F &&f)
```

Update an existing element in this cache.

Note: The function will call the entry’s `entry::touch` function if the indexed value is found in the cache.

Parameters

- `k` – [in] The key for the value which should be updated in the cache.
- `val` – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- `f` – [in] A callable taking two arguments, `k` and the key found in the cache (in that order). If `f` returns true, then the update will continue. If `f` returns false, then the update will not succeed.

Returns This function returns `true` if the entry has been successfully updated, otherwise it returns `false`. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```cpp
template<
typename Entry_,
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool update(key_type const &k, Entry_ &&&e)
```

Update an existing entry in this cache.

Note: The function will call the entry’s `entry::touch` function if the indexed value is found in the cache.

Parameters

- `k` – [in] The key for the value which should be updated in the cache.
- `val` – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- `f` – [in] A callable taking two arguments, `k` and the key found in the cache (in that order). If `f` returns true, then the update will continue. If `f` returns false, then the update will not succeed.

Returns This function returns `true` if the entry has been successfully updated, otherwise it returns `false`. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.
• \textbf{k} – [in] The key for the entry which should be updated in the cache.
• \textbf{e} – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

\textbf{Returns} This function returns \textit{true} if the entry has been successfully updated, otherwise it returns \textit{false}. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

\texttt{template<typename Func = policies::always<storage_value_type>>}
\texttt{inline size_type erase(Func &&ep = Func())}

Remove stored entries from the cache for which the supplied function object returns true.

\textbf{Parameters} \texttt{ep} – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is \textit{true}. Even then the entry might not be removed from the cache as its \texttt{entry::remove} function might return \textit{false}.

\textbf{Returns} This function returns the overall size of the removed entries (which is the sum of the values returned by the \texttt{entry::get_size} functions of the removed entries).

\texttt{inline size_type erase()}
Remove all stored entries from the cache.

\underline{Note:} All entries are considered for removal, but in the end an entry might not be removed from the cache as its \texttt{entry::remove} function might return \textit{false}. This function is very useful for instance in conjunction with an entry’s \texttt{entry::remove} function enforcing additional criteria like entry expiration, etc.

\underline{Returns} This function returns the overall size of the removed entries (which is the sum of the values returned by the \texttt{entry::get_size} functions of the removed entries).

\texttt{inline void clear()}
Clear the cache.

Unconditionally removes all stored entries from the cache.

\texttt{inline constexpr statistics_type const &get_statistics() const noexcept}
Allow to access the embedded statistics instance.

\underline{Returns} This function returns a reference to the statistics instance embedded inside this cache.

\texttt{inline statistics_type &get_statistics() noexcept}

namespace hpx

namespace util

namespace cache

template<typename Key, typename Entry, typename Statistics = statistics::no_statistics>
class lru_cache

#include <hpx/cache/lru_cache.hpp> The lru_cache implements the basic functionality needed for a local (non-distributed) LRU cache.

Template Parameters

• Key – The type of the keys to use to identify the entries stored in the cache
• Entry – The type of the items to be held in the cache.
• Statistics – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using key_type = Key

using entry_type = Entry

using statistics_type = Statistics

using entry_pair = std::pair<key_type, entry_type>

using storage_type = std::list<entry_pair>

using map_type = std::map<Key, typename storage_type::iterator>

using size_type = std::size_t
Public Functions

inline explicit lru_cache(size_type max_size = 0)

    Construct an instance of a lru_cache.
    Parameters max_size – [in] The maximal size this cache is allowed to reach any time.
    The default is zero (no size limitation). The unit of this value is usually determined by
    the unit of the values returned by the entry’s get_size function.

lru_cache(lru_cache const &other) = default

lru_cache(lru_cache &&other) = default

lru_cache &operator=(lru_cache const &other) = default

lru_cache &operator=(lru_cache &&other) = default

~lru_cache() = default

inline constexpr size_type size() const noexcept

    Return current size of the cache.
    Returns The current size of this cache instance.

inline constexpr size_type capacity() const noexcept

    Access the maximum size the cache is allowed to grow to.
    Note: The unit of this value is usually determined by the unit of the return values of the entry’s
    function entry::get_size.

    Returns The maximum size this cache instance is currently allowed to reach. If this num-
    ber is zero the cache has no limitation with regard to a maximum size.

inline void reserve(size_type max_size)

    Change the maximum size this cache can grow to.
    Parameters max_size – [in] The new maximum size this cache will be allowed to grow
    to.

inline bool holds_key(key_type const &key) const

    Check whether the cache currently holds an entry identified by the given key.
    Note: This function does not call the entry’s function entry::touch. It just checks if the cache
    contains an entry corresponding to the given key.

    Parameters key – [in] The key for the entry which should be looked up in the cache.
    Returns This function returns true if the cache holds the referenced entry, otherwise it
    returns false.

inline bool get_entry(key_type const &key, key_type &realkey, entry_type &entry)

    Get a specific entry identified by the given key.
    Note: The function will “touch” the entry and mark it as recently used if the key was found
    in the cache.

    Parameters
inline bool get_entry(key_type const &key, entry_type const &entry)

Get a specific entry identified by the given key.

**Note:** The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Parameters**
- `key` – [in] The key for the entry which should be retrieved from the cache.
- `entry` – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Returns** This function returns `true` if the cache holds the referenced entry, otherwise it returns `false`.

```cpp
template<typename Entry_, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>
inline bool insert(key_type const &key, Entry_ &&entry)

Insert a new entry into this cache.

**Note:** This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior.

**Parameters**
- `key` – [in] The key for the entry which should be added to the cache.
- `entry` – [in] The entry which should be added to the cache.

```cpp
template<typename Entry_, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>
inline void update(key_type const &key, Entry_ &&entry)

Update an existing element in this cache.

**Note:** The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Note:** The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

**Parameters**
- `key` – [in] The key for the value which should be updated in the cache.
- `entry` – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

```cpp
template<typename F, typename Entry_,
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>

```
inline bool update_if(key_type const &key, Entry_ &&entry, F &&f)
Update an existing element in this cache.

**Note:** The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Note:** The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

**Parameters**
- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, `k` and the key found in the cache (in that order). If `f` returns true, then the update will continue. If `f` returns false, then the update will not succeed.

**Returns** This function returns `true` if the entry has been successfully updated, otherwise it returns `false`. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename Func>
inline size_type erase(Func const &ep)
Remove stored entries from the cache for which the supplied function object returns true.

**Parameters** ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is true.

**Returns** This function returns the overall size of the removed entries (which is the sum of the values returned by the `entry::get_size` functions of the removed entries).

inline size_type erase()
Remove all stored entries from the cache.

**Returns** This function returns the overall size of the removed entries (which is the sum of the values returned by the `entry::get_size` functions of the removed entries).

inline size_type clear()
Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr statistics_type const &get_statistics() const noexcept
Allow to access the embedded statistics instance.

**Returns** This function returns a reference to the statistics instance embedded inside this cache.

inline statistics_type &get_statistics() noexcept

hpx/cache/entries/entry.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

namespace cache

namespace entries

class entry

#include <hpx/cache/entries/entry.hpp>

Template Parameters

- **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.
- **Derived** – The (optional) type for which this type is used as a base class.
Public Types

using value_type = Value

Public Functions

entry() = default
Any cache entry has to be default constructible.

inline explicit entry(value_type const &val)
    noexcept(std::is_nothrow_copy_constructible_v<value_type>)
Construct a new instance of a cache entry holding the given value.

inline explicit entry(value_type &&val) noexcept
Construct a new instance of a cache entry holding the given value.

inline value_type &get() noexcept
Get a reference to the stored data value.

Note: This function is part of the CacheEntry concept

inline constexpr value_type const &get() const noexcept

Public Static Functions

static inline constexpr bool touch() noexcept
The function touch is called by a cache holding this instance whenever it has been requested (touched).

Note: It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return true to indicate this to the cache, forcing to reorder the cache entries.

Note: This function is part of the CacheEntry concept

Returns This function should return true if the cache needs to update it’s internal heap.
Usually this is needed if the entry has been changed by touch() in a way influencing the sort order as mandated by the cache’s UpdatePolicy

static inline constexpr bool insert() noexcept
The function insert is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns This function should return true if the entry should be added to the cache, otherwise it should return false.
static inline constexpr bool remove() noexcept

The function `remove` is called by a cache holding this instance whenever it is about to be removed from the cache.

**Note:** This function is part of the CacheEntry concept

**Returns** The return value can be used to avoid removing this instance from the cache.

If the value is `true` it is ok to remove the entry, otherwise it will stay in the cache.

static inline constexpr std::size_t get_size() noexcept

Return the ‘size’ of this entry. By default the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

### Private Members

```cpp
value_type value_
```

### Friends

```cpp
inline friend bool operator<(entry const &lhs, entry const &rhs)
    noexcept(noexcept(std::declval<value_type const&>() < 
    std::declval<value_type const&>()))
```

Forwarding `operator<` allowing to compare entries instead of the values.

### hpx/cache/entries/fifo_entry.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx
    namespace util
        namespace cache
            namespace entries
                template<typename Value>
                    class fifo_entry : public hpx::util::cache::entries::entry<Value, fifo_entry<Value>>
```

#include `<hpx/cache/entries/fifo_entry.hpp>` The `fifo_entry` type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least recently inserted entries are discarded from the cache first.

**Note:** The `fifo_entry` conforms to the CacheEntry concept.
Note: This type can be used to model a ‘last in first out’ cache policy if it is used with a std::greater as the caches’ UpdatePolicy (instead of the default std::less).

Template Parameters Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

fifo_entry() = default

Any cache entry has to be default constructible.

inline explicit fifo_entry(Value const &val)

noexcept(std::is_nothrow_constructible_v<base_type, Value const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit fifo_entry(Value &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr bool insert()

The function insert is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns This function should return true if the entry should be added to the cache, otherwise it should return false.

inline constexpr time_point const &get_creation_time() const noexcept

Private Types

using base_type = entry<Value, fifo_entry<Value>>

using time_point = std::chrono::steady_clock::time_point

Private Members

time_point insertion_time_
Friends

inline friend bool operator<(fifo_entry const &lhs, fifo_entry const &rhs)
    noexcept(noexcept(std::declval<time_point const&>() <
                    std::declval<time_point const&>()))

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been created earlier (FIFO).

hpx/cache/entries/lfu_entry.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

namespace cache

namespace entries

template<typename Value>

class lfu_entry : public hpx::util::cache::entries::entry<Value, lfu_entry<Value>>

#include <hpx/cache/entries/lfu_entry.hpp> The lfu_entry type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least frequently used entries are discarded from the cache first.

Note: The lfu_entry conforms to the CacheEntry concept.

Note: This type can be used to model a ‘most frequently used’ cache policy if it is used with a std::greater as the caches’ UpdatePolicy (instead of the default std::less).

Template Parameters Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

lfu_entry() = default

Any cache entry has to be default constructible.

inline explicit lfu_entry(Value const &val)
    noexcept(std::is_nothrow_constructible_v<base_type, Value const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit lfu_entry(Value &&val) noexcept

Construct a new instance of a cache entry holding the given value.
inline bool touch() noexcept

The function touch is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the operator<().

**Returns** This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by touch() in a way influencing the sort order as mandated by the cache’s UpdatePolicy

```cpp
inline constexpr unsigned long const &get_access_count() const noexcept
```

### Private Types

```cpp
using base_type = entry<Value, lfu_entry<Value>>
```

### Private Members

```cpp
unsigned long ref_count_ = 0
```

### Friends

```cpp
inline friend bool operator<(lfu_entry const &lhs, lfu_entry const &rhs) noexcept
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less frequently (LFU).

### hpx/cache/entries/lru_entry.hpp

See Public API for a list of names and headers that are part of the public HPX API.

```cpp
namespace hpx
```

```cpp
namespace util
```

```cpp
namespace cache
```

```cpp
namespace entries
```

```cpp
template<typename Value>
```

```cpp
class lru_entry : public hpx::util::cache::entries::entry<Value, lru_entry<Value>>
```

```cpp
#include <hpx/cache/entries/lru_entry.hpp>
```

The lru_entry type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least recently used entries are discarded from the cache first.
Note: The lru_entry conforms to the CacheEntry concept.

Note: This type can be used to model a ‘most recently used’ cache policy if it is used with a std::greater as the caches’ UpdatePolicy (instead of the default std::less).

**Template Parameters**

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

**Public Functions**

inline lru_entry()
Any cache entry has to be default constructible.

inline explicit lru_entry(Value const &val)
noexcept(std::is_nothrow_constructible_v<base_type, Value const&>)
Construct a new instance of a cache entry holding the given value.

inline explicit lru_entry(Value &&val) noexcept
Construct a new instance of a cache entry holding the given value.

inline bool touch()
The function touch is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the operator<().

**Returns** This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by touch() in a way influencing the sort order as mandated by the cache’s UpdatePolicy.

inline constexpr time_point const &get_access_time() const noexcept
Returns the last access time of the entry.

**Private Types**

using base_type = entry<Value, lru_entry<Value>>

using time_point = std::chrono::steady_clock::time_point
Private Members

\textit{time\_point} \texttt{access\_time_}

Friends

inline friend bool \texttt{operator< (lru\_entry const &lhs, lru\_entry const &rhs)}
\begin{verbatim}
    noexcept(noexcept(std::declval<time\_point const&>() <
                  std::declval<time\_point const&>()))
\end{verbatim}

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less recently (LRU).

\texttt{hpx/cache/entries/size\_entry.hpp}

See \textit{Public API} for a list of names and headers that are part of the public HPX API.

namespace \texttt{hpx}

namespace \texttt{util}

namespace \texttt{cache}

namespace \texttt{entries}

class \texttt{size\_entry}

\texttt{#include <hpx/cache/entries/size\_entry.hpp>}

The \texttt{size\_entry} type can be used to store values in a cache which have a size associated (such as files, etc.). Using this type as the cache’s entry type makes sure that the entries with the biggest size are discarded from the cache first.

\underline{Note:} The \texttt{size\_entry} conforms to the CacheEntry concept.

\underline{Note:} This type can be used to model a ‘discard smallest first’ cache policy if it is used with a \texttt{std::greater} as the caches’ UpdatePolicy (instead of the default \texttt{std::less}).

\textbf{Template Parameters}

- \textbf{Value} – The data type to be stored in a cache. It has to be default constructible, copy constructible and less\_than\_comparable.
- \textbf{Derived} – The (optional) type for which this type is used as a base class.
**Public Functions**

`size_entry()` = default

Any cache entry has to be default constructible.

Inline explicit `size_entry` (Value const &val, std::size_t size = 0) noexcept (std::is_nothrow_constructible_v<base_type, Value const &>)

Construct a new instance of a cache entry holding the given value.

Inline explicit `size_entry` (Value &&val, std::size_t size = 0) noexcept

Construct a new instance of a cache entry holding the given value.

Inline constexpr `std::size_t get_size()` const noexcept

Return the 'size' of this entry.

**Private Types**

Using `derived_type` = typename detail::size_derived<Value, Derived>::type

Using `base_type` = `entry<Value, derived_type>`

**Private Members**

`std::size_t size_ = 0`

**Friends**

Inline friend constexpr friend bool operator< (size_entry const &lhs, size_entry const &rhs) noexcept

Compare the 'age' of two entries. An entry is 'older' than another entry if it has a bigger size.

**hpx/cache/statistics/local_statistics.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

namespace cache

namespace statistics

class local_statistics : public hpx::util::cache::statistics::no_statistics
**Public Functions**

`local_statistics()` = default

inline `vector` &operator=(`vector` &&other)

inline `allocator_type` get_allocator() const noexcept

    Returns the allocator associated with the container.

inline `reference` operator[](size_type pos)

inline `const_reference` operator[](size_type pos) const
inline `pointer data()` noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range 
`[data(); data() + size())` is always a valid range, even if the container is empty (`data()` is not dereferenceable in that case).

inline `const_pointer data()` const noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range 
`[data(); data() + size())` is always a valid range, even if the container is empty (`data()` is not dereferenceable in that case).

inline `T *device_data()` const noexcept

Returns a raw pointer corresponding to the address of the data allocated on the device.

inline `std::size_t size()` const noexcept

inline `std::size_t capacity()` const noexcept

inline bool empty() const noexcept

Returns: `size() == 0`.

inline void `resize(size_type)`

Effects: If size <= `size()`, equivalent to calling `pop_back()` size() - size times. If size() < size, appends size - `size()` default-inserted elements to the sequence.

Requires: `T` shall be MoveInsertable and DefaultInsertable into *this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable `T` there are no effects.

inline void `resize(size_type, T const&)`

Effects: If size <= `size()`, equivalent to calling `pop_back()` size() - size times. If size() < size, appends size - `size()` copies of val to the sequence.

Requires: `T` shall be CopyInsertable into *this.

Remarks: If an exception is thrown there are no effects.

namespace hpx

namespace execution

namespace experimental

class block_fork_join_executor

#include <block_fork_join_executor.hpp> An executor with fork-join (blocking) semantics.

The block_fork_join_executor creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a fork_join_executor hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of bulk_(a)sync_execute.

This behaviour is similar to the plain fork_join_executor except that the block_fork_join_executor creates a hierarchy of fork_join_executors, one for each target used to initialize it.

Public Functions

inline explicit block_fork_join_executor(threads::thread_priority priority =
threads::thread_priority::bound,
threads::thread_stacksize stacksize =
threads::thread_stacksize::small_,
fork_join_executor::loop_schedule const schedule =
fork_join_executor::loop_schedule::static_,
std::chrono::nanoseconds yield_delay =
std::chrono::millseconds(1))
Construct a `block_fork_join_executor`.

**Note:** This constructor will create one fork_join_executor for each numa domain

**Parameters**
- `priority` – The priority of the worker threads.
- `stacksize` – The stacksize of the worker threads. Must not be nostack.
- `schedule` – The loop schedule of the parallel regions.
- `yield_delay` – The time after which the executor yields to other work if it has not received any new work for execution.

```cpp
inline explicit block_fork_join_executor(std::vector<compute::host::target> const &targets, threads::thread_priority priority = threads::thread_priority::bound,
                                        threads::thread_stacksize stacksize = threads::thread_stacksize::small_,
                                        fork_join_executor::loop_schedule const schedule = fork_join_executor::loop_schedule::static_,
                                        std::chrono::nanoseconds yield_delay = std::chrono::milliseconds(1))
```

Construct a `block_fork_join_executor`.

**Note:** This constructor will create one fork_join_executor for each given target

**Parameters**
- `targets` – The list of targets to use for thread placement
- `priority` – The priority of the worker threads.
- `stacksize` – The stacksize of the worker threads. Must not be nostack.
- `schedule` – The loop schedule of the parallel regions.
- `yield_delay` – The time after which the executor yields to other work if it has not received any new work for execution.

```cpp
template<typename F, typename S, typename ...Ts>
inline void bulk_sync_execute_helper(F &&f, S const &shape, Ts&&... ts)

template<typename F, typename S, typename ...Ts>
inline decltype(auto) friend tag_invoke(hpx::parallel::execution::bulk_async_execute_t, block_fork_join_executor &exec, F &&f, S const &shape, Ts&&... ts)

template<typename ...Fs>

namespace hpx

namespace threads

Enums

enum class thread_schedule_state : std::int8_t

The thread_schedule_state enumerator encodes the current state of a thread instance

Values:

enumerator unknown

enumerator active
  thread is currently active (running, has resources)

enumerator pending
  thread is pending (ready to run, but no hardware resource available)

enumerator suspended
  thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator depleted
  thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator terminated
  thread has been stopped an may be garbage collected

enumerator staged
  this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator pending_do_not_schedule
  this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)
enumerator **pending_boost**

This is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling.

enum class **thread_priority** : std::int8_t

This enumeration lists all possible thread-priorities for HPX threads.

**Values:**

enumerator **unknown**

enumerator **default_**

Will assign the priority of the task to the default (normal) priority.

enumerator **low**

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator **normal**

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator **high_recursive**

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator **boost**

Same as **thread_priority_high** except that the thread will fall back to **thread_priority_normal** if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator **bound**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enum class **thread_restart_state** : std::int8_t

The **thread_restart_state** enumerator encodes the reason why a thread is being restarted

**Values:**

enumerator **unknown**

enumerator **signaled**

The thread has been signaled.
enumerator **timeout**
   The thread has been reactivated after a timeout.

enumerator **terminate**
   The thread needs to be terminated.

enumerator **abort**
   The thread needs to be aborted.

enum class **thread_stacksize** : `std::int8_t`
   A `thread_stacksize` references any of the possible stack-sizes for HPX threads.
   
   **Values:**
   
   enumerator **unknown**
   
   enumerator **small_**
      use small stack size (the underscore is to work around ‘small’ being defined to char on Windows)

   enumerator **medium**
      use medium sized stack size

   enumerator **large**
      use large stack size

   enumerator **huge**
      use very large stack size

   enumerator **nostack**
      this thread does not suspend (does not need a stack)

   enumerator **current**
      use size of current thread’s stack

   enumerator **default_**
      use default stack size

   enumerator **minimal**
      use minimally stack size

   enumerator **maximal**
      use maximally stack size

enum class **thread_schedule_hint_mode** : `std::int8_t`
   The type of hint given when creating new tasks.
   
   **Values:**
enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically indices will wrap around when too large.

enum class **thread_placement_hint** : *std::uint8_t*

The type of hint given to the scheduler related to thread placement

*Values:*

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator **depth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator **breadth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class **thread_sharing_hint** : *std::uint8_t*

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

*Values:*

enumerator **none**

No hint is specified. The implementation is free to chose what sharing methods to use.
enumerator do_not_share_function
A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator do_not_combine_tasks
A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

Public Functions

inline constexpr thread_schedule_hint() noexcept
  Construct a default hint with mode thread_schedule_hint_mode::none.

inline explicit constexpr thread_schedule_hint(
  std::int16_t thread_hint,
  thread_placement_hint placement = thread_placement_hint::none,
  thread_sharing_hint sharing = thread_sharing_hint::none) noexcept
  Construct a hint with mode thread_schedule_hint_mode::thread and the given hint as the local thread number.

inline constexpr thread_schedule_hint(
  thread_schedule_hint_mode mode,
  std::int16_t hint,
  thread_placement_hint placement = thread_placement_hint::none,
  thread_sharing_hint sharing = thread_sharing_hint::none) noexcept
  Construct a hint with the given mode and hint. The numerical hint is unused when the mode is thread_schedule_hint_mode::none.

inline constexpr thread_placement_hint placement_mode() const noexcept

inline void placement_mode(thread_placement_hint bits) noexcept

inline constexpr thread_sharing_hint sharing_mode() const noexcept

inline void sharing_mode(thread_sharing_hint bits) noexcept

Public Members

std::int16_t hint = -1
  The hint associated with the mode. The interpretation of this hint depends on the given mode.

thread_schedule_hint_mode mode = thread_schedule_hint_mode::none
  The mode of the scheduling hint.

std::int8_t placement_mode_bits
  The mode of the desired thread placement.

std::int8_t sharing_mode_bits
  The mode of the desired sharing hint.

util::basic_any<void, void, std::false_type> make_unique_any_nonser(std::initializer_list<U> il, Ts&&... ts)
```

### Performed type-safe access to the contained object.

**Parameters** operand – target any object

**Returns** If operand is not a null pointer, and the typeid of the requested T matches that of the contents of operand, a pointer to the value contained by operand, otherwise a null pointer.

```cpp
T *any_cast(util::basic_any<IArch, OArch, Char, Copyable> *operand) noexcept
```

### Performs type-safe access to the contained object.

**Parameters** operand – target any object

**Returns** If operand is not a null pointer, and the typeid of the requested T matches that of the contents of operand, a pointer to the value contained by operand, otherwise a null pointer.

```cpp
T const *any_cast(const util::basic_any<IArch, OArch, Char, Copyable> &operand) noexcept
```

### Performs type-safe access to the contained object. Let U be std::remove_cv_t<std::remove_reference_t<T>> The program is ill-formed if std::is_constructible_v<T, U&> is false.

**Parameters** operand – target any object

**Returns** static_cast<T>(*std::any_cast<U>(&operand))

```cpp
T any_cast(const util::basic_any<IArch, OArch, Char, Copyable> &operand)  
```

### Performs type-safe access to the contained object. Let U be std::remove_cv_t<std::remove_reference_t<T>> The program is ill-formed if std::is_constructible_v<T, const U&> is false.

**Parameters** operand – target any object

**Returns** static_cast<T>(*std::any_cast<const U>(&operand))
struct **bad_any_cast**: public bad_cast

```
#include <any.hpp>  Defines a type of object to be thrown by the value-returning forms of hpx::any_cast
on failure.
```

### Public Functions

**inline bad_any_cast**

```
inline bad_any_cast(std::type_info const &src, std::type_info const &dest)
Constructs a new bad_any_cast object with an implementation-defined null-terminated byte string
which is accessible through what().
```

**inline char const *what() const noexcept override**

```
inline char const *what() const noexcept override
Returns the explanatory string.
```

---

**Note:** Implementations are allowed but not required to override what().

**Returns**  Pointer to a null-terminated string with explanatory information. The string is suit-
able for conversion and display as a std::wstring. The pointer is guaranteed to be valid at
least until the exception object from which it is obtained is destroyed, or until a non-const
member function (e.g. copy assignment operator) on the exception object is called.

### Public Members

```

**hpx/datastructures/tuple.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

    Top level HPX namespace.
Functions

template<typename ...Ts>
constexpr tuple<util::decay_unwrap_t<Ts>...> make_tuple(Ts&&... ts)

Provides compile-time indexed access to the types of the elements of the tuple.

template<typename ...Ts>
constexpr tuple<Ts&...> tie(Ts&... ts)

Creates a tuple of lvalue references to its arguments or instances of hpx::ignore.

Parameters ts – zero or more lvalue arguments to construct the tuple from.

Returns hpx::tuple object containing lvalue references.

template<typename ...Tuples>
constexpr auto tuple_cat(Tuples&&... tuples)

Constructs a tuple that is a concatenation of all tuples in tuples. The behavior is undefined if any type in std::decay_t<Tuples>... is not a specialization of hpx::tuple. However, an implementation may choose to support types (such as std::array and std::pair) that follow the tuple-like protocol.

Parameters tuples – zero or more tuples to concatenate

Returns hpx::tuple object composed of all elements of all argument tuples constructed from hpx::get<Is>(UTuple,t) for each individual element.

Variables

cstexpr hpx::detail::ignore_type ignore = {}

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with hpx::tie when unpacking a hpx::tuple, as a placeholder for the arguments that are not used. While the behavior of hpx::ignore outside of hpx::tie is not formally specified, some code guides recommend using hpx::ignore to avoid warnings from unused return values of [[nodiscard]] functions.
class **tuple**

```
#include <tuple.hpp>  
```

Class template `hpx::tuple` is a fixed-size collection of heterogeneous values. It is a generalization of `hpx::pair`. If `std::is_trivially_destructible<Ti>::value` is true for every `Ti` in `Ts`, the destructor of tuple is trivial.

**Param Ts...** the types of the elements that the tuple stores.

```
template<
std::size_t I, typename T, typename Enable = void> 
```

struct **tuple_element**

```
#include <tuple.hpp>  
```

Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

```
template<typename T> 
```

struct **tuple_size**

```
#include <tuple.hpp>  
```

Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

---

Enums

enum class error : std::int16_t
    Possible error conditions.
    This enumeration lists all possible error conditions which can be reported from any of the API functions.
    Values:

    enumerator success
        The operation was successful.

    enumerator no_success
        The operation did failed, but not in an unexpected manner.

    enumerator not_implemented
        The operation is not implemented.

    enumerator out_of_memory
        The operation caused an out of memory condition.

    enumerator bad_action_code

    enumerator bad_component_type
        The specified component type is not known or otherwise invalid.

    enumerator network_error
        A generic network error occurred.

    enumerator version_too_new
        The version of the network representation for this object is too new.
enumerator \texttt{version\_too\_old}

The version of the network representation for this object is too old.

enumerator \texttt{version\_unknown}

The version of the network representation for this object is unknown.

enumerator \texttt{unknown\_component\_address}

enumerator \texttt{duplicate\_component\_address}

The given global id has already been registered.

enumerator \texttt{invalid\_status}

The operation was executed in an invalid status.

enumerator \texttt{bad\_parameter}

One of the supplied parameters is invalid.

enumerator \texttt{internal\_server\_error}

enumerator \texttt{service\_unavailable}

enumerator \texttt{bad\_request}

enumerator \texttt{repeated\_request}

enumerator \texttt{lock\_error}

enumerator \texttt{duplicate\_console}

There is more than one console locality.

enumerator \texttt{no\_registered\_console}

There is no registered console locality available.

enumerator \texttt{startup\_timed\_out}

enumerator \texttt{uninitialized\_value}

enumerator \texttt{bad\_response\_type}

enumerator \texttt{deadlock}

enumerator \texttt{assertion\_failure}
enumerator **null_thread_id**
   Attempt to invoke a API function from a non-HPX thread.

enumerator **invalid_data**

enumerator **yield_aborted**
   The yield operation was aborted.

enumerator **dynamic_link_failure**

enumerator **commandline_option_error**
   One of the options given on the command line is erroneous.

enumerator **serialization_error**
   There was an error during serialization of this object.

enumerator **unhandled_exception**
   An unhandled exception has been caught.

enumerator **kernel_error**
   The OS kernel reported an error.

enumerator **broken_task**
   The task associated with this future object is not available anymore.

enumerator **task_moved**
   The task associated with this future object has been moved.

enumerator **task_already_started**
   The task associated with this future object has already been started.

enumerator **future_already_retrieved**
   The future object has already been retrieved.

enumerator **promise_already_satisfied**
   The value for this future object has already been set.

enumerator **future_does_not_support_cancellation**
   The future object does not support cancellation.

enumerator **future_can_not_be_cancelled**
   The future can’t be canceled at this time.

enumerator **no_state**
   The future object has no valid shared state.
enumerator **broken_promise**
   The promise has been deleted.

enumerator **thread_resource_error**

enumerator **future_cancelled**

enumerator **thread_cancelled**

enumerator **thread_not_interruptable**

enumerator **duplicate_component_id**
   The component type has already been registered.

enumerator **unknown_error**
   An unknown error occurred.

enumerator **bad_plugin_type**
   The specified plugin type is not known or otherwise invalid.

enumerator **filesystem_error**
   The specified file does not exist or other filesystem related error.

enumerator **bad_function_call**
   equivalent of std::bad_function_call

enumerator **task_canceled_exception**
   parallel::task_canceled_exception

enumerator **task_block_not_active**
   task_region is not active

enumerator **out_of_range**
   Equivalent to std::out_of_range.

enumerator **length_error**
   Equivalent to std::length_error.

enumerator **migration_needs_retry**
   migration failed because of global race, retry

hpx/errors/error_code.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Unnamed Group

inline error_code make_error_code(error e, throwmode mode = throwmode::plain)
    Returns a new error_code constructed from the given parameters.
inline error_code make_error_code(error e, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, char const *msg, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, char const *msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, std::string const &msg, throwmode mode = throwmode::plain)
inline error_code make_error_code(error e, std::string const &msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
inline error_code make_error_code(std::exception_ptr const &e)

Functions

std::error_category const &get_hpx_category() noexcept
    Returns generic HPX error category used for new errors.
std::error_category const &get_hpx_rethrow_category() noexcept
    Returns generic HPX error category used for errors re-thrown after the exception has been de-serialized.
inline error_code make_success_code(throwmode mode = throwmode::plain)
    Returns error_code(hpx::error::success, “success”, mode).

class error_code : public error_code
    #include <error_code.hpp> A hpx::error_code represents an arbitrary error condition.

    The class hpx::error_code describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.
Note: Class `hpx::error_code` is an adjunct to error reporting by exception

Public Functions

```cpp
inline explicit error_code(throwable mode = throwmode::plain)
```
Construct an object of type `error_code`.

**Parameters**
- `mode` – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

**Throws** nothing –

```cpp
explicit error_code(error e, throwmode mode = throwmode::plain)
```
Construct an object of type `error_code`.

**Parameters**
- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- `mode` – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

**Throws** nothing –

```cpp
error_code(error e, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
```
Construct an object of type `error_code`.

**Parameters**
- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- `func` – The name of the function where the error was raised.
- `file` – The file name of the code where the error was raised.
- `line` – The line number of the code line where the error was raised.
- `mode` – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

**Throws** nothing –

```cpp
error_code(error e, char const *msg, throwmode mode = throwmode::plain)
```
Construct an object of type `error_code`.

**Parameters**
- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
- `mode` – The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

**Throws** `std::bad_alloc` – (if allocation of a copy of the passed string fails).

```cpp
error_code(error e, char const *msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
```
Construct an object of type `error_code`.

**Parameters**
- `e` – The parameter `e` holds the `hpx::error_code` the new exception should encapsulate.
- `msg` – The parameter `msg` holds the error message the new exception should encapsulate.
- `func` – The name of the function where the error was raised.
- `file` – The file name of the code where the error was raised.
- `line` – The line number of the code line where the error was raised.
mode – The parameter mode specifies whether the constructed hpx::error_code belongs to the error category hpx_category (if mode is plain, this is the default) or to the category hpx_category_rethrow (if mode is rethrow).

Throws std::bad_alloc – (if allocation of a copy of the passed string fails).

error_code(error e, std::string const &msg, throwmode mode = throwmode::plain)
Construct an object of type error_code.

Parameters
- e – The parameter e holds the hpx::error code the new exception should encapsulate.
- msg – The parameter msg holds the error message the new exception should encapsulate.
- mode – The parameter mode specifies whether the constructed hpx::error_code belongs to the error category hpx_category (if mode is plain, this is the default) or to the category hpx_category_rethrow (if mode is rethrow).

Throws std::bad_alloc – (if allocation of a copy of the passed string fails).

error_code(error e, std::string const &msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
Construct an object of type error_code.

Parameters
- e – The parameter e holds the hpx::error code the new exception should encapsulate.
- msg – The parameter msg holds the error message the new exception should encapsulate.
- func – The name of the function where the error was raised.
- file – The file name of the code where the error was raised.
- line – The line number of the code line where the error was raised.
- mode – The parameter mode specifies whether the constructed hpx::error_code belongs to the error category hpx_category (if mode is plain, this is the default) or to the category hpx_category_rethrow (if mode is rethrow).

Throws std::bad_alloc – (if allocation of a copy of the passed string fails).

std::string get_message() const
Return a reference to the error message stored in the hpx::error_code.

Throws nothing –

inline void clear() –
Clear this error_code object. The postconditions of invoking this method are.

- value() == hpx::error::success and category() == hpx::get_hpx_category()

error_code(error_code const &rhs)
Copy constructor for error_code

Note: This function maintains the error category of the left hand side if the right hand side is a success code.

error_code &operator=(error_code const &rhs)
Assignment operator for error_code

Note: This function maintains the error category of the left hand side if the right hand side is a success code.
Private Functions

```cpp
error_code(int err, hpx::exception const &e)
explicit error_code(std::exception_ptr const &e)
```

Private Members

```cpp
std::exception_ptr exception_
```

Friends

```cpp
friend class exception
friend error_code make_error_code(std::exception_ptr const&)
```

**hpx/errors/exception.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

**Typedefs**

```cpp
using custom_exception_info_handler_type = std::function<hpx::exception_info(std::string const&, std::string const&, long, std::string const&)>;
```

```cpp
using pre_exception_handler_type = std::function<void>();
```

**Functions**

```cpp
void set_custom_exception_info_handler(custom_exception_info_handler_type f)
void set_pre_exception_handler(pre_exception_handler_type f)
```

```cpp
std::string get_error_what(exception_info const &xi)
```

Return the error message of the thrown exception.

The function `hpx::get_error_what` can be used to extract the diagnostic information element representing the error message as stored in the given exception instance.

**See also:**

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`, `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_config()`, `hpx::get_error_state()`
Parameters \( \text{xi} \) – The parameter \( \text{e} \) will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: \( \text{hpx::exception\_info} \), \( \text{hpx::error\_code} \), \( \text{std::exception} \), or \( \text{std::exception\_ptr} \).

Throws \( \text{std::bad\_alloc} \) – (if one of the required allocations fails)

Returns The error message stored in the exception If the exception instance does not hold this information, the function will return an empty string.

\[
\text{error get\_error(hpx::exception const &e)}
\]

Return the error code value of the exception thrown.

The function \( \text{hpx::get\_error} \) can be used to extract the diagnostic information element representing the error value code as stored in the given exception instance.

See also:
\[
\text{hpx::diagnostic\_information()}, \quad \text{hpx::get\_error\_host\_name()}, \quad \text{hpx::get\_error\_process\_id()}.
\]
\[
\text{hpx::get\_error\_function\_name()}, \quad \text{hpx::get\_error\_file\_name()}, \quad \text{hpx::get\_error\_line\_number()}.
\]
\[
\text{hpx::get\_error\_os\_thread()}, \quad \text{hpx::get\_error\_thread\_id()}, \quad \text{hpx::get\_error\_thread\_description()}.
\]
\[
\text{hpx::get\_error\_backtrace()}, \quad \text{hpx::get\_error\_env()}, \quad \text{hpx::get\_error\_what()}, \quad \text{hpx::get\_error\_config()}.
\]

Parameters \( \text{e} \) – The parameter \( \text{e} \) will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: \( \text{hpx::exception} \), \( \text{hpx::error\_code} \), or \( \text{std::exception\_ptr} \).

Throws nothing –

Returns The error value code of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return \( \text{hpx::naming::invalid\_locality\_id} \).

\[
\text{error get\_error(hpx::error\_code const &e)}
\]

\[
\text{std::string get\_error\_function\_name(hpx::exception\_info const &xi)}
\]

Return the function name from which the exception was thrown.

The function \( \text{hpx::get\_error\_function\_name} \) can be used to extract the diagnostic information element representing the name of the function as stored in the given exception instance.

See also:
\[
\text{hpx::diagnostic\_information()}, \quad \text{hpx::get\_error\_host\_name()}, \quad \text{hpx::get\_error\_process\_id()}.
\]
\[
\text{hpx::get\_error\_file\_name()}, \quad \text{hpx::get\_error\_line\_number()}, \quad \text{hpx::get\_error\_os\_thread()}.
\]
\[
\text{hpx::get\_error\_thread\_id()}, \quad \text{hpx::get\_error\_thread\_description()}, \quad \text{hpx::get\_error()}.
\]
\[
\text{hpx::get\_error\_backtrace()}, \quad \text{hpx::get\_error\_env()}, \quad \text{hpx::get\_error\_what()}, \quad \text{hpx::get\_error\_config()}.
\]

Parameters \( \text{xi} \) – The parameter \( \text{e} \) will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: \( \text{hpx::exception\_info} \), \( \text{hpx::error\_code} \), \( \text{std::exception} \), or \( \text{std::exception\_ptr} \).

Throws \( \text{std::bad\_alloc} \) – (if one of the required allocations fails)
**Returns** The name of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
std::string get_error_file_name(hpx::exception_info const &xi)
```

Return the (source code) file name of the function from which the exception was thrown.

The function `hpx::get_error_file_name` can be used to extract the diagnostic information element representing the name of the source file as stored in the given exception instance.

See also:
- `hpx::get_error_host_name()`, `hpx::get_error_process_id()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`, `hpx::get_error_state()`

**Parameters** `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `std::bad_alloc` – (if one of the required allocations fails)

**Returns** The name of the source file of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
long get_error_line_number(hpx::exception_info const &xi)
```

Return the line number in the (source code) file of the function from which the exception was thrown.

The function `hpx::get_error_line_number` can be used to extract the diagnostic information element representing the line number as stored in the given exception instance.

See also:
- `hpx::get_error_host_name()`, `hpx::get_error_process_id()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`, `hpx::get_error_state()`

**Parameters** `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `nothing` –

**Returns** The line number of the place where the exception was thrown. If the exception instance does not hold this information, the function will return -1.

class exception : public system_error

```cpp
#include <exception.hpp>
```

A `hpx::exception` is the main exception type used by HPX to report errors.
The `hpx::exception` type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by `hpx::exception_list`

### Public Functions

```cpp
explicit exception(error e = hpx::error::success)
    Construct a `hpx::exception` from a `hpx::error`.
    Parameters e – The parameter e holds the hpx::error code the new exception should encapsulate.

explicit exception(std::system_error const &e)
    Construct a `hpx::exception` from a boost::system_error.

explicit exception(std::error_code const &e)
    Construct a `hpx::exception` from a boost::system::error_code (this is new for Boost V1.69). This constructor is required to compensate for the changes introduced as a resolution to LWG3162 (https://cplusplus.github.io/LWG/issue3162).

exception(error e, char const *msg, throwmode mode = throwmode::plain)
    Construct a `hpx::exception` from a `hpx::error` and an error message.
    Parameters
    • e – The parameter e holds the hpx::error code the new exception should encapsulate.
    • msg – The parameter msg holds the error message the new exception should encapsulate.
    • mode – The parameter mode specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is plain, this is the default) or to the category `hpx_category_rethrow` (if mode is rethrow).

exception(error e, std::string const &msg, throwmode mode = throwmode::plain)
    Construct a `hpx::exception` from a `hpx::error` and an error message.
    Parameters
    • e – The parameter e holds the hpx::error code the new exception should encapsulate.
    • msg – The parameter msg holds the error message the new exception should encapsulate.
    • mode – The parameter mode specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is plain, this is the default) or to the category `hpx_category_rethrow` (if mode is rethrow).
```

### Destructor

```cpp
~exception() override
    Destruct a `hpx::exception`
```

### Error Functions

```cpp
error get_error() const noexcept
    The function `get_error()` returns the hpx::error code stored in the referenced instance of a `hpx::exception`. It returns the hpx::error code this exception instance was constructed from.

error_code get_error_code(throwmode mode = throwmode::plain) const noexcept
    The function `get_error_code()` returns a `hpx::error_code` which represents the same error condition as this `hpx::exception` instance.
    Parameters mode – The parameter mode specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is throwmode::plain, this is the default) or to the category `hpx_category_rethrow` (if mode is rethrow).```
struct thread_interrupted : public exception

#include <exception.hpp> A hpx::thread_interrupted is the exception type used by HPX to interrupt a running HPX thread.

The hpx::thread_interrupted type is the exception type used by HPX to interrupt a running thread. A running thread can be interrupted by invoking the interrupt() member function of the corresponding hpx::thread object. When the interrupted thread next executes one of the specified interruption points (or if it is currently blocked whilst executing one) with interruption enabled, then a hpx::thread_interrupted exception will be thrown in the interrupted thread. If not caught, this will cause the execution of the interrupted thread to terminate. As with any other exception, the stack will be unwound, and destructors for objects of automatic storage duration will be executed.

If a thread wishes to avoid being interrupted, it can create an instance of hpx::this_thread::disable_interruption. Objects of this class disable interruption for the thread that created them on construction, and restore the interruption state to whatever it was before on destruction.

```cpp
void f()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::disable_interruption di2;
            // interruption still disabled
        } // di2 destroyed, interruption state restored
        // interruption still disabled
    } // di destroyed, interruption state restored
    // interruption now enabled
}
```

The effects of an instance of hpx::this_thread::disable_interruption can be temporarily reversed by constructing an instance of hpx::this_thread::restore_interruption, passing in the hpx::this_thread::disable_interruption object in question. This will restore the interruption state to what it was when the hpx::this_thread::disable_interruption object was constructed, and then disable interruption again when the hpx::this_thread::restore_interruption object is destroyed.

```cpp
void g()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::restore_interruption ri(di);
            // interruption now enabled
        } // ri destroyed, interruption disable again
        // di destroyed, interruption state restored
        // interruption now enabled
    }
}
At any point, the interruption state for the current thread can be queried by calling
\texttt{hpx::this\_thread::interruption\_enabled()}.

\texttt{hpx/errors/exception\_fwd.hpp}

See \textit{Public API} for a list of names and headers that are part of the public \textit{HPX API}.

\textbf{Defines}

\texttt{HPX\_THROWMODE\_UNSCOPED\_ENUM\_DEPRECATED\_MSG}

namespace \texttt{hpx}

\textbf{Enums}

enum class \texttt{throwmode} : \texttt{std::uint8\_t}

Encode error category for new \texttt{error\_code}.

\textbf{Values:}

**error_code throws**

Predefined `error_code` object used as “throw on error” tag.

The predefined `hpx::error_code` object `hpx::throws` is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form ‘`error_code`& ec=throws’ (with appropriate namespace qualifiers), have the following error handling semantics:

If &ec != &throws and an error occurred: ec.value() returns the implementation specific error number for the particular error that occurred and ec.category() returns the error_category for ec.value().

If &ec != &throws and an error did not occur, ec.clear().

If an error occurs and &ec == &throws, the function throws an exception of type `hpx::exception` or of a type derived from it. The exception’s `get_errorcode()` member function returns a reference to an `hpx::error_code` object with the behavior as specified above.

**hpx/errors/exception_list.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`

class `exception_list` : public `hpx::exception`

#include `<exception_list.hpp>` The class `exception_list` is a container of exception_ptr objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm.

The type `exception_list::const_iterator` fulfills the requirements of a forward iterator.

**Public Types**

using `iterator` = `exception_list_type::const_iterator` bidirectional iterator

**Public Functions**

```cpp
inline `std::size_t` `size()` const noexcept
```

The number of exception_ptr objects contained within the `exception_list`.

**Note:** Complexity: Constant time.

```cpp
inline `exception_list_type::const_iterator` `begin()` const noexcept
```

An iterator referring to the first exception_ptr object contained within the `exception_list`.

```cpp
inline `exception_list_type::const_iterator` `end()` const noexcept
```

An iterator which is the past-the-end value for the `exception_list`.
hpx/errors/throw_exception.hpp

See *Public API* for a list of names and headers that are part of the public *HPX API*.

Defines

**HPX_THROW_EXCEPTION** (errcode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter **errcode** holds the *hpx::error* code the new exception should encapsulate. The parameter **f** is expected to hold the name of the function exception is thrown from and the parameter **msg** holds the error message the new exception should encapsulate.

```cpp
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
                        "simulated error");
}
```

Example:

**HPX_THROWS_IF** (ec, errcode, f, ...)

Either throw a *hpx::exception* or initialize *hpx::error_code* from the given parameters.

The macro *HPX_THROWS_IF* can be used to either throw a *hpx::exception* or to initialize a *hpx::error_code* from the given parameters. If &ec == &hpx::throws, the semantics of this macro are equivalent to *HPX_THROW_EXCEPTION*. If &ec != &hpx::throws, the *hpx::error_code* instance *ec* is initialized instead.

The parameter **errcode** holds the *hpx::error* code from which the new exception should be initialized. The parameter **f** is expected to hold the name of the function exception is thrown from and the parameter **msg** holds the error message the new exception should encapsulate.

namespace *hpx*
See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace execution

**Typedefs**

typedef hpx::execution::experimental::adaptive_static_chunk_size instead

namespace experimental

struct adaptive_static_chunk_size

#include <adaptive_static_chunk_size.hpp> Loop iterations are divided into pieces of size chunk_size and then assigned to threads. If chunk_size is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

**Note:** This executor parameters type is equivalent to OpenMP’s STATIC scheduling directive.

**Public Functions**

inline constexpr adaptive_static_chunk_size() noexcept
Construct a adaptive_static_chunk_size executor parameters object

**Note:** By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr adaptive_static_chunk_size(std::size_t chunk_size) noexcept
Construct a adaptive_static_chunk_size executor parameters object

**Parameters chunk_size** — [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

namespace parallel

namespace execution
namespace hpx

namespace execution

namespace experimental

struct auto_chunk_size

#include <auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

Public Functions

inline explicit constexpr auto_chunk_size(
  std::uint64_t num_iters_for_timing = 0
) noexcept
Construct an auto_chunk_size executor parameters object

Note: Default constructed auto_chunk_size executor parameter types will use 80 microseconds as the minimal time for which any of the scheduled chunks should run.

inline explicit auto_chunk_size(
  hpx::chrono::steady_duration const &rel_time,
  std::uint64_t num_iters_for_timing = 0
) noexcept
Construct an auto_chunk_size executor parameters object

Parameters rel_time – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.

namespace parallel

namespace execution

hpx/execution/executors/dynamic_chunk_size.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace execution

namespace experimental
struct dynamic_chunk_size

#include <dynamic_chunk_size.hpp> Loop iterations are divided into pieces of size chunk_size and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another. If chunk_size is not specified, the default chunk size is 1.

Note: This executor parameters type is equivalent to OpenMP’s DYNAMIC scheduling directive.

Public Functions

inline explicit constexpr dynamic_chunk_size(std::size_t chunk_size = 1) noexcept

Construct a dynamic_chunk_size executor parameters object

Parameters chunk_size – [in] The optional chunk size to use as the number of loop iterations to schedule together. The default chunk size is 1.

namespace parallel

namespace execution

struct mark_begin_execution_t : public hpx::functional::detail::tag_fallback<mark_begin_execution_t>
#include <execution_parameters_fwd.hpp> Mark the begin of a parallel algorithm execution.

Note: This calls params.mark_begin_execution(exec) if it exists; otherwise it does nothing.

  Param params [in] The executor parameters object to use as a fallback if the executor does not expose
Private Functions

```cpp
template<typename Parameters, typename Executor>
inline decltype(auto) friend tag_fallback_invoke(mark_begin_execution_t, Parameters &&params, Executor &&exec)
```

**mark_end_execution_t**

```cpp
#include <execution_parameters_fwd.hpp>
```

Mark the end of a parallel algorithm execution

**Note:** This calls params.mark_end_execution(exec) if it exists; otherwise it does nothing.

**Param params** [in] The executor parameters object to use as a fallback if the executor does not expose

```cpp
template<typename Parameters, typename Executor>
inline decltype(auto) friend tag_fallback_invoke(mark_end_execution_t, Parameters &&params, Executor &&exec)
```

**mark_end_of_scheduling_t**

```cpp
#include <execution_parameters_fwd.hpp>
```

Mark the end of scheduling tasks during parallel algorithm execution

**Note:** This calls params.mark_begin_execution(exec) if it exists; otherwise it does nothing.

**Param params** [in] The executor parameters object to use as a fallback if the executor does not expose

```cpp
template<typename Parameters, typename Executor>
inline decltype(auto) friend tag_fallback_invoke(mark_end_of_scheduling_t, Parameters &&params, Executor &&exec)
```

**maximal_number_of_chunks_t**

```cpp
#include <execution_parameters_fwd.hpp>
```

Return the largest reasonable number of chunks to create for a single algorithm invocation.

**Param params** [in] The executor parameters object to use for determining the number of chunks for the given number of cores.

**Param exec** [in] The executor object which will be used for scheduling of the loop iterations.

**Param cores** [in] The number of cores the number of chunks should be determined for.

**Param num_tasks** [in] The number of tasks the chunk size should be determined for
Private Functions

```cpp
template<typename Parameters, typename Executor>
inline decltype(auto) friend tag_fallback_invoke(
    maximal_number_of_chunks_t,
    Parameters &&params,
    Executor &&exec,
    std::size_t cores,
    std::size_t num_tasks)
```

```cpp
struct measure_iteration_t : public hpx::functional::detail::tag_fallback<
    measure_iteration_t>
#include <execution_parameters_fwd.hpp> Return the measured execution time for one iteration based on running the given function.
```

**Note:** The parameter \( f \) is expected to be a nullary function returning a \( \text{std}::\text{size}\_\text{t} \) representing the number of iteration the function has already executed (i.e. which don’t have to be scheduled anymore).

**Param params** [in] The executor parameters object to use for determining the chunk size for the given number of tasks \( \text{num}\_\text{tasks} \).
**Param exec** [in] The executor object which will be used for scheduling of the loop iterations.
**Param f** [in] The function which will be optionally scheduled using the given executor.
**Param num_tasks** [in] The number of tasks the chunk size should be determined for
**Return** The execution time for one of the tasks.

Private Functions

```cpp
template<typename Parameters, typename Executor, typename F>
inline decltype(auto) friend tag_fallback_invoke(
    measure_iteration_t,
    Parameters &&params,
    Executor &&exec,
    F &&f,
    std::size_t num_tasks)
```

```cpp
struct processing_units_count_t : public hpx::functional::detail::tag_fallback<
    processing_units_count_t>
#include <execution_parameters_fwd.hpp> Retrieve the number of (kernel-)threads used by the associated executor.
```

**Note:** This calls params.processing_units_count(Executor&&) if it exists; otherwise it forwards the request to the executor parameters object.

**Param params** [in] The executor parameters object to use as a fallback if the executor does not expose
**Param iteration_duration** [in] The time one of the tasks require to be executed.
**Param num_tasks** [in] The number of tasks the number of cores should be determined for
**Return** The number of cores to use
### Private Functions

#### template<typename Parameters, typename Executor>

```cpp
inline decltype(auto) friend tag_fallback_invoke(processing_units_count_t, Parameters &&params, Executor &&exec, hpx::chrono::steady_duration const &iteration_duration, std::size_t num_tasks)
```

#### template<typename Parameters, typename Executor>

```cpp
inline decltype(auto) friend tag_fallback_invoke(processing_units_count_t tag, Parameters &&params, Executor &&exec, std::size_t num_tasks = 0)
```

#### template<typename Executor>

```cpp
inline decltype(auto) friend tag_fallback_invoke(processing_units_count_t tag, Executor &&exec, std::size_t num_tasks = 0)
```

#### struct reset_thread_distribution_t : public hpx::functional::detail::tag_fallback<reset_thread_distribution_t>

```cpp
#include <execution_parameters_fwd.hpp>
```

Reset the internal round robin thread distribution scheme for the given executor.

**Note:** This calls params.reset_thread_distribution(exec) if it exists; otherwise it does nothing.

- **Param params** [in] The executor parameters object to use for resetting the thread distribution scheme.
- **Param exec** [in] The executor object to use.

#### struct with_processing_units_count_t : public hpx::functional::detail::tag_fallback<with_processing_units_count_t>

```cpp
#include <execution_parameters_fwd.hpp>
```

Generate a policy that supports setting the number of cores for execution.
See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace *hpx*

namespace *execution*

namespace *experimental*

struct **guided_chunk_size**

```
#include <guided_chunk_size.hpp>
```

Iterations are dynamically assigned to threads in blocks as threads request them until no blocks remain to be assigned. Similar to `dynamic_chunk_size` except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to `number_of_iterations / number_of_cores`. Subsequent blocks are proportional to `number_of_iterations_remaining / number_of_cores`. The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

**Note:** This executor parameters type is equivalent to OpenMP’s GUIDED scheduling directive.

### Public Functions

```
inline explicit constexpr guided_chunk_size(
    std::size_t min_chunk_size = 1
) noexcept
```

Construct a `guided_chunk_size` executor parameters object

- **Parameters** `min_chunk_size` - [in] The optional minimal chunk size to use as the minimal number of loop iterations to schedule together. The default minimal chunk size is 1.

namespace *parallel*

namespace *execution*

### *hpx*/execution/executors/num_cores.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace *hpx*

namespace *execution*

namespace *experimental*

struct **num_cores**

```
#include <num_cores.hpp>
```

Control number of cores in executors which need a functionality for setting the number of cores to be used by an algorithm directly.
Public Functions

```cpp
inline explicit constexpr num_cores(std::size_t cores = 1) noexcept

Construct a num_cores executor parameters object.

Note: make sure the minimal number of cores is 1
```

namespace parallel

namespace execution

hpx/execution/executors/persistent_auto_chunk_size.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace execution

namespace experimental

struct persistent_auto_chunk_size

#include <persistent_auto_chunk_size.hpp>

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

Public Functions

```cpp
inline explicit constexpr persistent_auto_chunk_size(std::uint64_t num_iters_for_timing = 0) noexcept

Construct an persistent_auto_chunk_size executor parameters object.

Note: Default constructed persistent_auto_chunk_size executor parameter types will use 0 microseconds as the execution time for each chunk and 80 microseconds as the minimal time for which any of the scheduled chunks should run.
```

```cpp
inline explicit persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs,
                                         std::uint64_t num_iters_for_timing = 0)

noexcept

Construct an persistent_auto_chunk_size executor parameters object

Parameters time_cs – The execution time for each chunk.
```
inline **persistent_auto_chunk_size**(*hpx::chrono::steady_duration const &time_cs, hpx::chrono::steady_duration const &rel_time, std::uint64_t num_iters_for_timing = 0)* noexcept

Construct an **persistent_auto_chunk_size** executor parameters object

**Parameters**

- **rel_time** – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- **time_cs** – The execution time for each chunk.

iii. The behavior of a program that adds specializations for `is_execution_policy` is undefined.

```cpp
template<typename T>
struct is_parallel_execution_policy : public
  hpx::detail::is_parallel_execution_policy<std::decay_t<T>>
#include <is_execution_policy.hpp>
```

Extension: Detect whether given execution policy enables parallelization

i. The type `is_parallel_execution_policy` can be used to detect parallel execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

ii. If T is the type of a standard or implementation-defined execution policy, `is_parallel_execution_policy<T>` shall be publicly derived from `integral_constant<bool, true>`, otherwise from `integral_constant<bool, false>`.

iii. The behavior of a program that adds specializations for `is_parallel_execution_policy` is undefined.

```cpp
template<typename T>
struct is_sequenced_execution_policy : public
  hpx::detail::is_sequenced_execution_policy<std::decay_t<T>>
#include <is_execution_policy.hpp>
```

Extension: Detect whether given execution policy does not enable parallelization

i. The type `is_sequenced_execution_policy` can be used to detect non-parallel execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

ii. If T is the type of a standard or implementation-defined execution policy, `is_sequenced_execution_policy<T>` shall be publicly derived from `integral_constant<bool, true>`, otherwise from `integral_constant<bool, false>`.

iii. The behavior of a program that adds specializations for `is_sequenced_execution_policy` is undefined.

**execution_base**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/execution_base/execution.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace hpx

```cpp
namespace execution
```

```cpp
struct parallel_execution_tag
#include <execution.hpp>
```

Function invocations executed by a group of parallel execution agents execute in unordered fashion. Any such invocations executing in the same thread are indeterminately sequenced with respect to each other.
Note: parallel_execution_tag is weaker than sequenced_execution_tag.

struct sequenced_execution_tag

#include <execution.hpp>

Function invocations executed by a group of sequential execution agents execute in sequential order.

struct unsequenced_execution_tag

#include <execution.hpp>

Function invocations executed by a group of vector execution agents are permitted to execute in unordered fashion when executed in different threads, and un-sequenced with respect to one another when executed in the same thread.

Note: unsequenced_execution_tag is weaker than parallel_execution_tag.

namespace parallel

namespace execution

Variables

hpx::parallel::execution::sync_execute_t sync_execute

hpx::parallel::execution::async_execute_t async_execute

hpx::parallel::execution::then_execute_t then_execute

hpx::parallel::execution::post_t post

hpx::parallel::execution::bulk_sync_execute_t bulk_sync_execute

hpx::parallel::execution::bulk_async_execute_t bulk_async_execute

hpx::parallel::execution::bulk_then_execute_t bulk_then_execute

hpx::parallel::execution::async_invoke_t async_invoke

hpx::parallel::execution::sync_invoke_t sync_invoke

struct async_execute_t : public hpx::functional::detail::tag_fallback<async_execute_t>

#include <execution.hpp>

Customization point for asynchronous execution agent creation.

This asynchronously creates a single function invocation f() using the associated executor.
Note: Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

Note: This is valid for one way executors (calls `make_ready_future(exec.sync_execute(f, ts...) if it exists) and for two way executors (calls exec.async_execute(f, ts...) if it exists).

**Param** exec [in] The executor object to use for scheduling of the function f.

**Param** f [in] The function which will be scheduled using the given executor.

**Param** ts [in] Additional arguments to use to invoke f.

**Return** f(ts...)’s result through a future

**Private Functions**

```cpp
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(async_execute_t, Executor &&exec, F &&f, Ts&&... ts)
```

```
#include <execution.hpp>
```

Bulk form of asynchronous execution agent creation.

2.8. API reference 1029
This asynchronously creates a group of function invocations f(i) whose ordering is given by the execution_category associated with the executor.

Here i takes on all values in the index space implied by shape. All exceptions thrown by invocations of f(i) are reported in a manner consistent with parallel algorithm execution through the returned future.

**Note:** This is deliberately different from the bulk_async_execute customization points specified in P0443. The bulk_async_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

**Note:** This calls exec.bulk_async_execute(f, shape, ts...) if it exists; otherwise it executes async_execute(f, shape, ts...) as often as needed.

- **Param exec** [in] The executor object to use for scheduling of the function f.
- **Param f** [in] The function which will be scheduled using the given executor.
- **Param shape** [in] The shape objects which defines the iteration boundaries for the arguments to be passed to f.
- **Param ts** [in] Additional arguments to use to invoke f.
- **Return** The return type of executor_type::bulk_async_execute if defined by executor_type.
  Otherwise a vector of futures holding the returned values of each invocation of f.

### Private Functions

```cpp
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_async_execute_t, Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
```

```cpp
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_async_execute_t tag, Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
```

- **struct bulk_sync_execute_t** : public hpx::functional::detail::tag_fallback<bulk_sync_execute_t>

```
#include <execution.hpp> Bulk form of synchronous execution agent creation.
```

This synchronously creates a group of function invocations f(i) whose ordering is given by the execution_category associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here i takes on all values in the index space implied by shape. All exceptions thrown by invocations of f(i) are reported in a manner consistent with parallel algorithm execution through the returned future.

**Note:** This is deliberately different from the bulk_sync_execute customization points specified in P0443. The bulk_sync_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.
Note: This calls exec.bulk_sync_execute(f, shape, ts...) if it exists; otherwise it executes sync_execute(f, shape, ts...) as often as needed.

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param f** [in] The function which will be scheduled using the given executor.

**Param shape** [in] The shape objects which defines the iteration boundaries for the arguments to be passed to f.

**Param ts** [in] Additional arguments to use to invoke f.

**Return** The return type of `executor_type::bulk_sync_execute` if defined by `executor_type`. Otherwise a vector holding the returned values of each invocation of f except when f returns void, which case void is returned.

**Private Functions**

```cpp
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_sync_execute_t, Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)

template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_sync_execute_t tag, Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)

struct bulk_then_execute_t : public hpx::functional::detail::tag_fallback<bulk_then_execute_t>
#include <execution.hpp> Bulk form of execution agent creation depending on a given future.
```

This creates a group of function invocations f(i) whose ordering is given by the execution_category associated with the executor.

Here i takes on all values in the index space implied by shape. All exceptions thrown by invocations of f(i) are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the then_sync_execute customization points specified in P0443. The bulk_then_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls exec.bulk_then_execute(f, shape, pred, ts...) if it exists; otherwise it executes sync_execute(f, shape, pred.share(), ts...) (if this executor is also an OneWayExecutor), or async_execute(f, shape, pred.share(), ts...) (if this executor is also a TwoWayExecutor) - as often as needed.

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param f** [in] The function which will be scheduled using the given executor.

**Param shape** [in] The shape objects which defines the iteration boundaries for the arguments to be passed to f.

**Param predecessor** [in] The future object the execution of the given function depends on.

**Param ts** [in] Additional arguments to use to invoke f.
Return  The return type of executor_type::bulk_then_execute if defined by executor_type. Otherwise a vector holding the returned values of each invocation of f.

Private Functions

template<
typename Executor, typename F, typename Shape, typename Future, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_then_execute_t, Executor &&exec, F &&f, Shape const &shape, Future &&predecessor, Ts &&&... ts)

template<
typename Executor, typename F, typename Shape, typename Future, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_then_execute_t tag, Executor &&exec, F &&f, Shape const &shape, Future &&&predecessor, Ts &&&... ts)

struct post_t : public hpx::functional::detail::tag_fallback<post_t>
#include <execution.hpp> Customization point for asynchronous fire & forget execution agent creation.

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor.

Note:  This is valid for two way executors (calls exec.post(f, ts...), if available, otherwise it calls exec.async_execute(f, ts...) while discarding the returned future), and for non-blocking two way executors (calls exec.post(f, ts...) if it exists).

Param exec  [in] The executor object to use for scheduling of the function f.
Param f  [in] The function which will be scheduled using the given executor.
Param ts  [in] Additional arguments to use to invoke f.

Private Functions

template<
typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_t, Executor &&&exec, F &&&f, Ts &&&... ts)

struct sync_execute_t : public hpx::functional::detail::tag_fallback<sync_execute_t>
#include <execution.hpp> Customization point for synchronous execution agent creation.

This synchronously creates a single function invocation f() using the associated executor. The execution of the supplied function synchronizes with the caller.

Note:  It will call tag_invoke(sync_execute_t, exec, f, ts...) if it exists. For two-way executors it will invoke synch_execute_t and wait for the task’s completion before returning.

Param exec  [in] The executor object to use for scheduling of the function f.
Param f  [in] The function which will be scheduled using the given executor.
Param ts  [in] Additional arguments to use to invoke f.
Return  f(ts…)'s result

Private Functions

template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(sync_execute_t, Executor &&exec, F &&f, Ts&&... ts)

#include <execution.hpp>
Synchronously invoke the given set of nullary functions, each on its own execution agent

This creates a group of function invocations whose ordering is given by the execution_category associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This calls exec.sync_invoke(fs…) if it exists; otherwise it executes sync_execute(fs) for each fs.

Param exec  [in] The executor object to use for scheduling of the functions fs.
Param fs [in] The functions which will be scheduled using the given executor.
Return  The return type of executor_type::asyncInvoke if defined by executor_type.

Private Functions

#include<execution.hpp>
Customization point for execution agent creation depending on a given future.

This creates a single function invocation f() using the associated executor after the given future object has become ready.

Note: This is valid for two way executors (calls exec.then_execute(f, predecessor, ts…) if it exists) and for one way executors (calls predecessor.then(bind(f, ts…))).

Param exec  [in] The executor object to use for scheduling of the function f.
Param f  [in] The function which will be scheduled using the given executor.
Param predecessor  [in] The future object the execution of the given function depends on.
Param ts  [in] Additional arguments to use to invoke f.
Return  f(ts…)'s result through a future
Private Functions

template<typename Executor, typename F, typename Future, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(then_execute_t, Executor &&exec, F 
&&f, Future &&predecessor, Ts&&... ts)

Functions

template<typename R, typename ...As>
void set_value(R &r, As&&... as)
set_value is a customization point object. The expression hpx::execution::set_value(r, as...) is equivalent to:
• r.set_value(as...), if that expression is valid. If the function selected does not send the value(s) as... to the Receiver r’s value channel, the program is ill-formed (no diagnostic required).
• Otherwise, `set_value(r, as...)`, if that expression is valid, with overload resolution performed in a context that include the declaration void set_value();
• Otherwise, the expression is ill-formed. The customization is implemented in terms of hpx::functional::tag_invoke.

template<typename R>
void set_stopped(R &&r)
set_stopped is a customization point object. The expression hpx::execution::set_stopped(r) is equivalent to:
• r.set_stopped(), if that expression is valid. If the function selected does not signal the Receiver r’s done channel, the program is ill-formed (no diagnostic required).
• Otherwise, `set_stopped(r)`, if that expression is valid, with overload resolution performed in a context that include the declaration void set_stopped();
• Otherwise, the expression is ill-formed. The customization is implemented in terms of hpx::functional::tag_invoke.

template<typename R, typename E>
void set_error(R &r, E &e)
set_error is a customization point object. The expression hpx::execution::set_error(r, e) is equivalent to:
• r.set_stopped(e), if that expression is valid. If the function selected does not send the error e the Receiver r’s error channel, the program is ill-formed (no diagnostic required).
• Otherwise, `set_error(r, e)`, if that expression is valid, with overload resolution performed in a context that include the declaration void set_error();
• Otherwise, the expression is ill-formed. The customization is implemented in terms of hpx::functional::tag_invoke.

template<typename T, typename CS>
struct is_nothrow_receiver_of: public
hpx::execution::experimental::detail::is_nothrow_receiver_of_impl<is_receiver_v<T>, CS>, T, CS

struct is_receiver

#include <receiver.hpp> Receiving values from asynchronous computations is handled by the Receiver concept. A Receiver needs to be able to receive an error or be marked as being canceled. As such, the Receiver concept is defined by having the following two customization points defined, which form the completion-signal operations:
• `hpx::execution::experimental::set_stopped` * `hpx::execution::experimental::set_error`

Those two functions denote the completion-signal operations. The Receiver contract is as follows:
• None of a Receiver’s completion-signal operation shall be invoked before `hpx::execution::experimental::start` has been called on the operation state object that was returned by connecting a Receiver to a sender `hpx::execution::experimental::connect`.
• Once `hpx::execution::start` has been called on the operation state object, exactly one of the Receiver’s completion-signal operation shall complete without an exception before the Receiver is destroyed

Once one of the Receiver’s completion-signal operation has been completed without throwing an exception, the Receiver contract has been satisfied. In other words: The asynchronous operation has been completed.

See also:

`hpx::execution::experimental::is_receiver_of`

template<typename T, typename CS>
struct is_receiver_of

#include <receiver.hpp> The receiver_of concept is a refinement of the Receiver concept by requiring one additional completion-signal operation:
The receiver_of concept takes a receiver and an instance of the completion_signatures<> class template. The receiver_of concept, rather than accepting a receiver and some value types, is changed to take a receiver and an instance of the completion_signatures<> class template. A sender uses completion_signatures<> to describe the signals with which it completes. The receiver_of concept ensures that a particular receiver is capable of receiving those signals.

This completion-signal operation adds the following to the Receiver’s contract:

- If `hpx::execution::set_value` exits with an exception, it is still valid to call `hpx::execution::set_error` or `hpx::execution::set_stopped`

    namespace execution

    Typedefs

    typedef hpx::execution::parallel_executor instead

    namespace this_thread

    Functions

    hpx::execution::parallel_executor get_executor(error_code &ec = throws)
    
    Returns a reference to the executor that was used to create the current thread.

    Throws If &ec != &throws, never throws, but will set ec to an appropriate value
    when an error occurs. Otherwise, this function will throw an hpx::exception with an er-
    ror code of hpx::error::yield_aborted if it is signaled with wait_aborted. If called out-
    side of a HPX-thread, this function will throw an hpx::exception with an error code of
    hpx::error::null_thread_id. If this function is called while the thread-manager is not run-
    ning, it will throw an hpx::exception with an error code of hpx::error::invalid_status.
```
namespace threads

Functions

```cpp
hpx::execution::parallel_executor get_executor(thread_id_type const &id, error_code &ec = throws)
```

Returns a reference to the executor that was used to create the given thread.

Throws If `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

Typedefs

```cpp
using sequenced_task_policy = detail::sequenced_task_policy_shim<sequenced_executor>
```

Extension: The class sequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may not be parallelized (has to run sequentially).

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the sequenced_policy.

```cpp
using sequenced_policy = detail::sequenced_policy_shim<sequenced_executor>
```

The class sequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm’s execution may not be parallelized.
using **parallel_task_policy** = detail::parallel_task_policy_shim<parallel_executor>

Extension: The class parallel_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the parallel_policy.

using **parallel_policy** = detail::parallel_policy_shim<parallel_executor>

The class parallel_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.

using **parallel_unsequenced_task_policy** = detail::parallel_unsequenced_task_policy_shim<parallel_executor>

The class parallel_unsequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized.

using **parallel_unsequenced_policy** = detail::parallel_unsequenced_policy_shim<parallel_executor>

The class parallel_unsequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized.

using **unsequenced_task_policy** = detail::unsequenced_task_policy_shim<sequenced_executor>

The class unsequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized.

using **unsequenced_policy** = detail::unsequenced_policy_shim<sequenced_executor>

The class unsequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized.

    inline path canonical(path const &p, path const &base)
    inline path canonical(path const &p, path const &base, std::error_code &ec)

namespace filesystem

functional

See Public API for a list of names and headers that are part of the public HPX API.

hpx/functional/bind.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

    Top level namespace.

    Functions

template<typename F, typename ...Ts, typename Enable = std::enable_if_t<!traits::is_action_v<std::decay_t<F>>>>
constexpr detail::bound<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind(F &&f, Ts&&... vs)

The function template bind generates a forwarding call wrapper for f. Calling this wrapper is equivalent to invoking f with some of its arguments bound to vs.
Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments

- **vs** – list of arguments to bind, with the unbound arguments replaced by the placeholders \_1, \_2, \_3… of namespace hpx::placeholders

Returns A function object of unspecified type \( T \), for which

```cpp
hpx::is_bind_expression<T>::value == true.
```

namespace placeholders

The `hpx::placeholders` namespace contains the placeholder objects \[_1, \ldots, _N\] where \( N \) is an implementation defined maximum number.

When used as an argument in a `hpx::bind` expression, the placeholder objects are stored in the generated function object, and when that function object is invoked with unbound arguments, each placeholder \_N is replaced by the corresponding Nth unbound argument.

The types of the placeholder objects are DefaultConstructible and CopyConstructible, their default copy/move constructors do not throw exceptions, and for any placeholder \_N, the type `hpx::is_placeholder<decltype(_N)>` is defined, where `hpx::is_placeholder<decltype(_N)>` is derived from `std::integral_constant<int, N>`.

Variables

```cpp
constexpr detail::placeholder<1> _1 = {}
constexpr detail::placeholder<2> _2 = {}
constexpr detail::placeholder<3> _3 = {}
constexpr detail::placeholder<4> _4 = {}
constexpr detail::placeholder<5> _5 = {}
constexpr detail::placeholder<6> _6 = {}
constexpr detail::placeholder<7> _7 = {}
constexpr detail::placeholder<8> _8 = {}
constexpr detail::placeholder<9> _9 = {}
```

namespace hpx

Top level namespace.

**Functions**

template<typename F, typename ...Ts>
constexpr hpx::detail::bound_back<
  std::decay_t<F>,
  util::make_index_pack_t<
    sizeof...(Ts)>,
  util::decay_unwrap_t<Ts>...> bind_back(F&& f, Ts&&... vs)

Function templates `bind_back` generate a forwarding call wrapper for `f`. Calling this wrapper is equivalent to invoking `f` with its last `sizeof...(Ts)` parameters bound to `vs`.

**Parameters**

- `f` – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- `vs` – list of the arguments to bind to the last `sizeof...(Ts)` parameters of `f`

**Returns** A function object of type T that is unspecified, except that the types of objects returned by two calls to `hpx::bind_back` with the same arguments are the same.

namespace serialization

**Functions**

template<typename Archive, typename F, typename ...Ts>
void serialize(Archive &ar, ::hpx::detail::bound_back<F, Ts>... &bound, unsigned int const version = 0)

\]

Function template bind_front generates a forwarding call wrapper for \(f\). Calling this wrapper is equivalent to invoking \(f\) with its first \(\text{sizeof}...(Ts)\) parameters bound to \(vs\).

Parameters

- \(f\) – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- \(vs\) – list of the arguments to bind to the first or \(\text{sizeof}...(Ts)\) parameters of \(f\)

Returns A function object of type \(T\) that is unspecified, except that the types of objects returned by two calls to hpx::bind_front with the same arguments are the same.

HPX_UTIL_REGISTER_FUNCTION_DECLARATION(Sig, F, Name)
HPX_UTIL_REGISTER_FUNCTION(Sig, F, Name)

namespace hpx

Top level namespace.

template<typename Sig, bool Serializable = false>

class function

#include <function.hpp> Class template hpx::function is a general-purpose polymorphic function wrapper. Instances of hpx::function can store, copy, and invoke any CopyConstructible Callable target (functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of hpx::function. If an hpx::function contains no target, it is called empty. Invoking the target of an empty hpx::function results in hpx::error::bad_function_call exception being thrown. hpx::function satisfies the requirements of CopyConstructible and CopyAssignable.

`hpx/functional/function_ref.hpp`

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level namespace.

template<typename Sig>

class function_ref

```
#include <function_ref.hpp> function_ref class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n, f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.
```
using payload = std::optional< /* ... */ >;
// Repeatedly invokes 'action' up to 'times' repetitions.
// Immediately returns if 'action' returns a valid 'payload'.
// Returns 'std::nullopt' otherwise.
payload retry(size_t times, /* ????? */ action);

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, \texttt{hpx::function} or a template but it is much simpler with \texttt{function_ref} as seen below:

\begin{verbatim}
payload retry(size_t times, function_ref<payload()> action);
\end{verbatim}

\text{HPX\_INVOKE\_R}(R, F, ...)

namespace \text{hpx}

Top level namespace.

Functions

\[
\text{template<\text{typename F, typename ...Ts>}
\text{constexpr util::invoke\_result\_t<\text{F, Ts&&...}> \text{invoke}(F &&f, Ts&&... vs)
\text{\text{noexcept(noexcept(HPX\_INVOKE(HPX\_FORWARD(F,}
\text{f), HPX\_FORWARD(Ts, vs)...)))}}
\]

Invokes the given callable object f with the content of the argument pack vs

\[ \text{Note: This function is similar to std::invoke (C++17)} \]

Parameters

- f – Requires to be a callable object. If f is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- vs – An arbitrary pack of arguments

Throws std::exception – like objects thrown by call to object f with the argument types vs.
**Returns** The result of the callable object when it’s called with the given argument types.

```cpp
template<typename R, typename F, typename ...Ts>
constexpr R invoke_r(F &&f, Ts&&... vs) noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F, f), HPX_FORWARD(Ts, vs)...)))
```

Invokes the given callable object `f` with the content of the argument pack `vs`

---

**Note:** This function is similar to `std::invoke` (C++17)

**Parameters**
- `f` – Requires to be a callable object. If `f` is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- `vs` – An arbitrary pack of arguments

**Throws** `std::exception` – like objects thrown by call to object `f` with the argument types `vs`.

**Template Parameters** `R` – The result type of the function when it’s called with the content of the given argument types.

**Returns** The result of the callable object when it’s called with the given argument types.

```cpp
namespace functional

struct invoke

### Public Functions

```cpp
template<typename F, typename ...Ts>
inline constexpr util::invoke_result_t<F, Ts&&...> operator()(F &&f, Ts&&... vs) const noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F, f), HPX_FORWARD(Ts, vs)...)))
```

```cpp
template<typename R>
struct invoke_r

### Public Functions

```cpp
template<typename F, typename ...Ts>
inline constexpr R operator()(F &&f, Ts&&... vs) const

```

```cpp
noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F, f), HPX_FORWARD(Ts, vs)...)))
```
namespace hpx

Top level namespace.

**Functions**

```cpp
template<typename F, typename Tuple>
constexpr detail::invoke_fused_result_t<F, Tuple> invoke_fused(F &&f, Tuple &&t) noexcept
    (noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{},
                                 HPX_FORWARD(F, f),
                                 HPX_FORWARD(Tuple, t))))
```

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

**Note:** This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

**Parameters**

- **f** – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to hpx::get.

**Throws** `std::exception` – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

**Returns** The result of the callable object when it’s called with the content of the given sequenced type.

```cpp
template<typename R, typename F, typename Tuple>
constexpr R invoke_fused_r(F &&f, Tuple &&t) noexcept
    (noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{},
                                  HPX_FORWARD(F, f),
                                  HPX_FORWARD(Tuple, t))))
```

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

**Note:** This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

**Note:** The difference between `hpx::invoke_fused` and `hpx::invoke_fused_r` is that the later allows to specify the return type as well.

**Parameters**

- **f** – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
• \( t \) – A type whose contents are accessible through a call to `hpx::get`.

**Throws** `std::exception` – like objects thrown by call to object \( f \) with the arguments contained in the sequenceable type \( t \).

**Template Parameters** \( R \) – The result type of the function when it’s called with the content of the given sequenced type.

**Returns** The result of the callable object when it’s called with the content of the given sequenced type.

### `hpx/functional/mem_fn.hpp`

See **Public API** for a list of names and headers that are part of the public **HPX API**.

```cpp
namespace hpx {
    Top level namespace.
}
```

**Functions**

`template<typename M, typename C>`

```cpp
constexpr detail::mem_fn<M C::*>() mem_fn(M C::* pm) noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

**Parameters** `pm` – pointer to member that will be wrapped

**Returns** a call wrapper of unspecified type with the following member:

```cpp
template<typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let \( fn \) be the call wrapper returned by a call to `hpx::mem_fn` with a pointer to member \( pm \). Then the expression \( fn(t, a_2, \ldots, a_N) \) is equivalent to `HPX_INVOKE(pm, t, a_2, \ldots, a_N)`. Thus, the return type of `operator()` is `std::result_of<decaytype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decaytype(pm), Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decaytype(pm), Ts&&...>`. Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)`.

`template<typename R, typename C, typename ...Ps>`

```cpp
constexpr detail::mem_fn<R (C::*)(Ps...)> mem_fn(R (C::* pm)(Ps...)) noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

**Parameters** `pm` – pointer to member that will be wrapped

**Returns** a call wrapper of unspecified type with the following member:

```cpp
template<typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```
Let \( fn \) be the call wrapper returned by a call to \( \text{hpx::mem_fn} \) with a pointer to member \( pm \). Then the expression \( fn(t,a_2,\ldots,a_N) \) is equivalent to \( \text{HPX_INVOKE}(pm,t,a_2,\ldots,a_N) \). Thus, the return type of \( \text{operator}() \) is \( \text{std::result_of<\text{decltype}(pm)(Ts&&\ldots)>::type} \) or equivalently \( \text{std::invoke_result_t<\text{decltype}(pm),Ts&&\ldots>} \), and the value in \text{noexcept} specifier is equal to \( \text{std::is_nothrow_invocable_v<\text{decltype}(pm),Ts&&\ldots>} \). Each argument in \( vs \) is perfectly forwarded, as if by \( \text{std::forward<Ts>(vs)} \ldots \).

```cpp
template<typename R, typename C, typename ...Ps>
constexpr detail::mem_fn<R (C::*)(Ps...) const> \text{mem_fn}(R (C::* pm)(Ps...) const) noexcept
```

Function template \( \text{hpx::mem_fn} \) generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a \( \text{hpx::mem_fn} \).

**Parameters** \( pm \) – pointer to member that will be wrapped

**Returns** a call wrapper of unspecified type with the following member:

```cpp
template <typename... Ts>
constexpr typename \text{util::invoke_result<MemberPointer, Ts...>::type operator()}(Ts&&... vs) noexcept;
```

Let \( fn \) be the call wrapper returned by a call to \( \text{hpx::mem_fn} \) with a pointer to member \( pm \). Then the expression \( fn(t,a_2,\ldots,a_N) \) is equivalent to \( \text{HPX_INVOKE}(pm,t,a_2,\ldots,a_N) \). Thus, the return type of \( \text{operator}() \) is \( \text{std::result_of<\text{decltype}(pm)(Ts&&\ldots)>::type} \) or equivalently \( \text{std::invoke_result_t<\text{decltype}(pm),Ts&&\ldots>} \), and the value in \text{noexcept} specifier is equal to \( \text{std::is_nothrow_invocable_v<\text{decltype}(pm),Ts&&\ldots>} \). Each argument in \( vs \) is perfectly forwarded, as if by \( \text{std::forward<Ts>(vs)} \ldots \).

**hpx/functional/move_only_function.hpp**

See **Public API** for a list of names and headers that are part of the public \( \text{HPX} \) API.

**Defines**

**HPX_UTIL_REGISTER_UNIQUE_FUNCTION_DECLARATION**(Sig, F, Name)

**HPX_UTIL_REGISTER_UNIQUE_FUNCTION**(Sig, F, Name)

namespace hpx

Top level namespace.

```cpp
template<typename Sig, bool Serializable = false>
class move_only_function
```

#include <move_only_function.hpp> Class template \( \text{hpx::move_only_function} \) is a general-purpose polymorphic function wrapper. \( \text{hpx::move_only_function} \) objects can store and invoke any constructible (not required to be move constructible) Callable target &\#8212; functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of \( \text{hpx::move_only_function} \). If an \( \text{hpx::move_only_function} \) contains no target, it is called empty. Unlike \( \text{hpx::function} \), invoking an empty \( \text{hpx::move_only_function} \) results in undefined behavior.
hpx::move_only_functions supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). hpx::move_only_function satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

```cpp
template<typename R, typename ...Ts, bool Serializable>
class move_only_function<\(R(Ts...)\), Serializable> : public util::detail::basic_function<\(R(Ts...)\), false, Serializable>
```

**Public Types**

using `result_type = R`

**Public Functions**

```cpp
inline constexpr move_only_function(nullptr_t = nullptr) noexcept
move_only_function(move_only_function const&) = delete
move_only_function(move_only_function&&) noexcept = default
move_only_function &operator=(move_only_function const&) = delete
move_only_function &operator=(move_only_function&&) noexcept = default
```

```cpp
~move_only_function() = default
```

```cpp
template<typename F, typename FD = std::decay_t<F>, typename Enable1 = std::enable_if_t<!std::is_same_v<FD, move_only_function>>, typename Enable2 = std::enable_if_t<std::is_invocable_r_v<\(R, FD&, Ts\...)>>
inline move_only_function(F &&f)
```

```cpp
template<typename F, typename FD = std::decay_t<F>, typename Enable1 = std::enable_if_t<!std::is_same_v<FD, move_only_function>>, typename Enable2 = std::enable_if_t<std::is_invocable_r_v<\(R, FD&, Ts\...)>>
inline move_only_function &operator=(F &&f)
```

HPX_MAKE_EXCEPTIONAL_FUTURE(T, errorcode, f, msg)

namespace hpx

Top level HPX namespace.

Functions

template<typename R, typename U>
  hpx::future<R> make_future(hpx::future<U> &&f)
  Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

template<typename R, typename U, typename Conv>
  hpx::future<R> make_future(hpx::future<U> &&f, Conv &&conv)
  Converts any future of type U to any other future of type R based on a given conversion function: R conv(U).

template<typename R, typename U>
  hpx::future<R> make_future(hpx::shared_future<U> f)
  Converts any shared_future of type U to any other future of type R based on an existing conversion path from U to R.

template<typename R, typename U, typename Conv>
  hpx::future<R> make_future(hpx::shared_future<U> f, Conv &&conv)
  Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

template<typename R>
  hpx::shared_future<R> make_shared_future(hpx::future<R> &&f) noexcept
  Converts any future or shared_future of type T to a corresponding shared_future of type T.

template<typename R>
  hpx::shared_future<R> &make_shared_future(hpx::shared_future<R> &&f) noexcept
  Converts any future or shared_future of type T to a corresponding shared_future of type T.

template<typename R>
  hpx::shared_future<R> &&make_shared_future(hpx::shared_future<R> &&f) noexcept
  Converts any future or shared_future of type T to a corresponding shared_future of type T.

template<typename R>
  hpx::shared_future<R> const &make_shared_future(hpx::shared_future<R> const &f) noexcept
  Converts any future or shared_future of type T to a corresponding shared_future of type T.

template<typename T, typename Allocator, typename ...Ts>
  std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> make_ready_future_alloc(Allocator const &a, Ts&&... ts)

  Creates a pre-initialized future object with allocator (extension)

template<typename T, typename ...Ts>
The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

```cpp
template<int DeductionGuard = 0, typename Allocator, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_alloc(Allocator const &a, T &&init)
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

```cpp
template<typename T>
future<T> make_exceptional_future(std::exception_ptr const &e)
```

Creates a pre-initialized future object which holds the given error (extension)

```cpp
template<typename T, typename E>
future<T> make_exceptional_future(E e)
```

Creates a pre-initialized future object which holds the given error (extension)

```cpp
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_at(hpx::chrono::steady_time_point const &abs_time, T &&init)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

```cpp
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_after(hpx::chrono::steady_duration const &rel_time, T &&init)
```

Creates a pre-initialized future object which gets ready after a given point in time (extension)

```cpp
inline future<void> make_ready_future_alloc(Allocator const &a)
```

```cpp
future<void> make_ready_future()
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

```cpp
inline future<void> make_ready_future_at(hpx::chrono::steady_time_point const &abs_time)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

```cpp
inline future<void> make_ready_future_after(hpx::chrono::steady_duration const &rel_time)
```

Creates a pre-initialized future object which gets ready after a given point in time (extension)

```cpp
class future : public hpx::lcos::detail::future_base<future<R>, R>
```

The class template `hpx::future` provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via `hpx::async`, `hpx::packaged_task`, or `hpx::promise`) can provide a `hpx::future` object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the `hpx::future`. These methods may block if the asynchronous operation has not yet provided a value.

2.8. API reference
• When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. `hpx::promise::set_value`) that is linked to the creator’s `hpx::future`. Note that `hpx::future` references shared state that is not shared with any other asynchronous return objects (as opposed to `hpx::shared_future`).

**Public Types**

using `result_type = R`

using `shared_state_type = typename base_type::shared_state_type`

**Public Functions**

constexpr `future()` noexcept = default

`future(future &&other)` noexcept = default

inline `future(future<future> &&other)` noexcept

inline `future(future<shared_future<R>> &&other)` noexcept

template<typename T>
inline `future(future<T> &&other, std::enable_if_t<std::is_void_v<R> && !traits::is_future_v<T>, T>* = nullptr)` noexcept

`~future()` = default

`future & operator=(future &&other)` noexcept = default

inline `shared_future<R> share()` noexcept

inline `hpx::traits::future_traits<future>::result_type get()`

inline `hpx::traits::future_traits<future>::result_type get(error_code &ec)`

template<typename F>
inline decltype(auto) then(F &&f, error_code &ec = throws)

Attaches a continuation to *this. The behavior is undefined if *this has no associated shared state (i.e., `valid()==false`).

In cases where `decltype(func(*this))` is `future<R>`, the resulting type is `future<R>` instead of `future<future<R>>`. Effects:

• The continuation is called when the object’s shared state is ready (has a value or exception stored).
• The continuation launches according to the specified launch policy or executor.
• When the executor or launch policy is not provided the continuation inherits the parent’s launch policy or executor.
• If the parent was created with `std::promise` or with a `packaged_task` (has no associated launch policy), the continuation behaves the same as the third overload with a policy argument of `launch::async | launch::deferred` and the same argument for `func`.
• If the parent has a policy of `launch::deferred` and the continuation does not have a specified launch policy or scheduler, then the parent is filled by immediately calling `.wait()`, and the policy of the antecedent is `launch::deferred`

**Note:** Postcondition:
The future object is moved to the parameter of the continuation function.
valid() == false on original future object immediately after it returns.

Template Parameters

- **F** – The type of the function/function object to use (deduced). F must meet requirements of MoveConstructible.
- **error_code** – The type of error code.

Parameters

- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns An object of type future<decltype(func(*this))> that refers to the shared state created by the continuation.

```cpp
template<typename T0, typename F>
inline decltype(auto) then(T0 &&t0, F &&f, error_code &ec = throws)
```

Attaches a continuation to *this. The behavior is undefined if *this has no associated shared state (i.e., valid()==false). `copydetail hpx::future::then(F&& f, error_code& ec = throws)

**Note:** Postcondition:
- The future object is moved to the parameter of the continuation function.
- valid() == false on original future object immediately after it returns.

Template Parameters

- **T0** – The type of executor or launch policy.
- **F** – The type of the function/function object to use (deduced). F must meet requirements of MoveConstructible.
- **error_code** – The type of error code.

Parameters

- **t0** – The executor or launch policy to be used.
- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns An object of type future<decltype(func(*this))> that refers to the shared state created by the continuation.

```cpp
template<typename Allocator, typename F>
inline auto then_alloc(Allocator const &alloc, F &&f, error_code &ec = throws) ->
    decltype(base_type::then_alloc(alloc, HPX_MOVE(*this),
        HPX_FORWARD(F, f), ec))
```

template<typename R>
class shared_future : public hpx::lcos::detail::future_base<shared_future<R>, R>
#include <future_fwd.hpp> The class template hpx::shared_future provides a mechanism to access the result of asynchronous operations, similar to hpx::future, except that multiple threads are allowed to wait for the same shared state. Unlike hpx::future, which is only moveable (so only one instance can refer to any particular asynchronous result), hpx::shared_future is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a shared_future object.

Note: Postcondition:

• The future object is moved to the parameter of the continuation function.
• valid() == false on original future object immediately after it returns.

Template Parameters

• F – The type of the function/function object to use (deduced). F must meet requirements of MoveConstructible.
• error_code – The type of error code.

Parameters

• f – A continuation to be attached.
• ec – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.
Returns
An object of type `future<decltype(func(*this))>` that refers to the shared state created by the continuation.

```
template<typename T0, typename F>
inline decltype(auto) then(T0 &&t0, F &&f, error_code &ec = throws) const
```

Attaches a continuation to `*this`. The behavior is undefined if `*this` has no associated shared state (i.e., `valid()==false`). `copydetail hpx::future::then(F&& f, error_code& ec = throws)

**Note:** Postcondition:
- The future object is moved to the parameter of the continuation function.
- `valid()==false` on original future object immediately after it returns.

**Template Parameters**
- `T0` – The type of executor or launch policy.
- `F` – The type of the function/function object to use (deduced). `F` must meet requirements of `MoveConstructible`.
- `error_code` – The type of error code.

**Parameters**
- `t0` – The executor or launch policy to be used.
- `f` – A continuation to be attached.
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &=`#8212; A special ‘throw on error’ `error_code`.

**Returns**
An object of type `future<decltype(func(*this))>` that refers to the shared state created by the continuation.

```
template<typename Allocator, typename F>
inline auto then_alloc(Allocator const &alloc, F &&f, error_code &ec = throws) ->
    decltype(base_type::then_alloc(alloc, HPX_MOVE(*this),
                                  HPX_FORWARD(F, f), ec))
```

**Private Types**

```
using base_type = lcos::detail::future_base<shared_future<R>, R>
```

**Private Functions**

```
inline explicit shared_future(hpx::intrusive_ptr<shared_state_type> const &state)

inline explicit shared_future(hpx::intrusive_ptr<shared_state_type> &&&state)

template<typename SharedState>
inline explicit shared_future(hpx::intrusive_ptr<SharedState> const &state)
```

struct uses_allocator<hpx::packaged_task<Sig>, Allocator> : public true_type

namespace hpx

Top level HPX namespace.

template<typename Sig>
class packaged_task

#include <packaged_task.hpp> The class template hpx::packaged_task wraps any Callable` target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through hpx::future objects. Just like hpx::function, hpx::packaged_task is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.

See Public API for a list of names and headers that are part of the public HPX API.
template<typename R, typename Allocator>
struct uses_allocator<hpx::promise<R>, Allocator> : public true_type

namespace hpx

Top level HPX namespace.
The class template `hpx::promise` provides a facility to store a value or an exception that is later acquired asynchronously via a `hpx::future` object created by the `hpx::promise` object. Note that the `hpx::promise` object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- **make ready**: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- **release**: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by `hpx::async` which is not yet ready, this operation does not block.
- **abandon**: the promise stores the exception of type `hpx::future_error` with error code `hpx::error::broken_promise`, makes the shared state ready, and then releases it. The promise is the “push” end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `hpx::memory_order`) the successful return from any function that is waiting on the shared state (such as `hpx::future::get`). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of `hpx::shared_future::get` must either all be read-only or provide external synchronization.

**hpx/io_service/io_service_pool.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx
```
```cpp
namespace util
```

```cpp
class io_service_pool
    #include <io_service_pool.hpp> A pool of io_service objects.
```

**Public Functions**

**HPX_NON_COPYABLE**(io_service_pool)

```cpp
explicit io_service_pool(std::size_t pool_size = 2, threads::policies::callback_notifier const &notifier = threads::policies::callback_notifier(), char const *pool_name = "", char const *name_postfix = "")
```

Construct the io_service pool.

**Parameters**
- **pool_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

```cpp
explicit io_service_pool(threads::policies::callback_notifier const &notifier, char const *pool_name = ",", char const *name_postfix = "")
```

Construct the io_service pool.

**Parameters**
- **notifier** – [in]
• `pool_name` – [in]
• `name_postfix` – [in]

```cpp
~io_service_pool()
```

```cpp
bool run(bool join_threads = true, barrier *startup = nullptr)
    Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete

bool run(std::size_t num_threads, bool join_threads = true, barrier *startup = nullptr)
    Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete
```

```cpp
void stop()
    Stop all io_service objects in the pool.

void join()
    Join all io_service threads in the pool.

void clear()
    Clear all internal data structures.

void wait()
    Wait for all work to be done.

bool stopped()
```

```cpp
asio::io_context &get_io_service(int index = -1)
    Get an io_service to use.

std::thread &get_os_thread_handle(std::size_t thread_num)
    access underlying thread handle
```

```cpp
inline constexpr std::size_t size() const noexcept
    Get number of threads associated with this I/O service.

void thread_run(std::size_t index, barrier *startup = nullptr)
    Activate the thread index for this thread pool.
```

```cpp
inline constexpr char const *get_name() const noexcept
    Return name of this pool.
```

```cpp
void init(std::size_t pool_size)
```

---

**Protected Functions**

```cpp
bool run_locked(std::size_t num_threads, bool join_threads, barrier *startup)

using `work_type` = `std::unique_ptr<asio::io_context::work>`

**Private Functions**

inline `work_type initialize_work` (asio::io_context &io_service)

**Private Members**

`std::mutex mtx_`

`std::vector<io_service_ptr> io_services_`
   The pool of io_services.

`std::vector<std::thread> threads_`

`std::vector<work_type> work_`
   The work that keeps the io_services running.

`std::size_t next_io_service_`
   The next io_service to use for a connection.

bool `stopped_`
   set to true if stopped

`std::size_t pool_size_`
   initial number of OS threads to execute in this pool

`threads::policies::callback_notifier const &notifier_`
   call this for each thread start/stop

char const *`pool_name_`

char const *`pool_name_postfix_`

bool `waiting_`
   Set to true if waiting for work to finish.

`std::unique_ptr<barrier> wait_barrier_`

`std::unique_ptr<barrier> continue_barrier_`

pack_traversal

See Public API for a list of names and headers that are part of the public HPX API.

hpx/pack_traversal/pack_traversal.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util
Functions

```
template<typename Mapper, typename... T> < unspecified > map_pack (Mapper &&mapper, T &&... pack)

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:
• homogeneous containers (std::vector, std::list)
• heterogeneous containers (hpx::tuple, std::pair, std::array) and re-assembles
  the pack with the result of the mapper. Mapping from one type to a
different one is supported.

Elements that aren’t accepted by the mapper are routed through and preserved
through the hierarchy.

```// Maps all integers to floats
map_pack([](int value) {
    return float(value);
},
1, hpx::make_tuple(2, std::vector<int>({3, 4})), 5);

Throws std::exception – like objects which are thrown by an invocation to the mapper.

Parameters
• mapper – A callable object, which accept an arbitrary type and maps it to
  another type or the same one.
• pack – An arbitrary variadic pack which may contain any type.

Returns The mapped element or in case the pack contains multiple elements, the pack is
wrapped into a hpx::tuple.

hpx/pack_traversal/pack_traversal_async.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace util

Functions

```
template<typename Visitor, typename ...T>
auto traverse_pack_async(Visitor &&visitor, T &&... pack) ->

decltype(detail::apply_pack_transform_async(HPX_FORWARD(Visitor,
  visitor), HPX_FORWARD(T, pack)...))

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as traverse_pack, however, we are able to suspend
and continue the traversal at later time. Thus we require a visitor callable object which
provides three operator() overloads as depicted by the code sample below:
// The synchronous overload is called for each object, // it may return false to suspend the current control. // In that case the overload below is called. template <typename T> bool operator()(async_traverse_visit_tag, T&& element) {
    return true;
}

// The asynchronous overload this is called when the synchronous overload returned false. // In addition to the current visited element the overload is called with a continuation callable object which resumes the traversal when it's called later. // The continuation next may be stored and called later or dropped completely to abort the traversal early. template <typename T, typename N> void operator()(async_traverse_detach_tag, T&& element, N&& next) { }

// The overload is called when the traversal was finished. // As argument the whole pack is passed over which we traversed asynchronously. template <typename T> void operator()(async_traverse_complete_tag, T&& pack) { }

See traverse_pack for a detailed description about the traversal behavior and capabilities.

**Parameters**

- **visitor** – A visitor object which provides the three operator() overloads that were described above. Additionally the visitor must be compatible for referencing it from a hpx::intrusive_ptr. The visitor should must have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

**Returns**

A hpx::intrusive_ptr that references an instance of the given visitor object.

---

**hpx/pack_traversal/unwrap.hpp**

See **Public API** for a list of names and headers that are part of the public *HPX* API.

namespace hpx

**Functions**

template<typename ...Args>
auto unwrap(Args&&... args) -> decltype(util::detail::unwrap_depth_impl<1U>(HPX_FORWARD(Args, args)))

A helper function for retrieving the actual result of any hpx::future like type which is wrapped in an arbitrary way.

Unwraps the given pack of arguments, so that any hpx::future object is replaced by its future result type in the argument pack:

- hpx::future<int> -> int
- hpx::future<std::vector<float>> -> std::vector<float>
• std::vector<future<float>> -> std::vector<float>

The function is capable of unwrapping hpx::future like objects that are wrapped inside any container or tuple like type, see hpx::util::map_pack() for a detailed description about which surrounding types are supported. Non hpx::future like types are permitted as arguments and passed through.

```cpp
hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
   hpx::unwrap(hpx::make_ready_future(1),
               hpx::make_ready_future(2));
```

**Note:** This function unwraps the given arguments until the first traversed nested hpx::future which corresponds to an unwrapping depth of one. See hpx::unwrap_n() for a function which unwraps the given arguments to a particular depth or hpx::unwrap_all() that unwraps all future like objects recursively which are contained in the arguments.

**Parameters**

- **args** – the arguments that are unwrapped which may contain any arbitrary future or non future type.

**Throws**

- **std::exception** – like objects in case any of the given wrapped hpx::future objects were resolved through an exception. See hpx::future::get() for details.

**Returns**

- Depending on the count of arguments this function returns a hpx::tuple containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

```cpp
template<std::size_t Depth, typename ...Args>
auto unwrap_n(Args&&... args) ->
   decltype(util::detail::unwrap_depth_impl<Depth>(HPX_FORWARD(Args, args) ...))
```

An alternative version of hpx::unwrap(), which unwraps the given arguments to a certain depth of hpx::future like objects.

See unwrap for a detailed description.

**Template Parameters**

- **Depth** – The count of hpx::future like objects which are unwrapped maximally.

```cpp
template<typename ...Args>
auto unwrap_all(Args&&... args) ->
   decltype(util::detail::unwrap_depth_impl<0U>(HPX_FORWARD(Args, args) ...))
```

An alternative version of hpx::unwrap(), which unwraps the given arguments recursively so that all contained hpx::future like objects are replaced by their actual value.

See hpx::unwrap() for a detailed description.

```cpp
template<typename T>
auto unwrapping(T &&callable) ->
   decltype(util::detail::functional_unwrap_depth_impl<1U>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap() function and then passes the result to the given callable object.

2.8. API reference 1091
```cpp
    return left + right;
});

int i1 = callable(hpx::make_ready_future(1),
    hpx::make_ready_future(2));
```

See `hpx::unwrap()` for a detailed description.

**Parameters**

`callable` – the callable object which which is called with the result of the corresponding unwrap function.

```cpp
template<std::size_t Depth, typename T>
auto unwrapping_n(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<Depth>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_n()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

```cpp
template<typename T>
auto unwrapping_all(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<0U>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_all()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

namespace functional

struct unwrap

    #include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap`. For more information please refer to its documentation.

struct unwrap_all

    #include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap_all`. For more information please refer to its documentation.

template<std::size_t Depth>

struct unwrap_n

    #include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap_n`. For more information please refer to its documentation.
**preprocessor**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/preprocessor/cat.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**Defines**

**HPX_PP_CAT**\(A, B\)

Concatenates the tokens \(A\) and \(B\) into a single token. Evaluates to \(AB\)

**Parameters**

- \(A\) – First token
- \(B\) – Second token

**hpx/preprocessor/expand.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**Defines**

**HPX_PP_EXPAND**\(X\)

The HPX_PP_EXPAND macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

**Example:**

```cpp
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACROARGS()) // expands to (1)(2)(3)
```

**Parameters**

- \(X\) – Token to be expanded twice

**hpx/preprocessor/nargs.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.
Defines

**HPX_PP_NARGS(...)**

Expands to the number of arguments passed in

Example Usage:

```cpp
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

**Parameters**

- ... – The variadic number of arguments

**hpx/preprocessor/stringize.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

**HPX_PP_STRINGIZE(X)**

The *HPX_PP_STRINGIZE* macro stringizes its argument after it has been expanded.

The passed argument *X* will expand to "*X*". Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

**Parameters**

- *X* – The text to be converted to a string literal

**hpx/preprocessor/strip_parens.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.
Defines

**HPX_PP_STRIP_PARENS(X)**

For any symbol X, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to X itself without error.

The original implementation of this macro is from Steven Watanbe as shown in http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976

```cpp
HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))
```

Example Usage:

This produces the following output

```cpp
no_parens
with_parens
```

Parameters

- X – Symbol to strip parens from

**resiliency**

See *Public API* for a list of names and headers that are part of the public HPX API.

**hpx/resiliency/replay_executor.hpp**

See *Public API* for a list of names and headers that are part of the public HPX API.

```cpp

runtime_configuration

See Public API for a list of names and headers that are part of the public HPX API.

hpx/runtime_configuration/component_commandline_base.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_COMMANDLINE_REGISTRY (RegistryType, componentname)

The macro HPX_REGISTER_COMMANDLINE_REGISTRY is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_COMMANDLINE_REGISTRY_DYNAMIC (RegistryType, componentname)

HPX_REGISTER_COMMANDLINE_OPTIONS ()

The macro HPX_REGISTER_COMMANDLINE_OPTIONS is used to define the required Hpx.Plugin entry point for the command line option registry. This macro has to be used in not more than one compilation unit of a component module.

HPX_REGISTER_COMMANDLINE_OPTIONS_DYNAMIC ()

namespace hpx

namespace components

struct component_commandline_base

#include <component_commandline_base.hpp> The component_commandline_base has to be used as a base class for all component command-line line handling registries.

Public Functions

virtual ~component_commandline_base () = default

virtual hpx::program_options::options_description add_commandline_options () = 0

Return any additional command line options valid for this component.

Note: This function will be executed by the runtime system during system startup.

Returns The module is expected to fill a options_description object with any additional command line options this component will handle.
See Public API for a list of names and headers that are part of the public HPX API.

Defines

**HPX_REGISTER_COMPONENT_REGISTRY**(RegistryType, componentname)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

**HPX_REGISTER_COMPONENT_REGISTRY_DYNAMIC**(RegistryType, componentname)

**HPX_REGISTER_REGISTRY_MODULE()**

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

**HPX_REGISTER_REGISTRY_MODULE_DYNAMIC()**

namespace **hpx**

namespace **components**

struct **component_registry_base**

#include `<component_registry_base.hpp>` The **component_registry_base** has to be used as a base class for all component registries.

**Public Functions**

virtual ~**component_registry_base**() = default

virtual bool **get_component_info**(std::vector<std::string> &fillini, std::string const &filepath, bool is_static = false) = 0

Return the ini-information for all contained components.

**Parameters**

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]
- **is_static** – [in]

**Returns** Returns true if the parameter fillini has been successfully initialized with the registry data of all implemented in this module.

virtual void **register_component_type**() = 0

Register the component type represented by this component.
hpx/runtime_configuration/plugin_registry_base.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**Defines**

**HPX_REGISTER_PLUGIN_BASE_REGISTRY** (PluginType, name)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

**HPX_REGISTER_PLUGIN_REGISTRY_MODULE**

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

**HPX_REGISTER_PLUGIN_REGISTRY_MODULE_DYNAMIC**

namespace **hpx**
	namespace **plugins**

    struct **plugin_registry_base**

#include <plugin_registry_base.hpp> The **plugin_registry_base** has to be used as a base class for all plugin registries.

**Public Functions**

virtual ~**plugin_registry_base**() = default

virtual bool **get_plugin_info** (std::vector<std::string> &fillini) = 0

Return the configuration information for any plugin implemented by this module

**Parameters** fillini – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all plugins implemented in this module.

**Returns** Returns true if the parameter fillini has been successfully initialized with the reg-istry data of all implemented in this module.

inline virtual void **init** (int*, char***, util::runtime_configuration&)

hpx/runtime_configuration/runtime_mode.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**
**Enums**

```cpp
enum class runtime_mode
```

A HPX runtime can be executed in two different modes: console mode and worker mode.

**Values:**

- enumerator **invalid**
- enumerator **console**
  - The runtime is the console locality.
- enumerator **worker**
  - The runtime is a worker locality.
- enumerator **connect**
  - The runtime is a worker locality connecting late
- enumerator **local**
  - The runtime is fully local.
- enumerator **default_**
  - The runtime mode will be determined based on the command line arguments
- enumerator **last**

**Functions**

```cpp
char const *get_runtime_mode_name(runtime_mode state) noexcept
```

Get the readable string representing the name of the given runtime_mode constant.

```cpp
runtime_mode get_runtime_mode_from_name(std::string const &mode)
```

Returns the internal representation (runtime_mode constant) from the readable string representing the name.

This represents the internal representation from the readable string representing the name.

**Parameters**

- `mode` – this represents the runtime mode

**runtime_local**

See *Public API* for a list of names and headers that are part of the public *HPX API*. 
See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY(RegistryType, componentname)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS()

This macro is used to define the required Hpx.Plugin entry point for the startup/shutdown registry. This macro has to be used in not more than one compilation unit of a component module.

HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS_DYNAMIC()

namespace hpx

namespace components

struct component_startup_shutdown_base

#include <component_startup_shutdown_base.hpp> The component_startup_shutdown_base has to be used as a base class for all component startup/shutdown registries.

Public Functions

virtual ~component_startup_shutdown_base() = default

virtual bool get_startup_function(startup_function_type &startup, bool &pre_startup) = 0

Return any startup function for this component.

Parameters startup – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

Returns Returns true if the parameter startup has been successfully initialized with the startup function.

virtual bool get_shutdown_function(shutdown_function_type &shutdown, bool &pre_shutdown) = 0

Return any startup function for this component.

Parameters shutdown – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

Returns Returns true if the parameter shutdown has been successfully initialized with the shutdown function.
namespace hpx

Functions

\begin{verbatim}
std::string diagnostic_information(exception_info const &xi)

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function hpx::diagnostic_information can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

See also:
\end{verbatim}

$hpx::get_error_locality_id()$, $hpx::get_error_host_name()$, $hpx::get_error_process_id()$, $hpx::get_error_function_name()$, $hpx::get_error_file_name()$, $hpx::get_error_line_number()$, $hpx::get_error_os_thread()$, $hpx::get_error_thread_id()$, $hpx::get_error_thread_description()$, $hpx::get_error()$, $hpx::get_error_backtrace()$, $hpx::get_error_env()$, $hpx::get_error_what()$, $hpx::get_error_config()$, $hpx::get_error_state()$

Parameters $\textbf{xi}$ – The parameter $e$ will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: $hpx::exception_info$, $hpx::error_code$, $std::exception$, or $std::exception_ptr$.

Throws $std::bad_alloc$ – (if any of the required allocation operations fail)

Returns The formatted string holding all of the available diagnostic information stored in the given exception instance.

\begin{verbatim}
std::uint32_t get_error_locality_id(hpx::exception_info const &xi)

Return the locality id where the exception was thrown.

The function $hpx::get_error_locality_id$ can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

See also:
\end{verbatim}

$hpx::diagnostic_information()$, $hpx::get_error_host_name()$, $hpx::get_error_process_id()$, $hpx::get_error_function_name()$, $hpx::get_error_file_name()$, $hpx::get_error_line_number()$, $hpx::get_error_os_thread()$, $hpx::get_error_thread_id()$, $hpx::get_error_thread_description()$, $hpx::get_error()$, $hpx::get_error_backtrace()$, $hpx::get_error_env()$, $hpx::get_error_what()$, $hpx::get_error_config()$, $hpx::get_error_state()$

Parameters $\textbf{xi}$ – The parameter $e$ will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: $hpx::exception_info$, $hpx::error_code$, $std::exception$, or $std::exception_ptr$. 

Throws nothing –

Returns The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

```cpp
std::string get_error_host_name(hpx::exception_info const &xi)
```

Return the hostname of the locality where the exception was thrown.

The function `hpx::get_error_host_name` can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

See also:

```cpp
hpx::diagnostic_information() hpx::get_error_process_id(), hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(), hpx::get_error_os_thread(), hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(), hpx::get_error_state()
```

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return and empty string.

```cpp
std::int64_t get_error_process_id(hpx::exception_info const &xi)
```

Return the (operating system) process id of the locality where the exception was thrown.

The function `hpx::get_error_process_id` can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

See also:

```cpp
hpx::diagnostic_information(), hpx::get_error_process_id(), hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(), hpx::get_error_os_thread(), hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(), hpx::get_error_state()
```

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws nothing –

Returns The process id of the OS-process which threw the exception. If the exception instance does not hold this information, the function will return 0.
The function `hpx::get_error_env` can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

**See also:**
- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
- `hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
- `hpx::get_error_state()`

**Parameters**
- `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `std::bad_alloc` – (if one of the required allocations fails)

**Returns** The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

---

The function `hpx::get_error_backtrace` can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

**See also:**
- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
- `hpx::get_error()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
- `hpx::get_error_state()`

**Parameters**
- `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `std::bad_alloc` – (if one of the required allocations fails)

**Returns** The stack backtrace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

---

The function `hpx::get_error_os_thread` can be used to execute HPX-threads from which the exception was thrown.

**Returns** The sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

**See also:**
- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
- `hpx::get_error()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
- `hpx::get_error_state()`

**Parameters**
- `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws** `std::bad_alloc` – (if one of the required allocations fails)

**Returns** The sequence number of the OS-thread as stored in the given exception instance.
See also:

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
- `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`.

**Parameters e** – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws nothing** –

**Returns** The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size_t(-1)`.

```cpp
std::size_t get_error_thread_id(hpx::exception_info const &xi)
```

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_id` can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

See also:

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
- `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`.

**Parameters e** – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws nothing** –

**Returns** The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size_t(0)`.

```cpp
std::string get_error_thread_description(hpx::exception_info const &xi)
```

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_description` can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

See also:

- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
- `hpx::get_error_backtrace()`. 
Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
def get_error_config(hpx::exception_info const &xi)
    Return the HPX configuration information point from which the exception was thrown.
    The function `hpx::get_error_config` can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.
```

See also:
- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,
- `hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,
- `hpx::get_error_thread_description()`

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```cpp
def get_error_state(hpx::exception_info const &xi)
    Return the HPX runtime state information at which the exception was thrown.
    The function `hpx::get_error_state` can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.
```

See also:
- `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
- `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
- `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,
- `hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,
- `hpx::get_error_thread_description()`

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`. 
Throws std::bad_alloc – (if one of the required allocations fails)

Returns The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

hpx/runtime_local/get_locality_id.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

std::uint32_t get_locality_id(error_code &ec = throws)

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

Note: The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by get_num_localities()).

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

hpx/runtime_local/get_locality_name.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

std::string get_locality_name()

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

See also:

future<std::string> get_locality_name(hpx::id_type const& id)
Returns

This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

`hpx/runtime_local/get_num_all_localities.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`

### Functions

`std::uint32_t get_initial_num_localities()`

Return the number of localities which were registered at startup for the running application.

The function `get_initial_num_localities` returns the number of localities which were connected to the console at application startup.

See also:

`hpx::find_all_localities, hpx::get_num_localities`

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

`hpx::future<std::uint32_t> get_num_localities()`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

See also:

`hpx::find_all_localities, hpx::get_num_localities`

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

`std::uint32_t get_num_localities(launch::sync_policy, error_code &ec = throws)`

Return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console.

See also:

`hpx::find_all_localities, hpx::get_num_localities`
**Note:** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters** `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

---

**hpx/runtime_local/get_os_thread_count.hpp**

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

**Functions**

```cpp
std::size_t get_os_thread_count()
```

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

```cpp
std::size_t get_os_thread_count(threads::executor const &exec)
```

Return the number of worker OS-threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

**Parameters** `exec` – [in] The executor to be used.

namespace **threads**

---

**hpx/runtime_local/get_thread_name.hpp**

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**
Functions

`std::string get_thread_name()`  
Return the name of the calling thread.  
This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

`hpx/runtime_local/get_worker_thread_num.hpp`

See **Public API** for a list of names and headers that are part of the public **HPX** API.

`hpx/runtime_local/report_error.hpp`

See **Public API** for a list of names and headers that are part of the public **HPX** API.

namespace **hpx**

Functions

void `report_error(std::size_t num_thread, std::exception_ptr const &e)`  
The function `report_error` reports the given exception to the console.

void `report_error(std::exception_ptr const &e)`  
The function `report_error` reports the given exception to the console.

`hpx/runtime_local/runtime_local.hpp`

See **Public API** for a list of names and headers that are part of the public **HPX** API.

namespace **hpx**

Functions

void `set_error_handlers()`

class **runtime**

Public Types

using `notification_policy_type = threads::policies::callback_notifier`  
Generate a new notification policy instance for the given thread name prefix

using `hpx_main_function_type = int()`  
The `hpx_main_function_type` is the default function type usable as the main HPX thread function.
using hpx_errorsink_function_type = void(std::uint32_t, std::string const&)

Public Functions

virtual notification_policy_type get_notification_policy(char const *prefix, runtime_local::os_thread_type type)

state get_state() const
void set_state(state s)
explicit runtime(hpx::util::runtime_configuration &rtcfg, bool initialize)
   Construct a new HPX runtime instance.
virtual ~runtime()
   The destructor makes sure all HPX runtime services are properly shut down before exiting.
void on_exit(hpx::function<void()> const &f)
   Manage list of functions to call on exit.
void starting()
   Manage runtime ‘stopped’ state.
void stopping()
   Call all registered on_exit functions.
bool stopped() const
   This accessor returns whether the runtime instance has been stopped.
hpx::util::runtime_configuration &get_config()
   access configuration information
hpx::util::runtime_configuration const &get_config() const
std::size_t get_instance_number() const
util::thread_mapper &get_thread_mapper()
   Return a reference to the internal PAPI thread manager.
threads::topology const &get_topology() const
virtual int run(hpx::function<hpx_main_function_type> const &func)
   Run the HPX runtime system, use the given function for the main thread and block waiting for all threads to finish.

Note: The parameter func is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters func – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef hpx_main_function_type. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.
Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter func.
virtual int run()
    Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.
    Returns  This function will always return 0 (zero).

virtual void rethrow_exception()
    Rethrow any stored exception (to be called after stop())

virtual int start(hpx::function<hpx_main_function_type> const &func, bool blocking = false)
    Start the runtime system.
    Parameters
    •  func  – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef hpx_main_function_type.
    •  blocking  – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is true the function runtime::start will call runtime::wait internally.
    Returns  If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter func. Otherwise it will return zero.

virtual int start(bool blocking = false)
    Start the runtime system.
    Parameters  blocking  – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is true the function runtime::start will call runtime::wait internally.
    Returns  If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter func. Otherwise it will return zero.

virtual int wait()
    Wait for the shutdown action to be executed.
    Returns  This function will return the value as returned as the result of the invocation of the function object given by the parameter func.

virtual void stop(bool blocking = true)
    Initiate termination of the runtime system.
    Parameters  blocking  – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is false then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to true to wait for all internal work to be completed.

virtual int suspend()
    Suspend the runtime system.

virtual int resume()
    Resume the runtime system.

virtual int finalize(double)

virtual bool is_networking_enabled()
    Return true if networking is enabled.

virtual hpx::threads::threadmanager &get_thread_manager()
    Allow access to the thread manager instance used by the HPX runtime.
virtual std::string here() const
Returns a string of the locality endpoints (usable in debug output)

virtual bool report_error(std::size_t num_thread, std::exception_ptr const &e, bool terminate_all = true)
Report a non-recoverable error to the runtime system.

Parameters
- num_thread – [in] The number of the operating system thread the error has been detected in.
- e – [in] This is an instance encapsulating an exception which lead to this function call.

virtual bool report_error(std::exception_ptr const &e, bool terminate_all = true)
Report a non-recoverable error to the runtime system.

Note: This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

Parameters e – [in] This is an instance encapsulating an exception which lead to this function call.

virtual void add_pre_startup_function(startup_function_type f)
Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with add_startup_function.

Note: The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters f – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

virtual void add_startup_function(startup_function_type f)
Add a function to be executed inside a HPX thread before hpx_main

Parameters f – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

virtual void add_pre_shutdown_function(shutdown_function_type f)
Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

Note: The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters f – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void add_shutdown_function(shutdown_function_type f)
Add a function to be executed inside a HPX thread during hpx::finalize

Parameters f – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)
virtual hpx::util::io_service_pool *get_thread_pool(char const *name)

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument name are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

virtual bool register_thread(char const *name, std::size_t num = 0, bool service_thread = true, error_code &ec = throws)

Register an external OS-thread with HPX.
This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

Note: The function will compose a thread name of the form ‘<name>-thread#<num>’ which is used to register the thread. It is the user’s responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

Note: This function should be called for each thread exactly once. It will fail if it is called more than once.

Parameters
• name – [in] The name to use for thread registration.
• num – [in] The sequence number to use for thread registration. The default for this parameter is zero.
• service_thread – [in] The thread should be registered as a service thread. The default for this parameter is ‘true’. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.

Returns This function will return whether the requested operation succeeded or not.

virtual bool unregister_thread()

Unregister an external OS-thread with HPX.
This function will unregister any external OS-thread from HPX.

Note: This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see register_thread).

Returns This function will return whether the requested operation succeeded or not.

virtual runtime_local::os_thread_data get_os_thread_data(std::string const &label) const

Access data for a given OS thread that was previously registered by register_thread.

virtual bool enumerate_os_threads(hpx::function<bool(runtime_local::os_thread_data const&)> const &f) const

Enumerate all OS threads that have registered with the runtime.

notification_policy_type::on_startstop_type on_start_func() const
notification_policy_type::on_startstop_type on_stop_func() const
notification_policy_type::on_error_type on_error_func() const

notification_policy_type::on_startstop_type on_start_func(notification_policy_type::on_startstop_type&&) const
notification_policy_type::on_startstop_type on_stop_func(notification_policy_type::on_startstop_type&&) const
notification_policy_type::on_error_type on_error_func(notification_policy_type::on_error_type&&) const

virtual std::uint32_t get_locality_id(error_code &ec) const
virtual std::size_t get_num_worker_threads() const
virtual std::uint32_t get_num_localities(hpx::launch::sync_policy, error_code &ec) const
virtual std::uint32_t get_initial_num_localities() const
virtual hpx::future<std::uint32_t> get_num_localities() const
virtual std::string get_locality_name() const

inline virtual std::uint32_t assign_cores(std::string const& cores, std::uint32_t)
inline virtual std::uint32_t assign_cores(std::string const& cores)
inline hpx::program_options::options_description const & get_app_options() const
inline void set_app_options(hpx::program_options::options_description const &app_options)

Public Static Functions

static std::uint64_t get_system_uptime()

    Return the system uptime measure on the thread executing this call.

Protected Types

using on_exit_type = std::vector<hpx::function<void()>>

Protected Functions

Private Functions

void stop_helper(bool blocking, std::condition_variable &cond, std::mutex &mtx)
    Helper function to stop the runtime.
    Parameters blocking – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is false then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to true to wait for all internal work to be completed.

namespace threads
Functions

char const *get_stack_size_name(decltype::ptrdiff_t size)
  Returns the stack size name.
  Get the readable string representing the given stack size constant.
  Parameters size – this represents the stack size

decltype::ptrdiff_t get_default_stack_size()
  Returns the default stack size.
  Get the default stack size in bytes.

decltype::ptrdiff_t get_stack_size(thread_stacksize)
  Returns the stack size corresponding to the given stack size enumeration.
  Get the stack size corresponding to the given stack size enumeration.
  Parameters size – this represents the stack size

namespace util

Functions

bool retrieve_commandline_arguments(hpx::program_options::options_description const &app_options, hpx::program_options::variables_map &vm)

bool retrieve_commandline_arguments(std::string const &appname, hpx::program_options::variables_map &vm)

hpx/runtime_local/runtime_local_fwd.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

bool register_thread(runtime *rt, char const *name, error_code &ec = throws)
  Register the current kernel thread with HPX, this should be done once for each external OS-thread intended
to invoke HPX functionality. Calling this function more than once will return false.

void unregister_thread(runtime *rt)
  Unregister the thread from HPX, this should be done once in the end before the external thread exists.

runtime_local::os_thread_data get_os_thread_data(std::string const &label)
  Access data for a given OS thread that was previously registered by register_thread. This function must be
called from a thread that was previously registered with the runtime.

bool enumerate_os_threads(hpx::function<bool(os_thread_data const&)> const &f)
  Enumerate all OS threads that have registered with the runtime.

```cpp
t::size_t get_runtime_instance_number()
Return the runtime instance number associated with the runtime instance the current thread is running in.
```

```cpp
bool register_on_exit(hpx::function<void()> const&)
Register a function to be called during system shutdown.
```

```cpp
bool is_starting()
Test whether the runtime system is currently being started.
This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is hpx::state::startup
```

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

```cpp
bool tolerate_node_faults()
Test if HPX runs in fault-tolerant mode.
This function returns whether the runtime system is running in fault-tolerant mode
```

```cpp
bool is_running()
Test whether the runtime system is currently running.
This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is hpx::state::running
```

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

```cpp
bool is_stopped()
Test whether the runtime system is currently stopped.
This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is hpx::state::stopped
```

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

```cpp
bool is_stopped_or_shutting_down()
Test whether the runtime system is currently being shut down.
This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is hpx::state::stopped or hpx::state::shutdown
```

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

```cpp
t::size_t get_num_worker_threads()
Return the number of worker OS-threads used to execute HPX threads.
This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.
```

```cpp
t::uint64_t get_system_uptime()
Return the system uptime measure on the thread executing this call.
This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.
```
namespace threads

hpx/runtime_local/service_executors.hpp

See Public API for a list of names and headers that are part of the public HPX API.

hpx/runtime_local/shutdown_function.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

### Typedefs

typedef hpx::move_only_function<void()> shutdown_function_type

The type of a function which is registered to be executed as a shutdown or pre-shutdown function.

### Functions

```cpp
void register_pre_shutdown_function(shutdown_function_type f)
```

Add a function to be executed by a HPX thread during `hpx::finalize()` but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with `register_pre_shutdown_function` are guaranteed to be executed by an HPX thread during the execution of `hpx::finalize()` before any of the registered shutdown functions are executed (see: `hpx::register_shutdown_function()`).
See also:

\textit{\texttt{hpx::register_shutdown_function()}}

\textbf{Note:} If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise a \texttt{invalid\_status} exception.

\begin{itemize}
\item \textbf{Parameters} \texttt{f} – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.
\end{itemize}

\texttt{void \texttt{register\_shutdown\_function}(\texttt{shutdown\_function\_type f})}

Add a function to be executed by a HPX thread during \texttt{hpx::finalize()} but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with \texttt{register\_shutdown\_function} are guaranteed to be executed by an HPX thread during the execution of \texttt{hpx::finalize()} after any of the registered pre-shutdown functions are executed (see: \texttt{hpx::register\_pre\_shutdown\_function()}).

See also:

\textit{\texttt{hpx::register\_pre\_shutdown\_function()}}

\textbf{Note:} If this function is called while the shutdown functions are being executed, or after that point, it will raise a \texttt{invalid\_status} exception.

\begin{itemize}
\item \textbf{Parameters} \texttt{f} – [in] The function to be registered to run by an HPX thread as a shutdown function.
\end{itemize}

\texttt{hpx/runtime\_local/startup\_function.hpp}

See \textit{Public API} for a list of names and headers that are part of the public \textit{HPX} API.

namespace \texttt{hpx}

\textbf{Typedefs}

\texttt{typedef \texttt{hpx::move\_only\_function<void>} \texttt{startup\_function\_type}}

The type of a function which is registered to be executed as a startup or pre-startup function.
Functions

void register_pre_startup_function(startup_function_type f)
Add a function to be executed by a HPX thread before hpx_main but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with register_pre_startup_function are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see hpx::register_startup_function()).

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

hpx::register_startup_function()

Note: If this function is called while the pre-startup functions are being executed or after that point, it will raise a invalid_status exception.

Parameters f – [in] The function to be registered to run by an HPX thread as a pre-startup function.

void register_startup_function(startup_function_type f)
Add a function to be executed by a HPX thread before hpx_main but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with register_startup_function are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: hpx::register_pre_startup_function()), but before hpx_main is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

hpx::register_pre_startup_function()

Note: If this function is called while the startup functions are being executed or after that point, it will raise a invalid_status exception.

Parameters f – [in] The function to be registered to run by an HPX thread as a startup function.
namespace hpx

Functions

threads::policies::callback_notifier::on_startstop_type get_thread_on_start_func()  
Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see register_thread_on_start_func).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type get_thread_on_stop_func()  
Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see register_thread_on_stop_func).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_error_type get_thread_on_error_func()  
Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see register_thread_on_error_func).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type register_thread_on_start_func(threads::policies::callback_notifier::on_startstop_type &&f)  
Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see get_thread_on_start_func).

Note: This function can be called before the HPX runtime is initialized.
Parameters \( f \) – The function to install as the new start handler.

Returns The previously registered function of this category. It is the user’s responsibility to call that function if the callback is invoked by HPX.

\[
\text{threads::policies::callback_notifier::on_startstop_type register_thread_on_stop_func(threads::policies::callback_notifier::on_startstop_type \&\&f)}
\]

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see \text{get_thread_on_stop_func}).

Note: This function can be called before the HPX runtime is initialized.

Parameters \( f \) – The function to install as the new stop handler.

Returns The previously registered function of this category. It is the user’s responsibility to call that function if the callback is invoked by HPX.

\[
\text{threads::policies::callback_notifier::on_error_type register_thread_on_error_func(threads::policies::callback_notifier::on_error_type \&\&f)}
\]

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see \text{get_thread_on_error_func}).

Note: This function can be called before the HPX runtime is initialized.

Parameters \( f \) – The function to install as the new error handler.

Returns The previously registered function of this category. It is the user’s responsibility to call that function if the callback is invoked by HPX.

\text{hpx/runtime_local/thread_pool_helpers.hpp}

See \text{Public API} for a list of names and headers that are part of the public \text{HPX API}.

namespace hpx

namespace resource
Functions

`std::size_t get_num_thread_pools()`  
Return the number of thread pools currently managed by the `resource_partitioner`.

`std::size_t get_num_threads()`  
Return the number of threads in all thread pools currently managed by the `resource_partitioner`.

`std::size_t get_num_threads(std::string const &pool_name)`  
Return the number of threads in the given thread pool currently managed by the `resource_partitioner`.

`std::size_t get_num_threads(std::size_t pool_index)`  
Return the number of threads in the given thread pool currently managed by the `resource_partitioner`.

`std::size_t get_pool_index(std::string const &pool_name)`  
Return the internal index of the pool given its name.

`std::string get_pool_name(std::size_t pool_index)`  
Return the name of the pool given its internal index.

`threads::thread_pool_base &get_thread_pool(std::string const &pool_name)`  
Return the name of the pool given its name.

`threads::thread_pool_base &get_thread_pool(std::size_t pool_index)`  
Return the thread pool given its internal index.

`bool pool_exists(std::string const &pool_name)`  
Return true if the pool with the given name exists.

`bool pool_exists(std::size_t pool_index)`  
Return true if the pool with the given index exists.

namespace `threads`

Functions

`std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown)`  
The function `get_thread_count` returns the number of currently known threads.

**Note:** If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

**Parameters** state – [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_thread_count(thread_priority priority, thread_schedule_state state = thread_schedule_state::unknown)`  
The function `get_thread_count` returns the number of currently known threads.

**Note:** If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).
Parameters

• **priority** – [in] This specifies the thread-priority for which the number of threads should be retrieved.

• **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

```cpp
std::int64_t get_idle_core_count()
```

The function `get_idle_core_count` returns the number of currently idling threads (cores).

```cpp
mask_type get_idle_core_mask()
```

The function `get_idle_core_mask` returns a bit-mask representing the currently idling threads (cores).

```cpp
bool enumerate_threads(hpx::function<bool(thread_id_type)> const &f, thread_schedule_state state = thread_schedule_state::unknown)
```

The function `enumerate_threads` will invoke the given function `f` for each thread with a matching thread state.

**Parameters**

- **f** – [in] The function which should be called for each matching thread. Returning ‘false’ from this function will stop the enumeration process.

- **state** – [in] This specifies the thread-state for which the threads should be enumerated.

**serialization**

**hpx/synchronization/barrier.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace hpx

```cpp
template<typename OnCompletion = detail::empty_oncompletion>
```

```cpp
class barrier
```

```cpp
#include <barrier.hpp>
```

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [ Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note ] Each barrier phase consists of the following steps:

- The expected count is decremented by each call to arrive or arrive_and_drop.
- When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the CompletionFunction template parameter, the completion step is run as part of the call to arrive or arrive_and_drop that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
- When the completion step finishes, the expected count is reset to what was specified by the expected argument to the constructor, possibly adjusted by calls to arrive_and_drop, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling wait, and will remain blocked until the phase completion step is run. The phase completion step that is executed at the end of each phase has the following effects:

- Invokes the completion function, equivalent to completion().
- Unblocks all threads that are blocked on the phase synchronization point.
The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the CompletionFunction template parameter, the behavior is undefined if any of the barrier object’s member functions other than wait are called while the completion step is in progress.

Concurrent invocations of the member functions of barrier, other than its destructor, do not introduce data races. The member functions arrive and arrive_and_drop execute atomically.

CompletionFunction shall meet the Cpp17MoveConstructible (Table 28) and Cpp17Destructible (Table 32) requirements. std::is_nothrow_invocable_v<CompletionFunction&> shall be true.

The default value of the CompletionFunction template parameter is an unspecified type, such that, in addition to satisfying the requirements of CompletionFunction, it meets the Cpp17DefaultConstructible requirements (Table 27) and completion() has no effects.

barrier::arrival_token is an unspecified type, such that it meets the Cpp17MoveConstructible (Table 28), Cpp17MoveAssignable (Table 30), and Cpp17Destructible (Table 32) requirements.

### Public Types

```cpp
using arrival_token = bool
```

### Public Functions

```cpp
inline explicit constexpr barrier(std::ptrdiff_t expected, OnCompletion completion = OnCompletion())
```

- **Preconditions:** expected >= 0 is true and expected <= max() is true.
- **Effects:** Sets both the initial expected count for each barrier phase and the current expected count for the first phase to expected. Initializes completion with std::move(f). Starts the first phase. [Note: If expected is 0 this object can only be destroyed.- end note]

```cpp
~barrier() = default
```

```cpp
inline arrival_token arrive(std::ptrdiff_t update = 1)
```

- **Preconditions:** update > 0 is true, and update is less than or equal to the expected count for the current barrier phase.
- **Effects:** Constructs an object of type arrival_token that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by update.
- **Synchronization:** The call to arrive strongly happens before the start of the phase completion step for the current phase.

```cpp
  Throws
```

```cpp
inline void wait(arrival_token &&old_phase) const
```

- **Preconditions:** arrival is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.
- **Effects:** Blocks at the synchronization point associated with HPX_MOVE(arrival) until the phase completion step of the synchronization point’s phase is run. [ Note: If arrival is associated with the synchronization point for a previous phase, the call returns immediately. - end note ]

```cpp
  Throws
```
inline void arrive_and_wait()
   Effects: Equivalent to: wait(arrive()).

inline void arrive_and_drop()
   Preconditions: The expected count for the current barrier phase is greater than zero.
   Effects: Decrements the initial expected count for all subsequent phases by one. Then decrements the
   expected count for the current phase by one.
   Synchronization: The call to arrive_and_drop strongly happens before the start of the phase completion
   step for the current phase.
   Throws

hpx/synchronization/binary_semaphore.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

   class binary_semaphore
      
#include <binary_semaphore.hpp> A binary semaphore is a semaphore object that has only two states.
binary_semaphore is an alias for specialization of hpx::counting_semaphore with LeastMaxValue being 1.
HPX’s implementation of binary_semaphore is more efficient than the default implementation of a counting
semaphore with a unit resource count (hpx::counting_semaphore).
Public Functions

```cpp
binary_semaphore(binary_semaphore const&) = delete

binary_semaphore &operator=(binary_semaphore const&) = delete

binary_semaphore(binary_semaphore&&) = delete

binary_semaphore &operator=(binary_semaphore&&) = delete
```

```cpp
explicit binary_semaphore(std::ptrdiff_t value = 1)

Constructs an object of type hpx::binary_semaphore with the internal counter initialized to `value`.

**Parameters** `value` – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

```cpp
~binary_semaphore() = default
```

```cpp
void release(std::ptrdiff_t update = 1)

Atomically increments the internal counter by the value of `update`. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

**Note:** Synchronization: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

Throws `std::system_error`

**Parameters** `update` – the amount to increment the internal counter by

**Pre** Both `update >= 0` and `update <= max() - counter` are true, where `counter` is the value of the internal counter.

```cpp
bool try_acquire() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

**Returns** `true` if it decremented the internal counter, otherwise `false`

```cpp
void acquire()

Repeatedly performs the following steps, in order:

- Evaluates `try_acquire`. If the result is true, returns. Blocks on *this until counter is greater than zero.

Throws `std::system_error`

**Returns** `void`

```cpp
bool try_acquire_until(hpx::chrono::steady_time_point const &abs_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the `abs_time` time point has been passed.

**Parameters** `abs_time` – the earliest time the function must wait until in order to fail

Throws `std::system_error`

**Returns** `true` if it decremented the internal counter, otherwise `false`.
```
bool try_acquire_for(hpx::chrono::steady_duration const &rel_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the rel_time duration has been exceeded.

Throws std::system_error –

Parameters rel_time – the minimum duration the function must wait for to fail

Returns true if it decremented the internal counter, otherwise false

Public Static Functions

static constexpr std::ptrdiff_t max() noexcept

Returns The maximum value of counter. This value is greater than or equal to LeastMaxValue.

Returns The internal counter’s maximum possible value, as a std::ptrdiff_t.

hpx/synchronization/condition_variable.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Enums

class cv_status

The scoped enumeration hpx::cv_status describes whether a timed wait returned because of timeout or not. hpx::cv_status is used by the wait_for and wait_until member functions of hpx::condition_variable and hpx::condition_variable_any.

Values:

enumerator no_timeout

The condition variable was awakened with notify_all, notify_one, or spuriously

enumerator timeout

the condition variable was awakened by timeout expiration

enumerator error

there was an error

class condition_variable

#include <condition_variable.hpp> The condition_variable class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the condition_variable.

The thread that intends to modify the shared variable has to

i. acquire a hpx::mutex (typically via std::lock_guard)

ii. perform the modification while the lock is held
iii. execute `notify_one` or `notify_all` on the `condition_variable` (the lock does not need to be held for notification)

Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on `condition_variable` has to
i. acquire a `std::unique_lock<hpx::mutex>`, on the same mutex as used to protect the shared variable
ii. either
   A. check the condition, in case it was already updated and notified
   B. execute `wait`, `await_for`, or `wait_until`. The wait operations atomically release the mutex and suspend the execution of the thread.
   C. When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake up was spurious. or
   A. use the predicated overload of `wait`, `wait_for`, and `wait_until`, which takes care of the three steps above.

`hpx::condition_variable` works only with `std::unique_lock<hpx::mutex>`. This restriction allows for maximal efficiency on some platforms. `hpx::condition_variable` also provides a condition variable that works with any `BasicLockable` object, such as `std::shared_lock`.

Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.

The class `hpx::condition_variable` is a `StandardLayoutType`. It is not `CopyConstructible`, `MoveConstructible`, `CopyAssignable`, or `MoveAssignable`.

### Public Functions

**inline condition_variable()**

Construct an object of type `hpx::condition_variable`.

**~condition_variable() = default**

Destroys the object of type `hpx::condition_variable`.

IOW, `~condition_variable()` can execute before a signaled thread returns from a wait. If this happens with `condition_variable`, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the `condition_variable` object and the member functions `wait` (`wait_for`, etc.).

**Note:** Preconditions: There is no thread blocked on `*this`. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on `*this` once the destructor has been started, especially when the waiting threads are calling the `wait` functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. end note]
inline void notify_one(error_code &ec = throws)

If any threads are waiting on *this, calling notify_one unblocks one of the waiting threads.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns notify_one returns void.

inline void notify_all(error_code &ec = throws)

Unblocks all threads currently waiting for *this.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns notify_all returns void.

template<typename Mutex>
inline void wait(std::unique_lock<Mutex> &lock, error_code &ec = throws)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on *this. The thread will be unblocked when notify_all() or notify_one() is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

Note: 1. Calling this function if lock.mutex() is not locked by the current thread is undefined behavior.

A. Calling this function if lock.mutex() is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters Mutex – Type of mutex to wait on.

Parameters

• lock – unique_lock that must be locked by the current thread

• ec – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns wait returns void.

template<typename Mutex, typename Predicate>
inline void wait(std::unique_lock<Mutex> &lock, Predicate pred, error_code & = throws)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

while (!pred()) {
   wait(lock);
}

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after wait(lock) exits, which means that lock can be used to guard access to pred().

Note: 1. Calling this function if lock.mutex() is not locked by the current thread is undefined behavior.

A. Calling this function if lock.mutex() is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

• Mutex – Type of mutex to wait on.

• Predicate – Type of predicate pred function.
Parameters

- **lock** – unique_lock that must be locked by the current thread
- **pred** – Predicate which returns `false` if the waiting should be continued (bool(pred())==false). The signature of the predicate function should be equivalent to the following: `bool pred()``

Returns `wait` returns `void`.

template<typename Mutex>
inline `cv_status wait_until`(`std::unique_lock<Mutex>` &lock, hpx::chrono::steady_time_point const &abs_time, `error_code` &ec = throws)

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on `*this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed, or when the absolute time point `abs_time` is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and `wait_until` exits.

**Note:** 1. Calling this function if `lock.mutex()` is not locked by the current thread is undefined behavior.
A. Calling this function if `lock.mutex()` is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

**Template Parameters** `Mutex` – Type of mutex to wait on.

**Parameters**

- **lock** – unique_lock that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` &#8212; A special ‘throw on error’ `error_code`.

**Returns** `cv_status wait_until` returns `hpx::cv_status::timeout` if the absolute timeout specified by `abs_time` was reached and `hpx::cv_status::no_timeout` otherwise.

```
template<typename Mutex, typename Predicate>
inline bool wait_until(`std::unique_lock<Mutex>` &lock, hpx::chrono::steady_time_point const &abs_time, Predicate pred, `error_code` &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

```
while (!pred()) {
  if (wait_until(lock, abs_time) == hpx::cv_status::timeout) {
    return pred();
  }
}
return true;
```

This overload may be used to ignore spurious wakeups.

**Note:** 1. Calling this function if `lock.mutex()` is not locked by the current thread is undefined behavior.
A. Calling this function if `lock.mutex()` is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.
Template Parameters
- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate `pred` function.

Parameters
- **lock** – `unique_lock` that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **pred** – Predicate which returns `false` if the waiting should be continued
  
  ```cpp
  (bool(pred())==false)
  ```
  
  The signature of the predicate function should be equivalent to the following:
  ```cpp
  bool pred();
  ```
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` – A special ‘throw on error’ `error_code`.

Returns
- `bool` `wait_until` returns `false` if the predicate `pred` still evaluates to `false` after the `abs_time` timeout has expired, otherwise `true`. If the timeout had already expired, evaluates and returns the result of `pred`.

```cpp
template<typename Mutex>
inline cv_status wait_for(
    std::unique_lock<Mutex> &lock,
    hpx::chrono::steady_duration const &rel_time,
    error_code &ec = throws
)
```

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on `*this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed, or when the relative timeout `rel_time` expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and `wait_for()` exits.

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than `rel_time` due to scheduling or resource contention delays.

**Note:**
1. Calling this function if `lock.mutex()` is not locked by the current thread is undefined behavior.
   A. Calling this function if `lock.mutex()` is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.
   B. Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

Template Parameters **Mutex** – Type of mutex to wait on.

Parameters
- **lock** – `unique_lock` that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` – A special ‘throw on error’ `error_code`.

Returns
- `cv_status` `hpx::cv_status::timeout` if the relative timeout specified by `rel_time` expired, `hpx::cv_status::no_timeout` otherwise.

```cpp
template<typename Mutex, typename Predicate>
inline bool wait_for(
    std::unique_lock<Mutex> &lock,
    hpx::chrono::steady_duration const &rel_time,
    Predicate pred, error_code &ec = throws
)
```

Equivalent to.

```cpp
return wait_until(lock,
    hpx::chrono::steady_clock::now() + rel_time,
    hpx::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied

```cpp
(bool(pred())==true)
```
The standard recommends that a steady clock be used to measure the duration. This function may block for longer than `rel_time` due to scheduling or resource contention delays.

**Note:**
1. Calling this function if `lock.mutex()` is not locked by the current thread is undefined behavior.
   A. Calling this function if `lock.mutex()` is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

**Template Parameters**
- `Mutex` – Type of mutex to wait on.
- `Predicate` – Type of predicate `pred` function.

**Parameters**
- `lock` – `unique_lock` that must be locked by the current thread
- `rel_time` – represents the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- `pred` – Predicate which returns `false` if the waiting should be continued (bool(pred())==false). The signature of the predicate function should be equivalent to the following: `bool pred();`
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &`#8212; A special ‘throw on error’ error_code.

**Returns**
`bool wait_for` returns `false` if the predicate `pred` still evaluates to `false` after the `rel_time` timeout expired, otherwise `true`.

### Private Types

using data_type = hpx::intrusive_ptr<lcos::local::detail::condition_variable_data>
```

### Private Members

```cpp
hpx::util::cache_aligned_data_derived<data_type> data_
```

class `condition_variable_any`

```cpp
#include <condition_variable.hpp> The `condition_variable_any` class is a generalization of hpx::condition_variable. Whereas hpx::condition_variable works only on std::unique_lock<std::mutex>, a `condition_variable_any` can operate on any lock that meets the BasicLockable requirements.

See hpx::condition_variable for the description of the semantics of condition variables. It is not CopyConstructible\(^{521}\), MoveConstructible\(^{522}\), CopyAssignable\(^{523}\), or MoveAssignable\(^{524}\).```
Public Functions

inline condition_variable_any()

Constructs an object of type hpx::condition_variable_any.

~condition_variable_any() = default

Destroys the object of type hpx::condition_variable_any.

It is only safe to invoke the destructor if all threads have been notified. It is not required that they have exited their respective wait functions: some threads may still be waiting to reacquire the associated lock, or may be waiting to be scheduled to run after reacquiring it.

The programmer must ensure that no threads attempt to wait on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or are using the overloads of the wait functions that take a predicate.

Preconditions: There is no thread blocked on *this. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. end note]

IOW, ~condition_variable_any() can execute before a signaled thread returns from a wait. If this happens with condition_variable_any, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the condition_variable_any object and the member functions wait (wait_for, etc.).

inline void notify_one(error_code &ec = throws)

If any threads are waiting on *this, calling notify_one unblocks one of the waiting threads.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock. However, some implementations (in particular, many implementations of pthreads) recognize this situation and avoid this “hurry up and wait” scenario by transferring the waiting thread from the condition variable’s queue directly to the queue of the mutex within the notify call, without waking it up.

Notifying while under the lock may nevertheless be necessary when precise scheduling of events is required, e.g., if the waiting thread would exit the program if the condition is satisfied, causing destruction of the notifying thread’s condition variable. A spurious wakeup after mutex unlock but before notify would result in notify called on a destroyed object.

Note: The effects of notify_one/notify_all() and each of the three atomic parts of wait/wait_for/wait_until() (unlock+wait wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &8212; A special ‘throw on error’ error_code.

Returns notify_one returns void.
inline void notify_all(error_code &ec = throws)
Unblocks all threads currently waiting for *this.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock.

Note: The effects of notify_one()/notify_all() and each of the three atomic parts of wait()/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.
Returns notify_all returns void.

template<typename Lock>
inline void wait(Lock &lock, error_code &ec = throws)
wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on *this. The thread will be unblocked when notify_all() or notify_one() is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

The effects of notify_one()/notify_all() and each of the three atomic parts of wait()/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Note: If these functions fail to meet the postconditions (lock is locked by the calling thread), std::terminate is called. For example, this could happen if relocking the mutex throws an exception.

Template Parameters Lock – Type of lock.
Parameters
• lock – An object of type Lock that meets the BasicLockable requirements, which must be locked by the current thread
• ec – Used to hold error code value originated during the operation. Defaults to throws &#8212; A special ‘throw on error’ error_code.
Returns wait returns void.

template<typename Lock, typename Predicate>
inline void wait(Lock &lock, Predicate pred, error_code & = throws)
wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to
This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after `wait(lock)` exits, which means that lock can be used to guard access to `pred()`.

The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

**Note:** If these functions fail to meet the postconditions (lock is locked by the calling thread), `std::terminate` is called. For example, this could happen if relocking the mutex throws an exception.

---

**Template Parameters**
- `Lock` – Type of `lock`.
- `Predicate` – Type of `pred`.

**Parameters**
- `lock` – an object of type `Lock` that meets the `BasicLockable` requirements, which must be locked by the current thread
- `pred` – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred()`.

**Returns** `wait` returns `void`.

```cpp
template<typename Lock>
inline cv_status wait_until(Lock &lock, hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on `*this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed, or when the absolute time point `abs_time` is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and `wait_until` exits.

**Note:** The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

---

**Template Parameters** `Lock` – Type of `lock`.

**Parameters**
- `lock` – an object of type `Lock` that meets the requirements of `BasicLockable`, which must be locked by the current thread
- `abs_time` – represents the time when waiting should be stopped.
• ec – used to hold error code value originated during the operation. Defaults to throws error_code.

Returns cv_status hpx::cv_status::timeout if the absolute timeout specified by abs_time was reached, hpx::cv_status::no_timeout otherwise.

template<typename Lock, typename Predicate>
inline bool wait_until(Lock &lock, hpx::chrono::steady_time_point const &abs_time, Predicate pred, error_code &ec = throws)

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred()) == true).

Equivalent to

```cpp
while (!pred()) {
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout) {
        return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

Note: The effects of notify_one()/notify_all() and each of the three atomic parts of wait()/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters
• Lock – Type of lock.
• Predicate – Type of pred.

Parameters
• lock – an object of type Lock that meets the requirements of BasicLockable, which must be locked by the current thread
• abs_time – represents the time when waiting should be stopped.
• pred – predicate which returns false if the waiting should be continued (bool(pred()) == false). The signature of the predicate function should be equivalent to the following: bool pred();
• ec – Used to hold error code value originated during the operation. Defaults to throws error_code.

Returns bool false if the predicate pred still evaluates to false after the abs_time timeout expired, otherwise true. If the timeout had already expired, evaluates and returns the result of pred.

template<typename Lock>
inline cv_status wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, error_code &ec = throws)

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on *this. The thread will be unblocked when notify_all() or notify_one() is executed, or when the relative timeout rel_time expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait_for() exits.
The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

**Note:** Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

---

**Template Parameters**  
**Lock** – Type of lock.

**Parameters**  
- `lock` – an object of type `Lock` that meets the `BasicLockable` requirements, which must be locked by the current thread.
- `rel_time` – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` & `#8212; A special 'throw on error' error_code`.

**Returns**  
`cv_status hpx::cv_status::timeout` if the relative timeout specified by `rel_time` expired, `hpx::cv_status::no_timeout` otherwise.

---

`template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, Predicate pred, error_code &ec = throws)`

Equivalent to:

```cpp
return wait_until(lock,
                 hpx::chrono::steady_clock::now() + rel_time,
                 std::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (bool(pred()) == true).

**Note:** The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

---

**Template Parameters**  
- **Lock** – Type of lock.
- **Predicate** – Type of `pred`.

**Parameters**  
- `lock` – an object of type `Lock` that meets the `BasicLockable` requirements, which must be locked by the current thread.
- `rel_time` – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- `pred` – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`.
• **ec** – Used to hold error code value originated during the operation. Defaults to `throws &#8212; A special ‘throw on error’ error_code.

**Returns** bool `false` if the predicate `pred` still evaluates to `false` after the `rel_time` timeout expired, otherwise `true`.

```cpp
template<typename Lock, typename Predicate>
inline bool wait(Lock &lock, stop_token stoken, Predicate pred, error_code &ec = throws)
```

`wait` causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred()) == true).

An interruptible wait: registers the condition_variable_any for the duration of `wait()`, to be notified if a stop request is made on the given stoken’s associated stop-state; it is then equivalent to

```cpp
while (!stoken.stopRequested()) {
    if (pred()) return true;
    wait(lock);
}
return pred();
```

Note that the returned value indicates whether `pred` evaluated to `true`, regardless of whether there was a stop requested or not.

**Note:** The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

**Template Parameters**
- **Lock** – Type of `lock`.
- **Predicate** – Type of `pred`.

**Parameters**
- **lock** – an object of type `Lock` that meets the BasicLockable requirements, which must be locked by the current thread
- **stoken** – a hpx::stop_token to register interruption for
- **pred** – predicate which returns `false` if the waiting should be continued (bool(pred()) == false). The signature of the predicate function should be equivalent to the following: bool pred().
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws &#8212; A special ‘throw on error’ error_code.

**Returns** bool result of `pred()`.

```cpp
template<typename Lock, typename Predicate>
inline bool wait_until(Lock &lock, stop_token stoken, hpx::chrono::steady_time_point const &abs_time, Predicate pred, error_code &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred()) == true).

An interruptible wait: registers the condition_variable_any for the duration of `wait_until()`, to be notified if a stop request is made on the given stoken’s associated stop-state; it is then equivalent to

```cpp
while (!stoken.stopRequested()) {
    if (pred())
```

(continues on next page)
return true;
if (wait_until(lock, timeout_time) == hpx::cv_status::timeout)
    return pred();
}
return pred();

Note: The effects of notify_one()/notify_all() and each of the three atomic parts of wait()/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters
- **Lock** – Type of lock.
- **Predicate** – Type of pred.

Parameters
- **lock** – an object of type Lock that meets the requirements of BasicLockable\(^ {532}\), which must be locked by the current thread.
- **stoken** – a hpx::stop_token to register interruption for.
- **abs_time** – represents the time when waiting should be stopped.
- **pred** – predicate which returns \texttt{false} if the waiting should be continued (\texttt{bool (pred()) == false}). The signature of the predicate function should be equivalent to the following: \texttt{bool pred()};
- **ec** – Used to hold error code value originated during the operation. Defaults to \texttt{throws \&\#8212; A special ‘throw on error’ error_code}.

Returns \texttt{bool pred()}, regardless of whether the timeout was met or stop was requested.

template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, stop_token stoken, hpx::chrono::steady_duration const &rel_time, Predicate pred, error_code &ec = throws)

Equivalent to.

\[
\text{return wait_until(lock, std::move(stoken),}
\hpx::\text{chrono::steady\_clock::now() + rel\_time,}
\text{std::move(pred));}
\]

Note: The effects of notify_one()/notify_all() and each of the three atomic parts of wait()/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters
- **Lock** – Type of lock.
- **Predicate** – Type of pred.

Parameters
- **lock** – an object of type Lock that meets the BasicLockable\(^ {533}\) requirements, which must be locked by the current thread.
- **stoken** – a hpx::stop_token to register interruption for.
• **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.

• **pred** – predicate which returns `false` if the waiting should be continued (bool(pred()) == false). The signature of the predicate function should be equivalent to the following: `bool pred();`

• **ec** – Used to hold error code value originated during the operation. Defaults to `throws` `error_code`.

**Returns** `bool pred()`, regardless of whether the timeout was met or stop was requested.

template<std::ptrdiff_t LeastMaxValue = PTRDIFF_MAX>
class counting_semaphore

#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike hpx::mutex a counting_semaphore is not tied to threads of execution &\#8212; acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on counting_semaphore can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template counting_semaphore maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of hpx::counting_semaphore are not DefaultConstructible, CopyConstructible, Move-Constructible, CopyAssignable, or MoveAssignable.

Note: counting_semaphore’s try_acquire() can spuriously fail.

Template Parameters LeastMaxValue – counting_semaphore allows more than one concurrent access to the same resource, for at least LeastMaxValue concurrent accessor. As its name indicates, the LeastMaxValue is the minimum max value, not the actual max value. Thus max() can yield a number larger than LeastMaxValue.
Public Functions

`counting_semaphore(counting_semaphore const&)` = delete

`counting_semaphore &operator=(counting_semaphore const&)` = delete

`counting_semaphore(counting_semaphore&&)` = delete

`counting_semaphore &operator=(counting_semaphore&&)` = delete

explicit `counting_semaphore(std::ptrdiff_t value)`

Constructs an object of type hpx::counting_semaphore with the internal counter initialized to `value`.

Parameters

`value` – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

`~counting_semaphore` = default

`void release(std::ptrdiff_t update = 1)`

Atomically increments the internal counter by the value of `update`. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

Throws `std::system_error`

Parameters

`update` – the amount to increment the internal counter by

Pre

Both `update >= 0` and `update <= max()` - `counter` are true, where `counter` is the value of the internal counter.

`bool try_acquire()` noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns

`true` if it decremented the internal counter, otherwise `false`

`void acquire()`

Repeatedly performs the following steps, in order:

- Evaluates `try_acquire`. If the result is true, returns.
- Blocks on *this until counter is greater than zero.

Throws `std::system_error`

Returns `void`.

`bool try_acquire_until(hpx::chrono::steady_time_point const &abs_time)`

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the `abs_time` time point has been passed.

Parameters

`abs_time` – the earliest time the function must wait until in order to fail

Throws `std::system_error`

Returns

`true` if it decremented the internal counter, otherwise `false`.  

2.8. API reference 1151
bool try_acquire_for(hpx::chrono::steady_duration const &rel_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the rel_time duration has been exceeded.

Throws std::system_error –
Parameters rel_time – the minimum duration the function must wait for to fail
Returns true if it decremented the internal counter, otherwise false

Public Static Functions

static constexpr std::ptrdiff_t max() noexcept

Returns The maximum value of counter. This value is greater than or equal to LeastMaxValue.
Returns The internal counter’s maximum possible value, as a std::ptrdiff_t.

template<typename Mutex = hpx::spinlock, int N = 0>
class counting_semaphore_var

#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike hpx::mutex a counting_semaphore_var is not tied to threads of execution & 8211; acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on counting_semaphore_var can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template counting_semaphore_var maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of hpx::counting_semaphore_var are not DefaultConstructible 539, CopyConstructible 540, MoveConstructible 541, CopyAssignable 542, or MoveAssignable 543.

Note: counting_semaphore_var’s try_acquire() can spuriously fail.

Template Parameters

• Mutex – Type of mutex
• N – The initial value of the internal semaphore lock count.
Public Functions

explicit **counting_semaphore_var**(std::ptrdiff_t value = N)

Constructs an object of type `hpx::counting_semaphore_value` with the internal counter initialized to N.

**Parameters** value – The initial value of the internal semaphore lock count. Normally this value should be zero, values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set. Defaults to N (which in turn defaults to zero).

**counting_semaphore_var**(counting_semaphore_var const&) = delete

counting_semaphore_var & operator=(counting_semaphore_var const&) = delete

void **wait**(std::ptrdiff_t count = 1)

Wait for the semaphore to be signaled.

**Parameters** count – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

bool **try_wait**(std::ptrdiff_t count = 1)

Try to wait for the semaphore to be signaled.

**Parameters** count – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

**Returns** try_wait returns true if the calling thread was able to acquire the requested amount of credits. try_wait returns false if not sufficient credits are available at this point in time.

void **signal**(std::ptrdiff_t count = 1)

Signal the semaphore.

**Parameters** count – The value by which the internal lock count will be incremented.

std::ptrdiff_t **signal_all**()

Unblock all acquirers.

**Returns** std::ptrdiff_t internal lock count after the operation.

void **release**(std::ptrdiff_t update = 1)

Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

**Note:** Synchronization: Strongly happens before invocations of try_acquire that observe the result of the effects.

**Throws** std::system_error –

**Parameters** update – the amount to increment the internal counter by

**Pre** Both update >= 0 and update <= max() - counter are true, where counter is the value of the internal counter.

bool **try_acquire**() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

**Returns** true if it decremented the internal counter, otherwise false

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates try_acquire. If the result is true, returns.
Blocks on *this until counter is greater than zero.

**Throws** `std::system_error` –
**Returns** `void`.

bool **try_acquire_until** (`hpx::chrono::steady_time_point const &abs_time`)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the `abs_time` time point has been passed.

**Parameters** `abs_time` – the earliest time the function must wait until in order to fail

**Throws** `std::system_error` –
**Returns** `true` if it decremented the internal counter, otherwise `false`.

bool **try_acquire_for** (`hpx::chrono::steady_duration const &rel_time`)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the `rel_time` duration has been exceeded.

**Throws** `std::system_error` –
**Parameters** `rel_time` – the minimum duration the function must wait for to fail

**Returns** `true` if it decremented the internal counter, otherwise `false`.

**Public Static Functions**

static constexpr `std::ptrdiff_t max` () noexcept

Returns The maximum value of counter. This value is greater than or equal to `LeastMaxValue`.

**Returns** The internal counter’s maximum possible value, as a `std::ptrdiff_t`.

**Private Types**

using **mutex_type** = Mutex

std::atomic<bool> event_
namespace hpx

class latch

#include <latch.hpp> Latches are a thread coordination mechanism that allow one or more threads to block until an operation is completed. An individual latch is a singleuse object; once the operation has been completed, the latch cannot be reused.

Subclassed by hpx::lcos::local::latch

Public Functions

HPX_NON_COPYABLE(latch)

inline explicit latch(std::ptrdiff_t count)

    Initialize the latch
    Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

~latch() = default

    Requires: No threads are blocked at the synchronization point.

    **Note:** May be called even if some threads have not yet returned from wait() or count_down_and_wait(), provided that counter_ is 0.

    **Note:** The destructor might not return until all threads have exited wait() or count_down_and_wait().

    **Note:** It is the caller’s responsibility to ensure that no other thread enters wait() after one thread has called the destructor. This may require additional coordination.

inline void count_down(std::ptrdiff_t update)

    Decrements counter_ by n. Does not block.
    Requires: counter_ >= n and n >= 0.
    Synchronization: Synchronizes with all calls that block on this latch and with all try_wait calls on this latch that return true .

    **Throws** Nothing.

inline bool try_wait() const noexcept

    Returns: With very low probability false. Otherwise counter_ == 0.

inline void wait() const

    If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.

    **Throws** Nothing.
inline void arrive_and_wait(std::ptrdiff_t update = 1)
  Effects: Equivalent to: count_down(update); wait();

Public Static Functions

static inline constexpr std::ptrdiff_t() max () noexcept
  Returns: The maximum value of counter that the implementation supports.

Protected Types

using mutex_type = hpx::spinlock

Protected Attributes

mutable util::cache_line_data<hpx::lcos::local::detail::condition_variable> cond_

std::atomic<std::ptrdiff_t> counter_

bool notified_

namespace lcos

namespace local

class latch : public hpx::latch
  #include <latch.hpp> A latch maintains an internal counter_ that is initialized when the latch is
created. Threads may block at a synchronization point waiting for counter_ to be decremented to
0. When counter_ reaches 0, all such blocked threads are released.

Calls to countdown_and_wait(), count_down(), wait(), is_ready(), count_up(), and reset() behave
as atomic operations.

Note: A hpx::latch is not an LCO in the sense that it has no global id and it can’t be triggered
using the action (parcel) mechanism. Use hpx::distributed::latch instead if this is required. It is
just a low level synchronization primitive allowing to synchronize a given number of threads.
Public Functions

**HPX\_NON\_COPYABLE(latch)**

```cpp
inline explicit latch(std::ptrdiff_t count)
```
Initialize the latch

- Requires: count \(\ge 0\).
- Synchronization: None
- Postconditions: counter\_ == count.

```cpp
~latch() = default
```
Requires: No threads are blocked at the synchronization point.

**Note:** May be called even if some threads have not yet returned from `wait()` or `count_down_and_wait()`, provided that counter\_ is 0.

**Note:** The destructor might not return until all threads have exited `wait()` or `count_down_and_wait()`.

**Note:** It is the caller’s responsibility to ensure that no other thread enters `wait()` after one thread has called the destructor. This may require additional coordination.

```cpp
inline void count_down_and_wait()
```
Decrement counter\_ by 1. Blocks at the synchronization point until counter\_ reaches 0.

- Requires: counter\_ > 0.
- Synchronization: Synchronizes with all calls that block on this latch and with all `is_ready()` calls on this latch that return true.
- **Throws** Nothing.

```cpp
inline bool is_ready() const noexcept
```
Returns: counter\_ == 0. Does not block.

- **Throws** Nothing.

```cpp
inline void abort_all()
```

```cpp
inline void count_up(std::ptrdiff_t n)
```
Increments counter\_ by n. Does not block.

- Requires: n \(\ge 0\).
- **Throws** Nothing.

```cpp
inline void reset(std::ptrdiff_t n)
```
Reset counter\_ to n. Does not block.

- Requires: n \(\ge 0\).
- **Throws** Nothing.

```cpp
inline bool reset_if_needed_and_count_up(std::ptrdiff_t n, std::ptrdiff_t count)
```
Effects: Equivalent to: if (is\_ready()) reset(count); count\_up(n); Returns: true if the latch was reset.
HPX Documentation, master

hpx/synchronization/mutex.hpp
See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx
class mutex
#include <mutex.hpp> mutex class is a synchronization primitive that can be used to protect shared data
from being simultaneously accessed by multiple threads. mutex offers exclusive, non-recursive ownership
semantics:
• A calling thread owns a mutex from the time that it successfully calls either lock or try_lock until it
calls unlock.
• When a thread owns a mutex, all other threads will block (for calls to lock) or receive a false return
value (for try_lock) if they attempt to claim ownership of the mutex.
• A calling thread must not own the mutex prior to calling lock or try_lock.
The behavior of a program is undefined if a mutex is destroyed while still owned by any threads, or a thread
terminates while owning a mutex. The mutex class satisfies all requirements of Mutex544 and StandardLayoutType545 .
hpx::mutex is neither copyable nor movable.
Subclassed by hpx::timed_mutex
Public Functions
HPX_NON_COPYABLE(mutex)
hpx::mutex is neither copyable nor movable
inline HPX_HOST_DEVICE_CONSTEXPR mutex(char const*const = "") noexcept
Constructs the mutex. The mutex is in unlocked state after the constructor completes.
Note: Because the default constructor is constexpr, static mutexes are initialized as part of static
non-local initialization, before any dynamic non-local initialization begins. This makes it safe to lock
a mutex in a constructor of any static object.
Parameters description – description of the mutex.
~mutex()
Destroys the mutex. The behavior is undefined if the mutex is owned by any thread or if any thread
terminates while holding any ownership of the mutex.
void lock(char const *description, error_code &ec = throws)
Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution
until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior
is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and
throws a std::system_error with error condition resource_deadlock_would_occur instead of deadlocking. Prior unlock() operations on the same mutex synchronize- with (as defined in std::memory_order)
this operation.

2.8. API reference

1159


Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking.

Parameters

- **description** – Description of the `mutex`
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` & #8212; A special ‘throw on error’ `error_code`.

Returns void `lock` returns void.

```cpp
inline void lock(error_code &ec = throws)
```

Locks the mutex. If another thread has already locked the mutex, a call to `lock` will block execution until the lock is acquired. If `lock` is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlock- ing. Prior `unlock()` operations on the same mutex synchronize - with (as defined in `std::memory_order`) this operation.

Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking. This overload essentially calls `void lock(char const *description, error_code& ec = throws);` with `description` as `mutex::lock`.

Parameters

- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` & #8212; A special ‘throw on error’ `error_code`.

Returns void `lock` returns void.

```cpp
bool try_lock(char const *description, error_code &ec = throws)
```

Tries to lock the `mutex`. Returns immediately. On successful lock acquisition returns `true`, otherwise returns `false`. This function is allowed to fail spuriously and return `false` even if the `mutex` is not currently locked by any other thread. If `try_lock` is called by a thread that already owns the `mutex`, the behavior is undefined. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns `true`. Note that prior `lock()` does not synchronize with this operation if it returns `false`.

Parameters

- **description** – Description of the `mutex`
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` & #8212; A special ‘throw on error’ `error_code`.

Returns bool `try_lock` returns `true` on successful lock acquisition, otherwise returns `false`.

```cpp
inline bool try_lock(error_code &ec = throws)
```

Tries to lock the `mutex`. Returns immediately. On successful lock acquisition returns `true`, otherwise returns `false`. This function is allowed to fail spuriously and return `false` even if the `mutex` is not currently locked by any other thread. If `try_lock` is called by a thread that already owns the `mutex`, the behavior is undefined. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns `true`. Note that prior `lock()` does not synchronize with this operation if it returns `false`.

Note: This overload essentially calls

```cpp
void try_lock(char const * description,
              error_code& ec = throws);
```
with description as `mutex::try_lock`.

**Parameters**
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &apos;throw on error&apos; `error_code`.

**Returns**
- `bool` `try_lock` returns `true` on successful lock acquisition, otherwise returns `false`.

```cpp
void unlock(error_code &ec = throws)
```

Unlocks the mutex. The mutex must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation synchronizes-with (as defined in `std::memory_order`) any subsequent lock operation that obtains ownership of the same mutex.

**Parameters**
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &apos;throw on error&apos; `error_code`.

**Returns**
- `unlock` returns `void`.

class `timed_mutex` : private `hpx::mutex`

#include &lt;mutex.hpp&gt; The `timed_mutex` class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to `mutex`, `timed_mutex` offers exclusive, non-recursive ownership semantics. In addition, `timed_mutex` provides the ability to attempt to claim ownership of a `timed_mutex` with a timeout via the member functions `try_lock_for()` and `try_lock_until()`. The `timed_mutex` class satisfies all requirements of `TimedMutex` and `StandardLayoutType`.

`hpx::timed_mutex` is neither copyable nor movable.

## Public Functions

### `HPX_NON_COPYABLE(timed_mutex)`
- `hpx::timed_mutex` is neither copyable nor movable

```cpp
timed_mutex(char const *const description = "")
```

Constructs a `timed_mutex`. The mutex is in unlocked state after the call.

**Parameters**
- `description` – Description of the `timed_mutex`.

```cpp
~timed_mutex()
```

Destroys the `timed_mutex`. The behavior is undefined if the mutex is owned by any thread or if any thread terminates while holding any ownership of the mutex.

```cpp
bool try_lock_until(hpx::chrono::steady_time_point const &abs_time, char const *description,
                    error_code &ec = throws)
```

Tries to lock the mutex. Blocks until specified `abs_time` has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns `true`, otherwise returns `false`. If `abs_time` has already passed, this function behaves like `try_lock()`. As with `try_lock()`, this function is allowed to fail spuriously and return `false` even if the mutex was not locked by any other thread at some point before `abs_time`. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns `true`. If `try_lock_until` is called by a thread that already owns the mutex, the behavior is undefined.

**Parameters**
- `abs_time` – time point to block until
- `description` – Description of the `timed_mutex`
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` &apos;throw on error&apos; `error_code`.

**Returns**
- `bool` `try_lock_until` returns `true` if the lock was acquired successfully, otherwise `false`.  

2.8. API reference 1161
inline bool try_lock_until( hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified abs_time has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns true, otherwise returns false. If abs_time has already passed, this function behaves like try_lock(). As with try_lock(), this function is allowed to fail spuriously and return false even if the mutex was not locked by any other thread at some point before abs_time. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. If try_lock_until is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```c++
bool try_lock_until(
    hpx::chrono::steady_time_point const & abs_time,
    char const* description, error_code & ec = throws);
```

with description as mutex::try_lock_until.

### Parameters
- **abs_time** – time point to block until
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &##8212; A special ‘throw on error’ error_code.

### Returns
bool try_lock_until returns true if the lock was acquired successfully, otherwise false.

inline bool try_lock_for( hpx::chrono::steady_duration const &rel_time, char const *description, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified rel_time has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns true, otherwise returns false. If rel_time is less or equal rel_time.zero(), the function behaves like try_lock(). This function may block for longer than rel_time due to scheduling or resource contention delays. As with try_lock(), this function is allowed to fail spuriously and return false even if the mutex was not locked by any other thread at some point during rel_time. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. If try_lock_for is called by a thread that already owns the mutex, the behavior is undefined.

### Parameters
- **rel_time** – minimum duration to block for
- **description** – Description of the timed_mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to throws &##8212; A special ‘throw on error’ error_code.

### Returns
bool try_lock_for returns true if the lock was acquired successfully, otherwise false.

inline bool try_lock_for( hpx::chrono::steady_duration const &rel_time, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified rel_time has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns true, otherwise returns false. If rel_time is less or equal rel_time.zero(), the function behaves like try_lock(). This function may block for longer than rel_time due to scheduling or resource contention delays. As with try_lock(), this function is allowed to fail spuriously and return false even if the mutex was not locked by any other thread at some point during rel_time. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. If try_lock_for is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls
bool try_lock_for(
    hpx::chrono::steady_duration const& rel_time,
    char const* description, error_code& ec = throws)

with description as mutex::try_lock_for.

Parameters
• rel_time – minimum duration to block for
• ec – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns bool try_lock_for returns true if the lock was acquired successfully, otherwise false.

void lock(char const *description, error_code &ec = throws)
Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and throws a std::system_error with error condition resource_deadlock_would_occur instead of deadlocking. Prior unlock() operations on the same mutex synchronize-with (as defined in std::memory_order) this operation.

Note: lock() is usually not called directly: std::unique_lock, std::scoped_lock, and std::lock_guard are used to manage exclusive locking.

Parameters
• description – Description of the mutex
• ec – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns void lock returns void.

inline void lock(error_code &ec = throws)
Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and throws a std::system_error with error condition resource_deadlock_would_occur instead of deadlocking. Prior unlock() operations on the same mutex synchronize - with (as defined in std::memory_order) this operation.

Note: lock() is usually not called directly: std::unique_lock, std::scoped_lock, and std::lock_guard are used to manage exclusive locking. This overload essentially calls void lock(char const *description, error_code & ec = throws); with description as mutex::lock.

Parameters ec – Used to hold error code value originated during the operation. Defaults to throws &\#8212; A special ‘throw on error’ error_code.

Returns void lock returns void.

bool try_lock(char const *description, error_code &ec = throws)
Tries to lock the mutex. Returns immediately. On successful lock acquisition returns true, otherwise returns false. This function is allowed to fail spuriously and return false even if the mutex is not currently locked by any other thread. If try_lock is called by a thread that already owns the mutex, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. Note that prior lock() does not synchronize with this operation if it returns false.
Parameters

- **description** – Description of the mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` & 8212; A special ‘throw on error’ error_code.

Returns  bool try_lock returns true on successful lock acquisition, otherwise returns false.

```c++
inline bool try_lock(error_code & ec = throws)
```

Tries to lock the mutex. Returns immediately. On successful lock acquisition returns true, otherwise returns false. This function is allowed to fail spuriously and return false even if the mutex is not currently locked by any other thread. If try_lock is called by a thread that already owns the mutex, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in std::memory_order) this operation if it returns true. Note that prior lock() does not synchronize with this operation if it returns false.

Note: This overload essentially calls

```c++
void try_lock(char const* description, error_code& ec = throws);
```

with description as mutex::try_lock.

```c++
Parameters  ec – Used to hold error code value originated during the operation. Defaults to throws & 8212; A special ‘throw on error’ error_code.
Returns  bool try_lock returns true on successful lock acquisition, otherwise returns false.
```

```c++
void unlock(error_code & ec = throws)
```

Unlocks the mutex. The mutex must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation synchronizes-with (as defined in std::memory_order) any subsequent lock operation that obtains ownership of the same mutex.

```c++
Parameters  ec – Used to hold error code value originated during the operation. Defaults to throws & 8212; A special ‘throw on error’ error_code.
Returns  unlock returns void.
```

namespace lcos

namespace local

namespace threads

**Typedefs**

```c++
using thread_id_ref_type = thread_id_ref
```

```c++
using thread_self = coroutines::detail::coroutine_self
```
## Functions

**thread_id get_self_id() noexcept**

The function `get_self_id` returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

**thread_self *get_self_ptr() noexcept**

The function `get_self_ptr` returns a pointer to the (OS thread specific) self reference to the current HPX thread.

HPX_ONCE_INIT

namespace hpx

Functions

template<typename F, typename ...Args>
void call_once(once_flag &flag, F &&f, Args&&... args)

Executes the Callable object \( f \) exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time call_once is called, flag indicates that \( f \) was already called, call_once returns right away (such a call to call_once is known as passive).

- Otherwise, call_once invokes std::forward<Callable>(\( f \)) with the arguments std::forward<Args>(\( args \))... (as if by hpx::invoke). Unlike the hpx::thread constructor or hpx::async, the arguments are not moved or copied because they don’t need to be transferred to another thread of execution. (such a call to call_once is known as active).

  - If that invocation throws an exception, it is propagated to the caller of call_once, and the flag is not flipped so that another call will be attempted (such a call to call_once is known as exceptional).

  - If that invocation returns normally (such a call to call_once is known as returning), the flag is flipped, and all other calls to call_once with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to call_once are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note: If concurrent calls to call_once pass different functions \( f \), it is unspecified which \( f \) will be called. The selected function runs in the same thread as the call_once invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using hpx::call_once. The POSIX equivalent of this function is pthread_once.

Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke
- **args**... – arguments to pass to the function

Throws std::system_error – if any condition prevents calls to call_once from executing as specified or any exception thrown by \( f \)

struct once_flag

#include <once.hpp> The class hpx::once_flag is a helper structure for hpx::call_once. An object of type hpx::once_flag that is passed to multiple calls to hpx::call_once allows those calls to coordinate
with each other such that only one of the calls will actually run to completion. \texttt{hpx::once\_flag} is neither copyable nor movable.

**Public Functions**

\texttt{HPX\_NON\_COPYABLE(once\_flag)}

inline \texttt{once\_flag()} noexcept

Constructs an \texttt{once\_flag} object. The internal state is set to indicate that no function has been called yet.

**Private Members**

\texttt{std::atomic<long> status\_}

\texttt{lcos::local::event event\_}

**Friends**

template\<typename \texttt{F}, typename ...\texttt{Args}> friend void \texttt{call\_once(once\_flag &flag, F &\&f, Args&&... args)}

Executes the Callable object \texttt{f} exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time \texttt{call\_once} is called, flag indicates that \texttt{f} was already called, \texttt{call\_once} returns right away (such a call to \texttt{call\_once} is known as passive).
- Otherwise, \texttt{call\_once} invokes \texttt{std::forward\<Callable\>(f)} with the arguments \texttt{std::forward\<Args\>(args)}... (as if by \texttt{hpx::invoke}). Unlike the \texttt{hpx::thread} constructor or \texttt{hpx::async}, the arguments are not moved or copied because they don’t need to be transferred to another thread of execution. (such a call to \texttt{call\_once} is known as active).
  - If that invocation throws an exception, it is propagated to the caller of \texttt{call\_once}, and the flag is not flipped so that another call will be attempted (such a call to \texttt{call\_once} is known as exceptional).
  - If that invocation returns normally (such a call to \texttt{call\_once} is known as returning), the flag is flipped, and all other calls to \texttt{call\_once} with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to \texttt{call\_once} are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

\textbf{Note:} If concurrent calls to \texttt{call\_once} pass different functions \texttt{f}, it is unspecified which \texttt{f} will be called. The selected function runs in the same thread as the \texttt{call\_once} invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using \texttt{hpx::call\_once}. The POSIX equivalent of this function is \texttt{pthread\_once}.

**Parameters**

- \texttt{flag} – an object, for which exactly one function gets executed
- \texttt{f} – Callable object to invoke
• **args...** – arguments to pass to the function

**Throws** `std::system_error` – if any condition prevents calls to `call_once` from executing as specified or any exception thrown by `f`

See *Public API* for a list of names and headers that are part of the public **HPX** API.

namespace **hpx**

### Typedefs

using **shared_mutex** = detail::shared_mutex<>

The **shared_mutex** class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a **shared_mutex** has two levels of access:

- **shared** - several threads can share ownership of the same mutex.
- **exclusive** - only one thread can own the mutex.
If one thread has acquired the exclusive lock (through `lock`, `try_lock`), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through `lock_shared`, `try_lock_shared`), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The `shared_mutex` class satisfies all requirements of `SharedMutex` and `StandardLayoutType`.

hpx/synchronization/sliding_semaphore.hpp

See `Public API` for a list of names and headers that are part of the public `HPX` API.

namespace hpx

Typedefs

using sliding_semaphore = sliding_semaphore_var<>

template<typename Mutex = hpx::spinlock>
class sliding_semaphore_var

#include <sliding_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.
Public Functions

\texttt{sliding Semaphore\_Var}\texttt{\( (\texttt{sliding Semaphore\_Var} \ \texttt{const} \&) = \text{delete} \)}

\texttt{sliding Semaphore\_Var \&operator=}\texttt{\( (\texttt{sliding Semaphore\_Var} \ \texttt{const} \&) = \text{delete} \)}

\texttt{sliding Semaphore\_Var}\texttt{\( (\texttt{sliding Semaphore\_Var} \ \texttt{&&}) = \text{delete} \)}

\texttt{sliding Semaphore\_Var \&operator=}\texttt{\( (\texttt{sliding Semaphore\_Var} \ \texttt{&&}) = \text{delete} \)}

\texttt{inline explicit \texttt{sliding Semaphore\_Var}\texttt{\( (\texttt{std::int64\_t \ max\_difference, std::int64\_t \ lower\_limit} = 0) \ \text{noexcept} \)}

Construct a new sliding semaphore.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{max\_difference} – [in] The max difference between the upper limit (as set by \texttt{wait()} and the lower limit (as set by \texttt{signal()}) which is allowed without suspending any thread calling \texttt{wait()}.
  \item \texttt{lower\_limit} – [in] The initial lower limit.
\end{itemize}

\texttt{inline void \texttt{set\_max\_difference}\texttt{\( (\texttt{std::int64\_t \ max\_difference, std::int64\_t \ lower\_limit} = 0) \ \text{noexcept} \)}

Set/Change the difference that will cause the semaphore to trigger

\textbf{Parameters}

\begin{itemize}
  \item \texttt{max\_difference} – [in] The max difference between the upper limit (as set by \texttt{wait()} and the lower limit (as set by \texttt{signal()}) which is allowed without suspending any thread calling \texttt{wait()}.
  \item \texttt{lower\_limit} – [in] The initial lower limit.
\end{itemize}

\texttt{inline void \texttt{wait}\texttt{\( (\texttt{std::int64\_t \ upper\_limit}) \ \text{noexcept} \)}

Wait for the semaphore to be signaled.

\textbf{Parameters} \texttt{upper\_limit} – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest \texttt{lower\_limit} which was set by \texttt{signal()} is larger than the \texttt{max\_difference}.

\texttt{inline bool \texttt{try\_wait}\texttt{\( (\texttt{std::int64\_t \ upper\_limit} = 1) \ \text{noexcept} \)}

Try to wait for the semaphore to be signaled.

\textbf{Parameters} \texttt{upper\_limit} – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest \texttt{lower\_limit} which was set by \texttt{signal()} is larger than the \texttt{max\_difference}.

\textbf{Returns} The function returns true if the calling thread would not block if it was calling \texttt{wait()}. 

\texttt{inline void \texttt{signal}\texttt{\( (\texttt{std::int64\_t \ lower\_limit}) \ \text{noexcept} \)}

Signal the semaphore.

\textbf{Parameters} \texttt{lower\_limit} – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the \texttt{max\_difference}.

\texttt{inline \texttt{std::int64\_t} \texttt{signal\_all}()}

namespace `hpx`
Functions

template<typename Callback>

```cpp
stop_callback(stop_token, Callback) -> stop_callback<Callback>
```

The `stop_callback` class template provides an RAII object type that registers a callback function for an associated `hpx::stop_token` object, such that the callback function will be invoked when the `hpx::stop_token`'s associated `hpx::stop_source` is requested to stop. Callback functions registered via `stop_callback`'s constructor are invoked either in the same thread that successfully invokes `request_stop()` for a `hpx::stop_source` of the `stop_callback`'s associated `hpx::stop_token`; or if stop has already been requested prior to the constructor's registration, then the callback is invoked in the thread constructing the `stop_callback`. More than one `stop_callback` can be created for the same `hpx::stop_token`, from the same or different threads concurrently. No guarantee is provided for the order in which they will be executed, but they will be invoked synchronously; except for `stop_callback(s)` constructed after stop has already been requested for the `hpx::stop_token`, as described previously. If an invocation of a callback exits via an exception then `hpx::terminate` is called. `hpx::stop_callback` is not CopyConstructible, CopyAssignable, MoveConstructible, nor MoveAssignable. The template param `Callback` type must be both invocable and destructible. Any return value is ignored.

```cpp
inline void swap(stop_token &lhs, stop_token &rhs) noexcept
```

```cpp
inline void swap(stop_source &lhs, stop_source &rhs) noexcept
```

Variables

```cpp
constexpr nostopstate_t nostopstate = {}
```

This is a constant object instance of `hpx::nostopstate_t` for use in constructing an empty `hpx::stop_source`, as a placeholder value in the non-default constructor.

```cpp
struct nostopstate_t
```

```
#include <stop_token.hpp> Unit type intended for use as a placeholder in `hpx::stop_source` non-default constructor, that makes the constructed `hpx::stop_source` empty with no associated stop-state.
```

Public Functions

```cpp
explicit nostopstate_t() = default
```

```
template<typename Callback>
```

```cpp
class stop_callback
```

```
class stop_source
```

```
#include <stop_token.hpp> The `stop_source` class provides the means to issue a stop request, such as for `hpx::jthread` cancellation. A stop request made for one `stop_source` object is visible to all `stop_sources` and `hpx::stop_tokens` of the same associated stop-state; any `hpx::stop_callback(s)` registered for associated `hpx::stop_token(s)` will be invoked, and any `hpx::condition_variable_any` objects waiting on associated `hpx::stop_token(s)` will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

**Note:** For the purposes of `hpx::jthread` cancellation the `stop_source` object should be retrieved from the `hpx::jthread` object using `get_stop_source()`; or stop should be requested directly from the `hpx::jthread`
object using request_stop(). This will then use the same associated stop-state as that passed into the
hpx::jthread’s invoked function argument (i.e., the function being executed on its thread). For other uses,
however, a stop_source can be constructed separately using the default constructor, which creates new stop-
state.

class stop_token

#include <stop_token.hpp> The stop_token class provides the means to check if a stop request has been
made or can be made, for its associated hpx::stop_source object. It is essentially a thread-safe “view” of
the associated stop-state. The stop_token can also be passed to the constructor of hpx::stop_callback, such
that the callback will be invoked if the stop_token’s associated hpx::stop_source is requested to stop. And
stop_token can be passed to the interruptible waiting functions of hpx::condition_variable_any, to interrupt the condition variable’s wait if stop is requested.

Note: A stop_token object is not generally constructed independently, but rather retrieved from a hpx::jthread or hpx::stop_source. This makes it share the same associated stop-state as the hpx::jthread or hpx::stop_source.

namespace \texttt{hpx}

namespace \texttt{threads}

\textbf{Functions}

\texttt{hpx::future<void> resume_processing_unit(thread_pool_base &pool, std::size_t virt_core)}

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

\textbf{Parameters} \texttt{virt_core} – [in] The processing unit on the the pool to be resumed. The processing units are indexed starting from 0.

\textbf{Returns} A future\texttt{<void>} which is ready when the given processing unit has been resumed.

\texttt{void resume_processing_unit_cb(thread_pool_base &pool, hpx::function<\texttt{void}(\texttt{void})> callback, std::size_t virt_core, error_code &ec = throws)}

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

\textbf{Parameters}
• callback – [in] Callback which is called when the processing unit has been suspended.
• virt_core – [in] The processing unit to resume.
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

`hpx::future<void> suspend_processing_unit(thread_pool_base &pool, std::size_t virt_core)`

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

**Note:** Can only be called from an HPX thread. Use `suspend_processing_unit_cb` or to suspend the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

**Parameters**

virt_core – [in] The processing unit on the the pool to be suspended. The processing units are indexed starting from 0.

**Throws** `hpx::exception` – if called from outside the HPX runtime.

**Returns** A `future<void>` which is ready when the given processing unit has been suspended.

`void suspend_processing_unit_cb(hpx::function<void(void)> callback, thread_pool_base &pool, std::size_t virt_core, error_code &ec = throws)`

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

**Note:** Requires that the pool has `threads::policies::enable_elasticity` set.

**Parameters**

• callback – [in] Callback which is called when the processing unit has been suspended.
• virt_core – [in] The processing unit to suspend.
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

`hpx::future<void> resume_pool(thread_pool_base &pool)`

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

**Note:** Can only be called from an HPX thread. Use `resume_pool_cb` or `resume_direct` to suspend the pool from outside HPX.

**Throws** `hpx::exception` – if called from outside the HPX runtime.

**Returns** A `future<void>` which is ready when the thread pool has been resumed.

`void resume_pool_cb(thread_pool_base &pool, hpx::function<void(void)> callback, error_code &ec = throws)`

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

**Parameters**

• callback – [in] called when the thread pool has been resumed.
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.
Suspend the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

**Note:** Can only be called from an HPX thread. Use suspend_cb or suspend_direct to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A future<void> which is ready when the thread pool has been suspended.

```cpp
define suspend_pool_cb(thread_pool_base &pool, hpx::function<void(void)> callback, error_code &ec = throws)
```

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

**Note:** A thread pool cannot be suspended from an HPX thread running on the pool itself.

**Parameters**

- **callback** – [in] called when the thread pool has been suspended.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Throws `hpx::exception` – if called from an HPX thread which is running on the pool itself.

**thread_support**

See Public API for a list of names and headers that are part of the public HPX API.

**hpx/thread_support/unlock_guard.hpp**

See Public API for a list of names and headers that are part of the public HPX API.

```cpp
namespace hpx

template<typename Mutex>

class unlock_guard

#include <unlock_guard.hpp> The class unlock_guard is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

unlock_guard performs the opposite functionality of lock_guard. When a lock_guard object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the lock_guard object was created, the lock_guard is destructed and the mutex is released. Accordingly, when an unlock_guard object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the unlock_guard object was created, the unlock_guard is destructed and the mutex is owned again. In this way, the mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

namespace hpx

Functions

inline void swap(jthread &lhs, jthread &rhs) noexcept

class jthread

#include <jthread.hpp> The class jthread represents a single thread of execution. It has the same general behavior as hpx::thread, except that jthread automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, hpx::terminate is called. The top-level function may communicate its return value or an exception to the caller via hpx::promise or by modifying shared variables (which may require synchronization, see hpx::mutex and hpx::atomic) Unlike hpx::thread, the jthread logically holds an internal private
member of type `hpx::stop_source`, which maintains a shared stop-state. The `jthread` constructor accepts a function that takes a `hpx::stop_token` as its first argument, which will be passed in by the `jthread` from its internal `stop_source`. This allows the function to check if stop has been requested during its execution, and return if it has. `hpx::jthread` objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any `jthread` objects (after detach). No two `hpx::jthread` objects may represent the same thread of execution; `hpx::jthread` is not `CopyConstructible` or `CopyAssignable`, although it is `MoveConstructible` and `MoveAssignable`.

**Public Types**

class thread

#include <thread.hpp> The class thread represents a single thread of execution. Threads allow multiple functions to execute concurrently. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, hpx::terminate is called. The top-level function may communicate its return value or an exception to the caller via hpx::promise or by modifying shared variables (which may require synchronization, see hpx::mutex and hpx::atomic) hpx::thread objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may not be associated with any thread objects (after detach). No two hpx::thread objects may represent the same thread of execution; hpx::thread is not CopyConstructible or CopyAssignable, although it is MoveConstructible and MoveAssignable.

namespace this_thread

**Functions**

thread::id get_id() noexcept

Returns the id of the current thread.

void yield() noexcept

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

**Note:** The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler (SCHED_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

void yield_to(thread::id) noexcept

threads::thread_priority get_priority() noexcept

std::ptrdiff_t get_stack_size() noexcept

void interruption_point()

bool interruption_enabled()

bool interruption_requested()
void interrupt()

void sleep_until(hpx::chrono::steady_time_point const &abs_time)
    Blocks the execution of the current thread until specified abs_time has been reached.
    It is recommended to use the clock tied to abs_time, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than abs_time-Clock::now() at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after abs_time has been reached due to process scheduling or resource contention delays.
    Parameters abs_time – absolute time to block until

inline void sleep_for(hpx::chrono::steady_duration const &rel_time)
    Blocks the execution of the current thread for at least the specified rel_time. This function may block for longer than rel_time due to scheduling or resource contention delays.
    It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.
    Parameters rel_time – time duration to sleep

std::size_t get_thread_data()

std::size_t set_thread_data(std::size_t)

### Functions

template<typename F>
thread_function_type make_thread_function(F &&f)

template<typename F>
thread_function_type make_thread_function_nullary(F &&f)

inline threads::thread_id_ref_type register_thread(threads::thread_init_data &data,
threads::thread_pool_base *pool, error_code &ec = throws)

Create a new thread using the given data.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** invalid_status – if the runtime system has not been started yet.

**Returns** This function will return the internal id of the newly created HPX-thread.
inline threads::thread_id_ref_type register_thread(threads::thread_init_data &data, error_code &ec = throws)

Create a new thread using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** invalid_status – if the runtime system has not been started yet.

**Returns** This function will return the internal id of the newly created HPX-thread.

inline thread_id_ref_type register_work(threads::thread_init_data &data, threads::thread_pool_base *pool, error_code &ec = throws)

Create a new work item using the given data.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** invalid_status – if the runtime system has not been started yet.

inline thread_id_ref_type register_work(threads::thread_init_data &data, error_code &ec = throws)

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Throws** invalid_status – if the runtime system has not been started yet.
namespace hpx

struct scoped_annotation

#include <scoped_annotation.hpp> scoped_annotation associates a name with a section of code (scope). It can be used to visualize code execution in profiling tools like Intel VTune, Apex Profiler, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

namespace threads

Functions

thread_data *get_self_id_data() noexcept

The function get_self_id_data returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

thread_data *get_thread_id_data(thread_id_ref_type const &tid) noexcept

thread_data *get_thread_id_data(thread_id_type const &tid) noexcept
thread_self &get_self()

The function get_self returns a reference to the (OS thread specific) self reference to the current HPX thread.

thread_self *get_self_ptr() noexcept

The function get_self_ptr returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_self_impl_type *get_ctx_ptr()

The function get_ctx_ptr returns a pointer to the internal data associated with each coroutine.

thread_self *get_self_ptr_checked(error_code &ec = throws)

The function get_self_ptr_checked returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_id_type get_self_id() noexcept

The function get_self_id returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

thread_id_type get_parent_id() noexcept

The function get_parent_id returns the HPX thread id of the current thread’s parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::size_t get_parent_phase() noexcept

The function get_parent_phase returns the HPX phase of the current thread’s parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::ptrdiff_t get_self_stacksize() noexcept

The function get_self_stacksize returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

thread_stacksize get_self_stacksize_enum() noexcept

The function get_self_stacksize_enum returns the stack size of the thread.

std::uint32_t get_parent_locality_id() noexcept

The function get_parent_locality_id returns the id of the locality of the current thread’s parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::uint64_t get_self_component_id() noexcept

The function get_self_component_id returns the lva of the component the current thread is acting on.
Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_TARGET_ADDRESS being defined.

class thread_data : public thread_data_reference_counting
#include <thread_data.hpp> A thread is the representation of a HPX thread. It’s a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the thread-manager.

A thread encapsulates:
• A thread status word (see the functions thread::get_state and thread::set_state)
• A function to execute (the thread function)
• A frame (in this implementation this is a block of memory used as the threads stack)
• A block of registers (not implemented yet)

Generally, threads are not created or executed directly. All functionality related to the management of threads is implemented by the thread-manager.

Public Types

using spinlock_pool = util::spinlock_pool<thread_data>

Public Functions

thread_data(thread_data const&) = delete
thread_data(thread_data&&) = delete

thread_data &operator=(thread_data const&) = delete
thread_data &operator=(thread_data&&) = delete

inline thread_state get_state(std::memory_order load_order = std::memory_order_acquire) const
noexcept

The get_state function queries the state of this thread instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will be retrieved by using the function threadmanager::get_state.

Returns This function returns the current state of this thread. It will return one of the values as defined by the thread_state enumeration.

inline thread_state set_state(thread_schedule_state state, thread_restart_state state_ex = thread_restart_state::unknown, std::memory_order load_order = std::memory_order_acquire, std::memory_order exchange_order = std::memory_order_seq_cst) const noexcept

The set_state function changes the state of this thread instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the threadmanager. Moreover, changing the thread state using this function
does not change its scheduling status. It only sets the thread’s status word. To change the thread’s scheduling status \texttt{threadmanager::set\_state} should be used.

\begin{verbatim}
Parameters
\begin{itemize}
\item \texttt{state} – [in] The new state to be set for the thread.
\item \texttt{state\_ex} – [in]
\item \texttt{load\_order} – [in]
\item \texttt{exchange\_order} – [in]
\end{itemize}

\begin{verbatim}
inline bool \texttt{set\_state\_tagged(thread\_schedule\_state newstate, thread\_state const &prev\_state, thread\_state &new\_tagged\_state, std::memory\_order exchange\_order = std::memory\_order\_seq\_cst) const noexcept}
\end{verbatim}

\begin{verbatim}
inline bool \texttt{restore\_state(thread\_state new\_state, thread\_state old\_state, std::memory\_order load\_order = std::memory\_order\_relaxed, std::memory\_order load\_exchange = std::memory\_order\_seq\_cst) const noexcept}
\end{verbatim}

\begin{verbatim}
The restore\_state function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise it won’t touch the thread state of this instance.
\end{verbatim}

\begin{verbatim}
\textbf{Note:} This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the threadmanager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread’s status word. To change the thread’s scheduling status \texttt{threadmanager::set\_state} should be used.
\end{verbatim}

\begin{verbatim}
Parameters
\begin{itemize}
\item \texttt{new\_state} – [in] The new state to be set for the thread.
\item \texttt{old\_state} – [in] The old state of the thread which still has to be the current state.
\item \texttt{load\_order} – [in]
\item \texttt{load\_exchange} – [in]
\end{itemize}

\begin{verbatim}
inline bool \texttt{restore\_state(thread\_schedule\_state new\_state, thread\_restart\_state state\_ex, thread\_state old\_state, std::memory\_order load\_order = std::memory\_order\_seq\_cst) const noexcept}
\end{verbatim}

\[ \text{std::string as_string(thread_description const &desc)} \]

\[ \text{threads::thread_description get_thread_description(thread_id_type const &id, error_code &ec = throws)} \]

The function get_thread_description is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

Note: As long as \text{ec} is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter \text{ec}. Otherwise it throws an instance of hpx::exception.

Parameters

- \text{id} – [in] The thread id of the thread being queried.
- \text{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns the description of the thread referenced by the \text{id} parameter. If the thread is not known to the thread-manager the return value will be the string “<unknown>”.

\[ \text{threads::thread_description set_thread_description(thread_id_type const &id, threads::thread_description const &desc = threads::thread_description(), error_code &ec = throws)} \]

Functions

threads::thread_restart_statesuspend(threads::thread_schedule_state state, threads::thread_id_type nextid, threads::thread_description const &description = threads::thread_description("this_thread::suspend"), error_code &ec = throws)

The function suspend will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an hpx::exception with an error code of hpx::error::yield_aborted if it is signaled with wait_aborted. If called outside of a HPX-thread, this function will throw an hpx::exception with an error code of hpx::error::null_thread_id. If this function is called while the thread-manager is not running, it will throw an hpx::exception with an error code of hpx::error::invalid_status.

inline threads::thread_restart_statesuspend(threads::thread_schedule_state state = threads::thread_schedule_state::pending,
threads::thread_description const &description = threads::thread_description("this_thread::suspend"),
error_code &ec = throws)

The function suspend will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an hpx::exception with an error code of hpx::error::yield_aborted if it is signaled with wait_aborted. If called outside of a HPX-thread, this function will throw an hpx::exception with an error code of hpx::error::null_thread_id. If this function is called while the thread-manager is not running, it will throw an hpx::exception with an error code of hpx::error::invalid_status.

threads::thread_restart_statesuspend(hpx::chrono::steady_time_point const &abs_time,
threads::thread_id_type id, threads::thread_description const &description = threads::thread_description("this_thread::suspend"), error_code &ec = throws)

The function suspend will return control to the thread manager (suspends the current thread). It sets the new state of this thread to suspended and schedules a wakeup for this threads at the given time.
Note: Must be called from within a HPX-thread.

**Throws** If \(- \&ec != \&\texttt{throws}\), never throws, but will set \(ec\) to an appropriate value when an error occurs. Otherwise, this function will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::yield_aborted} if it is signaled with \texttt{wait_aborted}. If called outside of a HPX-thread, this function will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::null_thread_id}. If this function is called while the thread-manager is not running, it will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::invalid_status}.

```cpp
inline \texttt{threads::thread_restart_state} \texttt{suspend}(\texttt{hpx::chrono::steady\_time\_point} \texttt{const &abs\_time},
\texttt{threads::thread\_description} \texttt{const &description = threads::thread\_description}("this\_thread::suspend"),
\texttt{error\_code &ec = \texttt{throws}})
```

The function \texttt{suspend} will return control to the thread manager (suspends the current thread). It sets the new state of this thread to \texttt{suspended} and schedules a wakeup for this threads at the given time.

Note: Must be called from within a HPX-thread.

**Throws** If \(- \&ec != \&\texttt{throws}\), never throws, but will set \(ec\) to an appropriate value when an error occurs. Otherwise, this function will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::yield_aborted} if it is signaled with \texttt{wait_aborted}. If called outside of a HPX-thread, this function will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::null_thread_id}. If this function is called while the thread-manager is not running, it will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::invalid_status}.

```cpp
inline \texttt{threads::thread_restart_state} \texttt{suspend}(\texttt{hpx::chrono::steady\_duration} \texttt{const &rel\_time},
\texttt{threads::thread\_description} \texttt{const &description = threads::thread\_description}("this\_thread::suspend"),
\texttt{error\_code &ec = \texttt{throws}})
```

The function \texttt{suspend} will return control to the thread manager (suspends the current thread). It sets the new state of this thread to \texttt{suspended} and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.

**Throws** If \(- \&ec != \&\texttt{throws}\), never throws, but will set \(ec\) to an appropriate value when an error occurs. Otherwise, this function will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::yield_aborted} if it is signaled with \texttt{wait_aborted}. If called outside of a HPX-thread, this function will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::null_thread_id}. If this function is called while the thread-manager is not running, it will throw an \texttt{hpx::exception} with an error code of \texttt{hpx::error::invalid_status}.

```cpp
inline \texttt{threads::thread_restart_state} \texttt{suspend}(\texttt{hpx::chrono::steady\_duration} \texttt{const &rel\_time},
\texttt{threads::thread\_description} \texttt{const &description = threads::thread\_description}("this\_thread::suspend"),
\texttt{error\_code &ec = \texttt{throws}})
```

The function \texttt{suspend} will return control to the thread manager (suspends the current thread). It sets the new state of this thread to \texttt{suspended} and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.
Throws If \(-\&ec \neq \&throws\), never throws, but will set \(ec\) to an appropriate value when an error occurs. Otherwise, this function will throw an \(hpx::exception\) with an error code of \(hpx::error::yield_aborted\) if it is signaled with \(wait_aborted\). If called outside of a HPX-thread, this function will throw an \(hpx::exception\) with an error code of \(hpx::error::null_thread_id\). If this function is called while the thread-manager is not running, it will throw an \(hpx::exception\) with an error code of \(hpx::error::invalid_status\).

inline threads::thread_restart_state suspend(std::uint64_t ms, threads::thread_description const &description = threads::thread_description("this_thread::suspend"), error_code &ec = throws)

The function \textit{suspend} will return control to the thread manager (suspends the current thread). It sets the new state of this thread to \textit{suspended} and schedules a wakeup for this thread after the given time (specified in milliseconds).

\textbf{Note: } Must be called from within a HPX-thread.

Throws If \(-\&ec \neq \&throws\), never throws, but will set \(ec\) to an appropriate value when an error occurs. Otherwise, this function will throw an \(hpx::exception\) with an error code of \(hpx::error::yield_aborted\) if it is signaled with \(wait_aborted\). If called outside of a HPX-thread, this function will throw an \(hpx::exception\) with an error code of \(hpx::error::null_thread_id\). If this function is called while the thread-manager is not running, it will throw an \(hpx::exception\) with an error code of \(hpx::error::invalid_status\).

threads::thread_pool_base *get_pool(error_code &ec = throws)

Returns a pointer to the pool that was used to run the current thread.

\textbf{Throws } If \(-\&ec \neq \&throws\), never throws, but will set \(ec\) to an appropriate value when an error occurs. Otherwise, this function will throw an \(hpx::exception\) with an error code of \(hpx::error::yield_aborted\) if it is signaled with \(wait_aborted\). If called outside of a HPX-thread, this function will throw an \(hpx::exception\) with an error code of \(hpx::error::null_thread_id\). If this function is called while the thread-manager is not running, it will throw an \(hpx::exception\) with an error code of \(hpx::error::invalid_status\).

\begin{verbatim}
namespace threads

Functions

thread_state set_thread_state(thread_id_type const &id, thread_schedule_state state =
                     thread_schedule_state::pending, thread_restart_state stateex =
                     thread_restart_state::signaled, thread_priority priority =
                     thread_priority::normal, bool retry_on_active = true, hpx::error_code
&ec = throws)

Set the thread state of the \textit{thread} referenced by the \textit{thread_id} \textit{id}.

\textbf{Note: } If the \textit{thread} referenced by the \textit{parameter id} is in \textit{thread_state::active} state this function schedules a new thread which will set the state of the \textit{thread} as soon as its not active anymore. The function returns \textit{thread_state::active} in this case.

\textbf{Note: } As long as \textit{ec} is not pre-initialized to \textit{hpx::throws} this function doesn’t throw but returns the
\end{verbatim}
result code using the parameter \textit{ec}. Otherwise it throws an instance of hpx::exception.

**Parameters**

- \texttt{id} – [in] The thread id of the thread the state should be modified for.
- \texttt{state} – [in] The new state to be set for the thread referenced by the \texttt{id} parameter.
- \texttt{stateex} – [in] The new extended state to be set for the thread referenced by the \texttt{id} parameter.
- \texttt{priority} – [in]
- \texttt{retry_on_active} – [in]
- \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Returns**
This function returns the previous state of the thread referenced by the \texttt{id} parameter. It will return one of the values as defined by the \texttt{thread_state} enumeration. If the thread is not known to the thread-manager the return value will be \texttt{thread_state::unknown}.

```cpp
thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_time_point const &abs_time, std::atomic<bool> *started, thread_schedule_state state = thread_schedule_state::pending,
thread_restart_state stateex = thread_restart_state::timeout, thread_priority priority = thread_priority::normal, bool retry_on_active = true, error_code &ec = throws)
```

Set the thread state of the \textit{thread} referenced by the \texttt{thread_id} \texttt{id}.

Set a timer to set the state of the given \textit{thread} to the given new value after it expired (at the given time)

**Note:** As long as \textit{ec} is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter \textit{ec}. Otherwise it throws an instance of hpx::exception.

**Parameters**

- \texttt{id} – [in] The thread id of the thread the state should be modified for.
- \texttt{abs_time} – [in] Absolute point in time for the new thread to be run
- \texttt{started} – [in,out] A helper variable allowing to track the state of the timer helper thread
- \texttt{state} – [in] The new state to be set for the thread referenced by the \texttt{id} parameter.
- \texttt{stateex} – [in] The new extended state to be set for the thread referenced by the \texttt{id} parameter.
- \texttt{priority} – [in]
- \texttt{retry_on_active} – [in]
- \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Returns**

```cpp
inline thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_time_point const &abs_time,
thread_schedule_state state = thread_schedule_state::pending, thread_restart_state stateex = thread_restart_state::timeout, thread_priority priority = thread_priority::normal, bool retry_on_active = true, error_code &ec = throws)
```

```cpp
inline thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_duration const &rel_time, thread_schedule_state state = thread_schedule_state::pending, thread_restart_state stateex = thread_restart_state::timeout, thread_priority priority = thread_priority::normal, bool retry_on_active = true, error_code &ec = throws)
```
Set the thread state of the thread referenced by the thread_id id.

Set a timer to set the state of the given thread to the given new value after it expired (after the given duration)

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

### Parameters
- **id** – [in] The thread id of the thread the state should be modified for.
- **rel_time** – [in] Time duration after which the new thread should be run
- **state** – [in] The new state to be set for the thread referenced by the id parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the id parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

### Returns
- thread_state **get_thread_state**(thread_id_type const &id, error_code &ec = throws) noexcept

The function get_thread_backtrace is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception. The function get_thread_state is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

### Parameters
- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.
- **id** – [in] The thread id of the thread the state should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

### Returns
- This function returns the currently captured stack back trace of the thread referenced by the id parameter. If the thread is not known to the thread-manager the return value will be the zero.

### Returns
- This function returns the thread state of the thread referenced by the id parameter. If the thread is not known to the thread-manager the return value will be terminated.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the
result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread the phase should be modified for.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns the thread phase of the thread referenced by the id parameter. If the thread is not known to the thread-manager the return value will be ~0.

bool get_thread_interruption_enabled(thread_id_type const &id, error_code &ec = throws)

Returns whether the given thread can be interrupted at this point.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns true if the given thread can be interrupted at this point in time. It will return false otherwise.

bool set_thread_interruption_enabled(thread_id_type const &id, bool enable, error_code &ec = throws)

Set whether the given thread can be interrupted at this point.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread which should receive the new value.
- **enable** – [in] This value will determine the new interruption enabled status for the given thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns the previous value of whether the given thread could have been interrupted.

bool get_thread_interruption_requested(thread_id_type const &id, error_code &ec = throws)

Returns whether the given thread has been flagged for interruption.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns true if the given thread was flagged for interruption. It will return false otherwise.
void interrupt_thread(thread_id_type const &id, bool flag, error_code &ec = throws)

Flag the given thread for interruption.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **id** – [in] The thread id of the thread which should be interrupted.
- **flag** – [in] The flag encodes whether the thread should be interrupted (if it is true), or ‘uninterrupted’ (if it is false).
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

inline void interrupt_thread(thread_id_type const &id, error_code &ec = throws)

void interruption_point(thread_id_type const &id, error_code &ec = throws)

Interrupt the current thread at this point if it was canceled. This will throw a thread_interrupted exception, which will cancel the thread.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **id** – [in] The thread id of the thread which should be interrupted.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

threads::thread_priority get_thread_priority(thread_id_type const &id, error_code &ec = throws)
	noexcept

Return priority of the given thread

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

std::ptrdiff_t get_stack_size(thread_id_type const &id, error_code &ec = throws) noexcept

Return stack size of the given thread

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**
- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.
Returns a pointer to the pool that was used to run the current thread

Throws If \( \text{~} \&\text{ec} \neq \&\text{throws} \), never throws, but will set \text{ec} to an appropriate value when an error occurs. Otherwise, this function will throw an \text{hpx::exception} with an error code of \text{hpx::error::yield_aborted} if it is signaled with \text{wait_aborted}. If called outside of a HPX-thread, this function will throw an \text{hpx::exception} with an error code of \text{hpx::error::null_thread_id}. If this function is called while the thread-manager is not running, it will throw an \text{hpx::exception} with an error code of \text{hpx::error::invalid_status}.

\text{hpx/threading_base/thread_num_tss.hpp}

See \text{Public API} for a list of names and headers that are part of the public \text{HPX} API.

\text{namespace hpx}

\textbf{Functions}

\textit{std::size_t get_worker_thread_num()} 

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

\textbf{Note}: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by \text{get_os_thread_count()}).

\textbf{Note}: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

\textit{std::size_t get_worker_thread_num(error_code &ec)}

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

\textbf{Note}: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by \text{get_os_thread_count()}). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

\textbf{Note}: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

\textbf{Parameters ec} – [in,out] this represents the error status on exit.

\textit{std::size_t get_local_worker_thread_num()}

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.
This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

**Note:** The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

**Note:** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

```cpp
std::size_t get_local_worker_thread_num(error_code &ec)
```

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

**Note:** The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

**Note:** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

*Parameters* `ec` – [in,out] this represents the error status on exit.

```cpp
std::size_t get_thread_pool_num()
```

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

**Note:** The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

**Note:** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

```cpp
std::size_t get_thread_pool_num(error_code &ec)
```

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

**Note:** The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

**Note:** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).
Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters ec – [in,out] this represents the error status on exit.

namespace threads

hpx/threading_base/thread_pool_base.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace threads

Functions

\[ \text{std::ostream &operator<<} \left( \text{std::ostream &os, \text{thread_pool_base const &thread_pool} \right) \]

class thread_pool_base

#include <thread_pool_base.hpp> The base class used to manage a pool of OS threads.

Public Functions

virtual void suspend_processing_unit_direct(std::size_t virt_core, error_code &ec = throws) = 0

Suspends the given processing unit. Blocks until the processing unit has been suspended.

Parameters

- virt_core – [in] The processing unit on the the pool to be suspended. The processing units are indexed starting from 0.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

virtual void resume_processing_unit_direct(std::size_t virt_core, error_code &ec = throws) = 0

Resumes the given processing unit. Blocks until the processing unit has been resumed.

Parameters

- virt_core – [in] The processing unit on the the pool to be resumed. The processing units are indexed starting from 0.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

virtual void resume_direct(error_code &ec = throws) = 0

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.
virtual void suspend_direct(error_code &ec = throws) = 0

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

**Note:** A thread pool cannot be suspended from an HPX thread running on the pool itself.

**Parameters ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Throws** `hpx::exception` – if called from an HPX thread which is running on the pool itself.

bool pool_exists(std::string const &pool_name) const

bool pool_exists(std::size_t pool_index) const

thread_id_ref_type register_work(thread_init_data &data, error_code &ec = throws)

    The function register_work adds a new work item to the thread manager. It doesn’t immediately
    create a new thread, it just adds the task parameters (function, initial state and description) to the
    internal management data structures. The thread itself will be created when the number of existing
    threads drops below the number of threads specified by the constructors max_count parameter.

    Parameters

    • func – [in] The function or function object to execute as the thread’s function. This
        must have a signature as defined by thread_function_type.
    • description – [in] The value of this parameter allows to specify a description of the
        thread to create. This information is used for logging purposes mainly, but might be
        useful for debugging as well. This parameter is optional and defaults to an empty string.
void register_thread(thread_init_data &data, thread_id_type &id, error_code &ec = throws)

The function register_thread adds a new work item to the thread manager. It creates a new thread, adds it to the internal management data structures, and schedules the new thread, if appropriate.

Parameters

- **func** – [in] The function or function object to execute as the thread’s function. This must have a signature as defined by thread_function_type.
- **id** – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- **description** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.

bool run()

Run the thread manager’s work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function tfunc.

Returns The function returns true if the thread manager has been started successfully, otherwise it returns false.

void stop(bool blocking = true)

Forcefully stop the thread-manager.

Parameters blocking –

bool is_busy()

bool is_idle()

void wait()

bool wait_for(hpx::chrono::steady_duration const &rel_time)

void suspend()

void resume()

inline state status() const

Return whether the thread manager is still running. This returns the “minimal state”, i.e. the state of the least advanced thread pool.

std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown,
thread_priority priority = thread_priority::default_, std::size_t num_thread = std::size_t(-1), bool reset = false)

return the number of HPX-threads with the given state

Note: This function lock the internal OS lock in the thread manager

std::int64_t get_idle_core_count()

mask_type get_idle_core_mask()

std::int64_t get_background_thread_count() const

bool enumerate_threads(hpx::function<bool(thread_id_type)> const &f, thread_schedule_state state = thread_schedule_state::unknown) const
void **abort_all_suspended_threads()

bool **cleanup_terminated**(bool delete_all)

inline **std::size_t get_os_thread_count()** const

    Return the number of OS threads running in this thread-manager.

    This function will return correct results only if the thread-manager is running.

inline **std::thread &get_os_thread_handle(std::size_t num_thread)** const

inline void **report_error**(std::size_t num_thread, std::exception_ptr const &e) const

    API functions forwarding to notification policy.

    This notifies the thread manager that the passed exception has been raised. The exception will be
    routed through the notifier and the scheduler (which will result in it being passed to the runtime
    object, which in turn will report it to the console, etc.).

inline **mask_type get_used_processing_units()** const

    Returns the mask identifying all processing units used by this thread manager.

inline **hwloc_bitmap_ptr get_pool_numa_bitmap(std::string const &pool_name)** const

inline void **set_scheduler_mode**(threads::policies::scheduler_mode mode) noexcept

inline void **add_scheduler_mode**(threads::policies::scheduler_mode mode) noexcept

inline void **add_remove_scheduler_mode**(threads::policies::scheduler_mode to_add_mode,
                                          threads::policies::scheduler_mode to_remove_mode) noexcept

inline void **remove_scheduler_mode**(threads::policies::scheduler_mode mode) noexcept

inline void **reset_thread_distribution**()

inline void **init_tss**(std::size_t global_thread_num)

inline void **deinit_tss**()

**std::int64_t get_queue_length**(bool reset)

**std::int64_t get_cumulative_duration**(bool reset)

inline **std::int64_t get_thread_count_unknown**(bool reset)

inline **std::int64_t get_thread_count_active**(bool reset)

inline **std::int64_t get_thread_count_pending**(bool reset)

struct async_execute_after_t : public hpx::functional::detail::tag_fallback<async_execute_after_t>

#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation f() using the associated executor at the given point in time.

**Note:** This calls exec.async_execute_after(rel_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::async_execute() on the underlying non-time-scheduled execution agent.

---

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param rel_time** [in] The duration of time after which the given function should be scheduled to run.

**Param f** [in] The function which will be scheduled using the given executor.

**Param ts...** [in] Additional arguments to use to invoke f.

**Return** f(ts...)’s result through a future

---

**Private Functions**

template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(async_execute_after_t, Executor &&exec, hpx::chrono::steady_duration const &rel_time, F &&f, Ts &&... ts)

---

struct async_execute_at_t : public hpx::functional::detail::tag_fallback<async_execute_at_t>

#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation f() using the associated executor at the given point in time.

**Note:** This calls exec.async_execute_at(abs_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::async_execute() on the underlying non-time-scheduled execution agent.

---

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param abs_time** [in] The point in time the given function should be scheduled at to run.

**Param f** [in] The function which will be scheduled using the given executor.

**Param ts...** [in] Additional arguments to use to invoke f.

**Return** f(ts...)’s result through a future
**Private Functions**

```cpp
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(async_execute_at_t, Executor &&exec,
                                                   hpx::chrono::steady_time_point const &abs_time, F &&f, Ts&&... ts)
```

```cpp
#include <timed_execution_fwd.hpp>
```

Customization point of asynchronous fire & forget execution agent creation supporting timed execution.

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor at the given point in time.

**Note:** This calls exec.post_after(rel_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution agent.

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param rel_time** [in] The duration of time after which the given function should be scheduled to run.

**Param f** [in] The function which will be scheduled using the given executor.

**Param ts...** [in] Additional arguments to use to invoke f.

---

```cpp
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_after_t, Executor &&exec,
                                                   hpx::chrono::steady_duration const &rel_time, F &&f, Ts&&... ts)
```

```cpp
#include <timed_execution_fwd.hpp>
```

Customization point of asynchronous fire & forget execution agent creation supporting timed execution.

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor at the given point in time.

**Note:** This calls exec.post_at(abs_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution agent.

**Param exec** [in] The executor object to use for scheduling of the function f.

**Param abs_time** [in] The point in time the given function should be scheduled to run.

**Param f** [in] The function which will be scheduled using the given executor.

~topology()

inline std::size_t get_socket_number(std::size_t num_thread, [[maybe_unused]] error_code &ec = throws) const noexcept

Return the Socket number of the processing unit the given thread is running on.

Parameters

- num_thread – [in]
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

inline std::size_t get_numa_node_number(std::size_t num_thread, [[maybe_unused]] error_code &ec = throws) const noexcept

Return the NUMA node number of the processing unit the given thread is running on.

Parameters

- num_thread – [in]
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

mask_cref_type get_machine_affinity_mask(error_code &ec = throws) const noexcept

Return a bit mask where each set bit corresponds to a processing unit available to the application.

Parameters

- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

mask_type get_service_affinity_mask(mask_cref_type used_processing_units, error_code &ec = throws) const

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

Parameters

- used_processing_units – [in] This is the mask of processing units which are not available for service threads.
- ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

mask_cref_type get_socket_affinity_mask(std::size_t num_thread, error_code &ec = throws) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.
Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`mask_cref_type get_numa_node_affinity_mask(std::size_t num_thread, error_code &ec = throws) const`

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`mask_cref_type get_core_affinity_mask(std::size_t num_thread, error_code &ec = throws) const`

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`mask_cref_type get_thread_affinity_mask(std::size_t num_thread, error_code &ec = throws) const`

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`void set_thread_affinity_mask(mask_cref_type mask, error_code &ec = throws) const`

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

**Note:** Use this function on systems where the affinity must be set from inside the thread itself.

Parameters

- **mask** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`mask_type get_thread_affinity_mask_from_lva(void const *lva, error_code &ec = throws) const`

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

Parameters

- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`void print_affinity_mask(std::ostream &os, std::size_t num_thread, mask_cref_type m, std::string const &pool_name) const`

Prints the given mask `m` to `os` in a human readable form.
bool reduce_thread_priority(error_code &ec = throws) const

Reduce thread priority of the current thread.

Parameters:
ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

std::size_t get_number_of_sockets() const

Return the number of available NUMA domains.

std::size_t get_number_of_numa_nodes() const

Return the number of available NUMA domains.

std::size_t get_number_of_cores() const

Return the number of available cores.

std::size_t get_number_of_pus() const noexcept

Return the number of available hardware processing units.

std::size_t get_number_of_numa_node_cores(std::size_t numa) const

Return number of cores in given numa domain.

std::size_t get_number_of_numa_node_pus(std::size_t numa) const

Return number of processing units in a given numa domain.

std::size_t get_number_of_socket_pus(std::size_t socket) const

Return number of processing units in a given socket.

std::size_t get_number_of_core_pus(std::size_t core) const

Return number of processing units in given core.

std::size_t get_number_of_socket_cores(std::size_t socket) const

Return number of cores units in given socket.

inline std::size_t get_core_number(std::size_t num_thread, error_code& = throws) const

std::size_t get_pu_number(std::size_t num_core, std::size_t num_pu, error_code &ec = throws) const

std::size_t get_cache_size(mask_cref_type mask, int level) const

Return the size of the cache associated with the given mask.

mask_type get_cpubind_mask(error_code &ec = throws) const

mask_type get_cpubind_mask(std::thread &handle, error_code &ec = throws) const

hwloc_bitmap_ptr cpuset_to_nodeset(mask_cref_type mask) const

convert a cpu mask into a numa node mask in hwloc bitmap form

void write_to_log() const

void *allocate(std::size_t len) const

This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

void *allocate_membind(std::size_t len, const hwloc_bitmap_ptr &bitmap, hpx::hwloc_membind_policy policy, int flags) const

allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc docs)

threads::mask_type get_area_membind_nodeset(void const *addr, std::size_t len) const
bool set_area_membind_nodeset(void const *addr, std::size_t len, void *nodeset) const
int get_numa_domain(void const *addr) const
void deallocate(void *addr, std::size_t len) const noexcept
    Free memory that was previously allocated by allocate.
void print_hwloc(std::ostream&) const
mask_type init_socket_affinity_mask_from_socket(std::size_t num_socket) const
mask_type init_numa_node_affinity_mask_from_numa_node(std::size_t num_numa_node) const
mask_type init_core_affinity_mask_from_core(std::size_t num_core, mask_cref_type default_mask = empty_mask) const
mask_type init_thread_affinity_mask(std::size_t num_thread) const
mask_type init_thread_affinity_mask(std::size_t num_core, std::size_t num_pu) const
hwloc_bitmap_t mask_to_bitmap(mask_cref_type mask, hwloc_obj_type_t htype) const

**Functions**

template<typename Iterator>
constexpr bool insert_checked(std::pair<Iterator, bool> const &r) noexcept

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters `r` – [in] The return value of a std::map insert operation.

Returns This function returns `r.second`.

template<typename Iterator>
bool insert_checked(std::pair<Iterator, bool> const &r, Iterator &it)

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters
- `r` – [in] The return value of a std::map insert operation.
- `r` – [out] A reference to an Iterator, which is set to `r.first`.
- `it` – [out] on exit, will hold the iterator referring to the inserted element

Returns This function returns `r.second`. 
namespace hpx

namespace util

### Functions

```cpp
bool parse_sed_expression(std::string const &input, std::string &search, std::string &replace)
```

Parse a sed command.

**Note:** Currently, only supports search and replace syntax (s/search/replace/)

**Parameters**
- `input` – [in] The content to parse.
- `search` – [out] If the parsing is successful, this string is set to the search expression.
- `replace` – [out] If the parsing is successful, this string is set to the replace expression.

**Returns** `true` if the parsing was successful, false otherwise.

```cpp
struct sed_transform
```

```cpp
#include <sed_transform.hpp>
```

An unary function object which applies a sed command to its subject and returns the resulting string.

**Note:** Currently, only supports search and replace syntax (s/search/replace/)

### Public Functions

```cpp
sed_transform(std::string const &search, std::string replace)
```

```cpp
explicit sed_transform(std::string const &expression)
```

```cpp
std::string operator()(std::string const &input) const
```

```cpp
inline explicit operator bool() const noexcept
```

```cpp
inline bool operator!() const noexcept
```

namespace actions

Defines

HPX_REGISTER_ACTION_DECLARATION(...)  
Declare the necessary component action boilerplate code.

The macro HPX_REGISTER_ACTION_DECLARATION can be used to declare all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter action is the type of the action to declare the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

namespace app
{
   // Define a simple component exposing one action 'print_greeting'
   class HPX_COMPONENT_EXPORT server
      : public hpx::components::component_base<server>
   {
      void print_greeting ()
      {
         hpx::cout << "Hey, how are you?\n" << std::flush;
      }
   }  
}  
(continues on next page)
// Component actions need to be declared, this also defines the
// type 'print_greeting_action' representing the action.
HPX_DEFINE_COMPONENT_ACTION(server,
    print_greeting, print_greeting_action);
};
}

// Declare boilerplate code required for each of the component actions.
HPX_REGISTER_ACTION_DECLARATION(app::server::print_greeting_action)

Example:

Note: This macro has to be used once for each of the component actions defined using one of the
HPX_DEFINE_COMPONENT_ACTION macros. It has to be visible in all translation units using the action,
thus it is recommended to place it into the header file defining the component.

**HPX_REGISTER_ACTION_DECLARATION_**(...)**

**HPX_REGISTER_ACTION_DECLARATION_1**(action)

**HPX_REGISTER_ACTION**(...)**

Define the necessary component action boilerplate code.

The macro **HPX_REGISTER_ACTION** can be used to define all the boilerplate code which is required for proper
functioning of component actions in the context of HPX.

The parameter *action* is the type of the action to define the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the
action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not
usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot
be part of a C++ identifier, such as '<', '>', or ':'.

Note: This macro has to be used once for each of the component actions defined using one of the
HPX_DEFINE_COMPONENT_ACTION or HPX_DEFINE_PLAIN_ACTION macros. It has to occur exactly
once for each of the actions, thus it is recommended to place it into the source file defining the component.

Note: Only one of the forms of this macro **HPX_REGISTER_ACTION** or **HPX_REGISTER_ACTION_ID** should
be used for a particular action, never both.

**HPX_REGISTER_ACTION_ID**(action, actionname, actionid)

Define the necessary component action boilerplate code and assign a predefined unique id to the action.

The macro **HPX_REGISTER_ACTION** can be used to define all the boilerplate code which is required for proper
functioning of component actions in the context of HPX.

The parameter *action* is the type of the action to define the boilerplate for.
The parameter `actionname` specifies an unique name of the action to be used for serialization purposes. The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as ‘<’, ‘>’, or ‘:’.

The parameter `actionid` specifies an unique integer value which will be used to represent the action during serialization.

**Note:** This macro has to be used once for each of the component actions defined using one of the `HPX_DEFINE_COMPONENT_ACTION` or global actions `HPX_DEFINE_PLAIN_ACTION` macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

**Note:** Only one of the forms of this macro `HPX_REGISTER_ACTION` or `HPX_REGISTER_ACTION_ID` should be used for a particular action, never both.

namespace `hpx`

namespace `actions`

**hpx/actions_base/basic_action_fwd.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace `hpx`

namespace `actions`

```
template<typename Component, typename Signature, typename Derived>
struct basic_action

#include <basic_action_fwd.hpp>

Template Parameters
- `Component` – component type
- `Signature` – return type and arguments
- `Derived` – derived action class
```

**hpx/actions_base/component_action.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.
Defines

**HPX_DEFINE_COMPONENT_ACTION(...)**

Registers a member function of a component as an action type with HPX.

The macro `HPX_DEFINE_COMPONENT_ACTION` can be used to register a member function of a component as an action type named `action_type`.

The parameter `component` is the type of the component exposing the member function `func` which should be associated with the newly defined action type. The parameter `action_type` is the name of the action type to register with HPX.

```cpp
namespace app
{
    // Define a simple component exposing one action 'print_greeting'
    class HPX_COMPONENT_EXPORT server : public hpx::components::component_base<server>
    {
        void print_greeting() const
        {
            hpx::cout << "Hey, how are you?\n" << std::flush;
        }

        // Component actions need to be declared, this also defines the
        // type 'print_greeting_action' representing the action.
        HPX_DEFINE_COMPONENT_ACTION(server, print_greeting, print_greeting_action);
    }
}
```

**Example:**

The first argument must provide the type name of the component the action is defined for.

The second argument must provide the member function name the action should wrap.

The default value for the third argument (the typename of the defined action) is derived from the name of the function (as passed as the second argument) by appending '_action'. The third argument can be omitted only if the second argument with an appended suffix '_action' resolves to a valid, unqualified C++ type name.

**Note:** The macro `HPX_DEFINE_COMPONENT_ACTION` can be used with 2 or 3 arguments. The third argument is optional.
See Public API for a list of names and headers that are part of the public HPX API.

**Defines**

**HPX_DEFINE_PLAIN_ACTION(...)**

Defines a plain action type.

```cpp
namespace app
{
    void some_global_function(double d)
    {
        cout << d;
    }

    // This will define the action type 'app::some_global_action' which
    // represents the function 'app::some_global_function'.
    HPX_DEFINE_PLAIN_ACTION(some_global_function, some_global_action);
}
```

**Example:**

**Note:** Usually this macro will not be used in user code unless the intent is to avoid defining the action_type in global namespace. Normally, the use of the macro `HPX_PLAIN_ACTION` is recommended.

**Note:** The macro `HPX_DEFINE_PLAIN_ACTION` can be used with 1 or 2 arguments. The second argument is optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending `_action`. The second argument can be omitted only if the first argument with an appended suffix `_action` resolves to a valid, unqualified C++ type name.

**HPX_DECLARE_PLAIN_ACTION(...)**

Declares a plain action type.

**HPX_PLAIN_ACTION(...)**

Defines a plain action type based on the given function `func` and registers it with HPX.

The macro `HPX_PLAIN_ACTION` can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function `func`. It defines the action type `name` representing the given function. This macro additionally registers the newly define action type with HPX.

The parameter `func` is a global or free (non-member) function which should be encapsulated into a plain action. The parameter `name` is the name of the action type defined by this macro.
namespace app
{
    void some_global_function(double d)
    {
        cout << d;
    }
}

// This will define the action type 'some_global_action' which represents
// the function 'app::some_global_function'.
HPX_PLAIN_ACTION(app::some_global_function, some_global_action)

Example:

Note: The macro HPXPLAIN ACTION has to be used at global namespace even if the wrapped function is
located in some other namespace. The newly defined action type is placed into the global namespace as well.

Note: The macro HPXPLAIN ACTION ID can be used with 1, 2, or 3 arguments. The second and third
arguments are optional. The default value for the second argument (the typename of the defined action) is derived
from the name of the function (as passed as the first argument) by appending '_action'. The second argument
can be omitted only if the first argument with an appended suffix '_action' resolves to a valid, unqualified C++
type name. The default value for the third argument is hpx::components::factory_check.

Note: Only one of the forms of this macro HPXPLAIN ACTION or HPXPLAIN ACTION ID should be
used for a particular action, never both.

HPXPLAIN ACTION_ID(func, name, id)

Defines a plain action type based on the given function func and registers it with HPX.

The macro HPXPLAIN ACTION ID can be used to define a plain action (e.g. an action encapsulating a global
or free function) based on the given function func. It defines the action type actionname representing the given
function. The parameter actionid

The parameter actionid specifies an unique integer value which will be used to represent the action during seri-
alization.

The parameter func is a global or free (non-member) function which should be encapsulated into a plain action.
The parameter name is the name of the action type defined by this macro.

The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special
characters which cannot be part of a C++ identifier, such as '<', '>', or '(': 

namespace app
{
    void some_global_function(double d)
    {
        cout << d;
    }

    some_global_action;
}
// This will define the action type 'some_global_action' which represents
// the function 'app::some_global_function'.
HPX_PLAIN_ACTION_ID(app::some_global_function, some_global_action,
                some_unique_id);

Example:

Note: The macro HPX_PLAIN_ACTION_ID has to be used at global namespace even if the wrapped function
is located in some other namespace. The newly defined action type is placed into the global namespace as well.

Note: Only one of the forms of this macro HPX_PLAIN_ACTION or HPX_PLAIN_ACTION_ID should be
used for a particular action, never both.

```

```cpp
bool unregister_locality(naming::gid_type const &gid,
                         error_code &ec = throws)
```

Remove a locality from the runtime.

```cpp
void remove_resolved_locality(naming::gid_type const &gid)
```

remove given locality from locality cache

```cpp
bool get_console_locality(naming::gid_type &locality,
                          error_code &ec = throws)
```

Get locality locality_id of the console locality.

---

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**

- **locality** – [out] The locality_id value uniquely identifying the console locality. This is valid only, if the return value of this function is true.
- **try_cache** – [in] If this is set to true the console is first tried to be found in the local cache. Otherwise this function will always query AGAS, even if the console locality_id is already known locally.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if a console locality_id exists and returns `false` otherwise.
bool get_localities(std::vector<naming::gid_type> &locality_ids,
components::component_type type, error_code &ec = throws) const

Query for the locality_ids of all known localities.
This function returns the locality_ids of all localities known to the AGAS server or all localities
having a registered factory for a given component type.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns
the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- **locality_ids** – [out] The vector will contain the prefixes of all localities registered
with the AGAS server. The returned vector holds the prefixes representing the runtime_support components of these localities.
- **type** – [in] The component type will be used to determine the set of prefixes having a
registered factory for this component. The default value for this parameter is components::component_invalid, which will return prefixes of all localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws
the function will throw on error instead.

inline bool get_localities(std::vector<naming::gid_type> &locality_ids, error_code &ec =
throws) const

hpx::future<std::uint32_t> get_num_localities_async(components::component_type type =
components::component_invalid) const

Query for the number of all known localities.
This function returns the number of localities known to the AGAS server or the number of localities
having a registered factory for a given component type.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns
the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters
- **type** – [in] The component type will be used to determine the set of prefixes having a
registered factory for this component. The default value for this parameter is components::component_invalid, which will return prefixes of all localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws
the function will throw on error instead.

std::uint32_t get_num_localities(components::component_type type, error_code &ec = throws)
const

inline std::uint32_t get_num_localities(error_code &ec = throws) const

hpx::future<std::uint32_t> get_num_overall_threads_async() const

std::uint32_t get_num_overall_threads(error_code &ec = throws) const

hpx::future<std::vector<std::uint32_t>> get_num_threads_async() const

std::vector<std::uint32_t> get_num_threads(error_code &ec = throws) const
components::component_type get_component_id(std::string const &name, error_code &ec = throws) const

Return a unique id usable as a component type.

This function returns the component type id associated with the given component name. If this is the first request for this component name a new unique id will be created.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `name` – [in] The component name (string) to get the component type for.
- `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** The function returns the currently associated component type. Any error results in an exception thrown from this function.

void iterate_types(iterate_types_function_type const &f, error_code &ec = throws) const

std::string get_component_type_name(components::component_type id, error_code &ec = throws) const

inline components::component_type register_factory(naming::gid_type const &locality_id, std::string const &name, error_code &ec = throws) const

Register a factory for a specific component type.

This function allows to register a component factory for a given locality and component type.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `locality_id` – [in] The locality value uniquely identifying the given locality the factory needs to be registered for.
- `name` – [in] The component name (string) to register a factory for the given component type for.
- `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** The function returns the currently associated component type. Any error results in an exception thrown from this function. The returned component type is the same as if the function `get_component_id` was called using the same component name.

components::component_type register_factory(uint32_t locality_id, std::string const &name, error_code &ec = throws) const

bool get_id_range(uint64_t count, naming::gid_type &lower_bound, naming::gid_type &upper_bound, error_code &ec = throws)

Get unique range of freely assignable global ids.

Every locality needs to be able to assign global ids to different components without having to consult the AGAS server for every id to generate. This function can be called to preallocate a range of ids usable for this purpose.
Note: This function assigns a range of global ids usable by the given locality for newly created components. Any of the returned global ids still has to be bound to a local address, either by calling bind or bind_range.

This function returns true if a new range has been generated (it has been called for the first time for the given locality) and returns false if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

inline bool bind_local(naming::gid_type const &id, naming::address const &addr, error_code &ec = throws)

Bind a global address to a local address.

Parameters
• id – [in] The global address which has to be bound to the local address.
• addr – [in] The local address to be bound to the global address.
• ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function returns true, if this global id got associated with an local address. It returns false otherwise.

Note: Binding a gid to a local address sets its global reference count to one.

inline hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, std::uint32_t locality_id)
inline hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, naming::gid_type const &locality)
bool bind_range_local(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, error_code &ec = throws)

Bind unique range of global ids to given base address.

Every locality needs to be able to bind global ids to different components without having to consult the AGAS server for every id to bind. This function can be called to bind a range of consecutive global ids to a range of consecutive local addresses (separated by a given offset).

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- **lower_id** – [in] The lower bound of the assigned id range. The value can be used as the first id to assign.
- **count** – [in] The number of consecutive global ids to bind starting at `lower_id`.
- **baseaddr** – [in] The local address to bind to the global id given by `lower_id`. This is the base address for all additional local addresses to bind to the remaining global ids.
- **offset** – [in] The offset to use to calculate the local addresses to be bound to the range of global ids.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true`, if the given range was successfully bound. It returns `false` otherwise.

`hpx::future<bool> bind_range_async(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, naming::gid_type const &locality)`

`inline hpx::future<bool> bind_range_async(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, std::uint32_t locality_id)`

`inline bool unbind_local(naming::gid_type const &id, error_code &ec = throws)`

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

**Note:** You can unbind only global ids bound using the function `bind`. Do not use this function to unbind any of the global ids bound using `bind_range`.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** This function will raise an error if the global reference count of the given gid is not zero!
Parameters

- **id** – [in] The global address (id) for which the association has to be removed.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns

The function returns `true` if the association has been removed, and it returns `false` if no association existed. Any error results in an exception thrown from this function.

```cpp
inline bool unbind_local(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

**Note:** You can unbind only global ids bound using the function `bind`. Do not use this function to unbind any of the global ids bound using `bind_range`.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **id** – [in] The global address (id) for which the association has to be removed.
- **addr** – [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns

The function returns `true` if the association has been removed, and it returns `false` if no association existed. Any error results in an exception thrown from this function.

```cpp
inline bool unbind_range_local(naming::gid_type const &lower_id, std::uint64_t count, error_code &ec = throws)
```

Unbind the given range of global ids.

**Note:** You can unbind only global ids bound using the function `bind_range`. Do not use this function to unbind any of the global ids bound using `bind`.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **lower_id** – [in] The lower bound of the assigned id range. The value must the first id of the range as specified to the corresponding call to `bind_range`. 
**unbind_range_local**

```cpp
bool unbind_range_local(naming::gid_type const &lower_id, std::uint64_t count,
                        naming::address &addr, error_code &ec = throws)
```

Unbind the given range of global ids.

**Note:** You can unbind only global ids bound using the function `bind_range`. Do not use this function to unbind any of the global ids bound using `bind`.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** This function will raise an error if the global reference count of the given gid is not zero!

**Parameters**

- **lower_id** – [in] The lower bound of the assigned id range. The value must the first id of the range as specified to the corresponding call to `bind_range`.
- **count** – [in] The number of consecutive global ids to unbind starting at `lower_id`. This number must be identical to the number of global ids bound by the corresponding call to `bind_range`.
- **addr** – [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if a new range has been generated (it has been called for the first time for the given locality) and returns `false` if this locality already got a range assigned in an earlier call.

```
hpx::future<naming::address> unbind_range_async(naming::gid_type const &lower_id, 
                                                std::uint64_t count = 1)
```

**Parameters**

- **id** – [in] The address to test.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if the passed address refers to an object which lives on the locality of the caller.

```cpp
bool is_local_address_cached(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
bool is_local_address_cached(naming::gid_type const &id, naming::address &addr, std::pair<bool, components::pinned_ptr> &r, hpx::move_only_function<std::pair<bool, components::pinned_ptr>>(naming::address const&) &f, error_code &ec = throws)
```

```cpp
bool is_local_lva_encoded_address(std::uint64_t msb)
```

```cpp
inline bool resolve_local(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

Resolve a given global address (`id`) to its associated local address.

This function returns the local address which is currently associated with the given global address (`id`).

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- **id** – [in] The global address (`id`) for which the associated local address should be returned.
- **addr** – [out] The local address which currently is associated with the given global address (`id`), this is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** This function returns `true` if the global address has been resolved successfully (there exists an association to a local address) and the associated local address has been returned. The function returns `false` if no association exists for the given global address. Any error results in an exception thrown from this function.

```cpp
inline bool resolve_local(hpx::id_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
inline naming::address resolve_local(naming::gid_type const &id, error_code &ec = throws)
```

```cpp
inline naming::address resolve_local(hpx::id_type const &id, error_code &ec = throws)
```

```cpp
hpx::future<naming::address> resolve_async(naming::gid_type const &id)
```

```cpp
hpx::future<naming::address> resolve_async(hpx::id_type const &id)
```

```cpp
hpx::future<hpx::id_type> get_colocation_id_async(hpx::id_type const &id)
```

```cpp
bool resolve_full_local(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

```cpp
inline bool resolve_full_local(hpx::id_type const &id, naming::address &addr, error_code &ec = throws)
```

bool `resolve_full_local(naming::gid_type const *gids, naming::address *addrs, std::size_t size, hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)`

bool `resolve_cached(naming::gid_type const *gids, naming::address *addrs, std::size_t size, hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)`

`hpx::future<std::int64_t> incref_async(naming::gid_type const &gid, std::int64_t credits = 1, hpx::id_type const &keep_alive = hpx::invalid_id)`

Increment the global reference count for the given id.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `gid` – [in] The global address (id) for which the global reference count has to be incremented.
- `credits` – [in] The number of reference counts to add for the given id.
- `keep_alive` – [in] Id to keep alive (if valid)
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** Whether the operation was successful.

inline `std::int64_t incref(naming::gid_type const &gid, std::int64_t credits = 1, error_code &ec = throws)`

void `decref(naming::gid_type const &id, std::int64_t credits = 1, error_code &ec = throws)`

Decrement the global reference count for the given id.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `id` – [in] The global address (id) for which the global reference count has to be decremented.
• \( t \) – [out] If this was the last outstanding global reference for the given gid (the return value of this function is zero), \( t \) will be set to the component type of the corresponding element. Otherwise \( t \) will not be modified.
• \texttt{credits} – [in] The number of reference counts to add for the given id.
• \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hxpp::throws} the function will throw on error instead.

**Returns**  The global reference count after the decrement.

\[
\text{hxpp::future<iterate_names_return_type> iterate_ids(std::string const &pattern) const}
\]

Invoke the supplied \texttt{hxpp::function} for every registered global name.

This function iterates over all registered global ids and returns every found entry matching the given name pattern. Any error results in an exception thrown (or reported) from this function.

**Parameters** \texttt{pattern} – [in] pattern (possibly using wildcards) to match all existing entries against

\[
\text{bool register_name(std::string const &name, naming::gid_type const &id, error_code &ec = throws) const}
\]

Register a global name with a global address (id)

This function registers an association between a global name (string) and a global address (id) usable with one of the functions above (bind, unbind, and resolve).

**Note:** As long as \( ec \) is not pre-initialized to \texttt{hxpp::throws} this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of \texttt{hxpp::exception}.

**Parameters**

• \texttt{name} – [in] The global name (string) to be associated with the global address.
• \texttt{id} – [in] The global address (id) to be associated with the global address.
• \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hxpp::throws} the function will throw on error instead.

**Returns**  The function returns \texttt{true} if the global name was registered. It returns \texttt{false} if the global name is not registered.

\[
\text{hxpp::future<bool> register_name_async(std::string const &name, hpx::id_type const &id) const}
\]

\[
\text{bool register_name(std::string const &name, hpx::id_type const &id, error_code &ec = throws) const}
\]

\[
\text{hxpp::future<hpx::id_type> unregister_name_async(std::string const &name) const}
\]

Unregister a global name (release any existing association)

This function releases any existing association of the given global name with a global address (id).

**Note:** As long as \( ec \) is not pre-initialized to \texttt{hxpp::throws} this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of \texttt{hxpp::exception}.

**Parameters**

• \texttt{name} – [in] The global name (string) for which any association with a global address (id) has to be released.
• \texttt{ec} – [in,out] this represents the error status on exit, if this is pre-initialized to \texttt{hxpp::throws} the function will throw on error instead.

**Returns**  The function returns \texttt{true} if an association of this global name has been released, and it returns \texttt{false}, if no association existed. Any error results in an exception thrown from this function.
**hpx::id_type unregister_name**(std::string const &name, error_code &ec = throws) const

**hpx::future<hpx::id_type> resolve_name_async**(std::string const &name) const

Query for the global address associated with a given global name.

This function returns the global address associated with the given global name.

This function returns true if it returned global address (id), which is currently associated with the given global name, and it returns false, if currently there is no association for this global name. Any error results in an exception thrown from this function.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**

- **name** – [in] The global name (string) for which the currently associated global address has to be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Returns**

- [out] The id currently associated with the given global name (valid only if the return value is true).

**hpx::id_type resolve_name**(std::string const &name, error_code &ec = throws) const

**future<hpx::id_type> on_symbol_namespace_event**(std::string const &name, bool call_for_past_events = false) const

Install a listener for a given symbol namespace event.

This function installs a listener for a given symbol namespace event. It returns a future which becomes ready as a result of the listener being triggered.

**Note:** The only event type which is currently supported is **symbol_ns_bind**, i.e. the listener is triggered whenever a global id is registered with the given name.

**Parameters**

- **name** – [in] The global name (string) for which the given event should be triggered.
- **evt** – [in] The event for which a listener should be installed.
- **call_for_past_events** – [in,optional] Trigger the listener even if the given event has already happened in the past. The default for this parameter is **false**.

**Returns**

- A future instance encapsulating the global id which is causing the registered listener to be triggered.

**Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

void **update_cache_entry**(naming::gid_type const &gid, gva const &gva, error_code &ec = throws)

```
inline void **update_cache_entry**(naming::gid_type const &gid, naming::address const &addr,

namespace hpx

namespace agas

Functions

`naming::gid_type bootstrap_primary_namespace_gid()`

`hpx::id_type bootstrap_primary_namespace_id()`

namespace server

AGAS’s primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS’s primary namespace.

```
|------MSB------|------LSB------|
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
|prefix|RC|----identifier----|
```

**MSB** - Most significant bits (bit 64 to bit 127)

**LSB** - Least significant bits (bit 0 to bit 63)

**prefix** - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.

**RC** - Bit 88 to bit 92 of the MSB. This is the log2 of the number of reference counting credits on the GID. Bit 93 is used by the locking scheme for gid_types. Bit 94 is a flag which is set if the credit value is valid. Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality).

- Bit 87 marks the gid such that it will not be stored in any of the AGAS caches. This is used mainly for ids which represent 'one-shot' objects (like promises).

(continues on next page)
identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The content of these bits depends on the component type of the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For \a hpx#components#component_runtime_support the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

\[00000000xxxxxxxxxxxxxxxxxxxxxxxxxxxx\]
Historically unused address space reserved for future use.
\[xxxxxxxxxxxx0000xxxxxxxxxxxxxxxx\]
Address space for LVA-encoded GIDs.
\[00000001xxxxxxxxxxxxxxxxxxxxxxxxx\]
Prefix of the bootstrap AGAS locality.
\[00000001000000010000000000000001\]
Address of the primary_namespace component on the bootstrap AGAS locality.
\[00000001000000010000000000000002\]
Address of the component_namespace component on the bootstrap AGAS locality.
\[00000001000000010000000000000003\]
Address of the symbol_namespace component on the bootstrap AGAS locality.
\[00000001000000010000000000000004\]
Address of the locality_namespace component on the bootstrap AGAS locality.

Note: The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

See Public API for a list of names and headers that are part of the public HPX API.

hpx/async_colocated/get_colocation_id.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

```cpp
hpx::id_type get_colocation_id(launch::sync_policy, hpx::id_type const &id, error_code &ec = throws)
```

Return the id of the locality where the object referenced by the given id is currently located on.

The function `hpx::get_colocation_id()` returns the id of the locality where the given object is currently located.

See also:

hpx::get_colocation_id()

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The id of the object to locate.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.
**hpx::future<hpx::id_type> get_colocation_id(hpx::id_type const &id)**

Asynchronously return the id of the locality where the object referenced by the given id is currently located on.

**See also:**

**hpx::get_colocation_id(launch::sync_policy)**

**Parameters id** – [in] The id of the object to locate.

**async_distributed**

See Public API for a list of names and headers that are part of the public HPX API.

```
Public Static Functions

static inline constexpr hpx::lcos::base_lco const *call(hpx::naming::address_type lva) noexcept

namespace lcos

class base_lco

#include <base_lco.hpp>

The base_lco class is the common base class for all LCO’s implementing a simple set_event action

Subclassed by hpx::lcos::base_lco_with_value< Result, RemoteResult, ComponentTag >, hpx::lcos::base_lco_with_value< void, void, ComponentTag >

Public Types

typedef components::managed_component<base_lco> wrapping_type

typedef base_lco base_type_holder

Public Functions

virtual void set_event() = 0

virtual void set_exception(std::exception_ptr const &e)

virtual void connect(hpx::id_type const&)

virtual void disconnect(hpx::id_type const&)

virtual ~base_lco()

Destructor, needs to be virtual to allow for clean destruction of derived objects

void set_event_nonvirt()

The function set_event_nonvirt is called whenever a set_event_action is applied on a instance of a LCO. This function just forwards to the virtual function set_event, which is overloaded by the derived concrete LCO.

void set_exception_nonvirt(std::exception_ptr const &e)

The function set_exception is called whenever a set_exception_action is applied on a instance of a LCO. This function just forwards to the virtual function set_exception, which is overloaded by the derived concrete LCO.

Parameters e – [in] The exception encapsulating the error to report to this LCO instance.

void connect_nonvirt(hpx::id_type const &id)

The function connect_nonvirt is called whenever a connect_action is applied on a instance of a LCO. This function just forwards to the virtual function connect, which is overloaded by the derived concrete LCO.

Parameters id – [in] target id
void disconnect_nonvirt(hpx::id_type const &id)

The function disconnect_nonvirt is called whenever a disconnect_action is applied on a instance of a LCO. This function just forwards to the virtual function disconnect, which is overloaded by the derived concrete LCO.

Parameters id – [in] target id

HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, set_event_nonvirt, set_event_action) HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco)

Each of the exposed functions needs to be encapsulated into an action type, allowing to generate all required boilerplate code for threads, serialization, etc.

The set_event_action may be used to unconditionally trigger any LCO instances, it carries no additional parameters. The set_exception_action may be used to transfer arbitrary error information from the remote site to the LCO instance specified as a continuation. This action carries 2 parameters:

Parameters std::exception_ptr – [in] The exception encapsulating the error to report to this LCO instance.

set_exception_action HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco, connect_nonvirt, connect_action) HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco)

The connect_action may be used to.

The set_exception_action may be used to

namespace hpx

namespace components

namespace lcos

template<typename Result, typename RemoteResult, typename ComponentTag>

class base_lco_with_value : public hpx::lcos::base_lco, public ComponentTag

#include <base_lco_with_value.hpp> The base_lco_with_value class is the common base class for all
LCO’s synchronizing on a value. The RemoteResult template argument should be set to the type of
the argument expected for the set_value action.

Template Parameters

• RemoteResult – The type of the result value to be carried back to the LCO instance.
• ComponentTag – The tag type representing the type of the component (either compo-
nent_tag or managed_component_tag).
Public Types

using \texttt{wrapping\_type} = typename detail::base\_lco\_wrapping\_type<\texttt{ComponentTag}, \texttt{base\_lco\_with\_value}>::type

using \texttt{base\_type\_holder} = \texttt{base\_lco\_with\_value}

Public Functions

inline void \texttt{set\_value\_nonvirt} (\texttt{RemoteResult} &&result)

The function \texttt{set\_value\_nonvirt} is called whenever a \texttt{set\_value\_action} is applied on this LCO instance. This function just forwards to the virtual function \texttt{set\_value}, which is overloaded by the derived concrete LCO.

\textbf{Parameters} \texttt{result} – [in] The result value to be transferred from the remote operation back to this LCO instance.

inline \texttt{Result} \texttt{get\_value\_nonvirt} ()

The function \texttt{get\_result\_nonvirt} is called whenever a \texttt{get\_result\_action} is applied on this LCO instance. This function just forwards to the virtual function \texttt{get\_result}, which is overloaded by the derived concrete LCO.

\texttt{HPX\_DEFINE\_COMPONENT\_DIRECT\_ACTION} (\texttt{base\_lco\_with\_value}, \texttt{set\_value\_nonvirt}, \texttt{set\_value\_action}) \texttt{HPX\_DEFINE\_COMPONENT\_DIRECT\_ACTION} (\texttt{base\_lco\_with\_value})

The \texttt{set\_value\_action} may be used to trigger any LCO instances while carrying an additional parameter of any type.

RemoteResult is taken by rvalue ref. This allows for perfect forwarding. When the action thread function is created, the values are moved into the called function. If we took it by const lvalue reference, we would disable the possibility to further move the result to the designated destination.

\textbf{Parameters} \texttt{RemoteResult} – [in] The type of the result to be transferred back to this LCO instance. The \texttt{get\_value\_action} may be used to query the value this LCO instance exposes as its `result` value.

Public Members

namespace traits
namespace hpx

namespace distributed

template<typename Result, typename RemoteResult>
class promise

#include <promise.hpp> A promise can be used by a single thread to invoke a (remote) action and wait for the result. The result is expected to be sent back to the promise using the LCO’s set_event action.

A promise is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type Result. The promise allows to synchronize exactly one thread (the one passed during construction time).

// Create the promise (the expected result is a id_type)
hpx::distributed::promise<hpx::id_type> p;

// Get the associated future
future<hpx::id_type> f = p.get_future();

// initiate the action supplying the promise as a // continuation
apply<some_action>(new continuation(p.get_id()), ...);

// Wait for the result to be returned, yielding control // in the meantime.
hpx::id_type result = f.get();
// ...

Note: The action executed by the promise must return a value of a type convertible to the type as specified by the template parameter RemoteResult

Template Parameters
• Result – The template parameter Result defines the type this promise is expected to return from promise::get.
• RemoteResult – The template parameter RemoteResult defines the type this promise is expected to receive from the remote action.

namespace lcos
Typedefs

using instead = hpx::distributed::promise<Result, RemoteResult>

template<typename Result, typename RemoteResult, typename ComponentTag>
class base_lco_with_value : public hpx::lcos::base_lco, public ComponentTag
#include <base_lco_with_value.hpp>

template<typename Action, typename Result = typename traits::promise_local_result<typename Action::remote_result_type>::type, bool DirectExecute = Action::direct_execution::value>
class packaged_action
#include <packaged_action.hpp> A packaged_action can be used by a single thread to invoke a (remote) action and wait for the result. The result is expected to be sent back to the packaged_action using the LCO’s set_event action

A packaged_action is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type Result.

Note: The action executed using the packaged_action as a continuation must return a value of a type convertible to the type as specified by the template parameter Result.

Template Parameters

- **Action** – The template parameter Action defines the action to be executed by this packaged_action instance. The arguments arg0,… argN are used as parameters for this action.
- **Result** – The template parameter Result defines the type this packaged_action is expected to return from its associated future packaged_action::get_future.
- **DirectExecute** – The template parameter DirectExecute is an optimization aid allowing to execute the action directly if the target is local (without spawning a new thread for this). This template does not have to be supplied explicitly as it is derived from the template parameter Action.

template<>
class hpx::distributed::promise<void, hpx::util::unused_type> : public lcos::detail::promise_base<void, hpx::util::unused_type, lcos::detail::promise_data<void>>

Public Functions

promise() = default
  constructs a promise object and a shared state.

template<typename Allocator>
inline promise(std::allocator_arg_t, Allocator const &a)
  constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory for the shared state.

promise(promise &&other) noexcept = default
  constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly-constructed object.

Post other has no shared state.

~promise() = default
  Abandons any shared state.

promise &operator=(promise &&other) noexcept = default
  Abandons any shared state (30.6.4) and then as if promise(HPX_MOVE(other)).swap(*this).

Returns *this.

inline void swap(promise &other) noexcept
  Exchanges the shared state of *this and other.

Post *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

inline void set_value()
  atomically stores the value r in the shared state and makes that state ready (30.6.4).

Throws future_error – if its shared state already has a stored value. if shared state has no stored value exception is raised. promise_already_satisfied if its shared state already has a stored value or exception. no_state if *this has no shared state.

- \texttt{cont} – [in] This represents the LCO to trigger after completion.
- \texttt{move\_credits} – [in] If this is set to \texttt{true} then it is ok to send all credits in \texttt{id} along with the generated message. The default value is \texttt{true}.

template<typename Result>
void \texttt{set\_lco\_value(hpx::id\_type const \&id, naming::address \&\&addr, Result \&\&t, bool move\_credits = true)}

Set the result value for the LCO referenced by the given id.

Parameters

- \texttt{id} – [in] This represents the id of the LCO which should receive the given value.
- \texttt{addr} – [in] This represents the addr of the LCO which should be triggered.
- \texttt{t} – [in] This is the value which should be sent to the LCO.
• **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type
set_lco_value(hpx::id_type const &id, Result &&t, bool move_credits = true)
```

Set the result value for the (managed) LCO referenced by the given id.

**Parameters**

• **id** – [in] This represents the id of the LCO which should receive the given value.

• **t** – [in] This is the value which should be sent to the LCO.

• **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type
set_lco_value_unmanaged(hpx::id_type const &id, Result &&t, bool move_credits = true)
```

Set the result value for the (unmanaged) LCO referenced by the given id.

**Parameters**

• **id** – [in] This represents the id of the LCO which should receive the given value.

• **t** – [in] This is the value which should be sent to the LCO.

• **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```cpp
void set_lco_value(hpx::id_type const &id, naming::address &&addr, Result &&t, hpx::id_type const &cont, bool move_credits = true)
```

Set the result value for the LCO referenced by the given id.

**Parameters**

• **id** – [in] This represents the id of the LCO which should receive the given value.

• **addr** – [in] This represents the addr of the LCO which should be triggered.

• **t** – [in] This is the value which should be sent to the LCO.

• **cont** – [in] This represents the LCO to trigger after completion.

---

**1278 Chapter 2. What’s so special about HPX?**
• **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type
set_lco_value(hpx::id_type const &id, Result &&t, hpx::id_type const &cont, bool move_credits = true)
```

Set the result value for the (managed) LCO referenced by the given id.

**Parameters**

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type
set_lco_value_unmanaged(hpx::id_type const &id, Result &&t, hpx::id_type const &cont, bool move_credits = true)
```

Set the result value for the (unmanaged) LCO referenced by the given id.

**Parameters**

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
void set_lco_error(hpx::id_type const &id, naming::address &addr, std::exception_ptr const &e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.
Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
void set_lco_error(hpx::id_type const &id, naming::address &&addr, std::exception_ptr &&e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
inline void set_lco_error(hpx::id_type const &id, std::exception_ptr const &e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

```cpp
void set_lco_error(hpx::id_type const &id, std::exception_ptr &&e, hpx::id_type const &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.
void set_lco_error(hpx::id_type const &id, naming::address &addr, std::exception_ptr &e, hpx::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

inline void set_lco_error(hpx::id_type const &id, std::exception_ptr const &e, hpx::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

inline void set_lco_error(hpx::id_type const &id, std::exception_ptr &e, hpx::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to true then it is ok to send all credits in id along with the generated message. The default value is true.

**checkpoint**

See *Public API* for a list of names and headers that are part of the public *HPX API*. 

2.8. API reference
hpx/checkpoint/checkpoint.hpp

See Public API for a list of names and headers that are part of the public HPX API.

This header defines the save_checkpoint and restore_checkpoint functions. These functions are designed to help HPX application developer’s checkpoint their applications. Save_checkpoint serializes one or more objects and saves them as a byte stream. Restore_checkpoint converts the byte stream back into instances of the objects.

namespace hpx

namespace util

Functions

#include "hpx/traits/is_object.hpp"
#include "hpx/traits/is_launch_policy.hpp"
#include "hpx/future.hpp"
**Template Parameters**

- **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- **U** – This parameter is used to make sure that T is not a launch policy or a checkpoint. This forces the compiler to choose the correct overload.

**Parameters**

- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns**

`Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts>
=hpx::future<checkpoint>&& save_checkpoint(checkpoint &&c, T &&t, Ts&&... ts)
```

Save_checkpoint - Take a pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

**Template Parameters**

- **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.

**Parameters**

- **p** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns**

`Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename std::decay<T>::type, checkpoint>::value>::type>
=hpx::future<checkpoint>&& save_checkpoint(hpx::launch p, T &&t, Ts&&... ts)
```

Save_checkpoint - Policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

**Template Parameters**

- **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
• **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.

**Parameters**

• **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** `Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts>
hpx::future<checkpoint> save_checkpoint(hpx::launch p, checkpoint &&c, T &&t, Ts&&... ts)
```

Save_checkpoint - Policy overload & pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to `save_checkpoint`. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint.

**Template Parameters**

• **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
• **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.

**Parameters**

• **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
• **c** – Takes a pre-initialized checkpoint to copy data into.
• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** `Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```cpp
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename std::decay<T>::type, checkpoint>::value>::type>
checkpoint save_checkpoint(hpx::launch::sync_policy sync_p, T &&t, Ts&&... ts)
```

Save_checkpoint - Sync_policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to `save_checkpoint`. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

**Template Parameters**

• **T** – Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
• **Ts** – More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
• **U** – This parameter is used to make sure that T is not a checkpoint. This forces the compiler to choose the correct overload.

**Parameters**

• **sync_p** – hpx::launch::sync_policy
• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** Save_checkpoint which is passed hpx::launch::sync_policy will return a checkpoint which contains the serialized values checkpoint.

```cpp
template<typename T, typename ...Ts>
checkpoint save_checkpoint(hpx::launch::sync_policy sync_p, checkpoint&& c, T&& t, Ts&&... ts)
    Save_checkpoint - Sync_policy overload & pre-init. checkpoint
```

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component’s client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

**Template Parameters**

• **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
• **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

**Parameters**

• **sync_p** – hpx::launch::sync_policy
• **c** – Takes a pre-initialized checkpoint to copy data into.
• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** Save_checkpoint which is passed hpx::launch::sync_policy will return a checkpoint which contains the serialized values checkpoint.

```cpp
template<typename T, typename ...Ts, typename U = typename std::enable_if<!hpx::traits::is_launch_policy<T>::value && !std::is_same<typename std::decay<T>::type, checkpoint>::value>::type>
hpx::future<checkpoint> prepare_checkpoint(T const &t, Ts const&... ts)
    prepare_checkpoint
```

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. prepare_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Template Parameters**

• **T** – A container to restore.
• **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**

• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

```cpp
template<typename T, typename ...Ts>
```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<T, checkpoint>::value>::type>

hpx::future<checkpoint> prepare_checkpoint(hpx::launch p, T const &t, Ts const&... ts)

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. prepare_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters
- T – A container to restore.
- Ts – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters
- p – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- t – A container to restore.
- ts – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

template<typename T, typename ...Ts>
void restore_checkpoint(checkpoint const &c, T &t, Ts&... ts)

**Restore_checkpoint**

Restore_checkpoint takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in save_checkpoint). Restore_checkpoint can resurrect a stored component in two ways: by passing in an instance of a component’s shared_ptr or by passing in an instance of the component’s client.

**Template Parameters**
• **T** – A container to restore.
• **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**
• **c** – The checkpoint to restore.
• **t** – A container to restore.
• **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Returns** Restore_checkpoint returns void.

class checkpoint

#include <checkpoint.hpp> Checkpoint Object

Checkpoint is the container object which is produced by save_checkpoint and is consumed by a restore_checkpoint. A checkpoint may be moved into the save_checkpoint object to write the byte stream to the pre-created checkpoint object.

Checkpoints are able to store all containers which are able to be serialized including components.

**Friends**

friend class hpx::serialization::access

friend std::ostream &operator<<(std::ostream &ost, checkpoint const &ckp)
Operator<< Overload

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint’s data. The operator>> overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

**Parameters**
- ost – Output stream to write to.
- ckp – Checkpoint to copy from.

**Returns** Operator<< returns the ostream object.

friend std::istream &operator>>(std::istream &ist, checkpoint &ckp)
Operator>> Overload

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint’s data in the operator<< overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

**Parameters**
- ist – Input stream to write from.
- ckp – Checkpoint to write to.

**Returns** Operator>> returns the ostream object.

template< typename T, typename ...Ts>
friend void 
\textbf{restore\_checkpoint}(\textit{checkpoint }\textit{const }\&\textit{c, }\textit{T }\&\textit{t, }\textit{T}s\&\ldots\textit{ ts})

\textbf{Restore\_checkpoint}

\textit{Restore\_checkpoint} takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in \textit{save\_checkpoint}). \textit{Restore\_checkpoint} can resurrect a stored component in two ways: by passing in an instance of a component’s \texttt{shared\_ptr} or by passing in an instance of the component’s client.

\textbf{Template Parameters}  
- \texttt{T} – A container to restore.  
- \texttt{T}s – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

\textbf{Parameters}  
- \texttt{c} – The checkpoint to restore.  
- \texttt{t} – A container to restore.  
- \texttt{ts} – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

\textbf{Returns} \textit{Restore\_checkpoint} returns \texttt{void}.

See Public API for a list of names and headers that are part of the public HPX API.
Functions

template<typename T>
hpx::future<std::vector<std::decay_t<T>>> all_gather(char const *basename, T &&result,
            num_sites_arg num_sites = num_sites_arg(),
            this_site_arg this_site = this_site_arg(),
            generation_arg generation = generation_arg(),
            root_site_arg root_site = root_site_arg())

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_gather operation.
- **local_result** – The value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from create_communicator
- **local_result** – The value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_gather operation has been completed.

template<typename T>
hpx::future<std::vector<std::decay_t<T>>> all_gather(communicator comm, T &&result,
            this_site_arg this_site = this_site_arg(),
            generation_arg generation = generation_arg())

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from create_communicator
- **local_result** – The value to transmit to all participating sites from this call site.
than zero.

- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_gather operation has been completed.

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_gather operation has been completed.

#### Functions

```cpp
template<typename T, typename F>
hpx::future<
std::decay_t<T>> all_reduce(char const *basename, T &&result, F &&op,
num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg(), root_site_arg root_site = root_site_arg())
```

AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Parameters**

- **basename** – The base name identifying the all_reduce operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**Returns**

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```cpp
template<typename T, typename F>
hpx::future<
std::decay_t<T>> all_reduce(communicator comm, T &&result, F &&op, this_site_arg this_site =
this_site_arg(), generation_arg generation = generation_arg())
```

AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.
AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from `create_communicator`
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from `create_communicator`
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

`hpx/collectives/all_to_all.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace collectives

Functions

```cpp
template<
  typename T>
hpx::future<std::vector<std::decay_t<T>>> all_to_all(char const *basename, T &&result,
  num_sites_arg num_sites = num_sites_arg(),
  this_site_arg this_site = this_site_arg(),
  generation_arg generation = generation_arg(),
  root_site_arg root_site = root_site_arg())
```

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_to_all operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
• **generation** – The generational counter identifying the sequence number of the all_to_all operation performed on the given base name. This is optional and needs to be supplied only if the all_to_all operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns. 

**Parameters**

- **comm** – A communicator object returned from create_communicator
- **local_result** – The value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_to_all operation performed on the given base name. This is optional and needs to be supplied only if the all_to_all operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns**

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_to_all operation has been completed.

namespace hpx

namespace distributed

class barrier

#include <barrier.hpp>  The barrier is an implementation performing a barrier over a number of participating threads. The different threads don’t have to be on the same locality. This barrier can be invoked in a distributed application.

For a local only barrier

See also:

hpx::barrier.
Public Functions

explicit barrier(std::string const &base_name)

    Creates a barrier, rank is locality id, size is number of localities

    A barrier base_name is created. It expects that hpx::get_num_localities() participate and the local rank is hpx::get_locality_id().
    Parameters base_name – The name of the barrier

barrier(std::string const &base_name, std::size_t num)

    Creates a barrier with a given size, rank is locality id

    A barrier base_name is created. It expects that num participate and the local rank is hpx::get_locality_id().
    Parameters
    • base_name – The name of the barrier
    • num – The number of participating threads

barrier(std::string const &base_name, std::size_t num, std::size_t rank)

    Creates a barrier with a given size and rank

    A barrier base_name is created. It expects that num participate and the local rank is rank.
    Parameters
    • base_name – The name of the barrier
    • num – The number of participating threads
    • rank – The rank of the calling site for this invocation

barrier(std::string const &base_name, std::vector<std::size_t> const &ranks, std::size_t rank)

    Creates a barrier with a vector of ranks

    A barrier base_name is created. It expects that ranks.size() and the local rank is rank (must be contained in ranks).
    Parameters
    • base_name – The name of the barrier
    • ranks – Gives a list of participating ranks (this could be derived from a list of locality ids
    • rank – The rank of the calling site for this invocation

void wait() const

    Wait until each participant entered the barrier. Must be called by all participants
    Returns This function returns once all participants have entered the barrier (have called wait).

hpx::future<void> wait(hpx::launch::async_policy) const

    Wait until each participant entered the barrier. Must be called by all participants
    Returns a future that becomes ready once all participants have entered the barrier (have called wait).
Public Static Functions

static void synchronize()

Perform a global synchronization using the default global barrier. The barrier is created once at startup and can be reused throughout the lifetime of an HPX application.

Note: This function currently does not support dynamic connection and disconnection of localities.

hpx/collectives/broadcast.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace collectives

Functions

template<typename T>

hpx::future<void> broadcast_to(char const *basename, T &local_result, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Parameters

• basename – The base name identifying the broadcast operation
• local_result – A value to transmit to all participating sites from this call site.
• num_sites – The number of participating sites (default: all localities).
• generation – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future that will become ready once the broadcast operation has been completed.

template<typename T>

hpx::future<void> broadcast_to(communicator comm, T &local_result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding broadcast_to and broadcast_from have to match.

Parameters
template<typename T>
hpx::future<void> broadcast_to(communicator comm, generation_arg generation, T &&local_result, this_site_arg this_site = this_site_arg())

Broadcast a value to different call sites
This function sends a set of values to all call sites operating on the given base name.

Parameters
- comm – A communicator object returned from create_communicator
- local_result – A value to transmit to all participating sites from this call site.
- generation – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future that will become ready once the broadcast operation has been completed.

Note: The generation values from corresponding broadcast_to and broadcast_from have to match.

template<typename T>
hpx::future<T> broadcast_from(char const *basename, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())

Receive a value that was broadcast to different call sites
This function sends a set of values to all call sites operating on the given base name.

Parameters
- basename – The base name identifying the broadcast operation
- generation – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

template<typename T>
hpx::future<T> broadcast_from(communicator comm, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())

Receive a value that was broadcast to different call sites
This function sends a set of values to all call sites operating on the given base name.
Receive a value that was broadcast to different call sites
This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding `broadcast_to` and `broadcast_from` have to match.

Parameters
- `comm` – A communicator object returned from `create_communicator`
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- `generation` – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- `comm` – A communicator object returned from `create_communicator`
- `generation` – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

namespace hpx

namespace lcos

Functions

```cpp
template<typename Action, typename ArgN, ...>
> hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...
))) > broadcast (std::vector< hpx::id_type > const &ids, ArgN argN, ...)
```

Perform a distributed broadcast operation.

The function hpx::lcos::broadcast performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.)
The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

**Note:** If decltype(Action(...)) is void, then the result of this function is future<void>.

### Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

### Returns

This function returns a future representing the result of the overall reduction operation.

```cpp
template<typename Action, typename ArgN, ...
> void broadcast_post (std::vector< hpx::id_type > const &ids, ArgN argN,...)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function hpx::lcos::broadcast_post performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

### Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```cpp
template<typename Action, typename ArgN, ...
> hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))>> > broadcast_with_index (std::vector< hpx::id_type > const &ids,
ArgN argN,...)
```

Perform a distributed broadcast operation.

The function hpx::lcos::broadcast_with_index performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Note:** If decltype(Action(...)) is void, then the result of this function is future<void>.

### Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
• **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall reduction operation.

```cpp
template<typename Action, typename ArgN, ...
> void broadcast_post_with_index (std::vector< hpx::id_type > const &ids, 
    ArgN argN,...)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function `hpx::lcos::broadcast_post_with_index` performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Parameters**

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

---

**hpx/collectives/channel_communicator.hpp**

See **Public API** for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **collectives**

**Functions**

```cpp
hpx::future<channel_communicator> create_channel_communicator(char const *basename, 
    num_sites_arg num_sites = 
    num_sites_arg(), this_site_arg 
    this_site = this_site_arg())
```

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

**Parameters**

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**Returns** This function returns a future to a new communicator object usable with the collective operation.
channel_communicator create_channel_communicator(hpx::launch::sync_policy, char const *basename, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg())

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

Parameters

• basename – The base name identifying the collective operation
• num_sites – The number of participating sites (default: all localities).
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a new communicator object usable with the collective operation.

template<typename T>
hpx::future<void> set(channel_communicator comm, that_site_arg site, T &&value, tag_arg tag = tag_arg())

Send a value to the given site

This function sends a value to the given site based on the given communicator.

Parameters

• comm – The channel communicator object to use for the data transfer
• site – The destination site
• value – The value to send
• tag – The (optional) tag identifying the concrete operation

Returns This function returns a future<void> that becomes ready once the data transfer operation has finished.

template<typename T>
hpx::future<T> get(channel_communicator comm, that_site_arg site, tag_arg tag = tag_arg())

Send a value to the given site

This function receives a value from the given site based on the given communicator.

Parameters

• comm – The channel communicator object to use for the data transfer
• site – The source site

Returns This function returns a future<T> that becomes ready once the data transfer operation has finished. The future will hold the received value.

hpx/collectives/communication_set.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace collectives
Functions

communicator create_communication_set(char const *basename, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg(), arity_arg arity = arity_arg())

The function create_communication_set sets up a (distributed) tree-like communication structure that can be used with any of the collective APIs (such like all_to_all and similar).

Parameters

• basename – The base name identifying the all_to_all operation
• num_sites – The number of participating sites (default: all localities).
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
• generation – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
• arity – The number of children each of the communication nodes is connected to (default: picked based on num_sites).

Returns This function returns a new communicator object usable with the collective operation.

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace collectives

Functions

communicator create_communicator(char const *basename, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(),
geneneration_arg generation = generation_arg(), root_site_arg root_site = root_site_arg())

Create a new communicator object usable with any collective operation

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as all_gather, all_reduce, all_to_all, broadcast, etc.).

Parameters

• basename – The base name identifying the collective operation
• num_sites – The number of participating sites (default: all localities).
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
• generation – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
• **root_site** – The site that is responsible for creating the collective support object. This value is optional and defaults to ‘0’ (zero).

**Returns** This function returns a new communicator object usable with the collective operation.

```cpp
communicator create_local_communicator(char const *basename, num_sites_arg num_sites,
    this_site_arg this_site, generation_arg generation =
    generation_arg(), root_site_arg root_site =
    root_site_arg())
```

Create a new communicator object usable with any local collective operation

This function creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as `all_gather`, `all_reduce`, `all_to_all`, `broadcast`, etc.).

**Parameters**

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites
- **this_site** – The sequence number of this invocation (usually the sequence number of the object participating in the collective operation). This value must be in the range [0, num_sites).
- **generation** – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- **root_site** – The site that is responsible for creating the collective support object. This value is optional and defaults to ‘0’ (zero).

**Returns** This function returns a new communicator object usable for all local collective operations.

---

**hpx/collectives/exclusive_scan.hpp**

See **Public API** for a list of names and headers that are part of the public HPX API.

```cpp
namespace hpx

namespace collectives

**Functions**

```cpp
template<typename T, typename F>
hpx::future<
    std::decay_t<T>> exclusive_scan(char const *basename, T &&result, F &&op,
    num_sites_arg num_sites = num_sites_arg(),
    this_site_arg this_site = this_site_arg(),
    generation_arg generation = generation_arg(),
    root_site_arg root_site = root_site_arg())
```

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.
Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Parameters
- **basename** – The base name identifying the exclusive_scan operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns: This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

```cpp
template<typename T, typename F>
hpx::future<std::decay_t<T>> exclusive_scan(communicator comm, T &&result, F &&op,
                                          this_site_arg this_site = this_site_arg(),
                                          generation_arg generation = generation_arg())
```

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Parameters
- **comm** – A communicator object returned from create_communicator
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• **comm** – A communicator object returned from `create_communicator`
• **local_result** – The value to transmit to all participating sites from this call site.
• **op** – Reduction operation to apply to all values supplied from all participating sites
• **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**Returns**
This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

### `hpx/collectives/fold.hpp`

See `Public API` for a list of names and headers that are part of the public `HPX API`.

```cpp
namespace hpx

namespace lcos

Functions

```template<typename Action, typename FoldOp, typename Init, typename ArgN, ...>
> hpx::future< decltype(Action(hpx::id_type, ArgN,...))>

fold (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op, Init &&init,
ArgN argN,...)
```

Perform a distributed fold operation.

The function `hpx::lcos::fold` performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

**Note:** The type of the initial value must be convertible to the result type returned from the invoked action.

**Parameters**

• **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
• **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
• **init** – [in] The initial value to be used for the folding operation
• **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

**Returns**
This function returns a future representing the result of the overall folding operation.
Perform a distributed folding operation.

The function `hpx::lcos::fold_with_index` performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Parameters**
- `ids` – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `fold_op` – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- `init` – [in] The initial value to be used for the folding operation
- `argN` – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall folding operation.

Perform a distributed inverse folding operation.

The function `hpx::lcos::inverse_fold` performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

**Parameters**
- `ids` – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `fold_op` – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- `init` – [in] The initial value to be used for the folding operation
- `argN` – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall folding operation.
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> inverse_fold_with_index (std::vector< hpx::id_type > const &ids,
FoldOp &&fold_op, Init &&init, ArgN argN,...)

Perform a distributed inverse folding operation.

The function hpx::lcos::inverse_fold_with_index performs an inverse distributed folding operation
over results returned from action invocations on a given set of global identifiers. The action can be
either plain action (in which case the global identifiers have to refer to localities) or a component action
(in which case the global identifiers have to refer to instances of a component type which exposes the
action.

The function passes the index of the global identifier in the given list of identifiers as the last argument
to the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked
action.

Parameters
• ids – [in] A list of global identifiers identifying the target objects for which the given
action will be invoked.
• fold_op – [in] A binary function expecting two results as returned from the action invo-
cations. The function (or function object) is expected to return the result of the folding
operation performed on its arguments.
• init – [in] The initial value to be used for the folding operation
• argN – [in] Any number of arbitrary arguments (passed by value, by const reference or
by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

hpx/collectives/gather.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace collectives

Functions

template<typename T>

hpx::future<std::vector<decay_t<T>>> gather_here(char const *basename, T &&result,
num_sites_arg num_sites = num_sites_arg(),
this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg())

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters
• basename – The base name identifying the gather operation
• result – The value to transmit to the central gather point from this call site.
• num_sites – The number of participating sites (default: all localities).
• **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

• **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```cpp
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(communicator comm, T &&result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Note:** The generation values from corresponding `gather_here` and `gather_there` have to match.

```cpp
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_there(char const *basename, T &&result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg(), root_site_arg root_site = root_site_arg())
```

2.8. API reference
Gather a given value at the given call site
This function transmits the value given by \textit{result} to a central gather site (where the corresponding \textit{gather\_here} is executed)

\textbf{Parameters}
\begin{itemize}
  \item \texttt{basename} – The base name identifying the gather operation
  \item \texttt{result} – The value to transmit to the central gather point from this call site.
  \item \texttt{this\_site} – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever \texttt{hpx::get\_locality\_id()} returns.
  \item \texttt{generation} – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
  \item \texttt{root\_site} – The sequence number of the central gather point (usually the locality id). This value is optional and defaults to 0.
\end{itemize}

\textbf{Returns} This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

\begin{verbatim}
template<typename T>
hpx::future<
  std::vector<std::decay_t<T>>>
gather\_there(
  communicator comm,
  T &&result,
  this\_site_arg this\_site = this\_site_arg(),
  generation_arg generation = generation_arg())
\end{verbatim}

Gather a given value at the given call site
This function transmits the value given by \textit{result} to a central gather site (where the corresponding \textit{gather\_here} is executed)

Gather a given value at the given call site
This function transmits the value given by \textit{result} to a central gather site (where the corresponding \textit{gather\_here} is executed)

\textbf{Note:} The generation values from corresponding \textit{gather\_here} and \textit{gather\_there} have to match.

\textbf{Parameters}
\begin{itemize}
  \item \texttt{comm} – A communicator object returned from \texttt{create\_communicator}
  \item \texttt{result} – The value to transmit to the central gather point from this call site.
  \item \texttt{this\_site} – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever \texttt{hpx::get\_locality\_id()} returns.
  \item \texttt{generation} – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
  \item \texttt{comm} – A communicator object returned from \texttt{create\_communicator}
  \item \texttt{result} – The value to transmit to the central gather point from this call site.
  \item \texttt{generation} – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
\end{itemize}
Functions

```cpp
template<typename T, typename F>
hpx::future<std::decay_t<T>> inclusive_scan(char const *basename, T &&result, F &&op,
  num_sites_arg num_sites = num_sites_arg(),
  this_site_arg this_site = this_site_arg(),
  generation_arg generation = generation_arg(),
  root_site_arg root_site = root_site_arg())
```

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the inclusive_scan operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. 'params root_site The site that is responsible for creating the inclusive_scan support object. This value is optional and defaults to ‘0’ (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

```cpp
template<typename T, typename F>
hpx::future<std::decay_t<T>> inclusive_scan(communicator comm, T &&result, F &&op,
  this_site_arg this_site = this_site_arg(),
  generation_arg generation = generation_arg())
```

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

See Public API for a list of names and headers that are part of the public HPX API.
Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from `create_communicator`
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from `create_communicator`
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns

This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

**Public Functions**

`latch()` = default

Explicit `latch(std::ptrdiff_t count)`

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

Inline `latch(hpx::id_type const &id)`

Extension: Create a client side representation for the existing `server::latch` instance with the given global id `id`.

See [Public API](Public API) for a list of names and headers that are part of the public `HPX` API.

namespace `hpx`

namespace `distributed`

class `latch` : public `components::client_base<latch, hpx::lcos::server::latch>`

inline `latch(hpx::future<hpx::id_type> &&f)`

Extension: Create a client side representation for the existing `server::latch` instance with the given global id `id`.

inline `latch(hpx::shared_future<hpx::id_type> const &id)`

Extension: Create a client side representation for the existing `server::latch` instance with the given global id `id`.

inline `latch(hpx::shared_future<hpx::id_type> &&id)`

inline void `count_down_and_wait()`

Decrement counter_ by 1. Blocks at the synchronization point until counter_ reaches 0.

Requires: counter_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all `is_ready` calls on this latch that return `true`.

Throws Nothing. –

inline void `arrive_and_wait()`

Decrement counter_ by `update`. Blocks at the synchronization point until counter_ reaches 0.

Requires: counter_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all `is_ready` calls on this latch that return `true`.

Throws Nothing. –

inline void `count_down(std::ptrdiff_t n)`

Decrement counter_ by `n`. Does not block.

Requires: counter_ >= `n` and `n` >= 0.

Synchronization: Synchronizes with all calls that block on this latch and with all `is_ready` calls on this latch that return `true`.

Throws Nothing. –

inline bool `is_ready()` const noexcept

Returns: counter_ == 0. Does not block.

Throws Nothing. –

inline bool `try_wait()` const noexcept

Returns: counter_ == 0. Does not block.

Throws Nothing. –

inline void `wait()` const

If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.

Throws Nothing. –
**Private Types**

typedef components::client_base<latch, hpx::lcos::server::latch> base_type

namespace lcos

**hpx/collectives/reduce.hpp**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace hpx

namespace collectives

**Functions**

template<typename T, typename F>
hpx::future<std::decay_t<T>> reduce_here(char const *basename, T &&result, F &&op,
num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())

Reduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Parameters**

- **basename** – The base name identifying the all_reduce operation
- **local_result** – A value to reduce on the central reduction point from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns** This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

template<typename T, typename F>
hpx::future<decay_t<T>> reduce_here(communicator comm, T &&local_result, F &&op,
this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())

Reduce a set of values from different call sites

This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

Reduce a set of values from different call sites
This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

**Note:** The generation values from corresponding `reduce_here` and `reduce_there` have to match.

**Note:** The generation values from corresponding `reduce_here` and `reduce_there` have to match.

**Parameters**
- **comm** – A communicator object returned from `create_communicator`
- **local_result** – A value to reduce on the root_site from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

**Returns**
This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```cpp
template<typename T, typename F>
hpx::future<void> reduce_there(char const *basename, T &&result, this_site_arg this_site =
this_site_arg(), generation_arg generation = generation_arg(),
root_site_arg root_site = root_site_arg())
```

Reduce a given value at the given call site

This function transmits the value given by `result` to a central reduce site (where the corresponding `reduce_here` is executed)

**Parameters**
- **basename** – The base name identifying the reduction operation
- **result** – A future referring to the value to transmit to the central reduction point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed.
more than once. The generation number (if given) must be a positive number greater than zero.

- **root_site** – The sequence number of the central reduction point (usually the locality id). This value is optional and defaults to 0.

**Returns** This function returns a future<void>. It will become ready once the reduction operation has been completed.

```
template<typename T>
hpx::future<void> reduce_there(communicator comm, T &&local_result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Reduce a given value at the given call site

This function transmits the value given by result to a central reduce site (where the corresponding reduce_here is executed)

Reduce a given value at the given call site

This function transmits the value given by result to a central reduce site (where the corresponding reduce_here is executed)

**Note:** The generation values from corresponding reduce_here and reduce_there have to match.

**Parameters**

- **comm** – A communicator object returned from create_communicator
- **local_result** – A value to reduce on the central reduction point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from create_communicator
- **local_result** – A value to reduce on the central reduction point from this call site.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

**Returns** This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

**Returns** This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.
namespace hpx

namespace lcos

Functions

```cpp
template<typename Action, typename ReduceOp, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...
))>> reduce (std::vector< hpx::id_type > const &ids, ReduceOp &reduce_op,
ArgN argN,...)
```

Perform a distributed reduction operation.

The function hpx::lcos::reduce performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

**Parameters**
- `ids` – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `reduce_op` – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- `argN` – [in] Any number of arbitrary arguments (passed by by const reference) which will be forwarded to the action invocation.

**Returns** This function returns a future representing the result of the overall reduction operation.

```cpp
template<typename Action, typename ReduceOp, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))>> reduce_with_index (std::vector< hpx::id_type > const &ids, ReduceOp &reduce_op, ArgN argN,...)
```

Perform a distributed reduction operation.

The function hpx::lcos::reduce_with_index performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Parameters**
- `ids` – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `reduce_op` – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- `argN` – [in] Any number of arbitrary arguments (passed by by const reference) which will be forwarded to the action invocation.
Returns  This function returns a future representing the result of the overall reduction operation.

hpx/collectives/scatter.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace collectives

Functions

template<typename T>
hpx::future<T> scatter_from(char const *basename, this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg(), root_site_arg root_site =
root_site_arg())

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Parameters

• basename – The base name identifying the scatter operation
• this_site – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
• generation – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
• root_site – The sequence number of the central scatter point (usually the locality id). This value is optional and defaults to 0.

Returns  This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

template<typename T>
hpx::future<T> scatter_from(communicator comm, this_site_arg this_site = this_site_arg(),
generation_arg generation = generation_arg())

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Note: The generation values from corresponding scatter_to and scatter_from have to match.

Note: The generation values from corresponding scatter_to and scatter_from have to match.
Parameters

- **comm** – A communicator object returned from `create_communicator`
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the `all_gather` operation performed on the given base name. This is optional and needs to be supplied only if the `all_gather` operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from `create_communicator`
- **generation** – The generational counter identifying the sequence number of the `all_gather` operation performed on the given base name. This is optional and needs to be supplied only if the `all_gather` operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns

This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```cpp
template<typename T>
hpx::future<T> scatter_to(char const *basename, std::vector<T> &&result, num_sites_arg num_sites = num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Scatter (send) a part of the value set at the given call site

This function transmits the value given by `result` to a central scatter site (where the corresponding `scatter_from` is executed)

Parameters

- **basename** – The base name identifying the scatter operation
- **result** – The value to transmit to the central scatter point from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the `all_gather` operation performed on the given base name. This is optional and needs to be supplied only if the `all_gather` operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns

This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```cpp
template<typename T>
hpx::future<T> scatter_to(communicator comm, std::vector<T> &&result, this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Scatter (send) a part of the value set at the given call site

This function transmits the value given by `result` to a central scatter site (where the corresponding `scatter_from` is executed)
scatter_from is executed)

Note: The generation values from corresponding scatter_to and scatter_from have to match.

Note: The generation values from corresponding scatter_to and scatter_from have to match.

Parameters

- **comm** – A communicator object returned from create_communicator
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

components

See Public API for a list of names and headers that are part of the public HPX API.
namespace hpx

Functions

template<typename Client>
std::vector<Client> find_all_from_basename(std::string base_name, std::size_t num_ids)

Return all registered clients from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Return all registered ids from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Note: The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Note: The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Template Parameters Client – The client type to return

Parameters

- base_name – [in] The base name for which to retrieve the registered ids.
- num_ids – [in] The number of registered ids to expect.
- base_name – [in] The base name for which to retrieve the registered ids.
- num_ids – [in] The number of registered ids to expect.

Returns A list of futures representing the ids which were registered using the given base name.

template<typename Client>
std::vector<Client> find_from_basename(std::string base_name, std::vector<std::size_t> const &ids)

Return registered clients from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

Return registered ids from the given base name and sequence numbers.
This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

**Note:** The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Note:** The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Template Parameters**  
**Client** – The client type to return

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **ids** – [in] The sequence numbers of the registered ids.

**Returns**  
A list of futures representing the ids which were registered using the given base name and sequence numbers.

```cpp
template<typename Client>  
Client find_from_basename(std::string base_name, std::size_t sequence_nr)
```

Return registered id from the given base name and sequence number.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

**Note:** The future embedded in the returned client object will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Note:** The future will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

**Template Parameters**  
**Client** – The client type to return

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
• sequence_nr – [in] The sequence number of the registered id.

• base_name – [in] The base name for which to retrieve the registered ids.

• sequence_nr – [in] The sequence number of the registered id.

Returns A representing the id which was registered using the given base name and sequence numbers.

Returns A representing the id which was registered using the given base name and sequence numbers.

```cpp
template<typename Client, typename Stub, typename Data>
hpx::future<bool> register_with_basename(std::string base_name, components::client_base<Client, Stub, Data> &client, std::size_t sequence_nr)
```

Register the id wrapped in the given client using the given base name.

The function registers the object the given client refers to using the provided base name.

**Note:** The operation will fail if the given sequence number is not unique.

Template Parameters **Client** – The client type to register

Parameters

• base_name – [in] The base name for which to retrieve the registered ids.

• client – [in] The client which should be registered using the given base name.

• sequence_nr – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

Returns A future representing the result of the registration operation itself.

```cpp
template<typename Client>
Client unregister_with_basename(std::string base_name, std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Unregister the given id using the given base name.

Unregister the given base name.

The function unregisters the given ids using the provided base name.

The function unregisters the given ids using the provided base name.

Template Parameters **Client** – The client type to return

Parameters

• base_name – [in] The base name for which to retrieve the registered ids.

• sequence_nr – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with `register_with_basename` before.

• base_name – [in] The base name for which to retrieve the registered ids.

• sequence_nr – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with `register_with_basename` before.
**Functions**

```cpp
hpx::future<bool> register_with_basename
    (std::string base_name, hpx::id_type id,
    std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Register the given id using the given base name.
The function registers the given ids using the provided base name.

**Note:** The operation will fail if the given sequence number is not unique.

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **id** – [in] The id to register using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

**Returns** A future representing the result of the registration operation itself.

```cpp
bool register_with_basename(hpx::launch::sync_policy, std::string base_name, hpx::id_type id,
    std::size_t sequence_nr = ~static_cast<std::size_t>(0), error_code &ec = throws)
```

```cpp
hpx::future<bool> register_with_basename
    (std::string base_name, hpx::future<hpx::id_type> f,
    std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Register the id wrapped in the given future using the given base name.
The function registers the object the given future refers to using the provided base name.

**Note:** The operation will fail if the given sequence number is not unique.

**Parameters**

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **f** – [in] The future which should be registered using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.
**Returns** A future representing the result of the registration operation itself.

### hpx/components/components_fwd.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx

namespace components

template<typename Derived, typename Stub, typename ClientData = void>
class client_base
```

### hpx/components/get_ptr.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx

Functions

template<typename Component>
hpx::future<std::shared_ptr<Component>> get_ptr(hpx::id_type const &id)

Returns a future referring to the pointer to the underlying memory of a component.

The function `hpx::get_ptr` can be used to extract a future referring to the pointer to the underlying memory of a given component.

**Note:** This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise the function will raise an error.

**Note:** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned `shared_ptr` alive.

- **Parameters** `id` – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.
- **Template Parameters** `Component` – The type of the server side component.
- **Returns** This function returns a future representing the pointer to the underlying memory for the component instance with the given `id`.

```cpp
template<typename Derived, typename Stub, typename Data>
```
```cpp
hpx::future<
    std::shared_ptr<typename components::client_base<
        Derived, Stub, Data>
    >::server_component_type>
get_ptr(
    components::client_base<
        Derived, Stub, Data>
    const &c)
```

Returns a future referring to the pointer to the underlying memory of a component.

The function `hpx::get_ptr` can be used to extract a future referring to the pointer to the underlying memory of a given component.

**Note:** This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise the function will raise an error.

**Note:** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned `shared_ptr` alive.

**Parameters**
- `c` – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.

**Returns**
This function returns a future representing the pointer to the underlying memory for the component instance with the given `id`.

```cpp
template<typename Component>
std::shared_ptr<Component>
get_ptr(
    launch::sync_policy p,
    hpx::id_type const &id,
    error_code &ec = throws)
```

Returns the pointer to the underlying memory of a component.

The function `hpx::get_ptr_sync` can be used to extract the pointer to the underlying memory of a given component.

**Note:** This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise the function will raise and error.

**Note:** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned `shared_ptr` alive.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Parameters**
- `p` – [in] The parameter `p` represents a placeholder type to turn make the call synchronous.
- `id` – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialize to `hpx::throws` the function will throw on error instead.
**Template Parameters**  
The – only template parameter has to be the type of the server side component.

**Returns**  
This function returns the pointer to the underlying memory for the component instance with the given id.

```cpp
template<typename Derived, typename Stub, typename Data>
std::shared_ptr<typename components::client_base<Derived, Stub, Data>::server_component_type> get_ptr(launch::sync_policy p, components::client_base<Derived, Stub, Data> const &c, error_code &ec = throws)
```

Returns the pointer to the underlying memory of a component.

The function hpx::get_ptr_sync can be used to extract the pointer to the underlying memory of a given component.

**Note:** This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise the function will raise and error.

**Note:** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Parameters**

- **p** – [in] The parameter p represents a placeholder type to turn make the call synchronous.
- **c** – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

**Returns**  
This function returns the pointer to the underlying memory for the component instance with the given id.

    #include <component_startup_shutdown.hpp> The component_startup_shutdown class provides a minimal implementation of a component’s startup/shutdown function provider.
```

Public Functions

```cpp
inline bool get_startup_function(startup_function_type &startup, bool &pre_startup) override
    Return any startup function for this component.
Parameters startup – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
Returns Returns true if the parameter startup has been successfully initialized with the startup function.
```

```cpp
inline bool get_shutdown_function(shutdown_function_type &shutdown, bool &pre_shutdown) override
    Return any startup function for this component.
Parameters shutdown – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
```
Returns Returns true if the parameter shutdown has been successfully initialized with the shutdown function.

Typedefs

using instead = abstract_component_base<Component>

template<typename Component = detail::this_type>
class abstract_component_base

template<typename Component, typename Derived = detail::this_type>
class abstract_managed_component_base

template<typename Component>
class `component`

template<typename `Component` = detail::this_type>
class `component_base`

template<typename `Component`>
class `fixed_component`

template<typename `Component`>
class `fixed_component_base`

template<typename `Component`, typename `Derived`>
class `managed_component`

```cpp
#include <managed_component_base.hpp>
```
The `managed_component` template is used as an indirect layer for components allowing to gracefully handle the access to non-existing components. Additionally it provides memory management capabilities for the wrapping instances, and it integrates the memory management with the AGAS service. Every instance of a `managed_component` gets assigned a global id. The provided memory management allocates the `managed_component` instances from a special heap, ensuring fast allocation and avoids a full network round trip to the AGAS service for each of the allocated instances.

**Template Parameters**
- `Component` – Component type
- `Derived` – Most derived component type

template<typename `Component`, typename `Wrapper`, typename `CtorPolicy`, typename `DtorPolicy`>
class `managed_component_base`

namespace `components`

`hpx/components_base/get_lva.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

namespace `hpx`

template<typename `Component`, typename `Enable` = void>
struct `get_lva`

```cpp
#include <get_lva.hpp>
```
The `get_lva` template is a helper structure allowing to convert a local virtual address as stored in a local address (returned from the function `resolver_client::resolve`) to the address of the component implementing the action.

The default implementation uses the template argument `Component` to deduce the type wrapping the component implementing the action. This is used to get the needed address.

**Template Parameters**
- `Component` – This is the type of the component implementing the action to execute.

namespace hpx

namespace components

Variables

constexpr char const *const default_binpacking_counter_name = "/runtime{locality/total}/count/component@"

static const binpacking_distribution_policy binpacked = {}

A predefined instance of the binpacking distribution_policy. It will represent the local locality and will place all items to create here.
struct binpacking_distribution_policy

#include <binpacking_distribution_policy.hpp> This class specifies the parameters for a binpacking distribution policy to use for creating a given number of items on a given set of localities. The binpacking policy will distribute the new objects in a way such that each of the localities will equalize the number of overall objects of this type based on a given criteria (by default this criteria is the overall number of objects of this type).

Public Functions

inline binpacking_distribution_policy() Default-construct a new instance of a binpacking_distribution_policy. This policy will represent one locality (the local locality).

inline binpacking_distribution_policy operator()(std::vector<id_type> const &locs, char const *perf_counter_name = default_binpacking_counter_name) const

Create a new default_distribution policy representing the given set of localities.

Parameters

• locs – [in] The list of localities the new instance should represent
• perf_counter_name – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

inline binpacking_distribution_policy operator()(std::vector<id_type> &&locs, char const *perf_counter_name = default_binpacking_counter_name) const

Create a new default_distribution policy representing the given set of localities.

Parameters

• locs – [in] The list of localities the new instance should represent
• perf_counter_name – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

inline binpacking_distribution_policy operator()(id_type const &loc, char const *perf_counter_name = default_binpacking_counter_name) const

Create a new default_distribution policy representing the given locality.

Parameters

• loc – [in] The locality the new instance should represent
• perf_counter_name – [in] The name of the performance counter that should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

template<typename Component, typename ...Ts>
inline hpx::future<hpx::id_type> create(Ts&&... vs) const

Create one object on one of the localities associated by this policy instance.

Parameters vs – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object.

template<typename Component, typename ...Ts>
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const
Create multiple objects on the localities associated by this policy instance

**Parameters**
- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

**Returns** A future holding the list of global addresses which represent the newly created objects

```cpp
inline std::string const &
get_counter_name() const
```

Returns the name of the performance counter associated with this policy instance.

```cpp
inline std::size_t
get_num_localities() const
```

Returns the number of associated localities for this distribution policy.

---

**Note:** This function is part of the creation policy implemented by this class

---

### hpx/distribution_policies/colocating_distribution_policy.hpp

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace hpx

namespace components

#### Variables

```cpp
static const colocating_distribution_policy colocated = {}
```

A predefined instance of the co-locating `distribution_policy`. It will represent the local locality and will place all items to create here.

```cpp
struct colocating_distribution_policy
```

*include <colocating_distribution_policy.hpp>* This class specifies the parameters for a distribution policy to use for creating a given number of items on the locality where a given object is currently placed.

#### Public Functions

```cpp
constexpr colocating_distribution_policy() = default
```

Default-construct a new instance of a `colocating_distribution_policy`. This policy will represent the local locality.

```cpp
inline colocating_distribution_policy operator()(id_type const &id) const
```

Create a new `colocating_distribution_policy` representing the locality where the given object is current located

**Parameters**
- **id** – [in] The global address of the object with which the new instances should be colocated on

---

2.8. API reference
inline `colocating_distribution_policy operator() (client_base<Client, Stub, Data> const &client) const` Create a new `colocating_distribution_policy` representing the locality where the given object is current located

**Parameters**
- **client** – [in] The client side representation of the object with which the new instances should be colocated on

```cpp
template<typename Component, typename ...Ts>
inline hpx::future<hpx::id_type> create(Ts&&... vs) const
```
Create one object on the locality of the object this distribution policy instance is associated with

**Note:** This function is part of the placement policy implemented by this class

**Parameters**
- **vs** – [in] The arguments which will be forwarded to the constructor of the new object.

**Returns**
A future holding the global address which represents the newly created object

```cpp
template<typename Component, typename ...Ts>
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const
```
Create multiple objects colocated with the object represented by this policy instance

**Note:** This function is part of the placement policy implemented by this class

**Parameters**
- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

**Returns**
A future holding the list of global addresses which represent the newly created objects

```cpp
template<typename Action, typename ...Ts>
inline async_result<Action>::type async(launch policy, Ts&&... vs) const
```

```cpp
template<typename Action, typename Callback, typename ...Ts>
inline async_result<Action>::type async_cb(launch policy, Callback &&cb, Ts&&... vs) const
```

**Note:** This function is part of the invocation policy implemented by this class

```cpp
template<typename Action, typename Continuation, typename ...Ts>
inline bool apply(Continuation &&c, threads::thread_priority priority, Ts&&... vs) const
```

```cpp
template<typename Action, typename Continuation, typename Callback, typename ...Ts>
inline bool apply_cb(Continuation &&c, threads::thread_priority priority, Callback &&cb, Ts&&... vs) const
```

**Note:** This function is part of the invocation policy implemented by this class
template<typename Action, typename Callback, typename ...Ts>
inline bool apply_cb(threads::thread_priority priority, Callback &&cb, Ts&&... vs) const

inline hpx::id_type get_next_target() const
    Returns the locality which is anticipated to be used for the next async operation

Public Static Functions

static inline std::size_t get_num_localities()
    Returns the number of associated localities for this distribution policy

    Note: This function is part of the creation policy implemented by this class

Public Types

using type = hpx::future<typename traits::promise_local_result<typename hpx::traits::extract_action<Action>::remote_result_type>::type>

hpx/distribution_policies/default_distribution_policy.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace components

Variables

static const default_distribution_policy default_layout = {};
    A predefined instance of the default distribution_policy. It will represent the local locality and will place all items to create here.
```cpp
struct default_distribution_policy
#include <default_distribution_policy.hpp>
This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

Public Functions

constexpr default_distribution_policy() = default

Default-construct a new instance of a default_distribution_policy. This policy will represent one locality (the local locality).

inline default_distribution_policy operator()(std::vector<id_type> const &locs) const

Create a new default_distribution policy representing the given set of localities.

Parameters

- locs – [in] The list of localities the new instance should represent

inline default_distribution_policy operator()(std::vector<id_type> &&locs) const

Create a new default_distribution policy representing the given set of localities.

Parameters

- locs – [in] The list of localities the new instance should represent

inline default_distribution_policy operator()(id_type const &loc) const

Create a new default_distribution policy representing the given locality

Parameters

- loc – [in] The locality the new instance should represent

```cpp
template<typename Component, typename ...Ts>
inline hpx::future<hpx::id_type> create(Ts&&... vs) const

Create one object on one of the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

- vs – [in] The arguments which will be forwarded to the constructor of the new object.

Returns

A future holding the global address which represents the newly created object

```cpp
template<typename Component, typename ...Ts>
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const

Create multiple objects on the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

- count – [in] The number of objects to create
- vs – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns

A future holding the list of global addresses that represent the newly created objects

```cpp
template<typename Action, typename ...Ts>
inline async_result<Action>::type async(launch_policy, Ts&&... vs) const

template<typename Action, typename Callback, typename ...Ts>
```
inline `async_result<Action>::type async_cb(launch policy, Callback &&cb, Ts&&... vs) const`  

**Note:** This function is part of the invocation policy implemented by this class.

```
template<typename Action, typename Continuation, typename ...Ts>
inline bool apply(Continuation &&c, threads::thread_priority priority, Ts&&... vs) const  
```

**Note:** This function is part of the invocation policy implemented by this class.

```
template<typename Action, typename ...Ts>
inline bool apply(threads::thread_priority priority, Ts&&... vs) const  
```

**Note:** This function is part of the invocation policy implemented by this class.

```
template<typename Action, typename Continuation, typename Callback, typename ...Ts>
inline bool apply_cb(Continuation &&c, threads::thread_priority priority, Callback &&cb, Ts&&... vs) const  
```

**Note:** This function is part of the invocation policy implemented by this class.

```
template<typename Action, typename Callback, typename ...Ts>
inline bool apply_cb(threads::thread_priority priority, Callback &&cb, Ts&&... vs) const  
```

**Note:** This function is part of the invocation policy implemented by this class.

```
inline std::size_t get_num_localities() const  

Returns the number of associated localities for this distribution policy  

**Note:** This function is part of the creation policy implemented by this class.

```
inline hpx::id_type get_next_target() const  

Returns the locality which is anticipated to be used for the next async operation  
```

```
template<typename Action>
struct async_result  

#include <default_distribution_policy.hpp>  

**Note:** This function is part of the invocation policy implemented by this class.

### Public Types

```
using type = hpx::future<typename traits::promise_local_result<typename hpx::traits::extract_action<Action>::remote_result_type>::type>  
```

2.8. API reference 1349
 namespace hpx

 namespace components

 **Variables**

 static const target_distribution_policy target = {};

 A predefined instance of the target_distribution_policy. It will represent the local locality and will place all items to create here.

 struct target_distribution_policy

 #include <target_distribution_policy.hpp> This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

 **Public Functions**

 target_distribution_policy() = default

 Default-construct a new instance of a target_distribution_policy. This policy will represent one locality (the local locality).

 inline target_distribution_policy operator()(id_type const &id) const

 Create a new target_distribution_policy representing the given locality

 Parameters loc – [in] The locality the new instance should represent

 template<typename Component, typename ...Ts>

 inline hpx::future<hpx::id_type> create(Ts&&... vs) const

 Create one object on one of the localities associated by this policy instance

 **Note:** This function is part of the placement policy implemented by this class

 Parameters vs – [in] The arguments which will be forwarded to the constructor of the new object.

 Returns A future holding the global address which represents the newly created object

 template<typename Component, typename ...Ts>

 inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const

 Create multiple objects on the localities associated by this policy instance

 **Note:** This function is part of the placement policy implemented by this class

 Parameters

 * count – [in] The number of objects to create
 * vs – [in] The arguments which will be forwarded to the constructors of the new objects.
Returns A future holding the list of global addresses which represent the newly created objects.

```cpp
template<typename Action, typename ...Ts>
inline async_result<Action>::type async(launch policy, Ts&&... vs) const
```

```cpp
template<typename Action, typename Callback, typename ...Ts>

```

**Note:** This function is part of the invocation policy implemented by this class.

```cpp
template<typename Action, typename Continuation, typename ...Ts>
inline bool apply(Continuation &&c, threads::thread_priority priority, Ts&&... vs) const
```

**Note:** This function is part of the invocation policy implemented by this class.

```cpp
template<typename Action, typename ...Ts>
inline bool apply(threads::thread_priority priority, Ts&&... vs) const
```

```cpp
template<typename Action, typename Continuation, typename Callback, typename ...Ts>
inline bool apply_cb(Continuation &&c, threads::thread_priority priority, Callback &&cb, Ts&&... vs) const
```

**Note:** This function is part of the invocation policy implemented by this class.

```cpp
template<typename Action, typename Callback, typename ...Ts>
inline bool apply_cb(threads::thread_priority priority, Callback &&cb, Ts&&... vs) const
```

**Note:** This function is part of the invocation policy implemented by this class.

```cpp
inline std::size_t get_num_localities() const
```

Returns the number of associated localities for this distribution policy.

**Note:** This function is part of the creation policy implemented by this class.

```cpp
inline hpx::id_type get_next_target() const
```

Returns the locality which is anticipated to be used for the next async operation.

**Note:** This function is part of the creation policy implemented by this class.

```cpp
<hpx:idel_type get_next_target.hpp>
```

**Note:** This function is part of the invocation policy implemented by this class.

See Public API for a list of names and headers that are part of the public HPX API.

hpx/executors_distributed/distribution_policy_executor.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace parallel

namespace execution

Functions

template< typename DistPolicy>
distribution_policy_executor(DistPolicy&&) ->
    distribution_policy_executor<
    std::decay_t<DistPolicy>>

template< typename DistPolicy> HPX_DEPRECATED_V (1, 9,
    "hpx::parallel::execution::make_distribution_policy_executor is "
    "deprecated, use "
    "hpx::parallel::execution::distribution_policy_executor instead")
    distribution_policy_executor

Create a new distribution_policy_executor from the given distribution_policy.

Parameters policy – The distribution_policy to create an executor from

template< typename DistPolicy>
class distribution_policy_executor

#include <distribution_policy_executor.hpp> A distribution_policy_executor creates groups of
parallel execution agents that execute in threads implicitly created by the executor and placed on
any of the associated localities.

Template Parameters DistPolicy – The distribution policy type for which an executor
should be created. The expression hpx::traits::is_distribution_policy_v<DistPolicy> must
evaluate to true.
int finalize(double shutdown_timeout, double localwait = -1.0, error_code &ec = throws)

Main function to gracefully terminate the HPX runtime system.

The function `hpx::finalize` is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see `hpx::init`) on all localities.

The default value (-1.0) will try to find a globally set timeout value (can be set as the configuration parameter `hpx.shutdown_timeout`), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

The default value (-1.0) will try to find a globally set wait time value (can be set as the configuration parameter “hpx.finalize_wait_time”), and if this is not set or -1.0 as well, it will disable any addition local wait time before proceeding.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to `hpx::disconnect`, these functions do not need to be called both.

**Parameters**

- **shutdown_timeout** – This parameter allows to specify a timeout (in microseconds), specifying how long any of the connected localities should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.

- **localwait** – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.

---

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`. 
• **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns** This function will always return zero.

```cpp
inline int finalize(error_code &ec = throws)
```

Main function to gracefully terminate the HPX runtime system.

The function *hpx::finalize* is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on all localities.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to *hpx::disconnect*, these functions do not need to be called both.

**Note:** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn’t throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Parameters** *ec* – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns** This function will always return zero.

```cpp
void terminate()
```

Terminate any application non-gracefully.

The function *hpx::terminate* is the non-graceful way to exit any application immediately. It can be called from any locality and will terminate all localities currently used by the application.

**Note:** This function will cause HPX to call *std::terminate()* on all localities associated with this application. If the function is called not from an HPX thread it will fail and return an error using the argument *ec*.

```cpp
int disconnect(double shutdown_timeout, double localwait = -1.0, error_code &ec = throws)
```

Disconnect this locality from the application.

The function *hpx::disconnect* can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on this locality.

The default value ( -1.0) will try to find a globally set timeout value (can be set as the configuration parameter “hpx.shutdown_timeout”), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.
The default value (-1.0) will try to find a globally set wait time value (can be set as the configuration parameter `hpx.finalize_wait_time`), and if this is not set or -1.0 as well, it will disable any addition local wait time before proceeding.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

### Parameters

- **shutdown_timeout** – This parameter allows to specify a timeout (in microseconds), specifying how long this locality should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.

- **localwait** – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

### Returns

This function will always return zero.

```cpp
inline int disconnect(error_code &ec = throws)
```

Disconnect this locality from the application.

The function `hpx::disconnect` can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see `hpx::init`) on this locality.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

```cpp
int stop(error_code &ec = throws)
```

Stop the runtime system.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called on every locality. This function should be used only if the runtime system was started using `hpx::start`.

---

1356 Chapter 2. What’s so special about **HPX**?
**Returns** The function returns the value, which has been returned from the user supplied main HPX function (usually `hpx_main`).

`hpx/hpx_init.hpp`

**Returns** The function returns `true` if command line processing succeeded and the runtime system was started successfully. It will return `false` otherwise.

### `hpx/hpx_suspend.hpp`

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

#### Functions

```
int suspend(error_code &ec = throws)
```

Suspend the runtime system.

The function `hpx::suspend` is used to suspend the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be empty. This function only be called when the runtime is running, or already suspended in which case this function will do nothing.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.  

---

1364 Chapter 2. What’s so special about HPX?
Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function will always return zero.

int resume(error_code &ec = throws)
Resume the HPX runtime system.

The function hpx::resume is used to resume the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be resumed. This function only be called when the runtime suspended, or already running in which case this function will do nothing.

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Parameters ec – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns This function will always return zero.

naming_base
See Public API for a list of names and headers that are part of the public HPX API.

hpx/naming_base/unmanaged.hpp
See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

Functions

hpx::id_type unmanaged(hpx::id_type const &id)
The helper function hpx::unmanaged can be used to generate a global identifier which does not participate in the automatic garbage collection.

Note: This function allows to apply certain optimizations to the process of memory management in HPX. It however requires the user to take full responsibility for keeping the referenced objects alive long enough.

Parameters id – [in] The id to generated the unmanaged global id from This parameter can be itself a managed or a unmanaged global id.

Returns This function returns a new global id referencing the same object as the parameter id. The only difference is that the returned global identifier does not participate in the automatic garbage collection.
parcelset

See Public API for a list of names and headers that are part of the public HPX API.

hpx/parcelset/connection_cache.hpp

namespace hpx

namespace parcelset

**Typedefs**

using parcel_write_handler_type = hpx::function<void(std::error_code const&, hpx::parcelset::parcel const&)>  

The type of a function that can be registered as a parcel write handler using the function hpx::set_parcel_write_handler.
**Note:** A parcel write handler is a function which is called by the parcel layer whenever a parcel has been sent by the underlying networking library and if no explicit parcel handler function was specified for the parcel.

**Enums**

```cpp
class parcelport_background_mode
{
  enum
  {
    parcelport_background_mode_flush_buffers = 0,
    parcelport_background_mode_send = 1,
    parcelport_background_mode_receive = 2,
    parcelport_background_mode_all = 3,
  }
}
```

**Values:**

- **enumerator parcelport_background_mode_flush_buffers**
  perform buffer flush operations
- **enumerator parcelport_background_mode_send**
  perform send operations (includes buffer flush)
- **enumerator parcelport_background_mode_receive**
  perform receive operations
- **enumerator parcelport_background_mode_all**
  perform all operations

**Functions**

namespace performance_counters

Functions

bool default_counter_discoverer(counter_info const&, discover_counter_func const&,
                            discover_counters_mode, error_code&)

Default discovery function for performance counters; to be registered with the counter types. It will pass the counter_info and the error_code to the supplied function.

bool locality_counter_discoverer(counter_info const&, discover_counter_func const&,
                                  discover_counters_mode, error_code&)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:
/<objectname>(locality#<locality_id>/total)/<instancename>

bool locality_pool_counter_discoverer(counter_info const&, discover_counter_func const&,
                                       discover_counters_mode, error_code&)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:
/<objectname>(locality#<locality_id>/pool#<pool_name>/total)/<instancename>

bool locality0_counter_discoverer(counter_info const&, discover_counter_func const&,
                                  discover_counters_mode, error_code&)

Default discoverer function for AGAS performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:
/<objectname>{locality#0/total}/<instancename>

bool locality_thread_counter_discoverer(counter_info const &, discover_counter_func const &,
                                         discover_counters_mode, error_code &)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:
/<objectname>(locality#<locality_id>/worker-thread#<threadnum>)/<instancename>

bool locality_pool_thread_counter_discoverer(counter_info const &,
                                             discover_counter_func const &f,
                                             discover_counters_mode mode, error_code &ec)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:
/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum> }/<instancename>

bool locality_pool_thread_no_total_counter_discoverer(counter_info const &,
                                                        discover_counter_func const &f,
                                                        discover_counters_mode mode, 
                                                        error_code &ec)
Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

`/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum>}/<instancename>`

This is essentially the same as above just that `locality#/total` is not supported.

```cpp
bool locality numa_counter_discoverer(counter_info const&,
    discover_counter_func const&,
    discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

`/<objectname>(locality#<locality_id>/numa-node#<threadnum>)/<instancename>`

```cpp
naming::gid_type locality raw counter creator(counter_info const&,
    hpx::function<std::int64_t(bool)> const&, error_code&)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

`/<objectname>(locality#<locality_id>/total)/<instancename>`

```cpp
naming::gid_type locality raw values counter creator(counter_info const&,
    hpx::function<std::vector<std::int64_t>(bool)> const&, error_code&)
```

```cpp
naming::gid_type agas raw counter creator(counter_info const&, error_code&, char const*const)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

`/agas(<objectinstance>/total)/<instancename>`

```cpp
bool agas counter discoverer(counter_info const&,
    discover_counter_func const&,
    discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

`/agas(<objectinstance>/total)/<instancename>`

```cpp
naming::gid_type local action invocation counter creator(counter_info const&,
    error_code&)
```

```cpp
bool local action invocation counter discoverer(counter_info const&,
    discover_counter_func const&,
    discover_counters_mode, error_code&)
```

`hpx/performance_counters/counters.hpp`

See Public API for a list of names and headers that are part of the public HPX API.
**Typedefs**

typedef `hpx::function<naming::gid_type(counter_info const&, error_code&)>` **create_counter_func**

This declares the type of a function, which will be called by HPX whenever a new performance counter instance of a particular type needs to be created.

typedef `hpx::function<bool(counter_info const&, error_code&)>` **discover_counter_func**

This declares a type of a function, which will be passed to a `discover_counters_func` in order to be called for each discovered performance counter instance.

typedef `hpx::function<bool(counter_info const&, discover_counter_func const&, discover_counters_mode, error_code&)>` **discover_counters_func**

This declares the type of a function, which will be called by HPX whenever it needs to discover all performance counter instances of a particular type.

**Enums**

enum class **counter_type**

Values:

enumerator **text**

`text` shows a variable-length text string. It does not deliver calculated values.

Formula: None Average: None Type: Text

enumerator **raw**

`raw` shows the last observed value only. It does not deliver an average.

Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

enumerator **monotonically_increasing**

`monotonically_increasing` shows the cumulatively accumulated observed value. It does not deliver an average.

Formula: None. Shows cumulatively accumulated data as collected. Average: None Type: Instantaneous

enumerator **average_base**

`average_base` is used as the base data (denominator) in the computation of time or count averages for the `counter_type::average_count` and `counter_type::average_timer` counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in fractional calculations without delivering an output. Average: SUM (N) / x Type: Instantaneous

enumerator **average_count**

`average_count` shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.
Formula: \( \frac{(N1 - N0)}{(D1 - D0)} \), where the numerator \( (N) \) represents the number of items processed during the last sample interval, and the denominator \( (D) \) represents the number of operations completed during the last two sample intervals. Average: \( \frac{(Nx - N0)}{(Dx - D0)} \) Type: Average

enumerator **aggregating**

*aggregating* applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula: \( F(Nx) \)

enumerator **average_timer**

*average_timer* measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable \( F \) represents the number of ticks per second. The value of \( F \) is factored into the equation so that the result is displayed in seconds.

Formula: \( \frac{((N1 - N0)}{(D1 - D0)} \), where the numerator \( (N) \) represents the number of ticks counted during the last sample interval, the variable \( F \) represents the frequency of the ticks, and the denominator \( (D) \) represents the number of operations completed during the last sample interval. Average: \( \frac{((Nx - N0)}{(Dx - D0)} \) Type: Average

enumerator **elapsed_time**

*elapsed_time* shows the total time between when the component or process started and the time when this value is calculated. The variable \( F \) represents the number of time units that elapse in one second. The value of \( F \) is factored into the equation so that the result is displayed in seconds.

Formula: \( \frac{(D0 - N0)}{F} \), where the nominator \( (D) \) represents the current time, the numerator \( (N) \) represents the time the object was started, and the variable \( F \) represents the number of time units that elapse in one second. Average: \( \frac{(Dx - N0)}{F} \) Type: Difference

enumerator **histogram**

*histogram* exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a `counter_value_array` instead of a `counter_value`. Those will also not implement the `get_counter_value()` functionality. The results are exposed through a separate `get_counter_values_array()` function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

enumerator **raw_values**

*raw_values* exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a `counter_value_array` instead of a `counter_value`. Those will also not implement the `get_counter_value()` functionality. The results are exposed through a separate `get_counter_values_array()` function.

enumerator **text**

enumerator **raw**
enumerator `monotonically_increasing`

enumerator `average_base`

enumerator `average_count`

enumerator `aggregating`

enumerator `average_timer`

enumerator `elapsed_time`

enumerator `histogram`

enumerator `raw_values`

  `raw_values` counter exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a `counter_value_array` instead of a `counter_value`. Those will also not implement the `get_counter_value()` functionality. The results are exposed through a separate `get_counter_values_array()` function.

enum class `counter_status`

  Status and error codes used by the functions related to performance counters.

  **Values:**

  enumerator `valid_data`

  No error occurred, data is valid.

  enumerator `new_data`

  Data is valid and different from last call.

  enumerator `invalid_data`

  Some error occurred, data is not value.

  enumerator `already_definded`

  The type or instance already has been defined.

  enumerator `counter_unknown`

  The counter instance is unknown.

  enumerator `counter_type_unknown`

  The counter type is unknown.

  enumerator `generic_error`

  A unknown error occurred.
enumerator valid_data

enumerator new_data

enumerator invalid_data

enumerator already_defined

enumerator counter_unknown

enumerator counter_type_unknown

std::string const &helptext = "", std::uint32_t version = HPX_PERFORMANCE_COUNTER_V1,
std::string const &uom = "")
```

Public Members

```cpp
counter_type type_
    The type of the described counter.

std::uint32_t version_
    The version of the described counter using the 0xMMmmSSSS scheme

counter_status status_
    The status of the counter object.

std::string fullname_
    The full name of this counter.

std::string helptext_
    The full descriptive text for this counter.

std::string unit_of_measure_
    The unit of measure for this counter.
```

Private Functions

Values:

enumerator text
text shows a variable-length text string. It does not deliver calculated values.
Formula: None Average: None Type: Text

enumerator raw
raw shows the last observed value only. It does not deliver an average.
Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

enumerator monotonically_increasing
monotonically_increasing shows the cumulatively accumulated observed value. It does not deliver an average.
Formula: None. Shows cumulatively accumulated data as collected. Average: None Type: Instantaneous
enumerator **average_base**

`average_base` is used as the base data (denominator) in the computation of time or count averages for the `counter_type::average_count` and `counter_type::average_timer` counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in factional calculations without delivering an output. Average: `SUM (N) / x` Type: Instantaneous

enumerator **average_count**

`average_count` shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula: `(N1 - N0) / (D1 - D0)`, where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average: `(Nx - N0) / (Dx - D0)` Type: Average

enumerator **aggregating**

`aggregating` applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula: `F(Nx)`

enumerator **average_timer**

`average_timer` measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: `((N1 - N0) / F) / (D1 - D0)`, where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval. Average: `((Nx - N0) / F) / (Dx - D0)` Type: Average

enumerator **elapsed_time**

`elapsed_time` shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: `(D0 - N0) / F`, where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average: `(Dx - N0) / F` Type: Difference

enumerator **histogram**

`histogram` exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a `counter_value_array` instead of a `counter_value`. Those will also not implement the `get_counter_value()` functionality. The results are exposed through a separate `get_counter_values_array()` function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.
enumerator raw_values

raw_values exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a counter_value_array instead of a counter_value. Those will also not implement the get_counter_value() functionality. The results are exposed through a separate get_counter_values_array() function.

**Functions**

inline constexpr bool operator<(counter_type lhs, counter_type rhs) noexcept

inline constexpr bool operator>(counter_type lhs, counter_type rhs) noexcept

```cpp
std::ostream &operator<<(std::ostream &os, counter_status rhs)
```

```cpp
counter_status get_counter_type_name(counter_type_path_elements const &path, std::string &result, error_code &ec = throws)
```

Create a full name of a counter type from the contents of the given counter_type_path_elements instance. The generated counter type name will not contain any parameters.

```cpp
counter_status get_full_counter_type_name(counter_type_path_elements const &path, std::string &result, error_code &ec = throws)
```

Create a full name of a counter type from the contents of the given counter_type_path_elements instance. The generated counter type name will contain all parameters.
counter_status get_counter_name(counter_path_elements const &path, std::string &result, error_code &ec = throws)

Create a full name of a counter from the contents of the given counter_path_elements instance.

counter_status get_counter_instance_name(counter_path_elements const &path, std::string &result, error_code &ec = throws)

Create a name of a counter instance from the contents of the given counter_path_elements instance.

counter_status get_counter_type_path_elements(std::string const &name, counter_type_path_elements &path, error_code &ec = throws)

Fill the given counter_type_path_elements instance from the given full name of a counter type.

counter_status get_counter_path_elements(std::string const &name, counter_path_elements &path, error_code &ec = throws)

Fill the given counter_path_elements instance from the given full name of a counter.

counter_status get_counter_name(std::string const &name, std::string &countername, error_code &ec = throws)

Return the canonical counter instance name from a given full instance name.

counter_status get_counter_type_name(std::string const &name, std::string &type_name, error_code &ec = throws)

Return the canonical counter type name from a given (full) instance name.

HPX_DEPRECATED_V (1, 9, HPX_DISCOVER_COUNTERS_MODE_UNSCOPED_ENUM_DEPRECATION_MSG) inline const expr discover_counters_mode

counter_status complement_counter_info(counter_info &info, counter_info const &type_info, error_code &ec = throws)

Complement the counter info if parent instance name is missing.

counter_status complement_counter_info(counter_info &info, error_code &ec = throws)

counter_status add_counter_type(counter_info const &info, create_counter_func const &create_counter, discover_counters_func const &discover_counts, error_code &ec = throws)

counter_status discover_counter_types(discover_counter_func const &discover_counter, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

Call the supplied function for each registered counter type.

counter_status discover_counter_types(std::vector<counter_info> &counters, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

Return a list of all available counter descriptions.

counter_status discover_counter_type(std::string const &name, discover_counter_func const &discover_counter, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

Call the supplied function for the given registered counter type.
counter_status discover_counter_type(counter_info const &info, discover_counter_func const &discover_counter, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

counter_status discover_counter_type(std::string const &name, std::vector<counter_info> &counters, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

Return a list of matching counter descriptions for the given registered counter type.

counter_status discover_counter_type(counter_info const &info, std::vector<counter_info> &counters, discover_counters_mode mode = discover_counters_mode::minimal, error_code &ec = throws)

bool expand_counter_info(counter_info const& info, discover_counter_func const& discover_counter, error_code& ec)

call the supplied function with all expanded versions of the supplied counter info.

This function expands all locality#* and worker-thread#* wild cards only.

counter_status remove_counter_type(counter_info const &info, error_code &ec = throws)

Remove an existing counter type from the (local) registry.

Note: This doesn’t remove existing counters of this type, it just inhibits defining new counters using this type.

counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec = throws)

Retrieve the counter type for the given counter name from the (local) registry.

hpx::future<hpx::id_type> get_counter_async(std::string name, error_code &ec = throws)

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter name.

hpx::future<hpx::id_type> get_counter_async(counter_info const &info, error_code &ec = throws)

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter info.

void get_counter_infos(counter_info const &info, counter_type &type, std::string &helptext, std::uint32_t &version, error_code &ec = throws)

Retrieve the meta data specific for the given counter instance.

void get_counter_infos(std::string name, counter_type &type, std::string &helptext, std::uint32_t &version, error_code &ec = throws)

Retrieve the meta data specific for the given counter instance.

struct counter_value
Public Functions

inline counter_value(std::int64_t value = 0, std::int64_t scaling = 1, bool scale_inverse = false)

template<typename T>
inline T get_value(error_code &ec = throws) const

Retrieve the ‘real’ value of the counter_value, converted to the requested type T.

Public Members

std::uint64_t time_

The local time when data was collected.

std::uint64_t count_

The invocation counter for the data.

std::int64_t value_

The current counter value.

std::int64_t scaling_

The scaling of the current counter value.

counter_status status_

The status of the counter value.

bool scale_inverse_

If true, value_ needs to be divided by scaling_, otherwise it has to be multiplied.

Private Functions

void serialize(serialization::output_archive &ar, const unsigned int)

void serialize(serialization::input_archive &ar, const unsigned int)

**hpx/performance_counters/manage_counter_type.hpp**

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace hpx

```cpp
namespace performance_counters
```

**Functions**

```cpp
counter_status install_counter_type(std::string const &name, hpx::function<std::int64_t(bool)> const &counter_value, std::string const &helptext = "", std::string const &uom = "", counter_type type = counter_type::raw, error_code &ec = throws)
```

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new generic counter type based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this this counter type will cause the provided function to be called and the returned value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: `'/objectname{locality#/}<*>/total}/countername'` where `'<*>'` is a zero based integer identifying the locality the counter is created on.

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

**Parameters**

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format `/objectname/countername`.
- **counter_value** – [in] The function to call whenever the counter value is requested by a consumer.
- **helptext** – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **type** – [in] Type for the new performance counter type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.
Returns If successful, this function returns valid_data, otherwise it will either throw an exception or return an error_code from the enum counter_status (also, see note related to parameter ec).

```
counter_status install_counter_type(std::string const &name,
      hpx::function<
        std::vector<std::int64_t>(bool)>
        const &counter_value,
      std::string const &helptext = "", std::string
        const &uom = "", error_code &ec = throws)
```

Install a new generic performance counter type returning an array of values in a way, that will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new generic counter type that returns an array of values based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this this counter type will cause the provided function to be called and the returned array value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: '/objectname{locality#<*>/total}/countername' where '<*>' is a zero based integer identifying the locality the counter is created on.

Note: As long as `ec` is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of hpx::exception.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **counter_value** – [in] The function to call whenever the counter value (array of values) is requested by a consumer.
- **helptext** – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns If successful, this function returns valid_data, otherwise it will either throw an exception or return an error_code from the enum counter_status (also, see note related to parameter ec).

```
void install_counter_type(std::string const &name, counter_type type, error_code &ec = throws)
```

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new counter type based on the provided counter_type_info. The counter type will be automatically unregistered during system shutdown.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Note: As long as `ec` is not pre-initialized to hpx::throws this function doesn’t throw but returns the
result code using the parameter \( ec \). Otherwise it throws an instance of hpx::exception.

### Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

### Returns

If successful, this function returns valid_data, otherwise it will either throw an exception or return an error_code from the enum counter_status (also, see note related to parameter ec).

```cpp
counter_status install_counter_type(std::string const &name, counter_type type, std::string const &helptext, std::string const &uom = "", std::uint32_t version = HPX_PERFORMANCE_COUNTER_V1, error_code &ec = throws)
```

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new counter type based on the provided `counter_type_info`. The counter type will be automatically unregistered during system shutdown.

**Note:** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

**Note:** As long as \( ec \) is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter \( ec \). Otherwise it throws an instance of hpx::exception.

### Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **helptext** – [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **version** – [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

### Returns

If successful, this function returns valid_data, otherwise it will either throw an exception or return an error_code from the enum counter_status (also, see note related to parameter ec).

```cpp
counter_status install_counter_type(std::string const &name, counter_type type, std::string const &helptext, create_counter_func const &create_counter, discover_counters_func const &discover_count, std::uint32_t version = HPX_PERFORMANCE_COUNTER_V1, std::string const &uom = "", error_code &ec = throws)
```

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new generic counter type based on the provided...
counter_type_info. The counter type will be automatically unregistered during system shutdown.

**Note:** As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

**Note:** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

**Parameters**
- **name** [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** [in] The type of the counters of this counter_type.
- **helptext** [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **version** [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- **create_counter** [in] The function which will be called to create a new instance of this counter type.
- **discover_counters** [in] The function will be called to discover counter instances which can be created.
- **uom** [in] The unit of measure of the counter type (default: “”)
- **ec** [in,out] this represents the error status on exit, if this is pre-initializated to hpx::throws the function will throw on error instead.

**Returns** If successful, this function returns valid_data, otherwise it will either throw an exception or return an error_code from the enum counter_status (also, see note related to parameter ec).

hpx/performance_counters/registry.hpp

See **Public API** for a list of names and headers that are part of the public HPX API.

namespace hpx

namespace performance_counters

class registry

**Public Functions**

registry() = default

void clear()

Reset registry by deleting all stored counter types.

counter_status add_counter_type(counter_info const &info, create_counter_func const &create_counter, discover_counters_func const &discover_counters, error_code &ec = throws)

Add a new performance counter type to the (local) registry.
counter_status discover_counter_types(discover_counter_func discover_counter,
    discover_counters_mode mode, error_code &ec = throws)
Call the supplied function for all registered counter types.

counter_status discover_counter_type(std::string const &fullname, discover_counter_func
    discover_counter, discover_counters_mode mode, error_code &ec = throws)
Call the supplied function for the given registered counter type.

inline counter_status discover_counter_type(counter_info const &info, discover_counter_func
    const &f, discover_counters_mode mode, error_code &ec = throws)
inline counter_status discover_counter_type(counter_info const &info, discover_counter_func
    &create_counter, error_code &ec = throws) const

counter_status get_counter_create_function(counter_info const &info,
    create_counter_func &create_counter, error_code &ec = throws) const
Retrieve the counter creation function which is associated with a given counter type.

counter_status get_counter_discovery_function(counter_info const &info,
    discover_counters_func &func, error_code &ec) const
Retrieve the counter discovery function which is associated with a given counter type.

counter_status remove_counter_type(counter_info const &info, error_code &ec = throws)
Remove an existing counter type from the (local) registry.

**Note:** This doesn’t remove existing counters of this type, it just inhibits defining new counters
using this type.

counter_status create_raw_counter_value(counter_info const &info, std::int64_t *countervalue,
    naming::gid_type &id, error_code &ec = throws)
Create a new performance counter instance of type raw_counter based on given counter value.

counter_status create_raw_counter(counter_info const &info, hpx::function<
    std::int64_t()> const &f, naming::gid_type &id, error_code &ec = throws)
Create a new performance counter instance of type raw_counter based on given function returning
the counter value.

counter_status create_raw_counter(counter_info const &info, hpx::function<
    std::int64_t(bool)> const &f, naming::gid_type &id, error_code &ec = throws)
Create a new performance counter instance of type raw_counter based on given function returning
the counter value.

counter_status create_raw_counter(counter_info const &info,
    hpx::function<
        std::vector<std::int64_t> const &f, naming::gid_type &id, error_code &ec = throws)
Create a new performance counter instance of type raw_counter based on given function returning
the counter value.

counter_status create_raw_counter(counter_info const &info,
    hpx::function<
        std::vector<std::int64_t>(bool)> const &f, naming::gid_type &id, error_code &ec = throws)
Create a new performance counter instance of type raw_counter based on given function returning
the counter value.
counter_status create_counter(counter_info const &info, naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance based on given counter info.

counter_status create_statistics_counter(counter_info const &info, std::string const &base_counter_name, std::vector<std::size_t> const &parameters, naming::gid_type &id, error_code &ec = throws)

Create a new statistics performance counter instance based on given base counter name and given base time interval (milliseconds).

counter_status create_arithmetics_counter(counter_info const &info, std::vector<std::string> const &base_counter_names, naming::gid_type &id, error_code &ec = throws)

Create a new arithmetics performance counter instance based on given base counter names.

counter_status create_arithmetics_counter_extended(counter_info const &info, std::vector<std::string> const &base_counter_names, naming::gid_type &id, error_code &ec = throws)

Create a new extended arithmetics performance counter instance based on given base counter names.

counter_status add_counter(hpx::id_type const &id, counter_info const &info, error_code &ec = throws)

Add an existing performance counter instance to the registry.

counter_status remove_counter(counter_info const &info, hpx::id_type const &id, error_code &ec = throws)

Remove the existing performance counter from the registry

counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec = throws)

Retrieve counter type information for given counter name.

plugin_factories

See Public API for a list of names and headers that are part of the public HPX API.

hpx/plugin_factories/binary_filter_factory.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_BINARY_FILTER_FACTORY(BinaryFilter, pluginname)

This macro is used create and to register a minimal component factory with Hpx.Plugin.

namespace hpx

namespace plugins

template<typename BinaryFilter>
struct binary_filter_factory : public binary_filter_factory_base

#include <binary_filter_factory.hpp> The message_handler_factory provides a minimal implementation of a message handler’s factory. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a message handler’s factory instance.

Template Parameters BinaryFilter – The message handler type this factory should be responsible for.

Public Functions

inline binary_filter_factory(util::section const *global, util::section const *local, bool isenabled)

Construct a new factory instance.

Note: The contents of both sections has to be cloned in order to save the configuration setting for later use.

Parameters

- global – [in] The pointer to a hpx::util::section instance referencing the settings read from the [settings] section of the global configuration file (hpx.ini) This pointer may be nullptr if no such section has been found.
- local – [in] The pointer to a hpx::util::section instance referencing the settings read from the section describing this component type: [hpx.components.<name>], where <name> is the instance name of the component as given in the configuration files.

~binary_filter_factory() override = default

inline serialization::binary_filter *create(bool compress, serialization::binary_filter *next_filter = nullptr) override

Create a new instance of a message handler

return Returns the newly created instance of the message handler supported by this factory

Protected Attributes

util::section global_settings_

util::section local_settings_

bool isenabled_

namespace hpx

namespace plugins

template<typename Plugin, char const *const Name, char const *const Section, char const *const Suffix>
struct plugin_registry : public plugin_registry_base

#include <plugin_registry.hpp> The plugin_registry provides a minimal implementation of a plugin’s registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a plugin’s registry instance.

Template Parameters Plugin – The plugin type this registry should be responsible for.

Public Functions

inline bool get_plugin_info(std::vector<std::string> &fillini) override  
Return the ini-information for all contained components.

Parameters fillini – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

Returns Returns true if the parameter fillini has been successfully initialized with the registry data of all implemented in this module.
runtime_components

See Public API for a list of names and headers that are part of the public HPX API.

hpx/runtime_components/component_factory.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_COMPONENT(type, name, mode)
Define a component factory for a component type.

This macro is used to create and register a minimal component factory for a component type which allows it to be remotely created using the hpx::new_<> function.

This macro can be invoked with one, two or three arguments

Parameters

- **type** – The type parameter is a (fully decorated) type of the component type for which a factory should be defined.
- **name** – The name parameter specifies the name to use to register the factory. This should uniquely (system-wide) identify the component type. The name parameter must conform to the C++ identifier rules (without any namespace). If this parameter is not given, the first parameter is used.
- **mode** – The mode parameter has to be one of the defined enumeration values of the enumeration hpx::components::factory_state_enum. The default for this parameter is hpx::components::factory_enabled.

hpx/runtime_components/component_registry.hpp

See Public API for a list of names and headers that are part of the public HPX API.

Defines

template<typename Component, factory_state_enum state>
struct component_registry : public component_registry_base

#include <component_registry.hpp> The component_registry provides a minimal implementation of a component’s registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a component’s registry instance.

Template Parameters Component – The component type this registry should be responsible for.

Public Functions

inline bool get_component_info(std::vector<std::string> &fillini, std::string const &filepath, bool is_static = false) override

Return the ini-information for all contained components.

Parameters fillini – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

Returns Returns true if the parameter fillini has been successfully initialized with the registry data of all implemented in this module.

inline void register_component_type() override

Return the unique identifier of the component type this factory is responsible for.

Parameters

• locality – [in] The id of the locality this factory is responsible for.
• agas_client – [in] The AGAS client to use for component id registration (if needed).

Returns Returns the unique identifier of the component type this factory instance is responsible for. This function throws on any error.

namespace hpx

Functions

template<typename Component, typename... Ts> < unspecified > new_ (id_type const &locality, Ts &&... vs)

Create one or more new instances of the given Component type on the specified locality.

This function creates one or more new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:
**Parameters**

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

**Returns** The function returns different types depending on its use:

- If the explicit template argument `Component` represents a component type (`traits::is_component<Component>::value evaluates to true`), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument `Component` represents a client side object (`traits::is_client<Component>::value evaluates to true`), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```cpp
template<typename Component, typename... Ts> < unspecified > local_new (Ts &&... vs)
Create one new instance of the given Component type on the current locality.
```

This function creates one new instance of the given Component type on the current locality and returns a future object for the global address which can be used to reference the new component instance.

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```cpp
hpx::future<hpx::id_type> f =
    hpx::local_new<some_component>(...);
    hpx::id_type id = f.get();
```

**Note:** The difference of this function to `hpx::new_` is that it can be used in cases where the supplied arguments are non-copyable and non-movable. All operations are guaranteed to be local only.

**Parameters** `vs` – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

**Returns** The function returns different types depending on its use:

- If the explicit template argument `Component` represents a component type (`traits::is_component<Component>::value evaluates to true`), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component. If the first argument is `hpx::launch::sync` the function will directly return an `hpx::id_type`.
• If the explicit template argument `Component` represents a client side object (traits::is_client<Component>::value evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```cpp
template<typename Component, typename... Ts> < unspecified > new_ (id_type const &locality, std::size_t count, Ts &... vs)
Create multiple new instances of the given Component type on the specified locality.
```

This function creates multiple new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```cpp
hpx::future<std::vector<hpx::id_type> > f =
  hpx::new_<some_component[]>(hpx::find_here(), 10, ...);
```

**Parameters**

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

**Returns** The function returns different types depending on its use:

- If the explicit template argument `Component` represents an array of a component type (i.e. `Component[]`, where traits::is_component<Component>::value evaluates to true), the function will return an `hpx::future` object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a global address of one of the newly created components.

- If the explicit template argument `Component` represents an array of a client side object type (i.e. `Component[]`, where traits::is_client<Component>::value evaluates to true), the function will return an `hpx::future` object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

```cpp
template<typename Component, typename DistPolicy, typename... Ts> < unspecified > new_ (DistPolicy const &policy, Ts &... vs)
Create one or more new instances of the given Component type based on the given distribution policy.
```

This function creates one or more new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for global address which can be used to reference the new component instance(s).

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:
hpx::future<hpx::id_type> f =
hpx::new_<some_component>(hpx::default_layout, ...);
hpx::id_type id = f.get();

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument Component represents a component type (traits::is_component<Component>::value evaluates to true), the function will return an hpx::future object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument Component represents a client side object (traits::is_client<Component>::value evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```cpp
template<typename Component, typename DistPolicy, typename... Ts>
< unspecified > new_ (DistPolicy const &policy, std::size_t count, Ts &... vs)

Create multiple new instances of the given Component type on the localities as defined by the given distribution policy.

This function creates multiple new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:
```

hpx::future<std::vector<hpx::id_type> > f =
hpx::new_<some_component[]>(hpx::default_layout, 10, ...);
hpx::id_type id = f.get();

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument Component represents an array of a component type (i.e. Component[], where traits::is_component<Component>::value evaluates to true), the function will return an hpx::future object instance which holds a
std::vector<hpx::id_type>, where each of the items in this vector is a global address of one of the newly created components.

- If the explicit template argument Component represents an array of a client side object type (i.e. Component[], where traits::is_client<Component>::value evaluates to true), the function will return an hpx::future object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

### runtime_distributed

See Public API for a list of names and headers that are part of the public HPX API.

### hpx/runtime_distributed.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx

class runtime_distributed : public runtime

    #include <runtime_distributed.hpp> The runtime class encapsulates the HPX runtime system in a simple to use way. It makes sure all required parts of the HPX runtime system are properly initialized.

#### Public Functions

explicit runtime_distributed(\util::runtime_configuration &rtcfg, int (*pre_main)(runtime_mode) = nullptr, void (*post_main)() = nullptr)

Construct a new HPX runtime instance

Parameters locality_mode – [in] This is the mode the given runtime instance should be executed in.

~runtime_distributed()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

int start(hpx::function<hpx_main_function_type> const &func, bool blocking = false) override

Start the runtime system.

Parameters

- func – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef hpx_main_function_type.
- blocking – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is true the function runtime::start will call runtime::wait internally.

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter func. Otherwise it will return zero.

int start(bool blocking = false) override

Start the runtime system.

Parameters blocking – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is true the function runtime::start will call runtime::wait internally.
Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter func. Otherwise it will return zero.

int wait() override
    Wait for the shutdown action to be executed.
Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter func.

void stop(bool blocking = true) override
    Initiate termination of the runtime system.
Parameters blocking – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is false then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to true to wait for all internal work to be completed.

int finalize(double shutdown_timeout) override

void stop_helper(bool blocking, std::condition_variable &cond, std::mutex &mtx)
    Stop the runtime system, wait for termination.
Parameters blocking – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is false then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to true to wait for all internal work to be completed.

int suspend() override
    Suspend the runtime system.

int resume() override
    Resume the runtime system.

bool report_error(std::size_t num_thread, std::exception_ptr const &e, bool terminate_all = true) override
    Report a non-recoverable error to the runtime system.
Parameters
    • num_thread – [in] The number of the operating system thread the error has been detected in.
    • e – [in] This is an instance encapsulating an exception which lead to this function call.
    • terminate_all – [in] Kill all localities attached to the currently running application (default: true)

bool report_error(std::exception_ptr const &e, bool terminate_all = true) override
    Report a non-recoverable error to the runtime system.

Note: This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

Parameters
    • e – [in] This is an instance encapsulating an exception which lead to this function call.
    • terminate_all – [in] Kill all localities attached to the currently running application (default: true)

int run(hpx::function<hpx_main_function_type> const &func) override
    Run the HPX runtime system, use the given function for the main thread and block waiting for all threads to finish.
**Note:** The parameter `func` is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

**Parameters**

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef `hpx_main_function_type`. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

**Returns**

- This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

```cpp
int run() override

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

**Returns**

This function will always return 0 (zero).
```

```cpp
bool is_networking_enabled() override

```

**template<typename F>**

```cpp
inline components::server::console_error_dispatcher::sink_type set_error_sink(F &&sink)
```

**performance_counters::registry &get_counter_registry()**

- Allow access to the registry counter registry instance used by the HPX runtime.

**performance_counters::registry const &get_counter_registry() const**

- Allow access to the registry counter registry instance used by the HPX runtime.

```cpp
void register_counter_types()

Install all performance counters related to this runtime instance.
```

```cpp
void register_query_counters(std::shared_ptr<util::query_counters> const &active_counters)
```

```cpp
void start_active_counters(error_code &ec = throws)
```

```cpp
void stop_active_counters(error_code &ec = throws)
```

```cpp
void reset_active_counters(error_code &ec = throws)
```

```cpp
void reinit_active_counters(bool reset = true, error_code &ec = throws)
```

```cpp
void evaluate_active_counters(bool reset = false, char const *description = nullptr, error_code &ec = throws)
```

```cpp
void stop_evaluating_counters(bool terminate = false)
```

**naming::resolver_client &get_agas_client()**

- Allow access to the AGAS client instance used by the HPX runtime.

**hpx::threads::threadmanager &get_thread_manager()** override

- Allow access to the thread manager instance used by the HPX runtime.

**applier::applier &get_applier()**

- Allow access to the applier instance used by the HPX runtime.

**std::string here() const override**

- Returns a string of the locality endpoints (usable in debug output)
naming::address_type get_runtime_support_lva() const

naming::gid_type get_next_id(std::size_t count = 1)

void init_id_pool_range()

util::unique_id_ranges &get_id_pool()

void initialize_agas()

Initialize AGAS operation.

void add_pre_startup_function(startup_function_type f) override

Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with add_startup_function.

Note: The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters f – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void add_startup_function(startup_function_type f) override

Add a function to be executed inside a HPX thread before hpx_main

Parameters f – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void add_pre_shutdown_function(shutdown_function_type f) override

Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

Note: The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters f – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

void add_shutdown_function(shutdown_function_type f) override

Add a function to be executed inside a HPX thread during hpx::finalize

Parameters f – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

hpx::util::io_service_pool *get_thread_pool(char const *name) override

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument name are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

bool register_thread(char const *name, std::size_t num = 0, bool service_thread = true, error_code &ec = throws) override

Register an external OS-thread with HPX.
notification_policy_type get_notification_policy(char const *prefix,
                                             runtime_local::os_thread_type type) override

Generate a new notification policy instance for the given thread name prefix

std::uint32_t get_locality_id(error_code &ec) const override

std::size_t get_num_worker_threads() const override

std::uint32_t get_num_localities(hpx::launch::sync_policy, error_code &ec) const override

std::uint32_t get_initial_num_localities() const override

hpx::future<std::uint32_t> get_num_localities() const override

std::string get_locality_name() const override

std::uint32_t get_num_localities(hpx::launch::sync_policy, components::component_type type, error_code &ec) const

hpx::future<std::uint32_t> get_num_localities(components::component_type type) const

std::uint32_t assign_cores(std::string const &locality_basename, std::uint32_t num_threads) override

std::uint32_t assign_cores() override

namespace hpx

namespace applier

class applier

#include <applier.hpp> The applier class is used to decide whether a particular action has to be issued on a local or a remote resource. If the target component is local a new thread will be created, if the target is remote a parcel will be sent.
Public Functions

**HPX_NON_COPYABLE** (*applier*)

*applier*

void *init*(*threads::threadmanager &tm*)

~*applier*() = default

void *initialize*(*std::uint64_t rts*)

*threads::threadmanager* & *get_thread_manager*

Access the *thread-manager* instance associated with this *applier*.

This function returns a reference to the thread manager this *applier* instance has been created with.

*naming::gid_type* const & *get_raw_locality*(*error_code &ec = throws*) const

Allow access to the locality of the locality this *applier* instance is associated with.

This function returns a reference to the locality this *applier* instance is associated with.

*std::uint32_t* *get_locality_id*(*error_code &ec = throws*) const

Allow access to the id of the locality this *applier* instance is associated with.

This function returns a reference to the id of the locality this *applier* instance is associated with.

bool *get_raw_remote_localities*(*std::vector<naming::gid_type> &locality_ids,*
components::component_type type = components::component_invalid,*
error_code &ec = throws*) const

Return list of localities of all remote localities registered with the AGAS service for a specific component type.

This function returns a list of all remote localities (all localities known to AGAS except the local one) supporting the given component type.

**Parameters**

- **locality_ids** – [out] The reference to a vector of id_types filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

**Returns** The function returns *true* if there is at least one remote locality known to the AGAS service (!prefixes.empty()).

bool *get_remote_localities*(*std::vector<hpx::id_type> &locality_ids,*
components::component_type type = components::component_invalid,*
error_code &ec = throws*) const

bool *get_raw_localities*(*std::vector<naming::gid_type> &locality_ids,*
components::component_type type = components::component_invalid)* const

Return list of locality_ids of all localities registered with the AGAS service for a specific component type.

This function returns a list of all localities (all localities known to AGAS except the local one) supporting the given component type.

**Parameters**

- **locality_ids** – [out] The reference to a vector of id_types filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

**Returns** The function returns *true* if there is at least one remote locality known to the AGAS service (!prefixes.empty()).

namespace hpx

   namespace applier

**Functions**

applier &get_applier()
   The function get_applier returns a reference to the (thread specific) applier instance.

applier *get_applier_ptr()
   The function get_applier returns a pointer to the (thread specific) applier instance. The returned pointer is NULL if the current thread is not known to HPX or if the runtime system is not active.

namespace applier
   The namespace applier contains all definitions needed for the class hpx::applier::applier and its related functionality. This namespace is part of the HPX core module.
namespace hpx

namespace components

Functions

template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy)
    Copy given component to the specified target locality.
    The function copy<Component> will create a copy of the component referenced by to_copy on the
    locality specified with target_locality. It returns a future referring to the newly created component
    instance.

    Note: The new component instance is created on the locality of the component instance which is to
    be copied.

Parameters
• to_copy – [in] The global id of the component to copy

Template Parameters
• The – only template argument specifies the component type to create.

Returns
• A future representing the global id of the newly (copied) component instance.

template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy, hpx::id_type const &target_locality)
    Copy given component to the specified target locality.
    The function copy<Component> will create a copy of the component referenced by to_copy on the
    locality specified with target_locality. It returns a future referring to the newly created component
    instance.

Parameters
• to_copy – [in] The global id of the component to copy
• target_locality – [in] The locality where the copy should be created.

Template Parameters
• The – only template argument specifies the component type to create.

Returns
• A future representing the global id of the newly (copied) component instance.

template<typename Derived, typename Stub, typename Data>
Derived copy(client_base<Derived, Stub, Data> const &to_copy, hpx::id_type const &target_locality = hpx::invalid_id)
    Copy given component to the specified target locality.
    The function copy will create a copy of the component referenced by the client side object to_copy
    on the locality specified with target_locality. It returns a new client side object future referring to the
    newly created component instance.

    Note: If the second argument is omitted (or is invalid_id) the new component instance is created on
    the locality of the component instance which is to be copied.

Parameters
• to_copy – [in] The client side object representing the component to copy
• **target_locality** – [in, optional] The locality where the copy should be created (default is same locality as source).

**Template Parameters**

The only template argument specifies the component type to create.

**Returns**

A future representing the global id of the newly (copied) component instance.

### `hpx/runtime_distributed/find_all_localities.hpp`

See Public API for a list of names and headers that are part of the public HPX API.

```cpp
namespace hpx
{

### Functions

**`hpx::id_type find_root_locality(error_code &ec = throws)`**

Return the global id representing the root locality.

The function `find_root_locality()` can be used to retrieve the global id usable to refer to the root locality. The root locality is the locality where the main AGAS service is hosted.

**See also:**

`hpx::find_all_localities(), hpx::find_locality()`

**Note:**

Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Note:**

As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:**

This function will return meaningful results only if called from an HPX-thread. It will return `hpx::invalid_id` otherwise.

**Parameters**

`ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**

The global id representing the root locality for this application.

**`std::vector<hpx::id_type> find_all_localities(error_code &ec = throws)`**

Return the list of global ids representing all localities available to this application.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application.

**See also:**

`hpx::find_here(), hpx::find_locality()`
Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as \texttt{ec} is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \texttt{ec}. Otherwise it throws an instance of \texttt{hpx::exception}.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters \texttt{ec} – \texttt{[in,out]} this represents the error status on exit, if this is pre-initialized to \texttt{hpx::throws} the function will throw on error instead.

Returns The global ids representing the localities currently available to this application.

\begin{verbatim}
std::vector<hpx::id_type> find_remote_localities(error_code &ec = throws)
\end{verbatim}

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function \texttt{find_remote_localities()} can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one).

See also:

\texttt{hpx::find_here()}, \texttt{hpx::find_locality()}

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as \texttt{ec} is not pre-initialized to \texttt{hpx::throws} this function doesn’t throw but returns the result code using the parameter \texttt{ec}. Otherwise it throws an instance of \texttt{hpx::exception}.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters \texttt{ec} – \texttt{[in,out]} this represents the error status on exit, if this is pre-initialized to \texttt{hpx::throws} the function will throw on error instead.

Returns The global ids representing the remote localities currently available to this application.
namespace hpx

### Functions

`hpx::id_type find_here(error_code &ec = throws)`

Return the global id representing this locality.

The function `find_here()` can be used to retrieve the global id usable to refer to the current locality.

See also:

`hpx::find_all_localities(), hpx::find_locality()`

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Note:** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return `hpx::invalid_id` otherwise.

**Parameters** `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns** The global id representing the locality this function has been called on.

### hpx/runtime_distributed/find_localities.hpp

See Public API for a list of names and headers that are part of the public HPX API.

namespace hpx
Functions

```cpp
std::vector<hpx::id_type> find_all_localities(components::component_type type, error_code &ec = throws)
```

Return the list of global ids representing all localities available to this application which support the given component type.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application which support the creation of instances of the given component type.

See also:

hpx::find_here(), hpx::find_locality()

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters

- `type` – [in] The type of the components for which the function should return the available localities.
- `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The global ids representing the localities currently available to this application which support the creation of instances of the given component type. If no localities supporting the given component type are currently available, this function will return an empty vector.

```cpp
std::vector<hpx::id_type> find_remote_localities(components::component_type type, error_code &ec = throws)
```

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function `find_remote_localities()` can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one) which support the creation of instances of the given component type.

See also:

hpx::find_here(), hpx::find_locality()
Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as ec is not pre-initialized to hpx::throws this function doesn’t throw but returns the result code using the parameter ec. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return any available locality.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to hpx::throws the function will throw on error instead.

Returns The global ids representing the remote localities currently available to this application.

```cpp
hpx::id_type find_locality(components::component_type type, error_code &ec = throws)
```

Return the global id representing an arbitrary locality which supports the given component type.

The function `find_locality()` can be used to retrieve the global id of an arbitrary locality currently available to this application which supports the creation of instances of the given component type.

See also:

`hpx::find_here(), hpx::find_all_localities()`
**Returns** The global id representing an arbitrary locality currently available to this application which supports the creation of instances of the given component type. If no locality supporting the given component type is currently available, this function will return `hpx::invalid_id`.

### `hpx/runtime_distributed/get_locality_name.hpp`

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx {

    Functions

    future<std::string> get_locality_name(hpx::id_type const &id)
        Return the name of the referenced locality.
        This function returns a future referring to the name for the locality of the given id.
        
        See also:
        `std::string get_locality_name()`

            Parameters **id** – [in] The global id of the locality for which the name should be retrieved
            
            Returns This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

### `hpx/runtime_distributed/get_num_localities.hpp`

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```cpp
namespace hpx {

    Functions

    hpx::future<std::uint32_t> get_num_localities(components::component_type t)
        Asynchronously return the number of localities which are currently registered for the running application.
        The function `get_num_localities` asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.
        
        See also:
        `hpx::find_all_localities, hpx::get_num_localities`

        Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

```
Parameters t – The component type for which the number of connected localities should be retrieved.

```cpp
std::uint32_t get_num_localities(launch::sync_policy, component::component_type t, error_code &ec = throws)
```

Synchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also:
`hpx::find_all_localities, hpx::get_num_localities`

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

---

```cpp
def migrate<Component, DistPolicy>(hpx::id_type const &to_migrate, [[maybe_unused]] DistPolicy const &policy)
```

Migrate the given component to the specified target locality

The function `migrate<Component>` will migrate the component referenced by `to_migrate` to the locality specified with `target_locality`. It returns a future referring to the migrated component instance.

Parameters
- `policy` – [in] A distribution policy which will be used to determine the locality to migrate this object to.

Template Parameters
- `Component` – Specifies the component type of the component to migrate.
- `DistPolicy` – Specifies the distribution policy to use to determine the destination locality.

Returns A future representing the global id of the migrated component instance. This should be the same as `migrate_to`.
template<typename Derived, typename Stub, typename Data, typename DistPolicy>
Derived migrate(client_base<Derived, Stub, Data> const &to_migrate, DistPolicy const &policy)

Migrate the given component to the specified target locality.

The function migrate<Component> will migrate the component referenced by to_migrate to the locality specified with target_locality. It returns a future referring to the migrated component instance.

**Parameters**
- policy – [in] A distribution policy which will be used to determine the locality to migrate this object to.

**Template Parameters**
- Derived – Specifies the component type of the component to migrate.
- DistPolicy – Specifies the distribution policy to use to determine the destination locality.

**Returns** A future representing the global id of the migrated component instance. This should be the same as migrate_to.

template<typename Component>
future<hpx::id_type> migrate(hpx::id_type const &to_migrate, hpx::id_type const &target_locality)

Migrate the component with the given id to the specified target locality.

The function migrate<Component> will migrate the component referenced by to_migrate to the locality specified with target_locality. It returns a future referring to the migrated component instance.

**Parameters**
- target_locality – [in] The id of the locality to migrate this object to.

**Template Parameters**
- Component – Specifies the component type of the component to migrate.

**Returns** A future representing the global id of the migrated component instance. This should be the same as migrate_to.

template<typename Derived, typename Stub, typename Data>
Derived migrate(client_base<Derived, Stub, Data> const &to_migrate, hpx::id_type const &target_locality)

Migrate the given component to the specified target locality.

The function migrate<Component> will migrate the component referenced by to_migrate to the locality specified with target_locality. It returns a future referring to the migrated component instance.

**Parameters**
- target_locality – [in] The id of the locality to migrate this object to.

**Template Parameters**
- Derived – Specifies the component type of the component to migrate.

**Returns** A client side representation of representing of the migrated component instance. This should be the same as migrate_to.

namespace components

Functions

struct counter_interface_functions & counter_init()

class runtime_support : public hpx::components::stubs::runtime_support

#include <runtime_support.hpp>  The runtime_support class is the client side representation of a server::runtime_support component

Public Functions

inline runtime_support(hpx::id_type const & gid = hpx::invalid_id)

Create a client side representation for the existing server::runtime_support instance with the given global id gid.

template<typename Component, typename ... Ts>
inline hpx::id_type create_component(Ts&&... vs)

Create a new component type using the runtime_support.

template<typename Component, typename ... Ts>
inline hpx::future<hpx::id_type> create_component_async(Ts&&... vs)

Asynchronously create a new component using the runtime_support.

template<typename Component, typename ... Ts>
inline std::vector<hpx::id_type> bulk_create_component(std::size_t, Ts&&... vs)

Asynchronously create N new default constructed components using the runtime_support.

template<typename Component, typename ... Ts>
inline hpx::future<std::vector<hpx::id_type>> bulk_create_components_async(std::size_t, Ts&&... vs)

Asynchronously create a new component using the runtime_support.
inline hpx::future<int> load_components_async()

inline int load_components()

inline hpx::future<void> call_startup_functions_async(bool pre_startup)
inline void call_startup_functions(bool pre_startup)

inline hpx::future<void> shutdown_async(double timeout = -1)
    Shutdown the given runtime system.

inline void shutdown(double timeout = -1)
inline void shutdown_all(double timeout = -1)
    Shutdown the runtime systems of all localities.

inline hpx::future<void> terminate_async()
    Terminate the given runtime system.

inline void terminate()
inline void terminate_all()
    Terminate the runtime systems of all localities.

inline void get_config(util::section &ini)
    Retrieve configuration information.

inline hpx::id_type const &get_id() const

naming::gid_type copy_create_component(std::shared_ptr<Component> const &p, bool)
```

```cpp
template<typename Component>
naming::gid_type migrate_component_to_here(std::shared_ptr<Component> const &p, hpx::id_type)
```

```cpp
void shutdown(double timeout, hpx::id_type const &respond_to)
```

Gracefully shutdown this runtime system instance.

```cpp
void shutdown_all(double timeout)
```

Gracefully shutdown runtime system instances on all localities.

```cpp
void terminate(hpx::id_type const &respond_to)
```

Shutdown this runtime system instance.

```cpp
inline void terminate_act(hpx::id_type const &id)
```

```cpp
void terminate_all()
```

Shutdown runtime system instances on all localities.

```cpp
inline void terminate_all_act()
```

```cpp
util::section get_config()
```

Retrieve configuration information.

```cpp
int load_components()
```

Load all components on this locality.

```cpp
void call_startup_functions(bool pre_startup)
```

```cpp
void call_shutdown_functions(bool pre_shutdown)
```

```cpp
void garbage_collect()
```

Force a garbage collection operation in the AGAS layer.

```cpp
naming::gid_type create_performance_counter(performance_counters::counter_info const &info)
```

Create the given performance counter instance.

```cpp
void remove_from_connection_cache(naming::gid_type const &gid, parcelset::endpoints_type const &eps)
```

Remove the given locality from our connection cache.
HPX_DEFINE_COMPONENT_ACTION (runtime_support, terminate_act, terminate_action) HPX_DEFINE_COMPONENT_ACTION (runtime_support, termination_detection terminate_all_action HPX_DEFINE_COMPONENT_ACTION (runtime_support, remove_from_connection_cache) void run()

Start the runtime_support component.

void wait()

Wait for the runtime_support component to notify the calling thread.

This function will be called from the main thread, causing it to block while the HPX functionality is executed. The main thread will block until the shutdown_action is executed, which in turn notifies all waiting threads.

void stop(double timeout, hpx::id_type const &respond_to, bool remove_from_remote_caches)

Notify all waiting (blocking) threads allowing the system to be properly stopped.

Note: This function can be called from any thread.

void stopped()

called locally only

Public Static Functions

template<typename Component, typename ...Ts>
static inline hpx::future<hpx::id_type> create_component_async(hpx::id_type const &gid, Ts&&... vs)

Create a new component type using the runtime_support with the given targetgid. This is a non-blocking call. The caller needs to call future::get on the result of this function to obtain the global id of the newly created object.

template<typename Component, typename ...Ts>
static inline hpx::id_type create_component(hpx::id_type const &gid, Ts&&... vs)

Create a new component type using the runtime_support with the given targetgid. Block for the creation to finish.

template<typename Component, typename ...Ts>
static inline hpx::future<std::vector<hpx::id_type>> bulk_create_component_colocated_async(hpx::id_type const &gid, std::size_t count, Ts&&... vs)

Create multiple new components type using the runtime_support colocated with the with the given targetgid. This is a non-blocking call.

template<typename Component, typename ...Ts>
static inline std::vector<hpx::id_type> bulk_create_component_colocated(hpx::id_type const &gid, std::size_t count, Ts&&... vs)

Create multiple new components type using the runtime_support colocated with the with the given targetgid. Block for the creation to finish.

template<typename Component, typename ...Ts>
static inline hpx::future<std::vector<hpx::id_type>> bulk_create_component_async(hpx::id_type const &gid, std::size_t count, Ts&&... vs)

Create multiple new components type using the runtime_support on the given locality. This is a non-blocking call.

template<typename Component, typename ...Ts>
static inline std::vector<hpx::id_type> bulk_create_component(hpx::id_type const &gid, std::size_t count, Ts&&... vs)

Create multiple new components type using the runtime_support on the given locality. Block for the creation to finish.

template<typename Component, typename ...Ts>
static inline hpx::future<hpx::id_type> create_component_colocated_async(hpx::id_type const &gid, Ts&&... vs)

Create multiple new components type using the runtime_support on the given locality. This is a non-blocking call.
Create a new component type using the `runtime_support` with the given `targetgid`. This is a non-blocking call. The caller needs to call `future::get` on the result of this function to obtain the global id of the newly created object.

```
template<typename Component, typename ...Ts>
static inline hpx::id_type create_component_colocated(hpx::id_type const &gid, Ts&&... vs)
```

Create a new component type using the `runtime_support` with the given `targetgid`. Block for the creation to finish.

template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Reduce, typename Convert>
parallel::util::detail::algorithm_result<ExPolicy, T>::type tag_invoke(hpx::transform_reduce_t, ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

2.9 Contributing to HPX

HPX development happens on Github. The following sections are a collection of useful information related to HPX development.
2.9.1 Contributing to HPX

The main source of information to understand the process of how to contribute to HPX can be found in this document. This is a living document that is constantly updated with relevant information.

2.9.2 HPX governance model

The HPX project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. This document describes how that participation takes place and how to set about earning merit within the project community.

2.9.3 Release procedure for HPX

Below is a step by step procedure for making an HPX release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an HPX release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.

2. For minor and major releases: create and check out a new branch at an appropriate point on master with the name release-major.minor.X. major and minor should be the major and minor versions of the release. For patch releases: check out the corresponding release-major.minor.X branch.

3. Write release notes in docs/sphinx/releases/whats_new_$VERSION.rst. Keep adding merged PRs and closed issues to this until just before the release is made. Use tools/generate_pr_issue_list.sh to generate the lists. Add the new release notes to the table of contents in docs/sphinx/releases.rst.

4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
   - $HPX_SOURCE/README.rst
     - Update grant information
   - docs/sphinx/releases/whats_new_$VERSION.rst
   - docs/sphinx/about_hpx/people.rst
     - Update collaborators
     - Update grant information

5. This step does not apply to patch releases. For both APEX and libCDS:
   - Change the release branch to be the most current release tag available in the APEX/libCDS git_external section in the main CMakeLists.txt. Please contact the maintainers of the respective packages to generate a new release to synchronize with the HPX release (APEX, libCDS).

6. Make sure HPX_VERSION_MAJOR/MINOR/SUBMINOR in CMakeLists.txt contain the correct values. Change them if needed.

---

548 https://github.com/STEllAR-GROUP/hpx/blob/master/.github/CONTRIBUTING.md
549 http://hpx.stellar-group.org/documents/governance/
550 http://github.com/UO-OACISS/xpress-apex
551 https://github.com/STEllAR-GROUP/libcds
7. Change version references in CITATION.cff. There are two occurrences. Change year in the copyright file under /libs/core/version/src/version.cpp.

8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main CMakeLists.txt and also deleting all related code and tests from the main source tree.

The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:

   a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
   b. Second release cycle: turn this build option OFF by default.
   c. Third release cycle: completely remove the old code.

The main CMakeLists.txt contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don’t have a replacement yet, we keep them around in case (like Vc for example).

9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in prerequisites.rst.

10. Verify that the Jenkins setups for the release branch on Rostam and Piz Daint are running and do not display any errors.

11. Repeat the following steps until satisfied with the release.

   1. Change HPX_VERSION_TAG in CMakeLists.txt to -rcN, where N is the current iteration of this step. Start with -rc1.
   2. Create a pre-release on GitHub using the script tools/roll_release.sh. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.
   3. This step is not necessary for patch releases. Notify hpx-users@stellar-group.org and stellar@cct.lsu.edu of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
   4. Allow at least a week for testing of the release candidate.
      • Use git merge when possible, and fall back to git cherry-pick when needed. For patch releases git cherry-pick is most likely your only choice if there have been significant unrelated changes on master since the previous release.
      • Go back to the first step when enough patches have been added.
      • If there are no more patches, continue to make the final release.

12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, quickstart.rst contains instructions to check out the latest stable tag. Make sure that refers to the new version.

13. Add a new entry to the RPM changelog (cmake/packaging/rpm/Changelog.txt) with the new version number and a link to the corresponding changelog.

14. Change HPX_VERSION_TAG in CMakeLists.txt to an empty string.

15. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of HPX_VERSION_DATE in CMakeLists.txt.

16. Create a release on GitHub using the script tools/roll_release.sh. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.

17. Update the websites (hpx.stellar-group.org552, stellar-group.org553 and stellar.cct.lsu.edu554). You can login on

---

552 https://hpx.stellar-group.org
553 https://stellar-group.org
554 https://stellar.cct.lsu.edu

2.9. Contributing to HPX 1441
wordpress through this page <https://hpx.stellar-group.org/wp-login.php>. You can update the pages with the following:

- Update links on the downloads page. Link to the release on GitHub.
- Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
- A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).

18. Merge release branch into master.

19. Post-release cleanup. Create a new pull request against master with the following changes:
   1. Modify the release procedure if necessary.
   2. Change HPX_VERSION_TAG in CMakeLists.txt back to -trunk.
   3. Increment HPX_VERSION_MINOR in CMakeLists.txt.

20. Update Vcpkg (https://github.com/Microsoft/vcpkg) to pull from latest release.
   - Update version number in CONTROL
   - Update tag and SHA512 to that of the new release

   - Update version number in hpx/package.py and SHA256 to that of the new release

22. Announce the release on hpx-users@stellar-group.org, stellar@cct.lsu.edu, allcct@cct.lsu.edu, faculty@csc.lsu.edu, faculty@ece.lsu.edu, the HPX Slack channel, the IRC channel, our list of external collaborators, isocpp.org, reddit.com, HPC Wire, Inside HPC, Heise Online, and a CCT press release.

23. Beer and pizza.

### 2.9.4 Testing HPX

To ensure correctness of HPX, we ship a large variety of unit and regression tests. The tests are driven by the CTest tool and are executed automatically on each commit to the HPX Github repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our HPX Issues tracker with detailed information about the target system.

#### Running tests manually

Running the tests manually is as easy as typing make tests && make test. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the ctest command. You can list all available test targets using make help | grep tests. Please see the CTest Documentation for further details.

---

556 https://github.com/STEllAR-GROUP/hpx/
557 https://github.com/STEllAR-GROUP/hpx/issues
Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the HPX source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`).

Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

Issue tracker

If you stumble over a bug or missing feature in HPX, please submit an issue to our HPX Issues page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the Support Website page.

Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both CircleCI and a combination of CDash and pycicle. You can see the dashboards here: CircleCI HPX dashboard and CDash HPX dashboard. 

2.9.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, Docker provides a convenient alternative to quickly get all the dependencies needed to start development of HPX. Our testing setup on CircleCI uses a docker image to run all tests.

To get started you need to install Docker using whatever means is most convenient on your system. Once you have Docker installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on Docker Hub. To start a container using the HPX build environment, run:

```
$ docker run stellargroup/build_env
```
$ docker run --interactive --tty stellargroup/build_env:latest bash

You are now in an environment where all the HPX build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the Docker Documentation\(^\text{571}\) for more information on using Docker\(^\text{572}\).

**Warning:** All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the HPX source tree) after closing the container, you can bind directories from the host system into the container (see Docker Documentation (Bind mounts)\(^\text{573}\)).

### 2.9.6 Documentation

This documentation is built using Sphinx\(^\text{574}\), and an automatically generated API reference using Doxygen\(^\text{575}\) and Breathe\(^\text{576}\).

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

#### Prerequisites

To build the HPX documentation, you need recent versions of the following packages:

- python3
- sphinx 4.5.0 (Python package)
- sphinx-book-theme (Python package)
- breathe 4.33.1 (Python package)
- doxygen
- sphinxcontrib-bibtex
- sphinx-copybutton

If the Python\(^\text{577}\) dependencies are not available through your system package manager, you can install them using the Python package manager pip:

```
pip install --user "sphinx<5" sphinx-book-theme breathe sphinxcontrib-bibtex sphinx-copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

**DOXYGEN_ROOT**:PATH

Specifies where to look for the installation of the Doxygen\(^\text{578}\) tool.

\(^{571}\) https://docs.docker.com/

\(^{572}\) https://www.docker.com

\(^{573}\) https://docs.docker.com/storage/bind-mounts/

\(^{574}\) http://www.sphinx-doc.org

\(^{575}\) https://www.doxygen.org

\(^{576}\) https://breathe.readthedocs.io/en/latest

\(^{577}\) https://www.python.org

\(^{578}\) https://www.doxygen.org
**SPHINX_ROOT:**PATH

Specifies where to look for the installation of the Sphinx tool.

**BREATHE_APIDOC_ROOT:**PATH

Specifies where to look for the installation of the Breathe tool.

### Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during CMake configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

**Note:** If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

### Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with `=`.
- Sub-headings use only underlines with characters in decreasing level of importance: `=`, `-`, and `.`.
- Use sentence case in headings.
- Refer to common terminology using `:term:``Component``.`
- Indent content of directives (`.. directive::`) by three spaces.
- For C++ code samples at the end of paragraphs, use `::` and indent the code sample by 4 spaces.
  - For other languages (or if you don’t want a colon at the end of the paragraph), use `.. code-block::` `language` and indent by three spaces as with other directives.
- Use `.. list-table::` to wrap tables with a lot of text in cells.

### API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

2.9. Contributing to HPX 1445
2.9.7 Module structure

This section explains the structure of an *HPX* module.

The tool `create_library_skeleton.py`\(^{582}\) can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
  - README.rst
  - CMakeLists.txt
  - cmake
  - docs/
    * index.rst
  - examples/
    * CMakeLists.txt
  - include/
    * hpx/
      * <lib_name>
  - src/
    * CMakeLists.txt
  - tests/
    * CMakeLists.txt
    * unit/
      * CMakeLists.txt
    * regressions/
      * CMakeLists.txt
    * performance/
      * CMakeLists.txt

A README.rst should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main CMakeLists.txt is created in the root directory of the module. By default it contains a call to `add_hpx_module` which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

`add_hpx_module` requires a module name. Optional flags are:

Optional single-value arguments are:

- INSTALL_BINARIES: Install the resulting library.

\(^{582}\) https://github.com/STEllAR-GROUP/hpx/blob/master/libs/create_library_skeleton.py
Optional multi-value arguments are:

- **SOURCES**: List of source files.
- **HEADERS**: List of header files.
- **COMPAT_HEADERS**: List of compatibility header files.
- **DEPENDENCIES**: Libraries that this module depends on, such as other modules.
- **CMAKE_SUBDIRS**: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional CMake scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

### Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the `cpp-dependencies` tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See [Using docker for development](https://github.com/tomtom-international/cpp-dependencies) for details on how to use the docker image.

To produce the graph produced by CI run the following command (HPX_SOURCE is assumed to hold the path to the HPX source directory):

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a `dot` file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have graphviz installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on config, the following should give you a long list of paths from `algorithms` to `config`:

583 https://www.cmake.org
584 https://github.com/tomtom-international/cpp-dependencies
The following should report that it can’t find a path between the two modules:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

## 2.10 Releases

### 2.10.1 List of releases

**HPX V1.9.0 (May 2, 2023)**

**General changes**

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelsport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.
- HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.
- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:
  - Coroutines were integrated with senders/receivers.
    - get_completion_signatures now works with awaitable senders. - with_awaitable_senders allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. - when_all_vector was added.
  - sync_wait and sync_wait_with_variant sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the main() function until the result is retrieved.
  - The combinators for futures (a.k.a. async_combinators) when_*, wait_* , wait_*_nothrow were turned into CPOs allowing for end-user customization. For more information on the async_combinators refer to the documentation, [https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators](https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators).
  - The new datapar backend SVE allows simd and par_simd execution policies to exploit dataparalleism in the processors that have SVE vector registers like A64FX and Neoverse V1.
  - The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.
  - Copy button shortkey was added at the top-right of code-blocks.
  - Pragma directive that reports warnings as errors on MSVC was fixed.
  - Command line argument --hpx:loopback_network was added to faciltie debugging with networks.
  - We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.
Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- `tag_policy_tag` et.al. were re-added after HPX V1.8.1 deprecation.
- `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: HPX V1.9.0 Namespace changes.

Closed issues

- Issue #6203[^6203] - Compilation error with `-mcpu=a64fx` on Ookami
- Issue #6196[^6196] - Incorrect log destination
- Issue #6191[^6191] - installing HPX
- Issue #6184[^6184] - Wrong processing_units_count of restricted_thread_pool_executor
- Issue #6171[^6171] - Release Tag Name Request
- Issue #6162[^6162] - Current master does not compile on ROSTAM
- Issue #6156[^6156] - hpxcxx does not work if HPX_WITH_PKGCONFIG=OFF
- Issue #6108[^6108] - cxx17_aligned_new.cpp on msvc fails due to wrong pragma directive
- Issue #6045[^6045] - Can’t call nullary callables wrapped with `hpx::unwrapping`
- Issue #6013[^6013] - Unable to build subprojects hpx_collectives/hpx_compute with MSVC
- Issue #6008[^6008] - Missing `constexpr` default constructor for `hpx::mutex`
- Issue #5999[^5999] - Add HPX Conda package to conda-forge
- Issue #5998[^5998] - Serializing multiple arguments when applying distributed action results in segfault
- Issue #5958[^5958] - HPX 1.8.0 and Blaze issues
- Issue #5908[^5908] - Windows: duplicated symbols in static builds
- Issue #5802[^5802] - Lost status `is_ready` from future

• Issue #5767601 - Performance drop on Piz Daint
• Issue #5752602 - Implement stride_view from P1899 (experimental)
• Issue #5744603 - HPX_WITH_FETCH_ASIO not working on Ookami
• Issue #5561604 - Possible race condition in helper thread / hpx::cout

Closed pull requests

• PR #6228605 - Fixing algorithms for zero length sequences when run with s/r scheduler
• PR #6227606 - Reliably disable background work when no networking is enabled
• PR #6225607 - Make heap fails in par for small sized heaps #6217
• PR #6222608 - Add documentation for hpx::post
• PR #6221609 - Fix segmented algorithms tests
• PR #6218610 - Creating INSTALL component ‘runtime’ to enable installing binaries only
• PR #6216611 - added tests for set_difference, updated set_operation.hpp to fix #6198
• PR #6213612 - Modernize and streamline MPI parcelport
• PR #6211613 - Modernize modules of level 11, 12, and 13
• PR #6210614 - Fixing MPI parcelport initialization if MPI is initialized outside of HPX
• PR #6209615 - Prevent thread stealing during scheduler shutdown
• PR #6208616 - Fix the compilation warning in the MPI parcelport with gcc 11.2
• PR #6207617 - Automatically enable Boost.Context when compiling for arm64.
• PR #6206618 - Update CMakeLists.txt
• PR #6205619 - Do not generate hpxcxx if support for pkgconfig was disabled
• PR #6204620 - Use LRT_ instead of LAPP_ logging in barrier implementation
• PR #6202621 - Fixing Fedora build errors on Power systems
• PR #6201622 - Update the LCI parcelport documents

Chapter 2. What’s so special about HPX?
• PR #6200623 - Par link jobs
• PR #6197624 - LCI parcelport: add doc, upgrade to v1.7.4, refactor cmake autofetch.
• PR #6195625 - Change the default tag of autofetch LCI to v1.7.3.
• PR #6197626 - Fix page Writing single-node applications
• PR #6189627 - Making sure restricted_thread_pool_executor properly reports used number of cores
• PR #6187628 - Enable using for_loop with range generators
• PR #6186629 - thread_support/CMakeLists: Fix build issue
• PR #6185630 - Fix EVE datapar with cxx_standard less than 20
• PR #6183631 - Update CI integration for EVE
• PR #6182632 - Fixing performance regressions
• PR #6181633 - LCI parcelport: backlog queue, aggregation, separate devices, and more
• PR #6180634 - Fixing use of for_loop with rebound execution policy (using .with())
• PR #6179635 - Taking predicates for algorithms by value
• PR #6178636 - Changes needed to make chapel_hpx examples work
• PR #6176637 - Fixing warnings that were generated by PVS Studio
• PR #6174638 - Replace boost::integer::gcd with std::gcd
• PR #6172639 - [Docs] Fix example of how to run single/specific test(s)
• PR #6170640 - Adding missing fallback for processing_units_count customization point
• PR #6169641 - LCI parcelport: bypass the parcel queue and connection cache.
• PR #6167642 - Add create_local_communicator API function
• PR #6166643 - Add missing header for std::intmax_t
• PR #6165644 - Attempt to work around MSVC problem
• PR #6161645 - Update EVE integration
• PR #6160 - More cleanup for module levels 0 to 10
• PR #6159 - Fix minor spelling mistake in generate_issue_pr_list.sh
• PR #6158 - Update documentation in writing single-node applications page
• PR #6157 - Improve index_queue_spawning
• PR #6156 - Avoid performing late command line handling twice in distributed runtime
• PR #6155 - The -rd and -mr options didn’t work, and they should have been --rd and --mr
• PR #6152 - Refactoring the Manual page in documentation
• PR #6148 - Investigate the failure of the LCI parcelport.
• PR #6147 - Make posix co-routine stacks non-executable
• PR #6146 - Avoid ambiguities wrt tag_invoke
• PR #6145 - General improvements to scheduling and related fixes
• PR #6143 - Add list of new namespaces for new release
• PR #6140 - Fixing background scheduler to properly exit in the end
• PR #6139 - [P2300] execution: Cleanup coroutines integration and improve ADL isolation
• PR #6138 - Adding example of a simple master/slave distributed application
• PR #6137 - Deprecate execution::experimental::task_group in favor of experimental::task_group
• PR #6136 - Fixing warnings reported by MSVC analysis
• PR #6135 - Adding notification function for parcelports to be called after early parcel handling
• PR #6134 - Fixing to_non_par() for parallel simd policies
• PR #6131 - Modernize modules from level 25
• PR #6130 - Remove the mutex lock in the critical path of get_partitioner.
• PR #6129 - Modernize module from levels 22, 23
• PR #6128 - Working around gccV9 problem that prevent us from storing enum classes in bit fields
• PR #6126 - Deprecate hpx::parallel::task_block in favor of hpx::experimental::ta...
• PR #6125 - Making sure sync_wait compiles when used with an lvalue sender involving bulk
• PR #6124 - Fixing use of any_sender in combination with when_all
• PR #6123 - Fixed issues found by PVS-Studio
• PR #6121 - Modernize modules of level 21, 22
• PR #6120 - Use index_queue for parallel executors bulk_async_execute
• PR #6119 - Update CMakeLists.txt
• PR #6118 - Modernize modules from level 17, 18, 19, and 20
• PR #6117 - Initialize buffer_allocate_time_ to 0
• PR #6116 - Add new command line argument --hpx:loopback_network
• PR #6115 - Modernize modules of levels 14, 15, and 16
• PR #6114 - Enhance the formatting of the documentation
• PR #6113 - Modernize modules in module level 11, 12, and 13
• PR #6112 - Modernize modules from levels 9 and 10
• PR #6111 - Modernize all modules from module level 8
• PR #6110 - Use pragma error directive to report warnings as errors on msvc
• PR #6109 - Modernize serialization module
• PR #6108 - Modernize error module
• PR #6107 - Modernizing modules of levels 0 to 5
• PR #6106 - Optimizations on LCI parcelport: merge small messages; remove sender mutex lock.
• PR #6105 - Adding parameters API: measure_iteration
• PR #6104 - Document task_group and include in Public API
• PR #6103 - Prevent warnings generated by clang-cl

https://github.com/STEllAR-GROUP/hpx/pull/6103
https://github.com/STEllAR-GROUP/hpx/pull/6102
• PR #6101 - Using more fold expressions
• PR #6100 - Deprecate hpx::parallel::reduce_by_key in favor of hpx::experimental::reduce_by_key
• PR #6098 - Forking Boost.Lockfree
• PR #6096 - Forking Boost.Tokenizer
• PR #6095 - Replacing facilities from Boost.Range
• PR #6094 - Removing object_semaphore
• PR #6093 - Replace boost::string_ref with std::string_view
• PR #6092 - Use C++17 static_assert where possible
• PR #6091 - Replace artificial sequencing with fold expressions
• PR #6090 - Fixing use of get_chunk_size customization point
• PR #6088 - Add/fix Public API documentation
• PR #6087 - Deprecate hpx::util::unlock_guard in favor of hpx::unlock_guard
• PR #6085 - Add experimental sycl integration/executor
• PR #6084 - Renaming hpx::apply and friends to hpx::post
• PR #6083 - Using if constexpr instead of tag-dispatching, where possible
• PR #6082 - Replace util::always_void_t with std::void_t
• PR #6081 - Update github actions to avoid warnings
• PR #6080 - Disable some tests that fail on LCI
• PR #6079 - Adding more natvis files, correct existing
• PR #6078 - Changing target name of memory_counters component
• PR #6077 - Making default constructor of hpx::mutex constexpr
• PR #6076 - Cleaning up functionality that was deprecated in V1.7
• PR #6075 - Remove conditional code for gcc V7 and below

https://github.com/STEllAR-GROUP/hpx/pull/6075
• PR #6074\textsuperscript{715} - Fixing compilation issues on gcc V8
• PR #6073\textsuperscript{716} - Fixing PAPI counter component compilation
• PR #6072\textsuperscript{717} - Adding \texttt{ex::when\_all\_vector}
• PR #6071\textsuperscript{718} - Making \texttt{get\_forward\_progress\_guarantee\_t} specializations constexpr
• PR #6070\textsuperscript{719} - Implement P2690 for our algorithms
• PR #6069\textsuperscript{720} - Do not check for cancellation during each iteration but only once per partition
• PR #6068\textsuperscript{721} - Prevent using task and \texttt{non\_task} as a CPO
• PR #6067\textsuperscript{722} - Deprecated \texttt{hpx::util::mem\_fn} in favor of \texttt{hpx::mem\_fn}
• PR #6066\textsuperscript{723} - Create codeql.yml
• PR #6064\textsuperscript{724} - Adapting \texttt{adjacent\_difference} for S/R execution
• PR #6063\textsuperscript{725} - Modernize \texttt{iterator\_support} module
• PR #6062\textsuperscript{726} - Make sure wrapping executor does not go out of scope prematurely
• PR #6061\textsuperscript{727} - Minor fix in \texttt{small\_vector} (from upstream)
• PR #6060\textsuperscript{728} - Allow to disable registering signal handlers
• PR #6059\textsuperscript{729} - [P2300] Fix: declval cannot be ODR used
• PR #6058\textsuperscript{730} - Avoid ambiguity for \texttt{hpx::get} used with \texttt{std::variant}
• PR #6057\textsuperscript{731} - Create a dedicated thread pool to run LCI\_progress.
• PR #6056\textsuperscript{732} - Fix coroutine test for clang
• PR #6055\textsuperscript{733} - Patches needed to be able to build HPX 1.8.1 on various platforms
• PR #6054\textsuperscript{734} - Use MSVC specific attribute \{[\texttt{msvc::no\_unique\_address}]\}
• PR #6053\textsuperscript{735} - Deprecated \texttt{hpx::util::invoke\_fused} in favor of \texttt{hpx::invoke\_fused}
• PR #6051\textsuperscript{736} - Add non-contiguous index queue and use it in \texttt{thread\_pool\_bulk\_scheduler}
• PR #6049\textsuperscript{737} - Crosscompile arm sve

2.10. Releases
• PR #6048 - Deprecated hpx::util::invoke in favor of hpx::invoke
• PR #6047 - Separating binary_semaphore into its own file
• PR #6046 - Support using unwrapping with nullary function objects
• PR #6044 - Generalize the use of then() and dataflow
• PR #6043 - Clean up scan_partitioner
• PR #6042 - Modernize dataflow API
• PR #6041 - docs: document semaphores
• PR #6040 - Add/Fix documentation of Public API page
• PR #6039 - remove MPI dependency when only using LCI parcelport
• PR #6038 - Clean up command line handling
• PR #6037 - Avoid performing parcel related background work if networking is disabled
• PR #6036 - Support new datapar backend : SVE
• PR #6035 - Simplify datapar replace copy if
• PR #6034 - Add/Fix documentation of Public API
• PR #6033 - Support for data-parallelism for replace, replace_if, replace_copy, replace_copy_if algorithms
• PR #6032 - Add documentation in public API
• PR #6031 - Expose available cache sizes from topology object
• PR #6030 - Adding parcelport initialization hook for resource partitioner operation
• PR #6029 - Simplify startup code
• PR #6028 - Add/Fix documentation in Public API page
• PR #6027 - add option hpx:force_ipv4 to force resolving hostnames to ipv4 addresses
• PR #6026 - build(docs): remove leftover sections
• PR #6025 - Minor fixes on “How to build on Windows”

2.10. Releases
• PR #5986 - Fix warnings when building docs
• PR #5985 - Re-add deprecated tag_policy_tag et.al. types that were removed in V1.8.1
• PR #5981 - docs: add docs for condition_variable.hpp
• PR #5980 - More work on execution::read
• PR #5978 - Unsoprt clang-v8 and clang-v9, switch LSU clang-v13 to C++17
• PR #5977 - fix: Compilation errors for -std=c++17 builders
• PR #5975 - docs: fix & improve parallel algorithms documentation 5
• PR #5974 - [P2300] Adapt get completion signatures for awaitable senders
• PR #5973 - defaults boost.context on riscv64
• PR #5972 - Fix documentation for container algorithms
• PR #5971 - added logic to detect riscv compiler configured for 64 bit target
• PR #5968 - adds risc-v 64 bit support
• PR #5967 - Adding missing pieces to sync_wait, adding run_loop
• PR #5966 - docs: fix & improve parallel algorithms documentation 4
• PR #5965 - Fixing inspect problems, adding missing header file
• PR #5962 - Changes in html page of documentation
• PR #5961 - Prevent stalling during shutdown when running hello_world_distributed
• PR #5958 - Fix documentation for container algorithms
• PR #5952 - docs: fix & improve parallel algorithms documentation 3
• PR #5950 - Change executors to directly implement the executor CPOs
• PR #5949 - Converting async combinators into CPOs
• PR #5948 - Adding support for pure sender/receiver based executors to parallel algorithms
• PR #5945 - [P2300] Added fundamental coroutine_traits for S/R

**HPX V1.8.1 (Aug 5, 2022)**

This is a bugfix release with a few minor additions and resolved problems.

**General changes**

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

• A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
• Added a simple average power consumption performance counter.
• Added performance counters related to the use of zero-copy chunks in the networking layer.
• More work was done towards full compatibility with the sender/receivers proposal P2300.
• Fixing sync\_wait to decay the result types
• Fixed collective operations to properly avoid overlapping consecutive operations on the same communicator.
• Simplified the implementation of our execution policies and added mapping functions between those.
• Fixed performance issues with our implementation of small\_vector.
• Serialization now works with buffers of unsigned characters.
• Fixing dangling reference in serialization of non-default constructible types
• Fixed static linking on Windows.
• Fixed support for M1/MacOS based architectures.
• Fixed support for gentoo/musl.
• Fixed `hpx::counting_semaphore_var`.
• Properly check start and end bounds for `hpx::for_loop`
• A lot of changes and fixes to the documentation (see https://hpx-docs.stellar-group.org).

- PR #5887\(^{873}\) - Fixing dangling reference in serialization of non-default constructible types
• PR #5879⁷⁷⁴ - New performance counters related to zero-copy chunks.

**HPX V1.8.0 (May 18, 2022)**

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 (“std::execution”) and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

**General changes**

• The new documentation can now be found on our webpage: https://hpx-docs.stellar-group.org. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the “Quick start”, “Manual” and “Examples” was improved, while the “Build system” page was adapted to include necessary information for newcomers.

• With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
  - `copy`, `copy_n`
  - `generate`
  - `adjacent_difference`, `adjacent_find`
  - `all_of`, `any_of`, `none_of`
  - `equal`, `mismatch`,
  - `inner_product`
  - `count`, `count_if`
  - `fill`, `fill_n`
  - `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
  - `for_each`, `for_each_n`
  - `generate`, `generate_n`.

• Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.

• Several changes took place on the executors provided by HPX:
  - The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the corresponding execution.
  - The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as `hpx::async`, `hpx::dataflow`, etc.
  - The performance of `fork_join_executor` was improved.
  - The following algorithms have been added/adapted to be C++20 conformant:
    - `min_element`

⁷⁷⁴ https://github.com/STEllAR-GROUP/hpx/pull/5879
- max_element
- minmax_element
- starts_with
- ends_with
- swap_ranges
- unique
- unique_copy
- rotate
- rotate_copy
- sort
- shift_left
- shift_right
- stable_sort
- partition
- partition_copy
- stable_partition
- adjacent_difference
- nth_element
- partial_sort
- partial_sort_copy.

- HPX_FORWARD/HPX_MOVE macros were introduced that replaced the std::move and std::forward facilities that in the library code.

- Hangs on distributed barrier were fixed.

- The performance of scan_partitioner was improved.

- Support was added for thread_priority to the parallel_execution_policy

- Regarding senders/receivers and the P2300 proposal various actions took place. stop_token was adapted to the recent proposal version (in_place_stop_token was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to when_all. Support for completion signatures was added. The following schedulers and algorithms were added:
  - get_completion_scheduler
  - any_sender and unique_any_sender
  - split sender
  - transform_mpi sender
  - transfer sender
  - let_error, let_stopped
  - get_env and related environment queries
  - schedule, set_value, set_error, set_done, start and connect are now proper customization points as defined in P2300.
Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:

- hpx::parallel::induction/reduction were moved into namespace hpx::experimental
- for_loop and friends were moved into namespace hpx::experimental.
- hpx::util::optional and friends were moved into namespace hpx.
- hpx::lcos::barrier has been moved into the hpx::distributed namespace and hpx::lcos::local::cpp20_barrier has been renamed to barrier and moved into the hpx namespace.
- hpx::lcos::latch has been moved into the hpx::distributed namespace and lcos::local::latch has been moved into the hpx namespace. The count_down_and_wait() functionality of latch has been renamed to arrive_and_wait().
- hpx::util::unique_function_nonser has been renamed to hpx::move_only_function.
- hpx::util::unique_function has been renamed to hpx::distributed::move_only_function.
- hpx::util::function has been renamed to hpx::distributed::function.
- hpx::util::function_nonser has been renamed to hpx::function.
- hpx::util::function_ref have been moved to namespace hpx.
- hpx::lcos::split_future changed namespace and is now used as hpx::split_future.
- hpx::lcos::local::counting_semaphore has been deprecated and hpx::lcos::local::cpp20_counting_semaphore has been renamed to hpx::counting_semaphore.
- hpx::lcos::local::cpp20_binary_semaphore has been renamed to hpx::binary_semaphore.
- hpx::lcos::local::sliding_semaphore has been renamed to hpx::sliding_semaphore and
  hpx::lcos::local::sliding_semaphore_var has been renamed to hpx::sliding_semaphore_var.
- hpx::lcos::local::spinlock has been renamed to hpx::spinlock.
- hpx::lcos::local::mutex has been renamed to hpx::mutex.
- hpx::lcos::local::timed_mutex has been renamed to hpx::timed_mutex.
- hpx::lcos::local::no_mutex has been renamed to hpx::no_mutex.
- hpx::lcos::local::recursive_mutex has been renamed to hpx::recursive_mutex.
- hpx::lcos::local::shared_mutex has been renamed to hpx::shared_mutex.
- hpx::lcos::local::upgrade_lock has been renamed to hpx::upgrade_lock.
- hpx::lcos::local::upgrade_to_unique_lock has been renamed to hpx::upgrade_to_unique_lock.
- hpx::lcos::local::condition_variable has been renamed to hpx::condition_variable.
  hpx::lcos::local::condition_variable_var has been renamed to hpx::condition_variable_var.
- hpx::lcos::local::once_flag has been renamed to hpx::once_flag, and hpx::lcos::local::call_once has been renamed to hpx::call_once.

The new LCI (Lightweight Communication Interface) parcelport was added that supports irregular and asynchronous applications like graph analysis, sparse linear algebra, modern parallel architectures etc. Major features include:
Support for advanced communication primitives like two sided send/recv and one sided remote put.
Better multi-threaded performance.
Explicit user control of communication resource.
Flexible signaling mechanisms (synchronizer, completion queue, active message handler).

- The following CMake flags were added, mostly to support using HPX as a backend for SHAD (https://github.com/pnnl/SHAD). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you're doing:
  - HPX_SERIALIZATION_WITH_ALLOW_RAW_POINTER_SERIALIZATION
  - HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE
  - HPX_SERIALIZATION_WITH_ALLOW_CONST_TUPLE_MEMBERS

**Breaking changes**

- Minimum required C++ standard library is C++17.
- Support for GCC 7 and Clang 8.0.0 and below has been removed.
- CUDA version required updated to 11.4.
- CMake version required updated to 3.18.
- The default version of Asio used was updated to 1.20.0.
- The default version of APEX used was updated to 2.5.1.
- APEX version was updated to 2.5.1.
- tagged_pair and tagged_tuple were removed.
- tag_dispatch was renamed to tag_invoke.
- hpx.max_background_threads was renamed to hpx.parcel.max_background_threads.
- The following CMake flags were removed after being deprecated for at least two releases:
  - HPX_SCHEDULER_MAX_TERMINATED_THREADS
  - HPX_WITH_GOOGLE_PERFTOOLS
  - HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY
  - HPX_HAVE_{COROUTINE,PLUGIN}_GCC_HIDDEN_VISIBILITY
  - HPX_TOP_LEVEL

\section*{2.10. Releases}
• PR #5749\(^\text{1034}\) - P2300 stop token
• PR #5748\(^\text{1035}\) - Adding environmental query CPOs
• PR #5747\(^\text{1036}\) - Renaming set_done to set_stopped (as per P2300)
• PR #5745\(^\text{1037}\) - Modernize serialization module
• PR #5743\(^\text{1038}\) - Add check for MPICH and set the correct env to support multi-threaded
• PR #5741\(^\text{1040}\) - Support for data-parallelism for adjacent find
• PR #5740\(^\text{1041}\) - Support for data-parallelism for find algorithms
• PR #5739\(^\text{1042}\) - Enable the option to attach a debugger on a segmentation fault (linux)
• PR #5738\(^\text{1043}\) - Fixing spell-checking errors
• PR #5737\(^\text{1044}\) - Attempt to fix migrate_component issue
• PR #5736\(^\text{1045}\) - Set commit status from Jenkins also for special branches
• PR #5734\(^\text{1046}\) - Revert #5586
• PR #5732\(^\text{1047}\) - Attempt to improve build-id reporting to cdash
• PR #5731\(^\text{1048}\) - Randomly delay execution of bash scripts launched by Jenkins
• PR #5729\(^\text{1049}\) - Workaround for CMake/Ninja generator OOM problem
• PR #5727\(^\text{1050}\) - Moving compression plugins to components directory
• PR #5726\(^\text{1051}\) - Moving/consolidating parcel coalescing plugin sources
• PR #5725\(^\text{1052}\) - Making sure headers for serialization filters are being installed
• PR #5723\(^\text{1053}\) - Moving more tests to modules
• PR #5722\(^\text{1054}\) - Removing superfluous semicolons
• PR #5720\(^\text{1055}\) - Moving parcelports into modules
• PR #5719\(^\text{1056}\) - Moving more files to parcelset module
• PR #5718 - build: refactor sphinx config file
• PR #5717 - Creating parcelset modules
• PR #5716 - Avoid duplicate definition error
• PR #5715 - The new LCI parcelport for HPX
• PR #5714 - Refine propagation of HPX_WITH... options
• PR #5713 - Significantly reduce CI jobs run on Piz Daint
• PR #5712 - Updating jenkins configuration for Rostam2.2
• PR #5711 - Refactor manual sections
• PR #5710 - Making task_group serializable
• PR #5709 - Update the MPI cmake setup
• PR #5707 - Better diagnose parcel bootstrap problems
• PR #5704 - Test with hwloc 2.7.0 with GCC 11
• PR #5703 - Fix counting_iterator container tests
• PR #5702 - Attempting to fix CircleCI timeouts
• PR #5699 - Update CI to use Boost 1.78.0
• PR #5697 - Adding fork_join_executor to foreach_benchmark
• PR #5696 - Modernize when_all and friends (when_any, when_some, when_each)
• PR #5693 - Fix test errors with _GLIBCXX_DEBUG defined
• PR #5691 - Rename annotate_function to scoped_annotation
• PR #5690 - Replace tag_dispatch with tag_invoke in minmax segmented
• PR #5688 - Remove more deprecated macros
• PR #5687 - Add most important CMake options
• PR #5685 - Fix future API
- PR #5684 - Move lock registration to separate module and remove global lock registration
- PR #5683 - Make hpx::wait_all etc. throw exceptions when waited futures hold exceptions and deprecate hpx::lcos::wait_all[_n] in favor of hpx::wait_all[_n]
- PR #5682 - Fix macOS test exceptions
- PR #5681 - docs: add links to hpx recepies
- PR #5680 - Embed base execution policies to datapar execution policies
- PR #5679 - Fix fork_join_executor with dynamic schedule
- PR #5678 - Fix compilation of service executors with nvcc
- PR #5677 - Remove compute_cuda module
- PR #5676 - Don’t require up-to-date approvals for bors
- PR #5675 - Add default template type parameters for algorithms
- PR #5674 - Allow using any_sender in global variables
- PR #5671 - Making sure task_group can be reused
- PR #5670 - Relax constraints on execution::when_all
- PR #5669 - Use HPX_WITH_CXX_STANDARD for controlling C++ version
- PR #5667 - Attempt to fix compilation issues with Boost V1.76
- PR #5664 - Change logging errors to warnings in schedulers
- PR #5663 - Use dynamic bitsets by default for CPU masks
- PR #5662 - Disambiguate namespace for MSVC
- PR #5660 - Replacing remaining std::forward and std::move with HPX_FORWARD and HPX_MOVE
- PR #5659 - Modernize hpx::future and related facilities
- PR #5658 - Replace HPX_INLINE_CONSTEXPR_VARIABLE with inline constexpr
- PR #5657 - Remove tagged, tagged_pair and tagged_tuple, remove tuple/pair specializations
- PR #5656 - Rename on execution::schedule_from, rename just_on to just_transfer, and add transfer

https://github.com/STEllAR-GROUP/hpx/pull/5658
https://github.com/STEllAR-GROUP/hpx/pull/5657
https://github.com/STEllAR-GROUP/hpx/pull/5656
- PR #5655 - Avoid for module lists to grow indefinitely in cmake cache
- PR #5649 - build: replace usage of Python's reserved words and functions as variable names
- PR #5648 - Modernize action modules and related code
- PR #5646 - Fix ends_with test
- PR #5645 - Add matrix multiplication example
- PR #5644 - Rename execution::transform to execution::then and execution::detach to execution::start_detached
- PR #5643 - Update performance test references
- PR #5642 - Adapting adjacent_difference to work with proxy iterators
- PR #5641 - Factorize perfests scripts
- PR #5640 - Fixed links to sources in Sphinx documentation
- PR #5639 - Fix generate datapar tests for Vc
- PR #5638 - Simd all any none
- PR #5637 - Use bors for merging pull requests
- PR #5636 - Fix leftover std::holds_alternative usage
- PR #5635 - Update container image tag in GitHub actions HIP configuration
- PR #5633 - Moving packaged_task to module futures
- PR #5632 - Tell Asio to use std::aligned_new only if available
- PR #5631 - Adding tag parameter to channel communicator get/set
- PR #5630 - Add partial_sort_copy and adapt partial sort to c++ 20
- PR #5629 - Set HPX_WITH_FETCH_ASIO to OFF as available in the docker image
- PR #5628 - Add Clang 13 CI configuration
- PR #5627 - Replace alternative keyword
- PR #5626 - docs: add support for BibTeX references in Sphinx docs

2.10. Releases
• PR #5624 - Fix pkgconfig replacements involving CMAKE_INSTALL_PREFIX
• PR #5623 - build: remove unused import from conf.py.in
• PR #5622 - Remove HPX_WITH_VCPKG CMake option
• PR #5621 - Replacing boost::container::small_vector
• PR #5620 - Update Asio tag from 1.18.2 to 1.20.0
• PR #5619 - Fix block_os_threads_1036 test
• PR #5618 - Make sure condition variables are notified under a lock in the thread_pool_scheduler test
• PR #5617 - Use advance_and_get_distance where required
• PR #5616 - Remove separately building segmented algorithms on CircleCI
• PR #5613 - Fix Vc datapar adjacent_difference
• PR #5609 - docs: add anchor links to performance counter tables
• PR #5608 - Fix header test error by adding missing numeric
• PR #5607 - Fix simd adj diff
• PR #5605 - Fix usage of HPX_INVOKE macro
• PR #5604 - Make use of shell-session to allow non-copyable $
• PR #5603 - Suppress some MSVC warnings in C++20 mode
• PR #5602 - Test HPX_DATASTRUCTURES_WITH_ADAPT_STD_TUPLE=OFF to one CI configuration
• PR #5601 - Test case for any_sender should use hpx::tuple
• PR #5600 - Rename tag_dispatch back to tag_invoke
• PR #5599 - Change theme, fix Quickstart & Examples
• PR #5596 - Use precompiled headers in tests
• PR #5595 - Drop semicolons for macro calls
• PR #5594 - Adapt datapar generate

Chapter 2. What’s so special about HPX?
- PR #5593 - Update any_sender to use tag_dispatch for execution customizations
- PR #5592 - Add nth_element
- PR #5591 - Remove unnecessary checks for C++17 for tests
- PR #5589 - Add HPX_FORWARD/HPX_MOVE macros
- PR #5588 - Fixing the output formatting for id_types
- PR #5586 - Remove local functionality
- PR #5585 - Delete GitExternal.cmake
- PR #5584 - Serialization of hpx::tuple must use hpx::get
- PR #5583 - Fix coroutine_traits allocate calls, add unhandled_exception() implementation.
- PR #5582 - Make more examples work with local runtime
- PR #5581 - Add support for several performance tests in CI
- PR #5580 - Adapt simd adj diff
- PR #5579 - Split absolute paths for generated pkg-config files into -L/-l parts
- PR #5577 - Fix unit fill test for datapar with Vc
- PR #5576 - Update forgotten “Full” names
- PR #5575 - Change scan partitioner implementation
- PR #5574 - Remove a few deprecated and unused CMake options
- PR #5572 - Remove more guards for the distributed runtime
- PR #5571 - Add workaround for libstc++ in string_util trim
- PR #5569 - Use no_unique_address in sender adaptors
- PR #5568 - Change try catch block to try_catch_exception_ptr
- PR #5567 - Make default_agent::yield actually yield
- PR #5564 - Adjacent

[1170] https://github.com/STEllAR-GROUP/hpx/pull/5567
[1171] https://github.com/STEllAR-GROUP/hpx/pull/5564
• PR #5562 - More changes to overcome build problems on Windows after recent module rearrangements
• PR #5560 - Update tests and examples
• PR #5559 - Fixing cmake folder names after module restructuring
• PR #5558 - Fixing wrong module dependencies
• PR #5557 - Adding an example for the new channel_communicator API
• PR #5556 - Remove leftover thread pool os executor tests
• PR #5555 - Add option enabling serializing raw pointers
• PR #5554 - Make sure command line aliasing is properly handled
• PR #5552 - Modernizing some of the async facilities
• PR #5551 - Fixing for local executions of actions to properly set task names
• PR #5550 - Update CUDA module in clang-cuda configuration
• PR #5549 - Fixing agent_ref::yield_k to actually call yield_k
• PR #5548 - Making get_action_name() noexcept
• PR #5547 - Fixing communication set
• PR #5546 - Fixing shutdown problems caused by missing ref-counting
• PR #5545 - Remove wrong move in thread_pool_scheduler_bulk.hpp
• PR #5543 - Extend launch policy to carry stack size and scheduling hint in addition to priority
• PR #5542 - Simplify execution CPOs
• PR #5541 - Adapt partition, partition_copy and stable_partition to C++ 20
• PR #5539 - Adapt mismatch to support sentinels
• PR #5538 - Document specific sphinx version required for the documentation
• PR #5537 - Test release and debug builds on Piz Daint
• PR #5536 - This fixes referencing stale iterators during the execution of binary mismatch

https://github.com/STEllAR-GROUP/hpx/pull/5536
• PR #5535\textsuperscript{1195} - Rename simdpar to par_simd
• PR #5534\textsuperscript{1196} - Fix Quick start & Manual Docs
• PR #5533\textsuperscript{1197} - Fix annotate\_function for std::string
• PR #5532\textsuperscript{1198} - Update two remaining apex links from khuck to UO-OACISS
• PR #5531\textsuperscript{1199} - Use contiguous\_index\_queue in thread\_pool\_scheduler
• PR #5530\textsuperscript{1200} - Eagerly initialize a configurable number of threads on scheduler/thread queue init
• PR #5529\textsuperscript{1201} - Update benchmarks and add support for scheduler\_executor
• PR #5528\textsuperscript{1202} - Add missing properties to executors/schedulers
• PR #5527\textsuperscript{1203} - Set local thread/pool number in local/static\_queue\_scheduler
• PR #5526\textsuperscript{1204} - Update Rostam HIP configuration to use 4.3.0
• PR #5525\textsuperscript{1205} - Fix Building HPX in Quick start
• PR #5524\textsuperscript{1206} - Upload image on cdash
• PR #5523\textsuperscript{1207} - Modernize facilities related to hpx::sync
• PR #5522\textsuperscript{1208} - Add sender overloads for remaining algorithms
• PR #5521\textsuperscript{1209} - Minor changes that improve performance
• PR #5520\textsuperscript{1210} - Update reference as perftests failing regularly
• PR #5519\textsuperscript{1211} - Add transform\_mpi sender adapter
• PR #5518\textsuperscript{1212} - Add sender overloads to rotate/rotate\_copy
• PR #5517\textsuperscript{1213} - Fix coroutine integration
• PR #5515\textsuperscript{1214} - Avoid deadlock in ignore\_while\_locked\_1485 test
• PR #5514\textsuperscript{1215} - Add split sender adapter
• PR #5512\textsuperscript{1216} - Update Rostam HIP configuration
• PR #5511\textsuperscript{1217} - Fix Asio target name for precompiled headers

HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

General changes

- Added a CMake option to assume that all types are bitwise serializable by default: HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE. The default value OFF corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by HPX is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of HPX relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made hpx::util::bind more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: inclusive_scan, exclusive_scan, transform_inclusive_scan, transform-exclusive_scan.

Breaking changes

- The experimental hpx::execution::simdpar execution policy (introduced in 1.7.0) was renamed to hpx::execution::par_simd for consistency with the other parallel policies.

Closed issues

- Issue #5494\textsuperscript{1264} - Rename simdpar execution policy to par_simd
- Issue #5488\textsuperscript{1265} - hpx::util::bind doesn’t bounds-check placeholders
- Issue #5486\textsuperscript{1266} - Possible V1.7.1 release

Closed pull requests

- PR #5500\textsuperscript{1267} - Minor bug fix in transform exclusive and inclusive scan tests
- PR #5499\textsuperscript{1268} - Rename simdpar to par_simd
- PR #5489\textsuperscript{1269} - Adding bound-checking for bind placeholders
- PR #5485\textsuperscript{1270} - Add Asio version check
- PR #5482\textsuperscript{1271} - Change extra archive data to rely on uniqueness of a variable address, not a function address
- PR #5448\textsuperscript{1272} - More fixes to enable for all types to be assumed to be bitwise copyable

\textbf{HPX V1.7.0 (Jul 14, 2021)}

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

\textbf{General changes}

• The following algorithms have been adapted to be C++20 conformant:
  
  – remove,
  
  – remove_if,
  
  – remove_copy,
  
  – remove_copy_if,
  
  – replace,
  
  – replace_if,
  
  – reverse, and
  
  – lexicographical_compare.

• When the compiler and standard library support the standard execution policies std::execution::seq, std::execution::par, and std::execution::par_unseq they can now be used in all \textit{HPX} parallel algorithms with equivalent behaviour to the non-task policies hpx::execution::seq, hpx::execution::par, and hpx::execution::par_unseq.

• Vc support has been fixed, after being broken in 1.6.0. In addition, \textit{HPX} now experimentally supports GCC’s SIMD implementation, when available. The implementation can be used through the hpx::execution::simd and hpx::execution::simdpar execution policies.

• The customization points sync_execute, async_execute, then_execute, post, bulk_sync_execute, bulk_async_execute, and bulk_then_execute are now implemented using tag_dispatch (previously tag_invoke). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.

• New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the hpx::execution::experimental namespace. These can be accessed through the hpx/execution.hpp and hpx/local/execution.hpp headers. In particular, the following sender-based algorithms have been added:
  
  – detach,
- ensure_started,
- just,
- just_on,
- let_error,
- let_value,
- on,
- transform, and
- when_all.

Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.

- All `hpx::init` and `hpx::start` overloads now take `std::function` instead of `hpx::util::function_nonser`. No changes should be required in user code to accommodate this change.

- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.

- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.

- The dependency on Boost.Asio has been replaced with the standalone Asio available at https://github.com/chriskohlhoff/asio. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake’s fetchcontent by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.

- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.

- `hipBLAS` is now optional when compiling with `hipcc`. A warning instead of an error will be printed if `hipBLAS` is not found during configuration.

- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if `HPX` was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.

- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building `HPX`. This option should not be used on Windows.

- Numerous bug fixes.

### Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations: `- HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` `- HPX_WITH_ACTION_BASE_COMPATIBILITY` `- HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY` `- HPX_WITH_POOL_EXECUTOR_COMPATIBILITY` `- HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`
HPX WITH_REGISTER_THREAD_COMPATIBILITY - HPX WITH_REGISTER_THREAD_OVERLOADS_COMPATIBILITY
- HPX WITH_THREAD_AWARE_TIMER_COMPATIBILITY - HPX WITH_THREAD_EXECUTERS_COMPATIBILITY -
HPX WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY

- The HPX WITH_THREAD_SCHEDULERS CMake option has been removed. All schedulers are now enabled when possible.
- HPX WITH_INIT_START_OVERLOADS_COMPATIBILITY has been turned off by default.

Closed issues

- Issue #54231278 - Fix lvalue-ref qualified connect for when_all_sender
- Issue #54121279 - Link error

1337 https://github.com/STEllAR-GROUP/hpx/pull/5389
1338 https://github.com/STEllAR-GROUP/hpx/pull/5388
• PR #5387 - Extend thread state logging and change default stealing parameters
• PR #5386 - Attempt to fix the startup hang with nodes > 32
• PR #5384 - Remove HPX 1.5.0 deprecations
• PR #5382 - Prefer installed Asio before considering FetchContent
• PR #5379 - Allow using pre-downloaded (not installed) versions of Asio and/or Apex
• PR #5376 - Remove unnecessary explicit listing of library modules.rst files in CMakeLists.txt
• PR #5375 - Slight performance improvement for hpx::copy and hpx::move et.al.
• PR #5374 - Remove unnecessary moves from future sender implementations
• PR #5373 - More changes to clang-cuda Jenkins configuration
• PR #5372 - Slight improvements to min/max/minmax_element algorithms
• PR #5371 - Adapt uninitialized_copy and uninitialized_copy_n to C++ 20
• PR #5370 - Decay types in just_sender value_types to match stored types
• PR #5367 - Disable pkgconfig by default again on macOS
• PR #5365 - Use ccache for Jenkins builds on Piz Daint
• PR #5363 - Update cudatoolkit module name in clang-cuda Jenkins configuration
• PR #5362 - Adding channel_communicator
• PR #5361 - Fix compilation with MPI enabled
• PR #5360 - Update APEX and asio tags
• PR #5359 - Fix check for pu-step in single-core case
• PR #5357 - Making sure collective operations can be reused by preallocating communicator
• PR #5356 - Update API documentation
• PR #5355 - Make the sequenced_executor processing_units_count member function const
• PR #5354 - Making sure default_stack_size is defined whenever declared

Chapter 2. What’s so special about HPX?
- PR #5353 - Add CUDA timestamp support to HPX Hardware Clock
- PR #5352 - Adding missing includes
- PR #5351 - Adding enable.logging/disable.logging API functions
- PR #5350 - Adapt lexicographical_compare to C++20
- PR #5349 - Update minimum boost version needed on the docs
- PR #5348 - Rename tag_invoke and related facilities to tag_dispatch
- PR #5347 - Remove make_prefix for executor properties
- PR #5346 - Remove and disable compatibility options for 1.7.0
- PR #5343 - Fix timed_executor static cast conversion
- PR #5342 - Refactor CUDA event polling
- PR #5341 - Adding make_with_annotation and get_annotation properties
- PR #5339 - Making sure hpx::util::hardware::timestamp() is always defined
- PR #5338 - Fixing timed_executor specializations of customization points
- PR #5335 - Make partial_algorithm work with any number of arguments
- PR #5334 - Follow up iter_sent include on #5225
- PR #5332 - Simplify tag_invoke and friends
- PR #5331 - More work on cleaning up executor CPOs
- PR #5330 - Add option to disable pkgconfig generation
- PR #5328 - Adapt data parallel support using std-simd
- PR #5327 - Fix missing ifdef HPX_SMT_PAUSE
- PR #5326 - Adding resize() to serialize_buffer allowing to shrink its size
- PR #5324 - Add get member functions to async_rwlock proxy objects for explicitly getting the wrapped value
- PR #5323 - Add keep_future algorithm

1390 https://github.com/STEllAR-GROUP/hpx/pull/5324
1391 https://github.com/STEllAR-GROUP/hpx/pull/5323
- Replace executor customization point implementations with `tag_invoke`
- Separate segmented algorithms for reduce
- Fix `is_sender` trait and other small fixes to p0443 traits
- `gcc 11.1 c++20` build fixes
- Make hipblas dependency optional as not always available
- Attempt to fix checking for libatomic
- Add explicit keyword to fixture constructor
- Fix a race condition in async mpi affecting limiting executor
- Use local runtime and local headers in local-only modules and tests
- Add GCC 11 builder to jenkins
- Adding `hpx::execution::experimental::task_group`
- Separate datapar
- Separate segmented algorithms for `find`, `find_if`, `find_if_not`
- Separate segmented algorithms for `fill` and `generate`
- Fix compilation of sender CPOs with nvcc
- Remove `PRIVATE` flag that was propagated into the `LANGUAGES`
- Specify exact cmake and ninja versions when loading them in jenkins jobs
- Update clang-newest configuration to use clang 12 and Boost 1.76.0
- Fix Clang 11 cuda_future test bug
- Add `async_rwlock_mutex` based on senders
- “Fix” termination detection
- Fixed source file line statements in examples documentation
• PR #5289 - Allow splitting of futures holding std::tuple
• PR #5288 - Move algorithms to tag_fallback_invoke
• PR #5287 - Move algorithms to tag_fallback_invoke
• PR #5285 - Fix clang-format failure on master
• PR #5284 - Replacing util::function_nonser on std::function in hpx_init
• PR #5282 - Update Boost for daint 20.11 after update
• PR #5281 - Fix Segmentation fault on foreach_datapar_zipiter
• PR #5280 - Avoid modulo by zero in counting_iterator test
• PR #5279 - Fix more GCC 10 deprecation warnings
• PR #5277 - Small fixes and improvements to CUDA/MPI polling
• PR #5276 - Fix typo in docs
• PR #5274 - More P1897 algorithms
• PR #5273 - Retry CDash submissions on failure
• PR #5272 - Fix bogus deprecation warnings with GCC 10
• PR #5271 - Correcting target ids for symbol_namespace::iterate
• PR #5268 - Adding generic require, require_concept, and query properties
• PR #5267 - Support annotations in hpx::transform_reduce
• PR #5266 - Making late command line options available for local runtime
• PR #5265 - Leverage no_unique_address for member_pack
• PR #5264 - Adopt format in more places
• PR #5262 - Install HPX in Rostam Jenkins jobs
• PR #5261 - Limit Rostam Jenkins jobs to marvin partition temporarily
• PR #5260 - Separate segmented algorithms for transform_reduce
• PR #5259 - Making sure late command line options are recognized as configuration options
• PR #5258 - Allow for HPX algorithms being invoked with std execution policies
• PR #5256 - Separate segmented algorithms for transform
• PR #5255 - Future/sender adapters
• PR #5254 - Fixing datapar
• PR #5253 - Add utility to format ranges
• PR #5252 - Remove uses of Boost.Bimap
• PR #5251 - Banish `<iostream>` from library headers
• PR #5250 - Try fixing vc circle ci
• PR #5249 - Adding missing header
• PR #5248 - Use old Piz Daint modules after upgrade
• PR #5247 - Significantly speedup simple `for_each`, `for_loop`, and `transform`
• PR #5245 - P1897 `operator|` overloads
• PR #5244 - P1897 `when_all`
• PR #5243 - Make sure `HPX_DEBUG` is set based on HPX’s build type, not consuming project’s build type
• PR #5242 - Moving last files unrelated to parcel layer to modules
• PR #5240 - Change namespace for `transform_loop.hpp`
• PR #5239 - Make sure annotations are used in the binary transform
• PR #5237 - Add P1897 `just, just_on, and on` algorithms
• PR #5236 - Add an example demonstrating the use of the `invoke_function_action` facility
• PR #5235 - Attempting to fix datapar compilation issues
• PR #5234 - Fix small typo in `--hpx:local` option description
• PR #5233 - Only find Boost.Iostreams if required for plugins
• PR #5231 - Sort printed config options
• PR #5230 - Fix C++20 replace algo adaptation misses
• PR #5229 - Remove leftover Boost include from sync_wait.hpp
• PR #5228 - Print module name only if it has custom configuration settings
• PR #5227 - Update .codespell_whitelist
• PR #5226 - Use new docker image in all CircleCI steps
• PR #5225 - Adapt reverse to C++20
• PR #5224 - Separate segmented algorithms for none_of, any_of and all_of
• PR #5223 - Fixing build system for ittnotify
• PR #5222 - Moving LCO related files to modules
• PR #5220 - Separate segmented algorithms for count and count_if
• PR #5218 - Separate segmented algorithms for adjacent_find
• PR #5217 - Add a HIP github action
• PR #5215 - Update ROCm to 4.0.1 on Rostam
• PR #5214 - Fix clang-format error in sender.hpp
• PR #5213 - Removing ESSENTIAL option to the doc example
• PR #5212 - Separate segmented algorithms for for_each_n
• PR #5211 - Minor adapted algs fixes
• PR #5210 - Fixing is_invocable deprecation warnings
• PR #5209 - Moving more files into modules (actions, components, init_runtime, etc.)
• PR #5208 - Add examples and explanation on when tag_fallback/priority are useful
• PR #5207 - Always define HPX_COMPUTE_HOST_CODE for host code
• PR #5206 - Add formatting exceptions for libhpx to create_module_skeleton.py

2.10. Releases
- PR #5205 - Moving all distribution policies into modules
- PR #5203 - Move copy algorithms to `tag_fallback_invoke`
- PR #5202 - Make `HPX_WITH_PSEUDO_DEPENDENCIES` a cache variable
- PR #5201 - Replaced `tag_invoke` with `tag_fallback_invoke` for `adjacent_find` algorithm
- PR #5200 - Moving files to (distributed) runtime module
- PR #5199 - Update ICC module name on Piz Daint Jenkins configuration
- PR #5198 - Add doxygen documentation for `thread_schedule_hint`
- PR #5197 - Attempt to fix compilation of context implementations with unity build enabled
- PR #5196 - Re-enable component tests
- PR #5195 - Moving files related to colocation logic
- PR #5194 - Another attempt at fixing the Fedora 35 problem
- PR #5193 - Components module
- PR #5192 - Adapt `replace(_if)` to C++20
- PR #5191 - Set compatibility headers by default to on
- PR #5189 - Bump Boost minimum version to 1.71.0
- PR #5187 - Force CMake to set the `-std=c++XX` flag
- PR #5186 - Remove message to print .cu extension whenever .cu files are encountered
- PR #5185 - Remove some minor unnecessary CMake options
- PR #5184 - Remove some leftover `HPX_WITH_*_SCHEDULER` uses
- PR #5183 - Remove dependency on `boost/iterators/iterator_categories.hpp`
- PR #5182 - Fixing Fedora 35 for Power architectures
- PR #5181 - Bump version number and tag post 1.6.0 release
- PR #5180 - Fix httvs_v2 tests linking

https://github.com/STEllAR-GROUP/hpx/pull/5180
• PR #5179\textsuperscript{1500} - Make sure --hpx:local command line option is respected with networking is off but distributed runtime is on
• PR #5177\textsuperscript{1501} - Remove module cmake options
• PR #5176\textsuperscript{1502} - Starting to separate segmented algorithms: for_each
• PR #5174\textsuperscript{1503} - Don’t run segmented algorithms twice on CircleCI
• PR #5173\textsuperscript{1504} - Fetching APEX using cmake FetchContent
• PR #5172\textsuperscript{1505} - Add separate local-only entry point
• PR #5171\textsuperscript{1506} - Remove HPX\_WITH\_THREAD\_SCHEDULERS CMake option
• PR #5170\textsuperscript{1507} - Add HPX\_WITH\_PRECOMPILED\_HEADERS option
• PR #5166\textsuperscript{1508} - Moving some action tests to modules
• PR #5165\textsuperscript{1509} - Require cmake 3.17
• PR #5164\textsuperscript{1510} - Move thread\_pool\_suspension\_helper files to small utility module
• PR #5160\textsuperscript{1511} - Adding checks ensuring modules are not cross-referenced from other module categories
• PR #5158\textsuperscript{1512} - Replace boost: :asio with standalone asio
• PR #5155\textsuperscript{1513} - Allow logging when distributed runtime is off
• PR #5153\textsuperscript{1514} - Components module
• PR #5152\textsuperscript{1515} - Move more files to performance counter module
• PR #5150\textsuperscript{1516} - Adapt remove\_copy(_if) to C++20
• PR #5144\textsuperscript{1517} - AGAS module
• PR #5125\textsuperscript{1518} - Adapt remove and remove\_if to C++20
• PR #5117\textsuperscript{1519} - Attempt to fix segfaults assumed to be caused by future\_data instances going out of scope.
• PR #5099\textsuperscript{1520} - Allow mixing debug and release builds
• PR #5092\textsuperscript{1521} - Replace spirit.qi with x3
• PR #5053\textsuperscript{1522} - Add P0443r14 executor and a a few P1897 algorithms

HPX Documentation, master

- PR #5044\(^\text{1523}\) - Add performance test in jenkins and reports

**HPX V1.6.0 (Feb 17, 2021)**

**General changes**

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with hipcc and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: adjacent_find, includes, inplace_merge, is_heap, is_heap_until, is_partitioned, is_sorted, is_sorted_until, merge, set_difference, set_intersection, set_symmetric_difference, set_union.

- Experimental HIP support can be enabled by compiling *HPX* with hipcc. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the hpx::cuda namespace.

- We have added partial_sort based on Francisco Tapia’s implementation.

- hpx::init and hpx::start gained new overloads taking an hpx::init_params struct in 1.5.0. All overloads not taking an hpx::init_params are now deprecated.

- We have added an experimental fork_join_executor. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.

- The parallel_executor now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.

- hpx::dataflow can now be used with executors that inject additional parameters into the call of the user-provided function.

- We have added experimental support for properties as proposed in P2220\(^\text{1524}\). Currently the only supported property is the scheduling hint on parallel_executor.

- hpx::util::annotated_function can now be passed a dynamically generated std::string.

- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.

- We have removed all support for C and Fortran from our build system.

- We have further reduced the use of Boost types within *HPX* (boost::system::error_code and boost::detail::spinlock).

- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

---

\(^\text{1523}\) [https://github.com/STEllAR-GROUP/hpx/pull/5044](https://github.com/STEllAR-GROUP/hpx/pull/5044)

\(^\text{1524}\) [https://wg21.link/p2220](https://wg21.link/p2220)
Breaking changes

- hpxMP support has been completely removed.
- The verbs parcelport has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

**HPX V1.5.1 (Sep 30, 2020)**

**General changes**

This is a patch release. It contains the following changes:

• Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
• Fixes several compilation problems and warnings.
• Adds notes in the documentation explaining how to cite HPX.

**Closed issues**

• Issue #4971\textsuperscript{1699} - Parallel sort fails to compile with C++20
• Issue #4950\textsuperscript{1700} - Build with `HPX_WITH_PARCELPORT_ACTION_COUNTERS ON` fails
• Issue #4940\textsuperscript{1701} - Codespell report for “HPX” (on fossies.org)
• Issue #4937\textsuperscript{1702} - Allow suspension of runtime for multiple localities

**Closed pull requests**

• PR #4982\textsuperscript{1703} - Add page about citing HPX to documentation
• PR #4981\textsuperscript{1704} - Adding the missing include
• PR #4974\textsuperscript{1705} - Remove leftover format export hack
• PR #4972\textsuperscript{1706} - Removing use of `get_temporary_buffer` and `return_temporary_buffer`
• PR #4963\textsuperscript{1707} - Renaming files to avoid warnings from the vs build system
• PR #4951\textsuperscript{1708} - Fixing build if `HPX_WITH_PARCELPORT_ACTION_COUNTERS=On`
• PR #4946\textsuperscript{1709} - Allow suspension on multiple localities
• PR #4944\textsuperscript{1710} - Fix typos reported by fossies codespell report
• PR #4941\textsuperscript{1711} - Adding some explanation to README about how to cite HPX

General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of HPX in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in HPX. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of/any_of/none_of/ copy, count, destroy, equal, fill, find, for_each, generate, mismatch, move, reduce, transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the experimental namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below). An significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (`Public API`). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in PR #4514 for more details).
- The underlying executor of `block_executor` has been updated to a newer one.

---

1712 https://github.com/STEllAR-GROUP/hpx/pull/4939
1713 https://github.com/STEllAR-GROUP/hpx/pull/4514
• We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.

• All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).

• We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.

• We have added performance counters type information (aggregating, monotonically increasing, average count, average timer, etc.).

• HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn’t prevent the thread from being stolen, however.

• We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).

• `broadcast_to, broadcast_from, scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by value references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).

• New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).

• We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.

• We fixed task annotations for actions.

• The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.

• We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.

• We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.

• We have changed the CMake targets exposed to the user, it now includes `HPX::hpx, HPX::wrap_main` (int main as the first `HPX` thread of the application, see Starting the HPX runtime), `HPX::plugin`, `HPX::component`. The CMake variables `HPX/include_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX::hpx` CMake target.

• A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)

• A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)

• We now require for our CMake build system configuration files to be formatted using cmake-format.

• We have removed more dependencies on various Boost libraries.

• We have added an experimental option enabling unity builds of HPX using the `DHPX_WITHUNITY_BUILD=On` CMake option.
• Many bug fixes.

Breaking changes

• HPX now requires a C++14 capable compiler. We have set the HPX C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the \texttt{CMAKE\_CXX\_STANDARD} setting as mandated by CMake. The \texttt{HPX\_WITH\_CXX*} variables are now deprecated and will be removed in the future.

• Building and using HPX is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.

• We have added a \texttt{hpx::init\_params} struct to pass parameters for HPX initialization e.g. the resource partitioner callback to initialize thread pools (Using the resource partitioner).

• The \texttt{all\_to\_all} algorithm is renamed to \texttt{all\_gather}, and the new \texttt{all\_to\_all} algorithm is not compatible with the old one.

• We have moved all of the existing APIs related to resiliency into the namespace \texttt{hpx\::resiliency\::experimental}.

2.10. Releases
- Adapting hpx::find and friends to C++20
- Adapting mismatch to C++20
- Adapting hpx::equal to be conforming to C++20
- Fixing exception handling for hpx::copy and adding missing tests
- Adding different runtime exception when registering thread with the HPX runtime
- Adding example demonstrating how to disable thread stealing during the execution of parallel algorithms
- Adding non-policy tests to all_of, any_of, and none_of
- Set CUDA compute capability on rostam Jenkins builds
- Force partitioned vector scan tests to run serially
- Making move conforming with C++20
- Making destroy and destroy_n conforming to C++20
- Fix miscellaneous header problems
- Add CPOs for for_each
- Adapting count and count_if to be conforming to C++20
- Release notes 1.5.0
- adding libcds-hpx tag to prepare for hpx1.5 release
- Adding version specific deprecation options
- Limiting executor improvements
- Making fill and fill_n compatible with C++20
- Adapting all_of, any_of, and none_of to C++20
- Improve libCDS integration
- Correct typos in the documentation of the hpx performance counters

• PR #4854 - Removing obsolete code
• PR #4853 - Adding test that derives component from two other components
• PR #4852 - Fix mpi_ring test in distributed mode by ensuring all ranks run hpx_main
• PR #4851 - Converting resiliency APIs to tag_invoke based CPOs
• PR #4849 - Enable use of future_overhead test when DISTRIBUTED_RUNTIME is OFF
• PR #4847 - Fixing 'error prone' constructs as reported by Codacy
• PR #4846 - Disable Boost.Asio concepts support
• PR #4845 - Fix PAPI counters
• PR #4843 - Remove dependency on various Boost headers
• PR #4841 - Rearrange public API headers
• PR #4840 - Fixing TSS problems during thread termination
• PR #4839 - Fix async_cuda build problems when distributed runtime is disabled
• PR #4837 - Restore compatibility for old (now deprecated) copy algorithms
• PR #4836 - Adding CPOs for hpx::reduce
• PR #4835 - Remove using util::result_of from namespace hpx
• PR #4834 - Fixing the calculation of the number of idle cores and the corresponding idle masks
• PR #4833 - Allow thread function destructors to yield
• PR #4832 - Fixing assertion in split_gids and memory leaks in 1d_stencil_7
• PR #4831 - Making sure MPI_CXX_COMPILE_FLAGS is interpreted as a sequence of options
• PR #4830 - Update documentation on using HPX::wrap_main
• PR #4827 - Update clang-newest configuration to use clang 10
• PR #4826 - Add Jenkins configuration for rostam
• PR #4825 - Move all CUDA functionality to hpx::cuda::experimental namespace
• PR #4824 - Add support for building master/release branches to Jenkins configuration
• PR #4821 - Implement customization point for hpx::copy and hpx::ranges::copy
• PR #4819 - Allow finding Boost components before finding HPX
• PR #4817 - Adding range version of stable sort
• PR #4815 - Fix a wrong #ifdef for IO/TIMER pools causing build errors
• PR #4814 - Replace hpx::function_nonser with std::function in error module
• PR #4809 - Foreach adapt
• PR #4806 - Make internal algorithms functions const
• PR #4807 - Add Jenkins configuration for running on Piz Daint
• PR #4806 - Update documentation links to new domain name
• PR #4805 - Applying changes that resolve time complexity issues in sort
• PR #4803 - Adding implementation of stable_sort
• PR #4802 - Fix datapar header paths
• PR #4801 - Replace boost::shared_array<T> with std::shared_ptr<T> if supported
• PR #4799 - Fixing #include paths in compatibility headers
• PR #4798 - Include the main module header (fixes partially #4488)
• PR #4797 - Change cmake targets
• PR #4794 - Removing 128bit integer emulation
• PR #4793 - Make sure global variable is handled properly
• PR #4792 - Replace enable_if with HPX_CONCEPT_REQUIRES and add is_sentinel_for constraint
• PR #4790 - Move deprecation warnings from base template to template specializations for result_of etc. structs
• PR #4789 - Fix hangs during assertion handling and distributed runtime construction
• PR #4788 - Fixing inclusive transform scan algorithm to properly handle initial value
• PR #4785 - Fixing barrier test
• PR #4784 - Fixing deleter argument bindings in serialize_buffer
• PR #4783 - Add coveralls badge
• PR #4782 - Make header tests parallel again
• PR #4780 - Remove outdated comment about hpx::stop in documentation
• PR #4776 - debug print improvements
• PR #4775 - Checkpoint cleanup
• PR #4771 - Fix compilation with HPX_WITH_NETWORKING=OFF
• PR #4767 - Remove all force linking leftovers
• PR #4765 - Fix 1d stencil index calculation
• PR #4764 - Force some tests to run serially
• PR #4762 - Update pointees in compatibility headers
• PR #4761 - Fix running and building of execution module tests on CircleCI
• PR #4760 - Storing hpx_options in global property to speed up summary report
• PR #4759 - Reduce memory requirements for our main shared state
• PR #4757 - Fix mimalloc linking on Windows
• PR #4756 - Fix compilation issues
• PR #4753 - Re-adding API functions that were lost during merges
• PR #4751 - Revert “Create coverage reports and upload them to codecov.io”
• PR #4750 - Fixing possible race condition during termination detection
• PR #4749 - Deprecate result_of and friends
• PR #4748 - Create coverage reports and upload them to codecov.io
• PR #4747 - Changing #include for MPI parcelport

2.10. Releases

1519
• PR #4745 - Add is_sentinel_for trait implementation and test
• PR #4743 - Fix init_globally example after runtime mode changes
• PR #4742 - Update SUPPORT.md
• PR #4741 - Fixing a warning generated for unity builds with msvc
• PR #4740 - Rename local_lcos and basic_execution modules
• PR #4739 - Undeprecate a couple of hpx/modulename.hpp headers
• PR #4738 - Conditionally test schedulers in thread_stacksize_current test
• PR #4734 - Fixing a bunch of codacy warnings
• PR #4733 - Add experimental unity build option to CMake configuration
• PR #4730 - Fixing compilation problems with unordered map
• PR #4729 - Fix APEX build
• PR #4727 - Fix missing runtime includes for distributed runtime
• PR #4726 - Add more API headers
• PR #4725 - Add more compatibility headers for deprecated module headers
• PR #4724 - Fix 4723
• PR #4721 - Attempt to fixing migration tests
• PR #4717 - Make the compatibility headers macro conditional
• PR #4716 - Add hpx/runtime.hpp and hpx/distributed/runtime.hpp API headers
• PR #4714 - Add hpx/future.hpp header
• PR #4713 - Remove hpx/runtime/threads_fwd.hpp and hpx/util_fwd.hpp
• PR #4711 - Make module deprecation warnings overridable
• PR #4710 - Add compatibility headers and other fixes after module header renaming
• PR #4708 - Add termination handler for parallel algorithms

• PR #4707\textsuperscript{1954} - Use hpx::function_nonser instead of std::function internally
• PR #4706\textsuperscript{1955} - Move header file to module
• PR #4705\textsuperscript{1956} - Fix incorrect behaviour of cmake-format check
• PR #4704\textsuperscript{1957} - Fix resource tests
• PR #4701\textsuperscript{1958} - Fix missing includes for future::then specializations
• PR #4700\textsuperscript{1959} - Removing obsolete memory component
• PR #4699\textsuperscript{1960} - Add short descriptions to modules missing documentation
• PR #4696\textsuperscript{1961} - Rename generated modules headers
• PR #4693\textsuperscript{1962} - Overhauling thread_mapper for public consumption
• PR #4688\textsuperscript{1963} - Fix thread stack size handling
• PR #4687\textsuperscript{1964} - Adding all_gather and fixing all_to_all
• PR #4684\textsuperscript{1965} - Miscellaneous compilation fixes
• PR #4683\textsuperscript{1966} - Fix HPX\_WITH\_DYNAMIC\_HPX\_MAIN=OFF
• PR #4682\textsuperscript{1967} - Fix compilation of pack_traversal_rebind_container.hpp
• PR #4681\textsuperscript{1968} - Add missing hpx.execution.hpp includes for future::then
• PR #4678\textsuperscript{1969} - Typeless communicator
• PR #4677\textsuperscript{1970} - Forcing registry option to be accepted without checks.
• PR #4676\textsuperscript{1971} - Adding scatter_to/scatter_from collective operations
• PR #4673\textsuperscript{1972} - Fix PAPI counters compilation
• PR #4671\textsuperscript{1973} - Deprecate hpx::promise alias to hpx::lcos::promise
• PR #4670\textsuperscript{1974} - Explicitly instantiate get_exception
• PR #4667\textsuperscript{1975} - Add stopValue in Sentinel struct instead of Iterator
• PR #4666\textsuperscript{1976} - Add release build on Windows to GitHub actions

• PR #4664\(^{1977}\) - Creating itt\_notify module.
• PR #4663\(^{1978}\) - Mpi fixes
• PR #4659\(^{1979}\) - Making sure declarations match definitions in register\_locks implementation
• PR #4655\(^{1980}\) - Fixing task annotations for actions
• PR #4653\(^{1981}\) - Making sure APEX is linked into every application, if needed
• PR #4651\(^{1982}\) - Update get\_function\_annotation.hpp
• PR #4646\(^{1983}\) - Runtime type
• PR #4645\(^{1984}\) - Add a few more API headers
• PR #4644\(^{1985}\) - Fixing support for mpirun (and similar)
• PR #4633\(^{1986}\) - Fixing the fix for get\_idle\_core\_count() API
• PR #4638\(^{1987}\) - Remove HPX\_API\_EXPORT missed in previous cleanup
• PR #4636\(^{1988}\) - Adding C++20 barrier
• PR #4635\(^{1989}\) - Adding C++20 latch API
• PR #4634\(^{1990}\) - Adding C++20 counting semaphore API
• PR #4632\(^{1991}\) - Unify execution parameters customization points
• PR #4631\(^{1992}\) - Adding missing bulk\_sync\_execute wrapper to example executor
• PR #4630\(^{1993}\) - Updates to documentation; grammar edits.
• PR #4630\(^{1994}\) - Updates to documentation; moved hyperlink
• PR #4624\(^{1995}\) - Export set\_self\_ptr in thread\_data.hpp instead of with forward declarations where used
• PR #4623\(^{1996}\) - Clean up export macros
• PR #4621\(^{1997}\) - Trigger an error for older boost versions on power architectures
• PR #4617\(^{1998}\) - Ignore user-set compatibility header options if the module does not have compatibility headers
• PR #4616\(^{1999}\) - Fix cmake\-format warning

• PR #4615<sup>2000</sup> - Add handler for serializing custom exceptions
• PR #4614<sup>2001</sup> - Fix error message when HPX_IGNORE_CMAKE_BUILD_TYPE_COMPATIBILITY=OFF
• PR #4613<sup>2002</sup> - Make partitioner constructor private
• PR #4611<sup>2003</sup> - Making auto_chunk_size execute the given function using the given executor
• PR #4610<sup>2004</sup> - Making sure the thread-local lock registration data is moving to the core the suspended HPX thread is resumed on
• PR #4609<sup>2005</sup> - Adding an API function that exposes the number of idle cores
• PR #4608<sup>2006</sup> - Fixing moodycamel namespace
• PR #4607<sup>2007</sup> - Moving winsocket initialization to core library
• PR #4606<sup>2008</sup> - Local runtime module etc.
• PR #4604<sup>2009</sup> - Add config_registry module
• PR #4603<sup>2010</sup> - Deal with distributed modules in their respective CMakeLists.txt
• PR #4602<sup>2011</sup> - Small module fixes
• PR #4598<sup>2012</sup> - Making sure current_executor and service_executor functions are linked into the core library
• PR #4597<sup>2013</sup> - Adding broadcast_to/broadcast_from to collectives module
• PR #4596<sup>2014</sup> - Fix performance regression in block_executor
• PR #4595<sup>2015</sup> - Making sure main.cpp is built as a library if HPX_WITH_DYNAMIC_MAIN=OFF
• PR #4592<sup>2016</sup> - Futures module
• PR #4591<sup>2017</sup> - Adapting co_await support for C++20
• PR #4590<sup>2018</sup> - Adding missing exception test for for_loop()
• PR #4587<sup>2019</sup> - Move traits headers to hpx/modulename/traits directory
• PR #4586<sup>2020</sup> - Remove Travis CI config
• PR #4585<sup>2021</sup> - Update macOS test blacklist
• PR #4584<sup>2022</sup> - Attempting to fix missing symbols in stack trace
- PR #4583 - Fixing bad static_cast
- PR #4582 - Changing download url for Windows prerequisites to circumvent bandwidth limitations
- PR #4581 - Adding missing using placeholder::_X
- PR #4579 - Move get_stack_size_name and related functions
- PR #4575 - Excluding unconditional definition of class backtrace from global header
- PR #4574 - Changing return type of hardware_concurrency() to unsigned int
- PR #4570 - Move tests to modules
- PR #4564 - Reshuffle internal targets and add HPX::hpx_no_wrap_main target
- PR #4563 - Fix CMake option typo
- PR #4562 - Unregister lock earlier to avoid holding it while suspending
- PR #4561 - Adding test macros supporting custom output stream
- PR #4560 - Making sure hash_any::operator()() is linked into core library
- PR #4559 - Fixing compilation if HPX_WITH_THREAD_BACKTRACE_ON_SUSPENSION=On
- PR #4557 - Improve spinlock implementation to perform better in high-contention situations
- PR #4553 - Fix a runtime_ptr problem at shutdown when apex is enabled
- PR #4552 - Add configuration option for making exceptions less noisy
- PR #4551 - Clean up thread creation parameters
- PR #4549 - Test FetchContent build on GitHub actions
- PR #4548 - Fix stack size
- PR #4545 - Fix header tests
- PR #4544 - Fix a typo in sanitizer build
- PR #4541 - Add API to check if a thread pool exists
- PR #4540 - Making sure MPI support is enabled if MPI futures are used but networking is disabled
• PR #4538 - Move channel documentation examples to examples directory
• PR #4536 - Add generic allocator for execution policies
• PR #4534 - Enable compatibility headers for thread_executors module
• PR #4532 - Fixing broken url in README.rst
• PR #4531 - Update scripts
• PR #4530 - Make sure module API docs show up in correct order
• PR #4529 - Adding missing template code to module creation script
• PR #4528 - Make sure version module uses HPX’s binary dir, not the parent’s
• PR #4527 - Creating actions_base and actions module
• PR #4526 - Shared state for cv
• PR #4525 - Changing sub-name sequencing for experimental namespace

• PR #4464 - Include module
• PR #4462 - Merge hpx_init and hpx_wrap into one static library
• PR #4461 - Making thread_data test more realistic
• PR #4460 - Suppress MPI warnings in version.cpp
• PR #4452 - Make sure pkgconfig applications link with hpx_init
• PR #4458 - Added example demonstrating how to create and use a wrapping executor
• PR #4457 - Fixing execution of thread exit functions
• PR #4456 - Move backtrace files to debugging module
• PR #4455 - Move deadlock_detection and maintain_queue_wait_times source files into schedulers module
• PR #4450 - Fixing compilation with std::filesystem enabled
• PR #4449 - Fixing build system to actually build variant test
• PR #4444 - This fixes an obsolete #include
• PR #4446 - Resume tasks where they were suspended
• PR #4444 - Minor CUDA fixes
• PR #4443 - Add missing tests to CircleCI config
• PR #4442 - Adding a tag to all auto-generated files allowing for tools to visually distinguish those
• PR #4441 - Adding performance counter type information
• PR #4440 - Fixing MSVC build
• PR #4439 - Link HPX::plugin and component privately in hpx_setup_target
• PR #4437 - Adding a test that verifies the problem can be solved using a trait specialization
• PR #4434 - Clean up Boost dependencies and copy string algorithms to new module
• PR #4433 - Fixing compilation issues (!) if MPI parcelport is enabled
• PR #4431 - Ignore warnings about name mangling changing

2.10. Releases
• PR #4430 - Add performance_counters module
• PR #4428 - Don’t add compatibility headers to module API reference
• PR #4426 - Add currently failing tests on GitHub actions to blacklist
• PR #4425 - Clean up and correct minimum required versions
• PR #4424 - Making sure hpx.lock_detection=0 works as advertised
• PR #4421 - Making sure interval time stops underlying timer thread on termination
• PR #4417 - Adding serialization support for std::variant (if available) and std::tuple
• PR #4415 - Partially reverting changes applied by PR 4373
• PR #4414 - Added documentation for the compiler-wrapper script hpxcxx.in in creating_hpx_projects.rst
• PR #4413 - Merging from V1.4.1 release
• PR #4412 - Making sure to issue a warning if a file specified using –hpx:options-file is not found
• PR #4411 - Make test specific to HPX_WITH_SHARED_PRIORITY_SCHEDULER
• PR #4407 - Fix cross pool injection test, use default scheduler as fallback
• PR #4404 - Fix a race condition and clean-up usage of scheduler mode
• PR #4399 - Add more threading modules
• PR #4398 - Add CODEOWNERS file
• PR #4395 - Adding a parameter to auto_chunk_size allowing to control the amount of iterations to measure
• PR #4393 - Use appropriate cache-line size defaults for different platforms
• PR #4391 - Fixing use of allocator for C++20
• PR #4390 - Making –hpx:help behavior consistent
• PR #4388 - Change the resource partitioner initialization
• PR #4387 - Fix roll_release.sh

HPX V1.4.1 (Feb 12, 2020)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing pdb files on Windows
- Allow running tests using an installed version of HPX
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

Closed issues

- Issue #4320 - HPX 1.4.0 does not compile with gcc 10
- Issue #4336 - Building HPX 1.4.0 with IO Counters breaks (Windows)
- Issue #4334 - HPX Debug and RelWithDebinfo builds on Windows not installing .pdb files
- Issue #4322 - Undefine VT1 and VT2 after boost includes
- Issue #4314 - Compile error on 1.4.0
- Issue #4307 - ld: error: duplicate symbol: freebsd_environ
Closed pull requests

- PR #4376 - Attempt to fix some test build errors on Windows
- PR #4357 - Adding missing #includes to fix gcc V10 linker problems
- PR #4355 - Skip MPI_Finalize if MPI_Init is not called from HPX
- PR #4343 - Give a hard error if IO counters are enabled on non-Linux systems
- PR #4337 - Installing pdb files on Windows
- PR #4335 - Adding capability to buildsystem to use an installed version of HPX
- PR #4315 - Forcing exported symbols from composable_guard to be linked into core library
- PR #4310 - Remove environment handling from exception.cpp

HPX V1.4.0 (January 15, 2020)

General changes

- We have added the collectives all_to_all and all_reduce.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the documentation for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size thread_stacksize_nostack.
- We have added an implementation of unique_any, which is a non-copyable version of any.
- The shared_priority_queue_scheduler has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option --hpx:queuing=shared-priority. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters background-receive-duration and background-receive-overhead for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when HPX_WITH_NETWORKING=OFF.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on Boost.Filesystem can explicitly be turned on with HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON (it is off by default if the standard library supports std::filesystem). Boost.ProgramOptions has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use

---

2219 https://github.com/STEllAR-GROUP/hpx/pull/4357
2220 https://github.com/STEllAR-GROUP/hpx/pull/4333
2221 https://github.com/STEllAR-GROUP/hpx/pull/4343
2222 https://github.com/STEllAR-GROUP/hpx/pull/4337
2223 https://github.com/STEllAR-GROUP/hpx/pull/4335
2224 https://github.com/STEllAR-GROUP/hpx/pull/4315
2225 https://github.com/STEllAR-GROUP/hpx/pull/4310
Boost::ProgramOptions instead of the ProgramOptions provided by HPX. To remove the dependency
HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY must be explicitly set to OFF. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.

- It is now possible to use the process affinity mask set by tools like numactl and various batch environments with the command line option --hpx:use-process-mask. Enabling this option implies --hpx:ignore-batch-env.

- It is now possible to create standalone thread pools without starting the runtime. See the standalone_thread_pool_executor.cpp test in the execution module for an example.

- Tasks annotated with hpx::util::annotated_function now have their correct name when using APEX to generate OTF2 files.

- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.

- The option HPX_WITH_MORE_THAN_64_THREADS is now ignored and will be removed in a future release. The value is instead derived directly from HPX_WITH_MAX_CPU_COUNT option.

- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.

- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.

- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.

- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.

- We now enforce formatting with clang-format on the majority of our source files.

- We have added SPDX license tags to all files.

- Many bugfixes.

Breaking changes

- The HPX_WITH_THREAD_COMPATIBILITY option and the associated compatibility layer has been removed.

- The HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY option and the associated compatibility layer has been removed.

- The HPX_WITH_UNWRAPPED_COMPATIBILITY option and the associated compatibility layer has been removed.

• Issue #4204 - Trouble compiling HPX with Intel compiler
• Issue #4199 - Refactor APEX to eliminate circular dependency
• Issue #4187 - HPX can’t build on OSX
• Issue #4185 - Simple debug output for development
• Issue #4182 - @HPX_CONF_PREFIX@ is the empty string
• Issue #4169 - HPX won’t build with APEX
• Issue #4163 - Add back HPX_LIBRARIES and HPX_INCLUDE_DIRS
• Issue #4161 - It should be possible to call find_package(HPX) multiple times
• Issue #4155 - get_self_id() for stackless threads returns invalid_thread_id
• Issue #4151 - build error with MPI code
• Issue #4150 - hpx won’t build on POWER9 with clang 8
• Issue #4148 - cacheline_data delivers poor performance with C++17 compared to C++14
• Issue #4144 - target general in HPX_LIBRARIES does not exist
• Issue #4134 - CMake Error when -DHPX_WITH_HPXMP=ON
• Issue #4132 - parallel fill leaves elements unfilled
• Issue #4123 - PAPI performance counters are inaccessible
• Issue #4118 - static_chunk_size is not obeyed in scan algorithms
• Issue #4115 - dependency chaining error with APEX

• Issue #4107 - Initializing runtime without entry point function and command line arguments
• Issue #4105 - Bug in hpx:bind=numa-balanced
• Issue #4101 - Bound tasks
• Issue #4100 - Add SPDX identifier to all files
• Issue #4085 - hpx_topology library should depend on hwloc
• Issue #4067 - HPX fails to build on macOS
• Issue #4056 - Building without thread manager idle backoff fails
• Issue #4052 - Enforce clang-format style for modules
• Issue #4032 - Simple hello world fails to launch correctly
• Issue #4030 - Allow threads to skip context switching
• Issue #4029 - Add support for mimalloc
• Issue #4005 - Can’t link HPX when APEX enabled
• Issue #4002 - Missing header for algorithm module
• Issue #3989 - conversion from long to unsigned int requires a narrowing conversion on MSVC
• Issue #3958 - /statistics/average perf counter can’t be created
• Issue #3953 - CMake errors from HPX_AddPseudoDependencies
• Issue #3941 - CMake error for APEX install target
• Issue #3940 - Convert pseudo-doxygen function documentation into actual doxygen documentation
• Issue #3935 - HPX compiler match too strict?
• Issue #3929 - Buildbot failures on latest HPX stable
• Issue #3912 - I recommend publishing a version that does not depend on the boost library
• Issue #3890 - hpx.ini not working
• Issue #3883 - cuda compilation fails because of -faligned-new

• PR #4285 - Delete apex.hpp
• PR #4276 - Disable doxygen generation for hpx/debugging/print.hpp file
• PR #4275 - Make sure APEX is linked to even when not explicitly referenced
• PR #4272 - Fix pushing of documentation

---

2.10. Releases
- PR #4271: Updating APEX tag, don’t create new task_wrapper on operator= of hpx_thread object
- PR #4268: Testing for noexcept function specializations in C++11/14 mode
- PR #4267: Fixing MSVC warning
- PR #4266: Make sure macOS Travis CI fails if build step fails
- PR #4264: Clean up compatibility header options
- PR #4262: Cleanup modules CMakeLists.txt
- PR #4261: Fixing HPX/APEX linking and dependencies for external projects like Phylanx
- PR #4260: Fix docs compilation problems
- PR #4258: Couple of minor changes
- PR #4257: Fix apex annotation for async dispatch
- PR #4256: Remove lambdas from assert expressions
- PR #4255: Ignoring lock in all_to_all and all_reduce
- PR #4254: Adding action specializations for noexcept functions
- PR #4253: Move partlit.hpp to affinity module
- PR #4252: Make mismatching build types a hard error in CMake
- PR #4249: Scheduler improvement
- PR #4248: update hpxmp tag to v0.3.0
- PR #4247: Adding high performance channels
- PR #4244: Ignore lock in ignore_while_locked_1485 test
- PR #4243: Fix PAPI command line option documentation
- PR #4242: Ignore lock in target_distribution_policy
- PR #4241: Fix start_stop_callbacks test
- PR #4240: Mostly fix clang CUDA compilation

• PR #4202\(^{2344}\) - Fix CUDA configuration
• PR #4200\(^{2345}\) - Making sure `hpx_wrap` is not passed on to linker on non-Linux systems
• PR #4198\(^{2346}\) - Fix `execution_agent.cpp` compilation with GCC 5
• PR #4197\(^{2347}\) - Remove deprecated options for 1.4.0 release
• PR #4196\(^{2348}\) - minor fixes for building on OSX Darwin
• PR #4195\(^{2349}\) - Use full clone on CircleCI for pushing stable tag
• PR #4193\(^{2350}\) - Add scheduling hints to `hpx_world_distributed`
• PR #4192\(^{2351}\) - Set up CUDA in `HPXConfig.cmake`
• PR #4191\(^{2352}\) - Export allocators root variables
• PR #4190\(^{2353}\) - Don’t use `constexpr` in `thread_data` with GCC <= 6
• PR #4189\(^{2354}\) - Only use `quick_exit` if available
• PR #4188\(^{2355}\) - Google Season of Docs updates to documentation; writing single node hpx applications
• PR #4186\(^{2356}\) - correct vc to cuda in cuda cmake
• PR #4184\(^{2357}\) - Resetting some cached variables to make sure those are re-filled
• PR #4183\(^{2358}\) - Fix `hpxcxx` configuration
• PR #4181\(^{2359}\) - Rename base libraries var
• PR #4180\(^{2360}\) - Move header left behind earlier to plugin module
• PR #4179\(^{2361}\) - Moving `zip_iterator` and `transform_iterator` to `iterator_support` module
• PR #4178\(^{2362}\) - Move checkpointing support to its own module
• PR #4177\(^{2363}\) - Small const fix to `basic_execution` module
• PR #4176\(^{2364}\) - Add back `HPX_LIBRARIES` and friends to `HPXConfig.cmake`
• PR #4175\(^{2365}\) - Make Vc public and add it to `HPXConfig.cmake`
• PR #4173\(^{2366}\) - Wait for runtime to be running before returning from `hpx::start`

• PR #4172 - More protection against shutdown problems in error handling scenarios.
• PR #4171 - Ignore lock in condition_variable::wait
• PR #4170 - Adding APEX dependency to MPI parcelport
• PR #4168 - Adding utility include
• PR #4167 - Add a condition to setup the external libraries
• PR #4166 - Add an INTERNAL_FLAGS option to link to hpx_internal_flags
• PR #4165 - Forward HPX_* cmake cache variables to external projects
• PR #4164 - Affinity and batch environment modules
• PR #4162 - Handle quick exit
• PR #4160 - Using target_link_libraries for cmake versions >= 3.12
• PR #4159 - Make sure HPX_WITH_NATIVE_TLS is forwarded to dependent projects
• PR #4158 - Adding allocator imported target as a dependency of allocator module
• PR #4157 - Add hpx_memory as a dependency of parcelport plugins
• PR #4156 - Stackless coroutines now can refer to themselves (through get_self() and friends)
• PR #4154 - Added CMake policy CMP0060 for HPX applications.
• PR #4153 - add headeriomanip to tests and tool
• PR #4152 - Casting MPI tag value
• PR #4149 - Add back private m_desc member variable in program_options module
• PR #4147 - Resource partitioner and threadmanager modules
• PR #4146 - Google Season of Docs updates to documentation; creating hpx projects
• PR #4145 - Adding basic support for stackless threads
• PR #4143 - Exclude test_client_1950 from all target
• PR #4142 - Add a new thread_pool_executor
- PR #4140 - Google Season of Docs updates to documentation; why hpx
- PR #4139 - Remove runtime includes from coroutines module
- PR #4138 - Forking boost::intrusive_ptr and adding it as hpx::intrusive_ptr
- PR #4137 - Fixing TSS destruction
- PR #4136 - HPX.Compose modules
- PR #4135 - Fix block_executor
- PR #4130 - Applying fixes based on reports from PVS Studio
- PR #4139 - Adding missing header to build system
- PR #4129 - Fixing compilation if HPX_WITH_DATAPAR_VC is enabled
- PR #4128 - Renaming moveonly_any to unique_any
- PR #4128 - Attempt to fix basic_any constructor for gcc 7
- PR #4128 - Changing extra_archive_data implementation
- PR #4127 - Don’t link to Boost.System unless required
- PR #4126 - Add kernel launch helper utility (+saxpy demo) and merge in octotiger changes
- PR #4125 - Fixing migration test if networking is disabled.
- PR #4122 - Google Season of Docs updates to documentation; hpx build system v1
- PR #4110 - Making sure chunk_size and max_chunk are actually applied to parallel algorithms if specified
- PR #4110 - Make CircleCI formatting check store diff
- PR #4109 - Fix automatically setting C++ standard
- PR #4101 - Module serialization
- PR #4100 - Module datastructures
- PR #4100 - Fixing performance regression introduced earlier
- PR #4100 - Adding missing SPDX tags

• PR #4109 - Overload for start without entry point/argv.
• PR #4108 - Making sure C++ standard is properly detected and propagated
• PR #4106 - use std::round for guaranteed rounding without errors
• PR #4104 - Extend scheduler_mode with new work_stealing and task assignment modes
• PR #4103 - Add this to lambda capture list
• PR #4102 - Add spdx license and check
• PR #4099 - Module coroutines
• PR #4098 - Fix append module path in module CMakelists template
• PR #4097 - Function tests
• PR #4096 - Removing return of thread_result_type from functions not needing them
• PR #4095 - Stop-gap measure until cmake overhaul is in place
• PR #4094 - Deprecate HPX_WITH_MORE_THAN_64_THREADS
• PR #4093 - Fix initialization of global_num_tasks in parallel_executor
• PR #4092 - Add support for mi-malloc
• PR #4091 - Execution context
• PR #4089 - Make counters in coroutines optional
• PR #4087 - Making hpx::util::any compatible with C++17
• PR #4084 - Making sure destination array for std::transform is properly resized
• PR #4083 - Adapting thread_queue_mc to behave even if no 128bit atomics are available
• PR #4082 - Fix compilation on GCC 5
• PR #4081 - Adding option allowing to force using Boost.FileSystem
• PR #4080 - Updating module dependencies
• PR #4079 - Add missing tests for iterator_support module

**HPX V1.3.0 (May 23, 2019)**

### General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.

- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.

- Multiple issues reported by Clang sanitizers have been fixed.

- We have added (back) single-page HTML documentation and PDF documentation.

- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.

- We have added an implementation of `function_ref`.

- The `barrier` and `latch` classes have gained a few additional member functions.

### Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.

- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.

- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the CMake option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.

- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.

- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREFPROCESSOR_WITH_DEPRECATED_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREFPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

### Closed issues

- **Issue #3863** - shouldn’t “-faligned-new” be a usage requirement?

- **Issue #3841** - Build error with msvc 19 caused by SFINAE and C++17

- **Issue #3836** - master branch does not build with idle rate counters enabled

- **Issue #3819** - Add debug suffix to modules built in debug mode

- PR #3847 - Fix attach_debugger configuration option
- PR #3846 - Add tests forlibs header tests
- PR #3844 - Fixing source_groups in preprocessor module to properly handle compatibility headers
- PR #3843 - This fixes the launch_process/launched_process pair of tests
- PR #3842 - Fix macro call with ITTNOTIFY enabled
- PR #3840 - Fixing SLURM environment parsing
- PR #3837 - Fixing misplaced #endif
- PR #3835 - make all latch members protected for consistency
- PR #3834 - Disable transpose_block_numa example on CircleCI
- PR #3833 - make latch counter_ protected for deriving latch in hpxmp
- PR #3831 - Fix CircleCI config for modules
- PR #3830 - minor fix: option HPX_WITH_TEST was not working correctly
- PR #3828 - Avoid for binaries that depend on HPX to directly link against internal modules
- PR #3827 - Adding shortcut for hpx:get_ptr<> (sync, id) for a local, non-migratable objects
- PR #3826 - Fix and update modules documentation
- PR #3825 - Updating default APEX version to 2.1.3 with HPX
- PR #3822 - Fix pkgconfig libs handling
- PR #3821 - Change includes in hpx_wrap.cpp to more specific includes
- PR #3820 - Disable barrier_3792 test when networking is disabled
- PR #3819 - Assorted CMake fixes
- PR #3818 - Removing left-over debug output
- PR #3817 - Allow setting default scheduler mode via the configuration database
- PR #3816 - Make the deprecation warnings issued by the old pp headers optional

2.10. Releases
• PR #3812 - Windows requires to handle symlinks to directories differently from those linking files
• PR #3811 - Clean up PP module and library skeleton
• PR #3806 - Moving include path configuration to before APEX
• PR #3804 - Fix latch
• PR #3803 - Update hpxcxx to look at lib64 and use python3
• PR #3802 - Numa binding allocator
• PR #3801 - Remove duplicated includes
• PR #3800 - Attempt to fix Posix context switching after lazy init changes
• PR #3798 - count and count_if accepts different iterator types
• PR #3797 - Adding a couple of override keywords to overloaded virtual functions
• PR #3796 - Re-enable testing all schedulers in shutdown_suspended_test
• PR #3795 - Change std::terminate to std::abort in SIGSEGV handler
• PR #3794 - Fixing #3792
• PR #3793 - Extending migrate_polymorphic_component unit test
• PR #3791 - Change throw() to noexcept
• PR #3790 - Remove deprecated options for 1.3.0 release
• PR #3789 - Remove Boost filesystem compatibility header
• PR #3788 - Disabled even more spots that should not execute if networking is disabled
• PR #3787 - Bump minimal boost supported version to 1.61.0
• PR #3786 - Bump minimum required versions for 1.3.0 release
• PR #3785 - Explicitly set number of jobs for all ninja invocations on CircleCI
• PR #3784 - Fix leak and address sanitizer problems
• PR #3783 - Disabled even more spots that should not execute if networking is disabled
• PR #3782 - Cherry-picked tuple and thread_init_data fixes from #3701
• PR #3781 - Fix generic context coroutines after lazy stack allocation changes
• PR #3780 - Rename hello world examples
• PR #3776 - Sort algorithms now use the supplied chunker to determine the required minimal chunk size
• PR #3775 - Disable Boost auto-linking
• PR #3774 - Tag and push stable builds
• PR #3773 - Enable migration of polymorphic components
• PR #3771 - Fix link to stackoverflow in documentation
• PR #3770 - Replacing constexpr if in brace-serialization code
• PR #3769 - Fix SIGSEGV handler
• PR #3768 - Adding flags to scheduler allowing to control thread stealing and idle back-off
• PR #3767 - Fix help formatting in hpxrun.py
• PR #3765 - Fix a couple of bugs in the thread test
• PR #3764 - Workaround for SFINAE regression in msvc14.2
• PR #3762 - Prevent MSVC from prematurely instantiating things
• PR #3761 - Update python scripts to work with python 3
• PR #3760 - Fix callable vtable for GCC4.9
• PR #3759 - Rename PAGE_SIZE to PAGE_SIZE_ because AppleClang
• PR #3755 - Making sure locks are not held during suspension
• PR #3754 - Disable more code if networking is not available/not enabled
• PR #3752 - Move util::format implementation to source file
• PR #3751 - Fixing problems with lcos::barrier and iostreams
• PR #3750 - Change error message to take into account use_guard_page setting

https://github.com/STEllAR-GROUP/hpx/pull/3750
• PR #3749 - Fix lifetime problem in run_as_hpx_thread
• PR #3748 - Fixed unusable behavior of the clang code analyzer.
• PR #3747 - Added PMIX_RANK to the defaults of HPX_WITH_PARCELPORT_MPI_ENV.
• PR #3745 - Introduced cache_aligned_data and cache_line_data helper structure
• PR #3742 - Remove more unused functionality from util/logging
• PR #3740 - Fix includes in partitioned vector tests
• PR #3739 - More fixes to make sure that std::flush really flushes all output
• PR #3737 - Fix potential shutdown problems
• PR #3736 - Fix guided_pool_executor after dataflow changes caused compilation fail
• PR #3734 - Limiting executor
• PR #3732 - More constrained bound constructors
• PR #3730 - Attempt to fix deadlocks during component loading
• PR #3729 - Add latch member function count_up and reset, requested by hpxMP
• PR #3728 - Send even empty buffers on hpx::endl and hpx::flush
• PR #3727 - Adding example demonstrating how to customize the memory management for a component
• PR #3726 - Adding support for passing command line options through the HPX_COMMANDLINE_OPTIONS environment variable
• PR #3722 - Document known broken OpenMPI builds
• PR #3716 - Add barrier reset function, requested by hpxMP for reusing barrier
• PR #3715 - More work on functions and vtables
• PR #3714 - Generate single-page HTML, PDF, manpage from documentation
• PR #3713 - Updating default APEX version to 2.1.2
• PR #3712 - Update release procedure
• PR #3710 - Fix the C++11 build, after #3704
• PR #3709 - Move some component_registry functionality to source file
• PR #3708 - Ignore all locks while handling assertions
• PR #3707 - Remove obsolete hpx runtime executable
• PR #3705 - Fix and simplify make_ready_future overload sets
• PR #3704 - Reduce use of binders
• PR #3703 - Ini
• PR #3702 - Fixing CUDA compiler errors
• PR #3700 - Added barrier::increment function to increase total number of thread
• PR #3697 - One more attempt to fix migration…
• PR #3694 - Fixing component migration
• PR #3692 - Print thread state when getting disallowed value in set_thread_state
• PR #3691 - Only disable constexpr with clang-cuda, not nvcc+gcc
• PR #3690 - Link with libsupc++ if needed for thread_local
• PR #3691 - Remove thousands separators in set_operations_3442 to comply with C++11
• PR #3688 - Decouple serialization from function vtables
• PR #3687 - Fix a couple of test failures
• PR #3686 - Make sure tests.unit.build are run after install on CircleCI
• PR #3685 - Revise quickstart CMakelists.txt explanation
• PR #3684 - Provide concept emulation for Ranges-TS concepts
• PR #3683 - Ignore uninitialized chunks
• PR #3682 - Ignore uninitialized chunks. Check proper indices.
• PR #3680 - Ignore uninitialized chunks. Check proper range indices
• PR #3679 - Simplify basic action implementations

2.10. Releases
• PR #3678 - Making sure HPX_HAVE_LIBATOMIC is unset before checking
• PR #3677 - Fix generated full version number to be usable in expressions
• PR #3674 - Reduce functional utilities call depth
• PR #3672 - Change new build system to use existing macros related to pseudo dependencies
• PR #3669 - Remove indirection in function_ref when thread description is disabled
• PR #3668 - Unbreaking async_*cb* tests
• PR #3667 - Generate version.hpp
• PR #3665 - Enabling MPI parcelport for gitlab runners
• PR #3664 - Making clang-tidy work properly again
• PR #3662 - Attempt to fix exception handling
• PR #3661 - Move lcos::latch to source file
• PR #3660 - Fix accidentally explicit gid_type default constructor
• PR #3659 - Parallel executor latch
• PR #3658 - Fixing execution_parameters
• PR #3657 - Avoid dangling references in wait_all
• PR #3656 - Avoiding lifetime problems with sync_put_parcel
• PR #3655 - Fixing nullptr dereference inside of function
• PR #3652 - Attempt to fix thread_map_type definition with C++11
• PR #3650 - Allowing for end iterator being different from begin iterator
• PR #3649 - Added architecture identification to cmake to be able to detect timestamp support
• PR #3645 - Enabling sanitizers on gitlab runner
• PR #3644 - Attempt to tackle timeouts during startup
• PR #3642 - Cleanup parallel partitioners

- PR #3640 - Dataflow now works with functions that return a reference
- PR #3637 - Merging the executor-enabled overloads of `shared_future<>::then`
- PR #3632 - Replace deprecated boost endian macros
- PR #3632 - Add instructions on getting HPX to documentation
- PR #3631 - Simplify parcel creation
- PR #3630 - Small additions and fixes to release procedure
- PR #3629 - Modular pp
- PR #3627 - Implement `util::function_ref`
- PR #3626 - Fix cancelable_action_client example
- PR #3625 - Added automatic serialization for simple structs (see #3034)
- PR #3624 - Updating the default order of priority for `thread_description`
- PR #3621 - Update copyright year and other small formatting fixes
- PR #3620 - Adding support for gitlab runner
- PR #3619 - Store debug logs and core dumps on CircleCI
- PR #3618 - Various optimizations
- PR #3617 - Fix link to the gpg key (#2)
- PR #3615 - Fix unused variable warnings with networking off
- PR #3614 - Restructuring counter data in scheduler to reduce false sharing
- PR #3613 - Adding support for gitlab runners
- PR #3611 - Don’t wait for `stop_condition` in main thread
- PR #3608 - Add inline keyword to `invalid_thread_id` definition for nvcc
- PR #3607 - Adding configuration key that allows one to explicitly add a directory to the component search path
- PR #3606 - Add nvcc to exclude constexpr since it is not supported by nvcc
• PR #3605 - Add inline to definition of checkpoint stream operators to fix link error
• PR #3604 - Use format for string formatting
• PR #3603 - Improve the error message for using to less MAX_CPU_COUNT
• PR #3602 - Improve the error message for to small values of MAX_CPU_COUNT
• PR #3600 - Parallel executor aggregated
• PR #3599 - Making sure networking is disabled for default one-locality-runs
• PR #3598 - Store thread exit functions in forward_list instead of deque to avoid allocations
• PR #3597 - Fix typo/mistake in thread queue cleanup_terminated
• PR #3588 - Fix formatting errors in launching_and_configuring_hpx_applications.rst
• PR #3586 - Make bind propagate value category
• PR #3585 - Extend Cmake for building hpx as distribution packages (refs #3575)
• PR #3584 - Untangle function storage from object pointer
• PR #3582 - Towards Modularized HPX
• PR #3580 - Remove extra || in merge.hpp
• PR #3579 - Partially revert “Remove vtable empty flag”
• PR #3578 - Make sure empty startup/shutdown functions are not being used
• PR #3574 - Make sure DATAPAR settings are conveyed to depending projects
• PR #3573 - Make sure HPX is usable with latest released version of Vc (V1.4.1)
• PR #3572 - Adding test ensuring ticket 3565 is fixed
• PR #3571 - Make empty [unique_]function vtable non-dependent
• PR #3568 - Fix compilation with dynamic bitset for CPU masks
• PR #3562 - Drop util::[unique_]function target_type
• PR #3560 - Removing the target suffixes

**General changes**

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the future implementation.
- Fix several problems in the CMake configuration which affects external projects.
- Add support for Boost 1.69.0.

**Closed issues**

- Issue #3638 - Build HPX 1.2 with boost 1.69
- Issue #3635 - Non-deterministic crashing on Stampede2
- Issue #3550 - 1>e:000workhpxsrcthrow_exception.cpp(54): error C2440: ‘<function-style-cast>’: cannot convert from ‘boost::system::error_code’ to ‘hpx::exception’
- Issue #3549 - HPX 1.2.0 does not build on i686, but release candidate did
- Issue #3511 - Build on s390x fails
- Issue #3509 - Build on armv7l fails

**Closed pull requests**

- PR #3695 - Don’t install CMake templates and packaging files
- PR #3666 - Fixing yet another race in future_data
- PR #3663 - Fixing race between setting and getting the value inside future_data
- PR #3648 - Adding timestamp option for S390x platform
- PR #3647 - Blind attempt to fix warnings issued by gcc V9
- PR #3611 - Include GNUInstallDirs earlier to have it available for subdirectories
- PR #3595 - Use GNUInstallDirs lib path in pkgconfig config file
- PR #3593 - Add include(GNUInstallDirs) to HPXMacros.cmake
• PR #3591\textsuperscript{2883} - Fix compilation error on arm7 architecture. Compiles and runs on Fedora 29 on Pi 3.
• PR #3558\textsuperscript{2884} - Adding constructor `exception(boost::system::error_code const&)`
• PR #3555\textsuperscript{2885} - cmake: make install locations configurable
• PR #3551\textsuperscript{2886} - Fix uint64_t causing compilation fail on i686

**HPX V1.2.0 (Nov 12, 2018)**

**General changes**

Here are some of the main highlights and changes for this release:

• Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of hpx_main.hpp on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the CMake\textsuperscript{2887} or pkg-config. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during CMake\textsuperscript{2888} configuration. The implementation on Windows is unchanged.

• We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for HPX threads to be pinned to a particular worker thread.

• We have significantly improved the performance of our futures implementation by making the shared state atomic.

• We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.

• We have added a new option to the `--hpx:threads` command line option. It is now possible to use cores to tell HPX to only use one worker thread per core, unlike the existing option all which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of `--hpx:threads` has also been changed to cores as this leads to better performance in most cases.

• All command line options can now be passed alongside configuration options when initializing HPX. This means that some options that were previously only available on the command line can now be set as configuration options.

• HPXMP is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. HPXMP can be enabled within HPX by setting `DHPX_WITH_HPXMP=ON` during CMake\textsuperscript{2889} configuration.

• Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during CMake\textsuperscript{2890} configuration.

\textsuperscript{2883} https://github.com/STEllAR-GROUP/hpx/pull/3591
\textsuperscript{2884} https://github.com/STEllAR-GROUP/hpx/pull/3558
\textsuperscript{2885} https://github.com/STEllAR-GROUP/hpx/pull/3555
\textsuperscript{2886} https://github.com/STEllAR-GROUP/hpx/pull/3551
\textsuperscript{2887} https://www.cmake.org
\textsuperscript{2888} https://www.cmake.org
\textsuperscript{2889} https://www.cmake.org
\textsuperscript{2890} https://www.cmake.org
• The idling behaviour of HPX has been tweaked to allow for faster idling. This is useful in interactive applications where the HPX worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with HPX\_WITH\_THREAD\_MANAGER\_IDLE\_BACKOFF=OFF during CMake\textsuperscript{2891} configuration.

• It is now possible to register callback functions for HPX worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

**Breaking changes**

• The implementation of hpx\_main.hpp has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on using Makefiles for more details.

• The default value of --hpX:threads has changed from all to cores. The new option cores only starts one worker thread per core.

• We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.

• Our boost::format-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on hpx::util::format or hpx::util::format\_to. The pull request for this change contains more information: PR #3266\textsuperscript{2892}.

• The following deprecated options have now been completely removed: HPX\_WITH\_ASYNC\_FUNCTION\_COMPATIBILITY, HPX\_WITH\_LOCAL\_DATAFLOW, HPX\_WITH\_GENERIC\_EXECUTION\_POLICY, HPX\_WITH\_BOOST\_CHRONO\_COMPATIBILITY, HPX\_WITH\_EXECUTOR\_COMPATIBILITY, HPX\_WITH\_EXECUTION\_POLICY\_COMPATIBILITY, and HPX\_WITH\_TRANSFORM\_REDUCE\_COMPATIBILITY.

**Closed issues**

• Issue #3538\textsuperscript{2893} - numa handling incorrect for hwloc 2
• Issue #3533\textsuperscript{2894} - Cmake version 3.5.1 does not work (git ff26b35 2018-11-06)
• Issue #3526\textsuperscript{2895} - Failed building hpx-1.2.0-rc1 on Ubuntu16.04 x86-64 Virtualbox VM
• Issue #3512\textsuperscript{2896} - Build on aarch64 fails
• Issue #3475\textsuperscript{2897} - HPX fails to link if the MPI parcelport is enabled
• Issue #3462\textsuperscript{2898} - CMake configuration shows a minor and inconsequential failure to create a symlink
• Issue #3461\textsuperscript{2899} - Compilation Problems with the most recent Clang
• Issue #3460\textsuperscript{2900} - Deadlock when create\_partitioner fails (assertion fails) in debug mode
• Issue #3455\textsuperscript{2901} - HPX build failing with HWLOC errors on POWER8 with hwloc 1.8
• Issue #3438\textsuperscript{2902} - HPX no longer builds on IBM POWER8

- Issue #3376: Failed to build HPX with APEX using clang
- Issue #3366: Adapted Safe_Object example fails for --hpx:threads > 1
- Issue #3360: Segmentation fault when passing component id as parameter
- Issue #3358: HPX runtime hangs after multiple (~thousands) start-stop sequences
- Issue #3352: Support TCP provider in libfabric ParcelPort
- Issue #3342: undefined reference to __atomic_load_16
- Issue #3339: setting command line options/flags from init cfg is not obvious
- Issue #3325: AGAS migrates components prematurely
- Issue #3321: hpx bad_parameter handling is awful
- Issue #3318: Benchmarks fail to build with C++11
- Issue #3304: hpx::threads::run_as_hpx_thread does not properly handle exceptions
- Issue #3300: Setting pu step or offset results in no threads in default pool
- Issue #3297: Crash with APEX when running Phylanx lra_csv with > 1 thread
- Issue #3296: Building HPX with APEX configuration gives compiler warnings
- Issue #3290: make tests failing at hello_world_component
- Issue #3285: possible compilation error when “using namespace std;” is defined before including “hpx” headers files

2.10. Releases 1567
• Issue #3280 - HPX fails on OSX
• Issue #3272 - CircleCI does not upload generated docker image any more
• Issue #3270 - Error when compiling CUDA examples
• Issue #3267 - `tests.unit.host_.block_allocator` fails occasionally
• Issue #3264 - Possible move to Sphinx for documentation
• Issue #3263 - Documentation improvements
• Issue #3259 - `set_parcel_write_handler` test fails occasionally
• Issue #3258 - Links to source code in documentation are broken
• Issue #3247 - Rare `tests.unit.host_.block_allocator` test failure on 1.1.0-rc1
• Issue #3244 - Slowing down and speeding up an `interval_timer`
• Issue #3215 - Cannot build both tests and examples on MSVC with pseudo-dependencies enabled
• Issue #3195 - Unnecessary customization point route causing performance penalty
• Issue #3088 - A strange thing in `parallel::sort`.
• Issue #2650 - `libfabric` support for passive endpoints
• Issue #1205 - TSS is broken

Closed pull requests

• PR #3542 - Fix numa lookup from pu when using hwloc 2.x
• PR #3541 - Fixing the build system of the MPI parcelport
• PR #3540 - Updating HPX people section
• PR #3539 - Splitting test to avoid OOM on CircleCI
• PR #3537 - Fix guided exec
• PR #3536 - Updating grants which support the LSU team
• PR #3535 - Fix hiding of docker credentials
• PR #3534 - Fixing #3533
• PR #3532 - fixing minor doc typo –hpx:print-counter-at arg
• PR #3530 - Changing APEX default tag to v2.1.0
• PR #3529 - Remove leftover security options and documentation
• PR #3528 - Fix hwloc version check
• PR #3524 - Do not build guided pool examples with older GCC compilers
• PR #3523 - Fix logging regression
• PR #3522 - Fix more warnings
• PR #3521 - Fixing argument handling in induction and reduction clauses for parallel::for_loop
• PR #3520 - Remove docs symlink and versioned docs folders
• PR #3519 - hpxMP release
• PR #3518 - Change all steps to use new docker image on CircleCI
• PR #3516 - Drop usage of deprecated facilities removed in C++17
• PR #3515 - Remove remaining uses of Boost.TypeTraits
• PR #3513 - Fixing a CMake problem when trying to use libfabric
• PR #3512 - Remove memory_block component
• PR #3507 - Propagating the MPI compile definitions to all relevant targets
• PR #3503 - Update documentation colors and logo
• PR #3502 - Fix bogus ‘throws’ bindings in scheduled_thread_pool_impl
• PR #3501 - Split parallel::remove_if tests to avoid OOM on CircleCI
• PR #3500 - Support NONAMEPREFIX in add_hpx_library()
• PR #3497 - Note that cuda support requires cmake 3.9
• PR #3495 - Fixing dataflow

2.10. Releases
• PR #3493\(^{2971}\): Remove deprecated options for 1.2.0 part 2

• PR #3492\(^{2972}\): Add CUDA_LINK_LIBRARIES_KEYWOR to allow PRIVATE keyword in linkage t...

• PR #3491\(^{2973}\): Changing Base docker image

• PR #3490\(^{2974}\): Don’t create tasks immediately with hpx::apply

• PR #3489\(^{2975}\): Remove deprecated options for 1.2.0

• PR #3488\(^{2976}\): Revert “Use BUILD_INTERFACE generator expression to fix cmake flag exports”

• PR #3487\(^{2977}\): Revert “Fixing type attribute warning for transfer_action”

• PR #3485\(^{2978}\): Use BUILD_INTERFACE generator expression to fix cmake flag exports

• PR #3483\(^{2979}\): Fixing type attribute warning for transfer_action

• PR #3481\(^{2980}\): Remove unused variables

• PR #3480\(^{2981}\): Towards a more lightweight transfer action

• PR #3479\(^{2982}\): Fix FLAGS - Use correct version of target_compile_options

• PR #3478\(^{2983}\): Making sure the application’s exit code is properly propagated back to the OS

• PR #3476\(^{2984}\): Don’t print docker credentials as part of the environment.

• PR #3473\(^{2985}\): Fixing invalid cmake code if no jemalloc prefix was given

• PR #3472\(^{2986}\): Attempting to work around recent clang test compilation failures

• PR #3471\(^{2987}\): Enable jemalloc on windows

• PR #3470\(^{2988}\): Updates readme

• PR #3468\(^{2989}\): Avoid hang if there is an exception thrown during startup

• PR #3467\(^{2990}\): Add compiler specific fallthrough attributes if C++17 attribute is not available

• PR #3466\(^{2991}\): - bugfix : fix compilation with llvm-7.0

• PR #3465\(^{2992}\): This patch adds various optimizations extracted from the thread_local_allocator work

• PR #3464\(^{2993}\): Check for forked repos in CircleCI docker push step

• PR #3463 - cmake: create the parent directory before symlinking
• PR #3459 - Remove unused/incomplete functionality from util/logging
• PR #3458 - Fix a problem with scope of CMAKE_CXX_FLAGS and hpx_add_compile_flag
• PR #3457 - Fixing more size_t -> int16_t (and similar) warnings
• PR #3456 - Add #ifdefs to topology.cpp to support old hwloc versions again
• PR #3454 - Fixing warnings related to silent conversion of size_t -> int16_t
• PR #3451 - Add examples as unit tests
• PR #3450 - Constexpr-fying bind and other functional facilities
• PR #3446 - Fix some thread suspension timeouts
• PR #3445 - Fix various warnings
• PR #3443 - Only enable service pool config options if pools are enabled
• PR #3441 - Fix missing closing brackets in documentation
• PR #3439 - Use correct MPI CXX libraries for MPI parcelport
• PR #3438 - Add projection function to find_.* (and fix very bad bug)
• PR #3435 - Fixing 1205
• PR #3434 - Fix threads cores
• PR #3433 - Add Heise Online to release announcement list
• PR #3432 - Don’t track task dependencies for distributed runs
• PR #3431 - Circle CI setting changes for hpxMP
• PR #3430 - Fix unused params warning
• PR #3429 - One thread per core
• PR #3428 - This suppresses a deprecation warning that is being issued by MSVC 19.15.26726
• PR #3427 - Fixes #3426

• PR #3425 - Use source cache and workspace between job steps on CircleCI
• PR #3421 - Add CDash timing output to future overhead test (for graphs)
• PR #3420 - Add guided_pool_executor
• PR #3419 - Fix typo in CircleCI config
• PR #3418 - Add sphinx documentation
• PR #3415 - Scheduler NUMA hint and shared priority scheduler
• PR #3414 - Adding step to synchronize the APEX release
• PR #3413 - Fixing multiple defines of APEX_HAVE_HPX
• PR #3412 - Fixes linking with libhpx_wrap error with BSD and Windows based systems
• PR #3410 - Fix typo in CMakeLists.txt
• PR #3409 - Fix brackets and indentation in existing_performance_counters.qbk
• PR #3407 - Fix unused param and extra ; warnings emitted by gcc 8.x
• PR #3406 - Adding thread local allocator and use it for future shared states
• PR #3405 - Adding DHPX_HAVE_THREAD_LOCAL_STORAGE=ON to builds
• PR #3404 - Fixing multiple definition of main() in linux
• PR #3403 - Allow debug option to be enabled only for Linux systems with dynamic main on
• PR #3401 - Fix cuda_future_helper.h when compiling with C++11
• PR #3400 - Fix floating point exception scheduler_base idle backoff
• PR #3398 - Atomic future state
• PR #3397 - Fixing code for older gcc versions
• PR #3396 - Allowing to register thread event functions (start/stop/error)
• PR #3394 - Fix small mistake in primary_namespace_server.cpp
• PR #3393 - Explicitly instantiate configured schedulers
• PR #3392 - Add performance counters background overhead and background work duration
• PR #3391 - Adapt integration of HPXMP to latest build system changes
• PR #3390 - Make AGAS measurements optional
• PR #3389 - Fix deadlock during shutdown
• PR #3388 - Add several functionalities allowing to optimize synchronous action invocation
• PR #3387 - Add cmake option to opt out of fail-compile tests
• PR #3386 - Adding support for boost: : container: : small_vector to dataflow
• PR #3385 - Adds Debug option for hpx initializing from main
• PR #3384 - This hopefully fixes two tests that occasionally fail
• PR #3383 - Making sure thread local storage is enable for hpXMP
• PR #3382 - Fix usage of HPX_CAPTURE together with default value capture [=]
• PR #3381 - Replace undefined instantiations of uniform_int_distribution
• PR #3380 - Add missing semicolons to uses of HPX_COMPILER_FENCE
• PR #3379 - Fixing #3378
• PR #3378 - Adding build system support to integrate hpXmp into hpX at the user’s machine
• PR #3377 - Replacing wrapper for __libc_start_main with main
• PR #3376 - Adds hpX_wrap to HPX_LINK_LIBRARIES which links only when specified.
• PR #3375 - Forcing cache settings in HPXConfig.cmake to guarantee updated values
• PR #3374 - Fix some more c++11 build problems
• PR #3373 - Adds HPX_LINKER_FLAGS to HPX applications without editing their source codes
• PR #3372 - util: : format: add type_specifier<> specializations for %!s(MISSING) and %!l(MISSING)s
• PR #3371 - Adding configuration option to allow explicit disable of the new hpx_main feature on Linux
• PR #3368 - Updates doc with recent hpX_wrap implementation

• PR #3367 - Adds Mac OS implementation to hpx_main.hpp
• PR #3365 - Fix order of hpx libs in HPX_CONF_LIBRARIES.
• PR #3363 - Apex fixing null wrapper
• PR #3361 - Making sure all parcels get destroyed on an HPX thread (TCP pp)
• PR #3359 - Feature/improveerrorforcompiler
• PR #3357 - Static/dynamic executable implementation
• PR #3355 - Reverting changes introduced by #3283 as those make applications hang
• PR #3354 - Add external dependencies to HPX_LIBRARY_DIR
• PR #3353 - Fix libfabric tcp
• PR #3351 - Move obsolete header to tests directory.
• PR #3350 - Renaming two functions to avoid problem described in #3285
• PR #3349 - Make idle backoff exponential with maximum sleep time
• PR #3347 - Replace simple_component* with component* in the Documentation
• PR #3346 - Fix CMakeLists.txt example in quick start
• PR #3345 - Fix automatic setting of HPX_MORE_THAN_64_THREADS
• PR #3344 - Reduce amount of information printed for unknown command line options
• PR #3343 - Safeguard HPX against destruction in global contexts
• PR #3341 - Allowing for all command line options to be used as configuration settings
• PR #3340 - Always convert inspect results to JUnit XML
• PR #3336 - Only run docker push on master on CircleCI
• PR #3335 - Update description of hpx.os_threads config parameter.
• PR #3334 - Making sure early logging settings don’t get mixed with others
• PR #3333 - Update CMake links and versions in documentation
• PR #3332 - Add notes on target suffixes to CMake documentation
• PR #3331 - Add quickstart section to documentation
• PR #3330 - Rename resource_partitioner test to avoid conflicts with pseudodependencies
• PR #3328 - Making sure object is pinned while executing actions, even if action returns a future
• PR #3327 - Add missing std::forward to tuple.hpp
• PR #3326 - Make sure logging is up and running while modules are being discovered.
• PR #3324 - Replace C++14 overload of std::equal with C++11 code.
• PR #3323 - Fix a missing apex thread data (wrapper) initialization
• PR #3320 - Adding support for -std=c++2a (define HPX_WITH_CXX2A=On)
• PR #3319 - Replacing C++14 feature with equivalent C++11 code
• PR #3317 - Fix compilation with VS 15.7.1 and /std:c++latest
• PR #3316 - Fix includes for 1dStencil_*_omp examples
• PR #3314 - Remove some unused parameter warnings
• PR #3313 - Fix pu-step and pu-offset command line options
• PR #3312 - Add conversion of inspect reports to JUnit XML
• PR #3311 - Fix escaping of closing braces in format specification syntax
• PR #3310 - Don’t overwrite user settings with defaults in registration database
• PR #3309 - Fixing potential stack overflow for dataflow
• PR #3308 - This updates the .clang-format configuration file to utilize newer features
• PR #3306 - Marking migratable objects in their gid to allow not handling migration in AGAS
• PR #3305 - Add proper exception handling to run_as_hpx_thread
• PR #3303 - Changed std::rand to a better inbuilt PRNG Generator
• PR #3302 - All non-migratable (simple) components now encode their lva and component type in their gid

• PR #3036\textsuperscript{3148} - Switching to CircleCI 2.0

\textbf{HPX V1.1.0 (Mar 24, 2018)}

\textbf{General changes}

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way HPX manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the \texttt{hpx::resource::partitioner} that manages all available processing units and assigns resources to the used thread pools. Thread pools can be

\textsuperscript{3132} https://github.com/STEllAR-GROUP/hpx/pull/3268
\textsuperscript{3133} https://github.com/STEllAR-GROUP/hpx/pull/3266
\textsuperscript{3134} https://github.com/STEllAR-GROUP/hpx/pull/3265
\textsuperscript{3135} https://github.com/STEllAR-GROUP/hpx/pull/3262
\textsuperscript{3136} https://github.com/STEllAR-GROUP/hpx/pull/3261
\textsuperscript{3137} https://github.com/STEllAR-GROUP/hpx/pull/3260
\textsuperscript{3138} https://github.com/STEllAR-GROUP/hpx/pull/3256
\textsuperscript{3139} https://github.com/STEllAR-GROUP/hpx/pull/3254
\textsuperscript{3140} https://github.com/STEllAR-GROUP/hpx/pull/3253
\textsuperscript{3141} https://github.com/STEllAR-GROUP/hpx/pull/3251
\textsuperscript{3142} https://github.com/STEllAR-GROUP/hpx/pull/3239
\textsuperscript{3143} https://github.com/STEllAR-GROUP/hpx/pull/3234
\textsuperscript{3144} https://github.com/STEllAR-GROUP/hpx/pull/3232
\textsuperscript{3145} https://github.com/STEllAR-GROUP/hpx/pull/3230
\textsuperscript{3146} https://github.com/STEllAR-GROUP/hpx/pull/3228
\textsuperscript{3147} https://github.com/STEllAR-GROUP/hpx/pull/3163
\textsuperscript{3148} https://github.com/STEllAR-GROUP/hpx/pull/3036
now be suspended/resumed independently. This functionality helps in running HPX concurrently to code that is directly relying on OpenMP\textsuperscript{3149} and/or MPI\textsuperscript{3150}.

- We have continued to implement various parallel algorithms. HPX now almost completely implements all of the parallel algorithms as specified by the C++17 Standard\textsuperscript{3151}. We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as hpx::partitioned_vector).

- Added a compatibility layer for std::thread, std::mutex, and std::condition_variable allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The CMake\textsuperscript{3152} configuration option -DHPX_WITH_THREAD_COMPATIBILITY=On can be used to force using the Boost equivalents.

- The parameter sequence for the hpx::parallel::transform_inclusive_scan overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing -DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On to CMake\textsuperscript{3153}.

- The parameter sequence for the hpx::parallel::inclusive_scan overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing -DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On to CMake.

- Added a helper facility hpx::local_new which is equivalent to hpx::new_ except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.

- Removed the (broken) component type hpx::lcos::queue<T>. The old type is still available at configure time by passing -DHPX_WITH_QUEUE_COMPATIBILITY=On to CMake.

- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option -DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On on the CMake\textsuperscript{3154} command line.

- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.

- User defined components don’t have to be default-constructible anymore. Return types from actions don’t have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.

- We have added a new launch policy hpx::launch::lazy that allows oneto defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of CMake\(^{3155}\) is now V3.3.2.

- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.

- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.

- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.

- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.

- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the first place. In this case `hpx::async` now returns a `hpx::future<hpx::future<T>>` making its behavior conforming to its local counterpart.

- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.

- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.

- We have removed the experimental thread schedulers `hierarchy_scheduler`, `periodic_priority_scheduler` and `throttling_scheduler` in an effort to clean up and consolidate our thread schedulers.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #3250\(^{3156}\) - Apex refactoring with guids
- PR #3249\(^{3157}\) - Updating People.qbk
- PR #3246\(^{3158}\) - Assorted fixes for CUDA
- PR #3245\(^{3159}\) - Apex refactoring with guids
- PR #3242\(^{3160}\) - Modify task counting in thread_queue.hpp
- PR #3240\(^{3161}\) - Fixed typos
- PR #3238\(^{3162}\) - Readding accidentally removed std::abort
- PR #3237\(^{3163}\) - Adding Pipeline example
- PR #3236\(^{3164}\) - Fixing memory_block

PR #3119 - https://github.com/STEllAR-GROUP/hpx/pull/3119

2.10. Releases
• PR #3118 - Adding performance_counter::reinit to allow for dynamically changing counter sets
• PR #3117 - Replace uses of boost/experimental::optional with util::optional
• PR #3116 - Moving background thread APEX timer #2980
• PR #3115 - Fixing race condition in channel test
• PR #3114 - Avoid using util::function for thread function wrappers
• PR #3113 - cmake V3.10.2 has changed the variable names used for MPI
• PR #3112 - Minor fixes to exclusive_scan algorithm
• PR #3111 - Revert “fix detection of cxx11_std_atomic”
• PR #3110 - Suspend thread pool
• PR #3109 - Fixing thread scheduling when yielding a thread id
• PR #3108 - Revert “Suspend thread pool”
• PR #3107 - Remove UB from thread::id relational operators
• PR #3106 - Add cmake test for std::decay_t to fix cuda build
• PR #3105 - Fixing refcount for async traversal frame
• PR #3104 - Local execution of direct actions is now actually performed directly
• PR #3103 - Adding support for generic counter_raw_values performance counter type
• Issue #3102 - Introduce generic performance counter type returning an array of values
• PR #3101 - Revert “Adapting stack overhead limit for gcc 4.9”
• PR #3100 - Fix #3068 (condition_variable deadlock)
• PR #3099 - Fixing lock held during suspension in papi counter component
• PR #3098 - Unbreak broadcast_wait_for_2822 test
• PR #3097 - Adapting stack overhead limit for gcc 4.9
• PR #3096 - fix detection of cxx11_std_atomic

https://github.com/STEllAR-GROUP/hpx/pull/3097
https://github.com/STEllAR-GROUP/hpx/pull/3096
• PR #3095  - Add ciso646 header to get _LIBCPP_VERSION for testing inplace merge
• PR #3094  - Relax atomic operations on performance counter values
• PR #3093  - Short-circuit all_of/any_of/none_of instantiations
• PR #3092  - Take advantage of C++14 lambda capture initialization syntax, where possible
• PR #3091  - Remove more references to Boost from logging code
• PR #3090  - Unify use of yield/yield_k
• PR #3089  - Fix a strange thing in parallel::detail::handle_exception. (Fix #2834.)
• Issue #3088  - A strange thing in parallel::sort.
• PR #3087  - Fixing assertion in default_distribution_policy
• PR #3086  - Implement parallel::remove and parallel::remove_if
• PR #3085  - Addressing breaking changes in Boost V1.66
• PR #3084  - Ignore build warnings round 2
• PR #3083  - Fix typo HPX_WITH_MM_PREFECTH
• PR #3081  - Pre-decay template arguments early
• PR #3080  - Suspend thread pool
• PR #3079  - Ignore build warnings
• PR #3078  - Don’t test inplace_merge with libc++
• PR #3076  - Fixing 3075: Part 1
• PR #3074  - Fix more build warnings
• PR #3073  - Suspend thread cleanup
• PR #3072  - Change existing symbol_namespace::iterate to return all data instead of invoking a callback
• PR #3071  - Fixing pack_traversal_async test
• PR #3070 - Fix dynamic_counters_loaded_1508 test by adding dependency to memory_component

2.10. Releases
- PR #3069 - Fix scheduling loop exit
- Issue #3068 - hpx::lcos::condition_variable could be suspect to deadlocks
- PR #3067 - #ifdef out random_shuffle deprecated in later c++
- PR #3066 - Make coalescing test depend on coalescing library to ensure it gets built
- PR #3065 - Workaround for minimal_timed_async_executor_test compilation failures, attempts to copy a deferred call (in unevaluated context)
- PR #3064 - Fixing wrong condition in wrapper_heap
- PR #3063 - Fix exception handling for execution::seq
- PR #3061 - Adapt MSVC C++ mode handling to VS15.5
- PR #3060 - Fix compiler problem in MSVC release mode
- PR #3059 - Fixing #2931
- Issue #3058 - minimal_timed_async_executor_test_exe fails to compile on master (d6f505c)
- PR #3057 - Fix stable_merge_2964 compilation problems
- PR #3056 - Fix some build warnings caused by unused variables/unnecessary tests
- PR #3055 - Update documentation for running tests
- Issue #3054 - Assertion failure when using bulk hpx::new_ in asynchronous mode
- PR #3053 - Do not bind test running to cmake test build rule
- PR #3051 - Fix HPX-Qt interaction in Qt example.
- Issue #3048 - nqueen example fails occasionally
- PR #3047 - Fixing #3044
- PR #3046 - Add OS thread suspension
- PR #3042 - PyCicle - first attempt at a build toold for checking PR’s
- PR #3041 - Fix a problem about asynchronous execution of parallel::merge and parallel::partition.
- PR #3040 - Fix a mistake about exception handling in asynchronous execution of scan_partitioner.

https://github.com/STEllAR-GROUP/hpx/pull/3040
• PR #3039^3326 - Consistently use executors to schedule work
• PR #3038^3327 - Fixing local direct function execution and lambda actions perfect forwarding
• PR #3035^3328 - Make parallel unit test names match build target/folder names
• PR #3033^3329 - Fix setting of default build type
• Issue #3032^3330 - Fix partitioner arg copy found in #2982
• Issue #3031^3331 - Errors linking libhpx.so due to missing references (master branch, commit 6679a8882)
• PR #3030^3332 - Revert “implement executor then interface with && forwarding reference”
• PR #3029^3333 - Run CI inspect checks before building
• PR #3028^3334 - Added range version of parallel::move
• Issue #3027^3335 - Implement all scheduling APIs in terms of executors
• PR #3026^3336 - implement executor then interface with && forwarding reference
• PR #3025^3337 - Fix typo uninitialized to uninitialized
• PR #3024^3338 - Inspect fixes
• PR #3023^3339 - P0356 Simplified partial function application
• PR #3022^3340 - Master fixes
• PR #3021^3341 - Segfault fix
• PR #3020^3342 - Disable command-line aliasing for applications that use user_main
• PR #3019^3343 - Adding enable_elasticity option to pool configuration
• PR #3018^3344 - Fix stack overflow detection configuration in header files
• PR #3017^3345 - Speed up local action execution
• PR #3016^3346 - Unify stack-overflow detection options, remove reference to libsigsegv
• PR #3015^3347 - Speeding up accessing the resource partitioner and the topology info
• Issue #3014^3348 - HPX does not compile on POWER8 with gcc 5.4

2.10. Releases 1587
• Issue #3013[^3349] - hello_world occasionally prints multiple lines from a single OS-thread
• PR #3012[^3350] - Silence warning about casting away qualifiers in itt_notify.hpp
• PR #3011[^3351] - Fix cpuset leak in hwloc_topology_info.cpp
• PR #3010[^3352] - Remove useless decay_copy
• PR #3009[^3353] - Fixing 2996
• PR #3008[^3354] - Remove unused internal function
• PR #3007[^3355] - Fixing wrapper_heap alignment problems
• Issue #3006[^3356] - hwloc memory leak
• PR #3004[^3357] - Silence C4251 (needs to have dll-interface) for future_data_void
• Issue #3003[^3358] - Suspension of runtime
• PR #3001[^3359] - Attempting to avoid data races in async_traversal while evaluating dataflow()
• PR #3000[^3360] - Adding hpx::util::optional as a first step to replace experimental::optional
• PR #2998[^3361] - Cleanup up and Fixing component creation and deletion
• Issue #2996[^3362] - Build fails with HPX_WITH_HWLOC=OFF
• PR #2995[^3363] - Push more future_data functionality to source file
• PR #2994[^3364] - WIP: Fix throttle test
• PR #2993[^3365] - Making sure –hpx:help does not throw for required (but missing) arguments
• PR #2992[^3366] - Adding non-blocking (on destruction) service executors
• Issue #2991[^3367] - run_as_os_thread locks up
• Issue #2990[^3368] - –help will not work until all required options are provided
• PR #2989[^3369] - Improve error messages caused by misuse of dataflow
• PR #2988[^3370] - Improve error messages caused by misuse of .then
• Issue #2987[^3371] - stack overflow detection producing false positives

• PR #2986 - Deduplicate non-dependent thread_info logging types
• PR #2985 - Adapted parallel::{all_of|any_of|none_of} for Ranges TS (see #1668)
• PR #2984 - Refactor one_size_heap code to simplify code
• PR #2983 - Fixing local_new_component
• PR #2982 - Clang tidy
• PR #2981 - Simplify allocator rebinding in pack traversal
• PR #2980 - Fixing integer overflows
• PR #2979 - Implement parallel::inplace_merge
• Issue #2977 - Make hwloc compulsory instead of optional
• PR #2976 - Making sure client_base instance that registered the component does not unregister it when being destructed
• PR #2975 - Change version of pulled APEX to master
• PR #2974 - Fix domain not being freed at the end of scheduling loop
• PR #2973 - Fix small typos
• PR #2972 - Adding uintstd.h header
• PR #2971 - Fall back to creating local components using local_new
• PR #2970 - Improve is_tuple_like trait
• PR #2969 - Fix HPX_WITH_MORE_THAN_64_THREADS default value
• PR #2968 - Cleaning up dataflow overload set
• PR #2967 - Make parallel::merge is stable. (Fix #2964.)
• PR #2966 - Fixing a couple of held locks during exception handling
• PR #2965 - Adding missing #include
• Issue #2964 - parallel merge is not stable
• PR #2963 - Making sure any function object passed to dataflow is released after being invoked

2.10. Releases
• PR #2962 - Partially reverting #2891
• PR #2961 - Attempt to fix the gcc 4.9 problem with the async pack traversal
• Issue #2959 - Program terminates during error handling
• Issue #2958 - HPX_PLAIN_ACTION breaks due to missing include
• PR #2957 - Fixing errors generated by mixing different attribute syntaxes
• Issue #2956 - Mixing attribute syntaxes leads to compiler errors
• Issue #2955 - Fix OS-Thread throttling
• PR #2953 - Making sure any hpx.os_threads=N supplied through a --hpx::config file is taken into account
• PR #2952 - Removing wrong call to cleanup_terminated_locked
• PR #2951 - Revert “Make sure the function vtables are initialized before use”
• PR #2950 - Fix a namespace compilation error when some schedulers are disabled
• Issue #2949 - master branch giving lockups on shutdown
• Issue #2947 - hpx.ini is not used correctly at initialization
• PR #2946 - Adding explicit feature test for thread_local
• PR #2945 - Make sure the function vtables are initialized before use
• PR #2944 - Attempting to solve affinity problems on CircleCI
• PR #2943 - Changing channel actions to be direct
• PR #2942 - Adding split_future for std::vector
• PR #2941 - Add a feature test for CXX11 override
• Issue #2940 - Add split_future for std::vector<T>
• PR #2939 - Making error reporting during problems with setting affinity masks more verbose
• PR #2938 - Fix this various executors
• PR #2937 - Fix some typos in documentation
• PR #2934 - Remove the need for “complete” SFINAE checks
• PR #2933 - Making sure parallel::for_loop is executed in parallel if requested
• PR #2932 - Classify chunk_size_iterator to input iterator tag. (Fix #2866)
• Issue #2931 - hpx:help triggers unusual error with clang build
• PR #2930 - Add #include files needed to set _POSIX_VERSION for debug check
• PR #2929 - Fix a couple of deprecated c++ features
• PR #2928 - Fixing execution parameters
• Issue #2927 - CMake warning: ... cycle in constraint graph
• PR #2926 - Default pool rename
• Issue #2925 - Default pool cannot be renamed
• Issue #2924 - hpx:attach-debugger=startup does not work any more
• PR #2923 - Alloc membind
• PR #2922 - This fixes CircleCI errors when running with --hpx:bind=none
• PR #2921 - Custom pool executor was missing priority and stacksize options
• PR #2920 - Adding test to trigger problem reported in #2916
• PR #2919 - Make sure the resource_partitioner is properly destructed on hpx::finalize
• Issue #2918 - hpx::init calls wrong (first) callback when called multiple times
• PR #2917 - Adding util::checkpoint
• Issue #2916 - Weird runtime failures when using a channel and chained continuations
• PR #2915 - Introduce executor parameters customization points
• Issue #2914 - Task assignment to current Pool has unintended consequences
• PR #2913 - Fix rp hang
• PR #2912 - Update contributors
• PR #2911\textsuperscript{3441} - Fixing CUDA problems

- Issue #2835\(^{3510}\) - constexpr functions with void return type break compilation with CUDA 8.0
- Issue #2834\(^{3511}\) - One suspicion in parallel::detail::handle_exception
- PR #2833\(^{3512}\) - Implement parallel::merge
- PR #2832\(^{3513}\) - Fix a strange thing in parallel::util::detail::handle_local_exceptions. (Fix #2818)
- PR #2830\(^{3514}\) - Break the debugger when a test failed
- Issue #2831\(^{3515}\) - parallel/executors/execution_fwd.hpp causes compilation failure in C++11 mode.
- PR #2829\(^{3516}\) - Implement an API for asynchronous pack traversal
- PR #2828\(^{3517}\) - Split unit test builds on CircleCI to avoid timeouts
- Issue #2827\(^{3518}\) - failure to compile hello_world example with -Wererror
- PR #2824\(^{3519}\) - Making sure promises are marked as started when used as continuations
- PR #2823\(^{3520}\) - Add documentation for partitioned_vector_view
- Issue #2822\(^{3521}\) - Yet another issue with wait_for similar to #2796
- PR #2821\(^{3522}\) - Fix bugs and improve that about HPX_HAVE_CXX11_AUTO_RETURN_VALUE of CMake
- PR #2820\(^{3523}\) - Support C++11 in benchmark codes of parallel::partition and parallel::partition_copy
- PR #2819\(^{3524}\) - Fix compile errors in unit test of container version of parallel::partition
- Issue #2818\(^{3525}\) - A strange thing in parallel::util::detail::handle_local_exceptions
- Issue #2815\(^{3526}\) - HPX fails to compile with HPX_WITH_CUDA=ON and the new CUDA 9.0 RC
- Issue #2814\(^{3527}\) - Using `gmakeN` after `cmake` produces error in src/CMakeFiles/hpx.dir/runtime/agas/addressing_service.cpp.o
- PR #2813\(^{3528}\) - Properly support `[[noretturn]]` attribute if available
- Issue #2812\(^{3529}\) - Compilation fails with gcc 7.1.1
- PR #2811\(^{3530}\) - Adding hpx::launch::lazy and support for async, dataflow, and future::then
- PR #2810\(^{3531}\) - Add option allowing to disable deprecation warning
- PR #2809\(^{3532}\) - Disable throttling scheduler if HWLOC is not found/used

• PR #2665 - Hide the detail namespace in doxygen per default

---

2.10. Releases
• PR #2660 - Add documentation to hpx::util::unwrapped and hpx::util::unwrapped2
• PR #2659 - Improve integration with vcpkg
• PR #2658 - Unify access_data trait for use in both, serialization and de-serialization
• PR #2657 - Removing hpx::lcos::queue<T>
• PR #2656 - Reduce MAX_TERMINATED_THREADS default, improve memory use on manycore cpus
• PR #2655 - Maintenance for emulate-deleted macros
• PR #2654 - Implement parallel is_heap and is_heap_until
• PR #2653 - Drop support for VS2013
• PR #2652 - This patch makes sure that all parcels in a batch are properly handled
• PR #2649 - Update docs (Table 18) - move transform to end
• Issue #2647 - hpx::parcelset::detail::parcel_data::has_continuation is uninitialized
• Issue #2644 - Some .vcxproj in the HPX.sln fail to build
• Issue #2641 - hpx::lcos::queue should be deprecated
• PR #2640 - A new throttling policy with public APIs to suspend/resume
• PR #2639 - Fix a tiny typo in tutorial.
• Issue #2638 - Invalid return type ‘void’ of constexpr function
• PR #2636 - Add and use HPX_MSVC_WARNING_PRAGMA for #pragma warning
• PR #2633 - Distributed define_spmd_block
• PR #2631 - Move unordered_map out of parcelport into hpx/concurrent
• PR #2628 - Making sure that shutdown does not hang
• PR #2627 - Fix serialization

2.10. Releases
• Issue #701\textsuperscript{3763} - Add RCR performance counter component

• Issue #528\textsuperscript{3764} - Add support for known failures and warning count/comparisons to hpx_run_tests.py

HPX V1.0.0 (Apr 24, 2017)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

• Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts>...>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling HPX with VS2012.

• Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.

• Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.

• Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see PR #2289\textsuperscript{3765} for more details).

• Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.

• We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or \texttt{[boost_simd]}. Please see Issue #2333\textsuperscript{3766} for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this blog-post\textsuperscript{3767} for more information.

• The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.

• The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old inner_product names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.

• Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).

• Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.

• All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The old names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.

• The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also improved the performance of creating `hpx::future` and of various facilities handling those.

\textsuperscript{3763} https://github.com/STEllAR-GROUP/hpx/issues/701
\textsuperscript{3764} https://github.com/STEllAR-GROUP/hpx/issues/528
\textsuperscript{3765} https://github.com/STEllAR-GROUP/hpx/pull/2289
\textsuperscript{3766} https://github.com/STEllAR-GROUP/hpx/issues/2333
\textsuperscript{3767} http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/
• We have consolidated all of the code in HPX.Compute related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.

• Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.

• Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

**Breaking changes**

• We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.

• We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.

• The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.

• The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.

• The build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release.

• PR #2596\(^{3768}\) - Adding apex data
• PR #2595\(^{3769}\) - Remove obsolete file
• Issue #2594\(^{3770}\) - FindOpenCL.cmake mismatch with the official cmake module
• PR #2592\(^{3771}\) - First attempt to introduce spmd_block in hpx
• Issue #2591\(^{3772}\) - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
• PR #2588\(^{3773}\) - Daint fixes
• PR #2587\(^{3774}\) - Fixing transfer_(continuation)_action::schedule
• PR #2585\(^{3775}\) - Work around MSVC having an ICE when compiling with -Ob2
• PR #2583\(^{3776}\) - changing 7zip command to 7za in roll_release.sh

- PR #2582 - First attempt to introduce spmd_block in hpx
- PR #2581 - Enable annotated function for parallel algorithms
- PR #2580 - First attempt to introduce spmd_block in hpx
- PR #2579 - Make thread NICE level setting an option
- PR #2578 - Implementing enqueue instead of busy wait when no sender is available
- PR #2577 - Retrieve -std=c++11 consistent nvcc flag
- PR #2576 - Add missing dependencies of cuda based tests
- PR #2575 - Remove warnings due to some captured variables
- PR #2574 - Attempt to resolve resolve_locality
- PR #2572 - Adding APEX hooks to background thread
- PR #2571 - Pick up hpx.ignore_batch_env from config map
- PR #2570 - Add commandline options -hpx:print-counters-locally
- PR #2569 - Fix computeapi unit tests
- PR #2568 - This adds another barrier::synchronize before registering performance counters
- PR #2564 - Cray static toolchain support
- PR #2563 - Fixed unhandled exception during startup
- PR #2562 - Remove partitioned_vector.cu from build tree when nvcc is used
- Issue #2561 - octo-tiger crash with commit 6e921495ff6c26f125d62629cbaad0525f14f7ab
- PR #2560 - Prevent -Wundef warnings on Vc version checks
- PR #2559 - Allowing CUDA callback to set the future directly from an OS thread
- PR #2558 - Remove warnings due to float precisions
- PR #2557 - Removing bogus handling of compile flags for CUDA
- PR #2556 - Fixing scan partitioner

• PR #2554 - Add more diagnostics to error thrown from find_appropriate_destination
• Issue #2555 - No valid parcelport configured
• PR #2553 - Add cmake cuda_arch option
• PR #2552 - Remove incomplete datapar bindings to libflatarray
• PR #2551 - Rename hwloc_topology to hwloc_topology_info
• PR #2550 - Apex api updates
• PR #2549 - Pre-includes defines.hpp to get the macro HPX_HAVE_CUDA value
• PR #2548 - Fixing issue with disconnect
• PR #2546 - Some fixes around cuda clang partitioned_vector example
• PR #2545 - Fix uses of the Vc2 datapar flags; the value, not the type, should be passed to functions
• PR #2543 - Make HPX_WITH_MALLOC easier to use
• PR #2541 - Avoid recompiles when enabling/disabling examples
• PR #2540 - Fixing usage of target_link_libraries()
• PR #2539 - fix RPATH behaviour
• Issue #2538 - HPX_WITH_CUDA corrupts compilation flags
• PR #2537 - Add output of a Bazel Skylark extension for paths and compile options
• PR #2536 - Add counter exposing total available memory to Windows as well
• PR #2535 - Remove obsolete support for security
• Issue #2534 - Remove command line option --hpx:run-agas-server
• PR #2533 - Pre-cache locality endpoints during bootstrap
• PR #2532 - Fixing handling of GIDs during serialization preprocessing
• PR #2531 - Amend uses of the term “functor”
• PR #2529 - added counter for reading available memory
• PR #2527 - Facilities to create actions from lambdas
• PR #2526 - Updated docs: HPX_WITH_EXAMPLES
• PR #2525 - Remove warnings related to unused captured variables
• Issue #2524 - CMAKE failed because it is missing: TCMALLOC_LIBRARY TCMALLOC_INCLUDE_DIR
• PR #2523 - Fixing compose_cb stack overflow
• PR #2522 - Instead of unlocking, ignore the lock while creating the message handler
• PR #2521 - Create LPROGRESS_ logging macro to simplify progress tracking and timings
• PR #2520 - Intel 17 support
• PR #2519 - Fix components example
• PR #2518 - Fixing parcel scheduling
• Issue #2517 - Race condition during Parcel Coalescing Handler creation
• Issue #2516 - HPX locks up when using at least 256 localities
• Issue #2515 - error: Install cannot find “/lib/hpx/libparcel_coalescing.so.0.9.99” but I can see that file
• PR #2514 - Making sure that all continuations of a shared_future are invoked in order
• PR #2513 - Fixing locks held during suspension
• PR #2512 - MPI Parcelport improvements and fixes related to the background work changes
• PR #2511 - Fixing bit-wise (zero-copy) serialization
• Issue #2509 - Linking errors in hwloc_topology
• PR #2508 - Added documentation for debugging with core files
• PR #2506 - Fixing background work invocations
• PR #2505 - Fix tuple serialization
• Issue #2504 - Ensure continuations are called in the order they have been attached
• PR #2503 - Adding serialization support for Vc v2 (datapar)

- PR #2502 - Resolve various, minor compiler warnings
- PR #2501 - Some other fixes around cuda examples
- Issue #2500 - nvcc / cuda clang issue due to a missing -DHPX_WITH_CUDA flag
- PR #2499 - Adding support for std::array to wait_all and friends
- PR #2498 - Execute background work as HPX thread
- PR #2497 - Fixing configuration options for spinlock-deadlock detection
- PR #2496 - Accounting for different compilers in CrayKNL toolchain file
- PR #2494 - Adding component base class which ties a component instance to a given executor
- PR #2493 - Enable controlling amount of pending threads which must be available to allow thread stealing
- PR #2492 - Adding new command line option --hpex:print-counter-reset
- PR #2491 - Resolve ambiguities when compiling with APEX
- PR #2490 - Resuming threads waiting on future with higher priority
- Issue #2489 - nvcc issue because -std=c++11 appears twice
- PR #2488 - Adding performance counters exposing the internal idle and busy-loop counters
- PR #2487 - Allowing for plain suspend to reschedule thread right away
- PR #2486 - Only flag HPX code for CUDA if HPX_WITH_CUDA is set
- PR #2485 - Making thread-queue parameters runtime-configurable
- PR #2484 - Added atomic counter for parcel-destinations
- PR #2483 - Added priority-queue lifo scheduler
- PR #2482 - Changing scheduler to steal only if more than a minimal number of tasks are available
- PR #2481 - Extending command line option --hpex:print-counter-destination to support value 'none'
- PR #2479 - Added option to disable signal handler
- PR #2478 - Makingsurethesineperformancecountermodulegetsloadedonlyforthecorrespondingexample

• Issue #2477 - Breaking at a throw statement
• PR #2476 - Annotated function
• PR #2475 - Ensure that using `%osthread%` during logging will not throw for non-hpx threads
• PR #2474 - Remove now superficial non_direct actions from base_lco and friends
• PR #2473 - Refining support for ITTNotify
• PR #2472 - Some fixes around hpx compute
• Issue #2470 - redefinition of boost::detail::spinlock
• Issue #2469 - Dataflow performance issue
• PR #2468 - Perf docs update
• PR #2466 - Guarantee to execute remote direct actions on HPX-thread
• PR #2465 - Improve demo: Async copy and fixed device handling
• PR #2464 - Adding performance counter exposing instantaneous scheduler utilization
• PR #2463 - Downcast to future<void>
• PR #2462 - Fixed usage of ITT-Notify API with Intel Amplifier
• PR #2461 - Cublas demo
• PR #2460 - Fixing thread bindings
• PR #2459 - Make `-std=c++11` nvcc flag consistent for in-build and installed versions
• Issue #2457 - Segmentation fault when registering a partitioned vector
• PR #2452 - Properly releasing global barrier for unhandled exceptions
• PR #2451 - Fixing long shutdown times
• PR #2450 - Attempting to fix initialization errors on newer platforms (Boost V1.63)
• PR #2449 - Replace BOOST_COMPILER_FENCE with an HPX version
• PR #2448 - This fixes a possible race in the migration code
- PR #2445 - Fixing dataflow et.al. for futures or future-ranges wrapped into ref()
- PR #2444 - Fix segfaults
- PR #2443 - Issue 2442
- Issue #2442 - Mismatch between #if/#endif and namespace scope brackets in this_thread_executers.hpp
- Issue #2441 - undeclared identifier BOOST_COMPILER_FENCE
- PR #2440 - Knl build
- PR #2438 - Datapar backend
- PR #2437 - Adapt algorithm parameter sequence changes from C++17
- PR #2436 - Adapt execution policy name changes from C++17
- Issue #2435 - Trunk broken, undefined reference to hpx::thread::interrupt(hpx::thread::id, bool)
- PR #2434 - More fixes to resource manager
- PR #2433 - Added versions of hpx::get_ptr taking client side representations
- PR #2432 - Warning fixes
- PR #2431 - Adding facility representing set of performance counters
- PR #2430 - Fix parallel_executor thread spawning
- PR #2429 - Fix attribute warning for gcc
- Issue #2427 - Seg fault running octo-tiger with latest HPX commit
- Issue #2426 - Bug in 9592f5c0bc29806fceedbe73f35b6ca7e027e6eb causes immediate crash in Octo-tiger
- PR #2425 - Fix nvcc errors due to constexpr specifier
- Issue #2424 - Async action on component present on hpx::find_here is executing synchronously
- PR #2423 - Fix nvcc errors due to constexpr specifier
- PR #2422 - Implementing hpx::this_thread thread data functions
- PR #2421 - Adding benchmark for wait_all

• Issue #2420\textsuperscript{3915} - Returning object of a component client from another component action fails
• PR #2419\textsuperscript{3916} - Infiniband parcelport
• Issue #2418\textsuperscript{3917} - gcc + nvcc fails to compile code that uses partitioned\_vector
• PR #2417\textsuperscript{3918} - Fixing context switching
• PR #2416\textsuperscript{3919} - Adding fixes and workarounds to allow compilation with nvcc/msvc (VS2015up3)
• PR #2415\textsuperscript{3920} - Fix errors coming from hpx compute examples
• PR #2414\textsuperscript{3921} - Fixing msvc12
• PR #2413\textsuperscript{3922} - Enable cuda/nvcc or cuda/clang when using add\_hpx\_executable()
• PR #2412\textsuperscript{3923} - Fix issue in HPX\_SetupTarget.cmake when cuda is used
• PR #2411\textsuperscript{3924} - This fixes the core compilation issues with MSVC12
• Issue #2410\textsuperscript{3925} - undefined reference to opal\_hwloc191\_hwloc......
• PR #2409\textsuperscript{3926} - Fixing locking for channel and receive\_buffer
• PR #2407\textsuperscript{3927} - Solving #2402 and #2403
• PR #2406\textsuperscript{3928} - Improve guards
• PR #2405\textsuperscript{3929} - Enable parallel::for\_each for iterators returning proxy types
• PR #2404\textsuperscript{3930} - Forward the explicitly given result\_type in the hpx invoke
• Issue #2403\textsuperscript{3931} - datapar\_execution + zip iterator: lambda arguments aren't references
• Issue #2402\textsuperscript{3932} - datapar algorithm instantiated with wrong type #2402
• PR #2401\textsuperscript{3933} - Added support for imported libraries to HPX\_Libraries.cmake
• PR #2400\textsuperscript{3934} - Use CMake policy CMP0060
• Issue #2399\textsuperscript{3935} - Error trying to push back vector of futures to vector
• PR #2398\textsuperscript{3936} - Allow config #defines to be written out to custom config\_defines.hpp
• Issue #2397\textsuperscript{3937} - CMake generated config defines can cause tedious rebuilds category
• Issue #2396 - BOOST_ROOT paths are not used at link time
• PR #2395 - Fix target_link_libraries() issue when HPX Cuda is enabled
• Issue #2394 - Template compilation error using HPX_WITH_DATAPAR_LIBFLATARRAY
• PR #2393 - Fixing lock registration for recursive mutex
• PR #2392 - Add keywords in target_link_libraries in hpx_setup_target
• PR #2391 - Clang goroutines
• Issue #2390 - Adapt execution policy name changes from C++17
• PR #2389 - Chunk allocator and pool are not used and are obsolete
• PR #2388 - Adding functionalities to datapar needed by octotiger
• PR #2387 - Fixing race condition for early parcels
• Issue #2386 - Lock registration broken for recursive_mutex
• PR #2385 - Datapar zip iterator
• PR #2384 - Fixing race condition in for_loop_reduction
• PR #2383 - Continuations
• PR #2382 - add LibFlatArray-based backend for datapar
• PR #2381 - remove unused typedef to get rid of compiler warnings
• PR #2380 - Tau cleanup
• PR #2379 - Can send immediate
• PR #2378 - Renaming copy_helper/copy_n_helper/move_helper/move_n_helper
• Issue #2376 - Boost trunk’s spinlock initializer fails to compile
• PR #2375 - Add support for minimal thread local data
• PR #2374 - Adding API functions set_config_entry_callback
• PR #2373 - Add a simple utility for debugging that gives suspended task backtraces

2.10. Releases
• PR #2372 - Barrier Fixes
• Issue #2370 - Can’t wait on a wrapped future
• PR #2369 - Fixing stable_partition
• PR #2367 - Fixing find_prefixes for Windows platforms
• PR #2366 - Testing for experimental/optional only in C++14 mode
• PR #2364 - Adding set_config_entry
• PR #2363 - Fix papi
• PR #2362 - Adding missing macros for new non-direct actions
• PR #2361 - Improve cmake output to help debug compiler incompatibility check
• PR #2360 - Fixing race condition in condition_variable
• PR #2359 - Fixing shutdown when parcels are still in flight
• Issue #2357 - failed to insert console_print_action into typename_to_id_t registry
• PR #2356 - Fixing return type of get_iterator_tuple
• PR #2355 - Fixing compilation against Boost 1.62
• PR #2354 - Adding serialization for mask_type if CPU_COUNT > 64
• PR #2353 - Adding hooks to tie in APEX into the parcel layer
• Issue #2352 - Compile errors when using intel 17 beta (for KNL) on edison
• PR #2351 - Fix function vtable get_function_address implementation
• Issue #2350 - Build failure - master branch (4de09f5) with Intel Compiler v17
• PR #2349 - Enabling zero-copy serialization support for std::vector>
• PR #2348 - Adding test to verify #2334 is fixed
• PR #2347 - Bug fixes for hpx.compute and hpx::lcos::channel
• PR #2346 - Removing cmake “find” files that are in the APEX cmake Modules

• PR #2345 - Implemented parallel::stable_partition
• PR #2344 - Making hpx::lcos::channel usable with basename registration
• PR #2343 - Fix a couple of examples that failed to compile after recent api changes
• Issue #2342 - Enabling APEX causes link errors
• PR #2341 - Removing cmake “find” files that are in the APEX cmake Modules
• PR #2340 - Implemented all existing datapar algorithms using Boost.SIMD
• PR #2339 - Fixing 2338
• PR #2338 - Possible race in sliding semaphore
• PR #2337 - Adjust osu_latency test to measure window_size parcels in flight at once
• PR #2336 - Allowing remote direct actions to be executed without spawning a task
• PR #2335 - Making sure multiple components are properly initialized from arguments
• Issue #2334 - Cannot construct component with large vector on a remote locality
• PR #2332 - Fixing hpx::lcos::local::barrier
• PR #2331 - Updating APEX support to include OTF2
• PR #2330 - Support for data-parallelism for parallel algorithms
• Issue #2329 - Coordinate settings in cmake
• PR #2328 - fix LibGeoDecomp builds with HPX + GCC 5.3.0 + CUDA 8RC
• PR #2326 - Making scan_partitioner work (for now)
• Issue #2324 - Constructing a vector of components only correctly initializes the first component
• PR #2322 - Fix problems that bubbled up after merging #2278
• PR #2321 - Scalable barrier
• PR #2320 - Std flag fixes
• Issue #2319 - -std=c++14 and -std=c++1y with Intel can’t build recent Boost builds due to insufficient C++14 support; don’t enable these flags by default for Intel

2.10. Releases
• PR #2318 - Improve handling of –hpx:bind=<bind-spec>
• PR #2317 - Making sure command line warnings are printed once only
• PR #2316 - Fixing command line handling for default bind mode
• PR #2315 - Set id_retrieved if set_id is present
• Issue #2314 - Warming for requested/allocated thread discrepancy is printed twice
• Issue #2313 - –hpx:print-bind doesn’t work with –hpx:pu-step
• Issue #2312 - –hpx:bind range specifier restrictions are overly restrictive
• Issue #2311 - hpx_0.9.99 out of project build fails
• PR #2310 - Simplify function registration
• PR #2309 - Spelling and grammar revisions in documentation (and some code)
• PR #2306 - Correct minor typo in the documentation
• PR #2305 - Cleaning up and fixing parcel coalescing
• PR #2304 - Inspect checks for stream related includes
• PR #2303 - Add functionality allowing to enumerate threads of given state
• PR #2301 - Algorithm overloads fix for VS2013
• PR #2300 - Use <cstdint>, add inspect checks
• PR #2299 - Replace boost::[c]ref with std::[c]ref, add inspect checks
• PR #2297 - Fixing compilation with no hw_loc
• PR #2296 - Hpx compute
• PR #2295 - Making sure for_loop(execution::par, 0, N, ...) is actually executed in parallel
• PR #2294 - Throwing exceptions if the runtime is not up and running
• PR #2293 - Removing unused parcel port code
• PR #2292 - Refactor function vtables

- PR #2291 - Fixing 2286
- PR #2290 - Simplify algorithm overloads
- PR #2289 - Adding performance counters reporting parcel related data on a per-action basis
- Issue #2288 - Remove dormant parcelports
- Issue #2286 - adjustments to parcel handling to support parcelports that do not need a connection cache
- PR #2285 - add CMake option to disable package export
- PR #2283 - Add more inspect checks for use of deprecated components
- Issue #2282 - Arithmetic exception in executor static chunker
- Issue #2281 - For loop doesn’t parallelize
- PR #2280 - Fixing 2277: build failure with PAPI
- PR #2279 - Child vs parent stealing
- Issue #2277 - master branch build failure (53c5b4f) with papi
- PR #2276 - Compile time launch policies
- PR #2275 - Replace boost::chrono with std::chrono in interfaces
- PR #2274 - Replace most uses of Boost.Assign with initializer list
- PR #2273 - Fixed typos
- PR #2272 - Inspect checks
- PR #2270 - Adding test verifying -lhpox.os_threads=all
- PR #2269 - Added inspect check for now obsolete boost type traits
- PR #2268 - Moving more code into source files
- Issue #2267 - Add inspect support to deprecate Boost.TypeTraits
- PR #2265 - Adding channel LCO
- PR #2264 - Make support for std::ref mandatory
• PR #2263 - Constrain tuple_member forwarding constructor
• Issue #2262 - Test hpx.os_threads=all
• Issue #2261 - OS X: Error: no matching constructor for initialization of ‘hpx::lcos::local::condition_variable_any’
• Issue #2260 - Make support for std::ref mandatory
• PR #2259 - Remove most of Boost.MPL, Boost.EnableIf and Boost.TypeTraits
• PR #2258 - Fixing #2256
• PR #2257 - Fixing launch process
• Issue #2256 - Actions are not registered if not invoked
• PR #2255 - Coalescing histogram
• PR #2254 - Silence explicit initialization in copy-constructor warnings
• PR #2253 - Drop support for GCC 4.6 and 4.7
• PR #2252 - Prepare V1.0
• PR #2251 - Convert to 0.9.99
• PR #2249 - Adding iterator_facade and iterator_adaptor
• Issue #2248 - Need a feature to yield to a new task immediately
• PR #2246 - Adding split_future
• PR #2245 - Add an example for handing over a component instance to a dynamically launched locality
• Issue #2243 - Add example demonstrating AGAS symbolic name registration
• Issue #2242 - pkgconfig test broken on CentOS 7 / Boost 1.61
• Issue #2241 - Compilation error for partitioned vector in hpx_compute branch
• PR #2240 - Fixing termination detection on one locality
• Issue #2239 - Create a new facility lcos::split_all
• Issue #2236 - hpx::cout vs. std::cout

• Issue #702 - Add instrumentation of parcel layer
• Issue #668 - Implement ispc task interface
• Issue #533 - Thread queue/deque internal parameters should be runtime configurable
• Issue #475 - Create a means of combining performance counters into querysets

HPX V0.9.99 (Jul 15, 2016)

General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming HPX V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of HPX and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big ‘Thank you!’ to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move HPX components to a different compute node). Additionally, this release of HPX cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

4076 https://github.com/STEllAR-GROUP/hpx/pull/2232
4077 https://github.com/STEllAR-GROUP/hpx/issues/2147
4078 https://github.com/STEllAR-GROUP/hpx/issues/2109
4079 https://github.com/STEllAR-GROUP/hpx/issues/1973
4080 https://github.com/STEllAR-GROUP/hpx/issues/1864
4081 https://github.com/STEllAR-GROUP/hpx/issues/1754
4082 https://github.com/STEllAR-GROUP/hpx/issues/1655
4083 https://github.com/STEllAR-GROUP/hpx/issues/1591
4084 https://github.com/STEllAR-GROUP/hpx/issues/1401
4085 https://github.com/STEllAR-GROUP/hpx/issues/1125
4086 https://github.com/STEllAR-GROUP/hpx/issues/839
4087 https://github.com/STEllAR-GROUP/hpx/issues/702
4088 https://github.com/STEllAR-GROUP/hpx/issues/668
4089 https://github.com/STEllAR-GROUP/hpx/issues/533
4090 https://github.com/STEllAR-GROUP/hpx/issues/475
• We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.

• We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges (N4560) proposal. This also includes the addition of projections to the existing algorithms. Please see Issue #1668 for a list of algorithms which have been adapted to N4560.

• We have implemented index-based parallel for-loops based on a corresponding standardization proposal (P0075R1). Please see Issue #2016 for a list of available algorithms.

• We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See Issue #1141 for an overview of which algorithms are available by now.

• We have started to implement a new prototypical functionality with HPX.Compute which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.

• We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.

• Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type T into a future of any other type R, either based on default conversion rules of the embedded types or using a given explicit conversion function.

• We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without 'stopping the world' for the object to migrate. HPX will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See Issue #559 and PR #1966 for more details.

• The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see Issue #1265 and PR #1912 for more information.

• Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).

• We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of HPX itself and also of applications depending on it. We have further decreased the dependency of HPX on the Boost libraries by replacing part of those with facilities available from the standard libraries.

• Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.

• We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.
• We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.

• We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).

• We have extended the interfaces exposed from executors (as proposed by N4406\(^{4101}\)) to accept an arbitrary number of arguments.

Breaking changes

• In order to move the dataflow facility to namespace `hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to CMake\(^{4102}\) is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.

• The adaptation of the C++ Extensions for Ranges (N4560\(^{4103}\)) proposal imposes some breaking changes related to the return types of some of the parallel algorithms. Please see Issue #1668\(^{4104}\) for a list of algorithms which have already been adapted.

• The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.

• We have removed support for Intel V13 and gcc 4.4.x.

• We have removed (default) support for the generic `hpx::parallel::execution_policy` because it was removed from the Parallelism TS (__cpp11_n4104__) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to CMake.

• Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.

• Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.

• Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in `HPX` (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- **PR #2250** - change default chunker of parallel executor to static one
- **PR #2247** - HPX on ppc64le
- **PR #2244** - Fixing MSVC problems
- **PR #2238** - Fixing small typos
- **PR #2237** - Fixing small typos
- **PR #2234** - Fix broken add test macro when extra args are passed in
- **PR #2231** - Fixing possible race during future awaiting in serialization
- **PR #2230** - Fix stream nvcc
- **PR #2229** - Fixed run_as_hpx_thread
- **PR #2228** - On prefetching_test branch : adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- **PR #2227** - Support for HPXCL's opencl::event
- **PR #2226** - Preparing for release of V0.9.99
- **PR #2225** - fix issue when compiling components with hpccxx
- **PR #2224** - Compute alloc fix
- **PR #2223** - Simplify promise
- **PR #2222** - Replace last uses of boost::function by util::function_nonser
- **PR #2221** - Fix config tests
- **PR #2220** - Fixing gcc 4.6 compilation issues
- **PR #2219** - nullptr support for [unique_]function
- **PR #2218** - Introducing clang tidy
- **PR #2216** - Replace NULL with nullptr

• Issue #2214 - Let inspect flag use of NULL, suggest nullptr instead
• PR #2213 - Require support for nullptr
• PR #2212 - Properly find jemalloc through pkg-config
• PR #2211 - Disable a couple of warnings reported by Intel on Windows
• PR #2210 - Fixed host::block_allocator::bulk_construct
• PR #2209 - Started to clean up new sort algorithms, made things compile for sort_by_key
• PR #2208 - A couple of fixes that were exposed by a new sort algorithm
• PR #2207 - Adding missing includes in /hpx/include/serialization.hpp
• PR #2206 - Call package_action::get_future before package_action::apply
• PR #2205 - The indirect_packaged_task::operator() needs to be run on a HPX thread
• PR #2204 - Variadic executor parameters
• PR #2203 - Delay-initialize members of partitioned iterator
• PR #2202 - Added segmented fill for hpx::vector
• Issue #2201 - Null Thread id encountered on partitioned_vector
• PR #2200 - Fix hangs
• PR #2199 - Deprecating hpx/traits.hpp
• PR #2198 - Making explicit inclusion of external libraries into build
• PR #2197 - Fix typo in QT CMakeLists
• PR #2196 - Fixing a gcc warning about attributes being ignored
• PR #2194 - Fixing partitioned_vector_spmd_foreach example
• Issue #2193 - partitioned_vector_spmd_foreach seg faults
• PR #2192 - Support Boost.Thread v4
• PR #2191 - HPX.Compute prototype

• PR #2164\textsuperscript{4172} - Fix wait all
• PR #2163\textsuperscript{4173} - Fix some typos in config tests
• PR #2162\textsuperscript{4174} - Improve #includes
• PR #2160\textsuperscript{4175} - Add inspect check for missing #include <list>
• PR #2159\textsuperscript{4176} - Add missing finalize call to stop test hanging
• PR #2158\textsuperscript{4177} - Algo fixes
• PR #2157\textsuperscript{4178} - Stack check
• Issue #2156\textsuperscript{4179} - OSX reports stack space incorrectly (generic context coroutines)
• Issue #2155\textsuperscript{4180} - Race condition suspected in runtime
• PR #2154\textsuperscript{4181} - Replace boost::detail::atomic_count with the new util::atomic_count
• PR #2153\textsuperscript{4182} - Fix stack overflow on OSX
• PR #2152\textsuperscript{4183} - Define is_bitwise_serializable as is_trivially_copyable when available
• PR #2151\textsuperscript{4184} - Adding missing <cstring> for std::mem* functions
• Issue #2150\textsuperscript{4185} - Unable to use component clients as action return types
• PR #2149\textsuperscript{4186} - std::memmove copies bytes, use bytes*sizeof(type) when copying larger types
• PR #2148\textsuperscript{4187} - Adding customization point for parallel copy/move
• PR #2145\textsuperscript{4188} - Applying changes to address warnings issued by latest version of PVS Studio
• Issue #2148\textsuperscript{4189} - hpx::parallel::copy is broken after trivially copyable changes
• PR #2144\textsuperscript{4190} - Some minor tweaks to compute prototype
• PR #2143\textsuperscript{4191} - Added Boost version support information over OSX platform
• PR #2142\textsuperscript{4192} - Fixing memory leak in example
• PR #2141\textsuperscript{4193} - Add missing specializations in execution policies
• PR #2139\textsuperscript{4194} - This PR fixes a few problems reported by Clang’s Undefined Behavior sanitizer

• PR #2138
  - Revert “Adding fedora docs”
• PR #2136
  - Removed double semicolon
• PR #2135
  - Add deprecated #include check for hpx_fwd.hpp
• PR #2134
  - Resolved memory leak in stencil_8
• PR #2133
  - Replace uses of boost pointer containers
• PR #2132
  - Removing unused typedef
• PR #2131
  - Add several include checks for std facilities
• PR #2130
  - Fixing parcel compression, adding test
• PR #2129
  - Fix invalid attribute warnings
• Issue #2128
  - hpx::init seems to segfault
• PR #2127
  - Making executor_traits N-ary
• PR #2126
  - GCC 4.6 fails to deduce the correct type in lambda
• PR #2125
  - Making parcel coalescing test actually test something
• Issue #2124
  - Make a testcase for parcel compression
• Issue #2123
  - hpx/hpx/runtime/applier_fwd.hpp - Multiple defined types
• Issue #2122
  - Exception in primary_namespace::resolve_free_list
• Issue #2121
  - Possible memory leak in 1d_stencil_8
• PR #2120
  - Fixing 2119
• Issue #2119
  - reduce_by_key compilation problems
• Issue #2118
  - Premature unwrapping of boost::ref’ed arguments
• PR #2117
  - Added missing initializer on last constructor for thread_description
• PR #2116
  - Use a lightweight bind implementation when no placeholders are given
• PR #2115
  - Replace boost::shared_ptr with std::shared_ptr

• PR #2114 - Adding hook functions for executor_parameter_traits supporting timers
• Issue #2113 - Compilation error with gcc version 4.9.3 (MacPorts gcc49 4.9.3_0)
• PR #2112 - Replace uses of safe_bool with explicit operator bool
• Issue #2111 - Compilation error on QT example
• Issue #2110 - Compilation error when passing non-future argument to unwrapped continuation in dataflow
• Issue #2109 - Warning while compiling hp
• Issue #2108 - Stack trace of last bug causing issues with octotiger
• Issue #2107 - Stack trace of last bug causing issues with octotiger
• PR #2106 - Making sure that a missing parcel_coalescing module does not cause startup exceptions
• PR #2105 - Stop using hpx_fwd.hpp
• Issue #2104 - coalescing plugin handler is not optional any more
• Issue #2103 - Make executor_traits N-nary
• Issue #2102 - Build error with octotiger and hpx commit e657426d
• PR #2101 - Combining thread data storage
• PR #2100 - Added repartition version of 1d stencil that uses any performance counter
• PR #2099 - Drop obsolete TR1 result_of protocol
• PR #2098 - Replace uses of boost::bind with util::bind
• PR #2097 - Deprecated inspect checks
• PR #2096 - Reduce by key, extends #1141
• PR #2095 - Moving local cache from external to hpx/util
• PR #2094 - Bump minimum required Boost to 1.50.0
• PR #2093 - Add include checks for several Boost utilities
• Issue #2093 - /.../local_cache.hpp(89): error #303: explicit type is missing (“int” assumed)
• PR #2091 - Fix for Raspberry pi build
• PR #2090 - Fix storage size for util::function<>
• PR #2089 - Fix #2088
• Issue #2088 - More verbose output from cmake configuration
• PR #2087 - Making sure init_globally always executes hpx_main
• Issue #2086 - Race condition with recent HPX
• PR #2085 - Adding #include checker
• PR #2084 - Replace boost lock types with standard library ones
• PR #2083 - Simplify packaged task
• PR #2082 - Updating APEX version for testing
• PR #2081 - Cleanup exception headers
• PR #2080 - Make call_once variadic
• Issue #2079 - With GNU C++, line 85 of hpx/config/version.hpp causes link failure when linking application
• Issue #2078 - Simple test fails with _GLIBCXX_DEBUG defined
• PR #2077 - Instantiate board in nqueen client
• PR #2076 - Moving coalescing registration to TUs
• PR #2075 - Fixed some documentation typos
• PR #2074 - Adding flush-mode to message handler flush
• PR #2073 - Fixing performance regression introduced lately
• PR #2072 - Refactor local::condition_variable
• PR #2071 - Timer based on boost::asio::deadline_timer
• PR #2070 - Refactor tuple based functionality
• PR #2069 - Fixed typos

• Issue #2068  - Seg fault with octotiger
• PR #2067  - Algorithm cleanup
• PR #2066  - Split credit fixes
• PR #2065  - Rename HPX_MOVABLE_BUT_NOT_COPYABLE to HPX_MOVABLE_ONLY
• PR #2064  - Fixed some typos in docs
• PR #2063  - Adding example demonstrating template components
• Issue #2062  - Support component templates
• PR #2061  - Replace some uses of lexical_cast<string> with C++11 std::to_string
• PR #2060  - Replace uses of boost::noncopyable with HPX_NON_COPYABLE
• PR #2059  - Adding missing for_loop algorithms
• PR #2058  - Move several definitions to more appropriate headers
• PR #2057  - Simplify assert_owns_lock and ignore_while_checking
• PR #2056  - Replacing std::result_of with util::result_of
• PR #2055  - Fix process launching/connecting back
• PR #2054  - Add a forwarding coroutine header
• PR #2053  - Replace uses of boost::unordered_map with std::unordered_map
• PR #2052  - Rewrite tuple unwrap
• PR #2051  - Replace uses of BOOST_SCOPED_ENUM with C++11 scoped enums
• PR #2049  - Attempt to narrow down split_credit problem
• PR #2048  - Fixing gcc startup hangs
• PR #2047  - Fixing when_xxx and wait_xxx for MSVC12
• PR #2046  - adding persistent_auto_chunk_size and related tests for for_each
• PR #2045  - Fixing HPX_HAVE_THREAD_BACKTRACE_DEPTH build time configuration

2.10. Releases
• PR #2044 - Adding missing service executor types
• PR #2043 - Removing ambiguous definitions for is_future_range and future_range_traits
• PR #2042 - Clarify that HPX builds can use (much) more than 2GB per process
• PR #2041 - Changing future_iterator_traits to support pointers
• Issue #2040 - Improve documentation memory usage warning?
• PR #2039 - Coroutine cleanup
• PR #2038 - Fix cmake policy CMP0042 warning MACOSX_RPATH
• PR #2037 - Avoid redundant specialization of [unique]_function_nonser
• PR #2036 - nvcc dies with an internal error upon pushing/popping warnings inside templates
• Issue #2035 - Use a less restrictive iterator definition in hpx::lcos::detail::future_iterator_traits
• PR #2034 - Fixing compilation error with thread queue wait time performance counter
• Issue #2033 - Compilation error when compiling with thread queue waittime performance counter
• Issue #2032 - Ambiguous template instantiation for is_future_range and future_range_traits.
• PR #2031 - Don’t restart timer on every incoming parcel
• PR #2030 - Unify handling of execution policies in parallel algorithms
• PR #2029 - Make pkg-config .pc files use .dylib on OSX
• PR #2028 - Adding process component
• PR #2027 - Making check for compiler compatibility independent on compiler path
• PR #2025 - Fixing inspect tool
• PR #2024 - Intel13 removal
• PR #2023 - Fix errors related to older boost versions and parameter pack expansions in lambdas
• Issue #2022 - gmake fail: “No rule to make target /usr/lib46/libboost_context-mt.so”
• PR #2021 - Added Sudoku example

https://github.com/STEllAR-GROUP/hpx/issues/2022
- Issue #2020\textsuperscript{4310} - Make errors related to init\_globally.cpp example while building HPX out of the box
- PR #2019\textsuperscript{4311} - Fixed some compilation and cmake errors encountered in nqueen example
- PR #2018\textsuperscript{4312} - For loop algorithms
- PR #2017\textsuperscript{4313} - Non-recursive at\_index implementation
- Issue #2016\textsuperscript{4314} - Add index-based for-loops
- Issue #2015\textsuperscript{4315} - Change default bind-mode to balanced
- PR #2014\textsuperscript{4316} - Fixed dataflow if invoked action returns a future
- PR #2013\textsuperscript{4317} - Fixing compilation issues with external example
- PR #2012\textsuperscript{4318} - Added Sierpinski Triangle example
- Issue #2011\textsuperscript{4319} - Compilation error while running sample hello\_world\_component code
- PR #2010\textsuperscript{4320} - Segmented move implemented for hpx::vector
- Issue #2009\textsuperscript{4321} - pkg\-config order incorrect on 14.04 / GCC 4.8
- Issue #2008\textsuperscript{4322} - Compilation error in dataflow of action returning a future
- PR #2007\textsuperscript{4323} - Adding new performance counter exposing overall scheduler time
- PR #2006\textsuperscript{4324} - Function includes
- PR #2005\textsuperscript{4325} - Adding an example demonstrating how to initialize HPX from a global object
- PR #2004\textsuperscript{4326} - Fixing 2000
- PR #2003\textsuperscript{4327} - Adding generation parameter to gather to enable using it more than once
- PR #2002\textsuperscript{4328} - Turn on position independent code to solve link problem with hpx\_init
- Issue #2001\textsuperscript{4329} - Gathering more than once segfaults
- Issue #2000\textsuperscript{4330} - Undefined reference to hpx::assertion\_failed
- Issue #1999\textsuperscript{4331} - Seg fault in hpx\::lcos\::base\_lco\_with\_value\<\*\>::set\_value\_nonvirt() when running octo\_tiger
- PR #1998\textsuperscript{4332} - Detect unknown command line options

• PR #1997 - Extending thread description
• PR #1996 - Adding natvis files to solution (MSVC only)
• Issue #1995 - Command line handling does not produce error
• PR #1994 - Possible missing include in test_utils.hpp
• PR #1993 - Add missing LANGUAGES tag to a hpx_add_compile_flag_if_available() call in CMakeLists.txt
• PR #1992 - Fixing shared_executor_test
• PR #1991 - Making sure the winsock library is properly initialized
• PR #1990 - Fixing bind_test placeholder ambiguity coming from boost-1.60
• PR #1989 - Performance tuning
• PR #1987 - Make configurable size of internal storage in util::function
• PR #1986 - AGAS Refactoring+1753 Cache mods
• PR #1985 - Adding missing task_block::run() overload taking an executor
• PR #1984 - Adding an optimized LRU Cache implementation (for AGAS)
• PR #1983 - Avoid invoking migration table look up for all objects
• PR #1981 - Replacing uintptr_t (which is not defined everywhere) with std::size_t
• PR #1980 - Optimizing LCO continuations
• PR #1979 - Fixing Cori
• PR #1978 - Fix test check that got broken in hasty fix to memory overflow
• PR #1977 - Refactor action traits
• PR #1976 - Fixes typo in README.rst
• PR #1975 - Reduce size of benchmark timing arrays to fix test failures

2.10. Releases 1635
• PR #1947\textsuperscript{4379} - Adding workaround for tagged_tuple
• Issue #1946\textsuperscript{4380} - Hang in wait_all() in distributed run
• PR #1945\textsuperscript{4381} - Fixed container algorithm tests
• Issue #1944\textsuperscript{4382} - assertion `p.destination_locality() == hpx::get_locality()` failed
• PR #1943\textsuperscript{4383} - Fix a couple of compile errors with clang
• PR #1942\textsuperscript{4384} - Making parcel coalescing functional
• Issue #1941\textsuperscript{4385} - Re-enable parcel coalescing
• PR #1940\textsuperscript{4386} - Touching up make_future
• PR #1939\textsuperscript{4387} - Fixing problems in over-subscription management in the resource manager
• PR #1938\textsuperscript{4388} - Removing use of unified Boost.Thread header
• PR #1937\textsuperscript{4389} - Cleaning up the use of Boost.Accumulator headers
• PR #1936\textsuperscript{4390} - Making sure interval timer is started for aggregating performance counters
• PR #1935\textsuperscript{4391} - Tagged results
• PR #1934\textsuperscript{4392} - Fix remote async with deferred launch policy
• Issue #1933\textsuperscript{4393} - Floating point exception in statistics_counter<boost::accumulators::tag::mean>::get_counter_value
• PR #1932\textsuperscript{4394} - Removing superfluous includes of boost/lockfree/detail/branch_hints.hpp
• PR #1931\textsuperscript{4395} - Fix compilation with clang 3.8.0
• Issue #1930\textsuperscript{4396} - Missing online documentation for HPX 0.9.11
• PR #1929\textsuperscript{4397} - LWG2485: get() should be overloaded for const tuple&&
• PR #1928\textsuperscript{4398} - Revert “Using ninja for circle-ci builds”
• PR #1927\textsuperscript{4399} - Using ninja for circle-ci builds
• PR #1926\textsuperscript{4400} - Fixing serialization of std::array
• Issue #1925\textsuperscript{4401} - Issues with static HPX libraries
• Issue #1924 - Performance degrading over time
• Issue #1923 - serialization of std::array appears broken in latest commit
• PR #1924 - Container algorithms
• PR #1921 - Tons of smaller quality improvements
• Issue #1920 - Seg fault in hpx::serialization::output_archive::add_gid when running octotiger
• Issue #1919 - Intel 15 compiler bug preventing HPX build
• PR #1918 - Address sanitizer fixes
• PR #1917 - Fixing compilation problems of parallel::sort with Intel compilers
• PR #1916 - Making sure code compiles if HPX_WITH_HWLOC=Off
• Issue #1915 - max_cores undefined if HPX_WITH_HWLOC=Off
• PR #1914 - Add utility member functions for partitioned_vector
• PR #1913 - Adding support for invoking actions to dataflow
• PR #1911 - Adding first batch of container algorithms
• PR #1910 - Keep cmake_module_path
• PR #1909 - Fix mpirun with pbs
• PR #1908 - Changing parallel::sort to return the last iterator as proposed by N4560
• PR #1907 - Adding a minimum version for Open MPI
• PR #1906 - Updates to the Release Procedure
• PR #1905 - Fixing #1903
• PR #1904 - Making sure std containers are cleared before serialization loads data
• Issue #1903 - When running octotiger, I get: assertion '(*new_gids_)[gid].size() == 1' failed: HPX(assertion_failure)
• Issue #1902 - Immediate crash when running hpx/octotiger with _GLIBCXX_DEBUG defined.
• PR #1901 - Making non-serializable classes non-serializable

2.10. Releases
• Issue #1900 - Two possible issues with std::list serialization
• PR #1899 - Fixing a problem with credit splitting as revealed by #1898
• Issue #1898 - Accessing component from locality where it was not created segfaults
• PR #1897 - Changing parallel::sort to return the last iterator as proposed by N4560
• Issue #1896 - version 1.0?
• Issue #1895 - Warning comment on numa_allocator is not very clear
• PR #1894 - Add support for compilers that have thread_local
• PR #1893 - Fixing 1890
• PR #1892 - Adds typed future_type for executor_traits
• PR #1891 - Fix wording in certain parallel algorithm docs
• Issue #1890 - Invoking papi counters give segfault
• PR #1889 - Fixing problems as reported by clang-check
• PR #1888 - WIP parallel is_heap
• PR #1887 - Fixed resetting performance counters related to idle-rate, etc
• Issue #1886 - Run hpx with qsub does not work
• PR #1885 - Warning cleaning pass
• PR #1884 - Add missing parallel algorithm header
• PR #1883 - Add feature test for thread_local on Clang for TLS
• PR #1882 - Fix some redundant qualifiers
• Issue #1881 - Unable to compile Octotiger using HPX and Intel MPI on SuperMIC
• Issue #1880 - clang with libc++ on Linux needs TLS case
• PR #1879 - Doc fixes for #1868
• PR #1878 - Simplify functions

Chapter 2. What’s so special about HPX?
- PR #1877 - Removing most usage of Boost.Config
- PR #1876 - Add missing parallel algorithms to algorithm.hpp
- PR #1875 - Simplify callables
- PR #1874 - Address long standing FIXME on using std::unique_ptr with incomplete types
- PR #1873 - Fixing 1871
- PR #1872 - Making sure PBS environment uses specified node list even if no PBS_NODEFILE env is available
- Issue #1871 - Fortran checks should be optional
- PR #1870 - Touch local::mutex
- PR #1869 - Documentation refactoring based off #1868
- PR #1867 - Embrace static_assert
- PR #1866 - Fix #1803 with documentation refactoring
- PR #1865 - Setting OUTPUT_NAME as target properties
- PR #1863 - Use SYSTEM for boost includes
- PR #1862 - Minor cleanups
- PR #1861 - Minor Corrections for Release
- PR #1860 - Fixing hpx gdb script
- Issue #1859 - reset_active_counters resets times and thread counts before some of the counters are evaluated
- PR #1858 - Release V0.9.11
- PR #1857 - removing diskperf example from 9.11 release
- PR #1856 - fix return in packaged_task_base::reset()  
- Issue #1842 - Install error: file INSTALL cannot find libhpx_parcel_coalescing.so.0.9.11
- PR #1839 - Adding fedora docs
- PR #1824 - Changing version on master to V0.9.12

2.10. Releases
• PR #1818 - Fixing #1748
• Issue #1815 - seg fault in AGAS
• Issue #1803 - wait_all documentation
• Issue #1796 - Outdated documentation to be revised
• Issue #1759 - glibc munmap_chunk or free(): invalid pointer on SuperMIC
• Issue #1753 - HPX performance degrades with time since execution begins
• Issue #1748 - All public HPX headers need to be self contained
• PR #1719 - How to build HPX with Visual Studio
• Issue #1684 - Race condition when using –hpx:connect?
• PR #1658 - Add serialization for std::set (as there is for std::vector and std::map)
• PR #1641 - Generic client
• Issue #1632 - heartbeat example fails on separate nodes
• PR #1603 - Adds preferred namespace check to inspect tool
• Issue #1559 - Extend inspect tool
• Issue #1523 - Remote async with deferred launch policy never executes
• Issue #1472 - Serialization issues
• Issue #1457 - Implement N4392: C++ Latches and Barriers
• PR #1444 - Enabling usage of moveonly types for component construction
• Issue #1407 - The Intel 13 compiler has failing unit tests
• Issue #1405 - Allow component constructors to take movable only types
• Issue #1265 - Enable dataflow() to be usable with actions
• Issue #1236 - NUMA aware allocators
• Issue #802 - Fix Broken Examples
• Issue #559\textsuperscript{4494} - Add hpx::migrate facility
• Issue #449\textsuperscript{4495} - Make actions with template arguments usable and add documentation
• Issue #279\textsuperscript{4496} - Refactor addressing_service into a base class and two derived classes
• Issue #224\textsuperscript{4497} - Changing thread state metadata is not thread safe
• Issue #55\textsuperscript{4498} - Uniform syntax for enums should be implemented

**HPX V0.9.11 (Nov 11, 2015)**

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an executor, which can be used to customize the where and when of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choice of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (master) are prohibited. Any change has to go through a peer review before it will be merged to master. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the master branch since the last release.

**General changes**

• We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.

• Added integration with the CircleCI\textsuperscript{4499} hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.

• The compiler configurationsubsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.

• The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_` only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.

• Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
  
  – `hpx::components::default_distribution_policy` which tries to place multiple component instances as evenly as possible.

2.10. Releases 1641
- `hpx::components::colocating_distribution_policy` which will refer to the locality where a given component instance is currently placed.

- `hpx::components::binpacking_distribution_policy` which will place multiple component instances as evenly as possible based on any performance counter.

- `hpx::components::target_distribution_policy` which allows one to represent a given locality in the context of a distribution policy.

- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)`, which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.

- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.

- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal N4411⁴⁵⁰⁰.

- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a task_block with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.

- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see N4399⁴⁵⁰¹).

- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).

- Added performance counters allowing to track the number of action invocations (local and remote invocations).

- Added new command line options `--hpx:print-counter-at` and `--hpx:reset-counters`.

- The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.

- Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.

- Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).

- HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see https://github.com/UO-OACISS/xpress-apex. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.

- We have implemented many more of the Using parallel algorithms. Please see Issue #1141⁴⁵⁰² for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

⁴⁵⁰⁰ http://wg21.link/n4411
⁴⁵⁰¹ http://wg21.link/n4399
⁴⁵⁰² https://github.com/STEllAR-GROUP/hpx/issues/1141
Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a \texttt{hpx::components::component_base} instead of \texttt{hpx::components::managed_component_base}.

- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.

- The CMake project name has changed from ‘hpx’ to ‘HPX’ for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into \texttt{<prefix>/lib/cmake/HPX} and not \texttt{<prefix>/lib/cmake/hpx}.

- The macro \texttt{HPX_REGISTER_MINIMAL_COMPONENT_FACTORY} has been deprecated. Please use \texttt{HPX_REGISTER_COMPONENT} instead. The old macro will be removed in the next release.

- The obsolete distributing\_factory and binpacking\_factory components have been removed. The corresponding functionality is now provided by the \texttt{hpx::new\_API} function in conjunction with the \texttt{hpx::default\_layout} and \texttt{hpx::binpacking} distribution policies (\texttt{hpx::components::default\_distribution\_policy} and \texttt{hpx::components::binpacking\_distribution\_policy})

- The API function \texttt{hpx::new\_colocated} has been deprecated. Please use the consolidated API \texttt{hpx::new\_} in conjunction with the new \texttt{hpx::colocated} distribution policy (\texttt{hpx::components::colocating\_distribution\_policy}) instead. The old API function will still be available for at least one release of \texttt{HPX} if the configuration variable \texttt{HPX\_WITH\_COLOCADED\_BACKWARDS\_COMPATIBILITY} is enabled.

- The API function \texttt{hpx::async\_colocated} has been deprecated. Please use the consolidated API \texttt{hpx::async} in conjunction with the new \texttt{hpx::colocated} distribution policy (\texttt{hpx::components::colocating\_distribution\_policy}) instead. The old API function will still be available for at least one release of \texttt{HPX} if the configuration variable \texttt{HPX\_WITH\_COLOCADED\_BACKWARDS\_COMPATIBILITY} is enabled.

- The obsolete remote\_object component has been removed.

- Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding announcement\textsuperscript{4503} on the \texttt{hpX-users@stellar.cct.lsu.edu} mailing list.

- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with \texttt{HPX\_WITH\_...} while the preprocessor constant which is used at build time starts with \texttt{HPX\_HAVE\_...}. For instance, the former cmake command line \texttt{-DHPX\_MALLOC=...} now has to be specified a \texttt{-DHPX\_WITH\_MALLOC=...} and will cause the preprocessor constant \texttt{HPX\_HAVE\_MALLOC} to be defined. The actual name of the constant (i.e. \texttt{MALLOC}) has not changed. Please see the corresponding documentation for more details (CMake options).

- The \texttt{get\_gid()} functions exposed by the component base classes \texttt{hpx::components::server::simple\_component\_base, hpx::components::server::managed\_component\_base, and hpx::components::server::fixed\_component\_base} have been replaced by two new functions: \texttt{get\_unmanaged\_id()} and \texttt{get\_id()}. To enable the old function name for backwards compatibility, use the cmake configuration option \texttt{HPX\_WITH\_COMPONENT\_GET\_GID\_COMPATIBILITY=On}.

- All functions which were named \texttt{get\_gid()} but were returning \texttt{hpx::id\_type} have been renamed to \texttt{get\_id()}. To enable the old function names for backwards compatibility, use the cmake configuration option \texttt{HPX\_WITH\_COMPONENT\_GET\_GID\_COMPATIBILITY=On}.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #1855 [4504] - Completely removing external/endian
- PR #1854 [4505] - Don’t pollute CMAKE_CXX_FLAGS through find_package()
- PR #1853 [4506] - Updating CMake configuration to get correct version of TAU library
- PR #1852 [4507] - Fixing Performance Problems with MPI Parcelport
- PR #1851 [4508] - Fixing hpx_add_link_flag() and hpx_remove_link_flag()
- PR #1850 [4509] - Fixing 1836, adding parallel::sort
- PR #1849 [4510] - Fixing configuration for use of more than 64 cores
- PR #1848 [4511] - Change default APEX version for release
- PR #1847 [4512] - Fix client_base::then on release
- PR #1846 [4513] - Removing broken lcos::local::channel from release
- PR #1845 [4514] - Adding example demonstrating a possible safe-object implementation to release
- PR #1844 [4515] - Removing stubs from accumulator examples
- PR #1843 [4516] - Don’t pollute CMAKE_CXX_FLAGS through find_package()
- PR #1841 [4517] - Fixing client_base<>::then
- PR #1840 [4518] - Adding example demonstrating a possible safe-object implementation
- PR #1838 [4519] - Update version rc1
- PR #1837 [4520] - Removing broken lcos::local::channel
- PR #1835 [4521] - Adding explicit move constructor and assignment operator to hpx::lcos::promise
- PR #1834 [4522] - Making hpx::lcos::promise move-only
- PR #1833 [4523] - Adding fedora docs
- Issue #1832 [4524] - hpx::lcos::promise<> must be move-only

2.10. Releases
• Issue #1804 - register_with_basename causes hangs
• PR #1801 - Enhanced the inspect tool to take user directly to the problem with hyperlinks
• Issue #1800 - Problems compiling application on smic
• PR #1799 - Fixing cv exceptions
• PR #1798 - Documentation refactoring & updating
• PR #1797 - Updating the activeharmony CMake module
• PR #1795 - Fixing cv
• PR #1794 - Fix connect with hpx::runtime_mode_connect
• PR #1793 - fix a wrong use of HPX_MAX_CPU_COUNT instead of HPX_HAVE_MAX_CPU_COUNT
• PR #1792 - Allow for default constructed parcel instances to be moved
• PR #1791 - Fix connect with hpx::runtime_mode_connect
• Issue #1790 - assertion action_.get() failed: HPX(assertion_failure) when running Octotiger with pull request 1786
• PR #1789 - Fixing discover_counter_types API function
• Issue #1788 - connect with hpx::runtime_mode_connect
• Issue #1787 - discover_counter_types not working
• PR #1786 - Changing addressing_service to use std::unordered_map instead of std::map
• PR #1785 - Fix is_iterator for container algorithms
• PR #1784 - Adding new command line options:
• PR #1783 - Minor changes for APEX support
• PR #1782 - Drop legacy forwarding action traits
• PR #1781 - Attempt to resolve the race between cv::wait_xxx and cv::notify_all
• PR #1780 - Removing serialize_sequence
• PR #1779 - Fixed #1501: hwloc configuration options are wrong for MIC

4570 https://github.com/STEllAR-GROUP/hpx/pull/1779
- PR #1778 - Removing ability to enable/disable parcel handling
- PR #1777 - Completely removing stackless threads
- PR #1776 - Cleaning up util/plugin
- PR #1775 - Agas fixes
- PR #1774 - Action invocation count
- PR #1773 - Fixed Problems in MPI parcelport and future serialization.
- PR #1772 - Fixing intel 13 compiler errors related to variadic template template parameters for lcos::when_tests
- PR #1770 - Forwarding decay to std::
- PR #1769 - Add more characters with special regex meaning to the existing patch
- PR #1768 - Adding test for receive_buffer
- PR #1767 - Making sure that uptime counter throws exception on any attempt to be reset
- PR #1766 - Cleaning up code related to throttling scheduler
- PR #1765 - Restricting thread_data to creating only with intrusive_pointers
- PR #1764 - Fixing 1763
- Issue #1763 - UB in thread_data::operator delete
- PR #1762 - Making sure all serialization registries/factories are unique
- PR #1761 - Fixed #1751: hpx::future::wait_for fails a simple test
- PR #1758 - Fixing #1757
- Issue #1757 - pinning not correct using –hpx:bind
- Issue #1756 - compilation error with MinGW
- PR #1755 - Making output serialization const-correct
- Issue #1753 - HPX performance degrades with time since execution begins

2.10. Releases
• Issue #1752\(^{4594}\) - Error in AGAS
• Issue #1751\(^{4595}\) - hpx::future::wait_for fails a simple test
• PR #1750\(^{4596}\) - Removing hpx_fwd.hpp includes
• PR #1749\(^{4597}\) - Simplify result_of and friends
• PR #1747\(^{4598}\) - Removed superfluous code from message_buffer.hpp
• PR #1746\(^{4599}\) - Tuple dependencies
• Issue #1745\(^{4600}\) - Broken when_some which takes iterators
• PR #1744\(^{4601}\) - Refining archive interface
• PR #1743\(^{4602}\) - Fixing when_all when only a single future is passed
• PR #1742\(^{4603}\) - Config includes
• PR #1741\(^{4604}\) - Os executors
• Issue #1740\(^{4605}\) - hpx::promise has some problems
• PR #1739\(^{4606}\) - Parallel composition with generic containers
• Issue #1738\(^{4607}\) - After building program and successfully linking to a version of hpx DHPX_DIR seems to be ignored
• Issue #1737\(^{4608}\) - Uptime problems
• PR #1736\(^{4609}\) - added convenience c-tor and begin()/end() to serialize_buffer
• PR #1735\(^{4610}\) - Config includes
• PR #1734\(^{4611}\) - Fixed #1688: Add timer counters for tfunc_total and exec_total
• Issue #1733\(^{4612}\) - Add unit test for hpx/lcos/local/receive_buffer.hpp
• PR #1732\(^{4613}\) - Renaming get_os_thread_count
• PR #1731\(^{4614}\) - Basename registration
• Issue #1730\(^{4615}\) - Use after move of thread_init_data
• PR #1729\(^{4616}\) - Rewriting channel based on new gate component

\(^{4616}\) https://github.com/STEllAR-GROUP/hpx/pull/1729
• PR #1728 - Fixing #1722
• PR #1727 - Fixing compile problems with apply_colocated
• PR #1726 - Apex integration
• PR #1725 - fixed test timeouts
• PR #1724 - Renaming vector
• Issue #1723 - Drop support for intel compilers and gcc 4.4. based standard libs
• Issue #1722 - Add support for detecting non-ready futures before serialization
• PR #1721 - Unifying parallel executors, initializing from launch policy
• PR #1720 - dropped superfluous typedef
• Issue #1718 - Windows 10 x64, VS 2015 - Unknown CMake command “add_hpx_pseudo_target”.
• PR #1717 - Timed executor traits for thread-executors
• PR #1716 - serialization of arrays didn’t work with non-pod types. fixed
• PR #1715 - List serialization
• PR #1714 - changing misspellings
• PR #1713 - Fixed distribution policy executors
• PR #1712 - Moving library detection to be executed after feature tests
• PR #1711 - Simplify parcel
• PR #1710 - Compile only tests
• PR #1709 - Implemented timed executors
• PR #1708 - Implement parallel::executor_traits for thread-executors
• PR #1707 - Various fixes to threads::executors to make custom schedulers work
• PR #1706 - Command line option –hpx:cores does not work as expected
• Issue #1705 - Command line option –hpx:cores does not work as expected

• PR #1704 - vector deserialization is speeded up a little
• PR #1703 - Fixing shared_mutes
• Issue #1702 - Shared_mutex does not compile with no_mutex cond_var
• PR #1701 - Add distribution_policy_executor
• PR #1700 - Executor parameters
• PR #1699 - Readers writer lock
• PR #1698 - Remove leftovers
• PR #1697 - Fixing held locks
• PR #1696 - Modified Scan Partitioner for Algorithms
• PR #1695 - This thread executors
• PR #1694 - Fixed #1688: Add timer counters for tfunc_total and exec_total
• PR #1693 - Fix #1691: is_executor template specification fails for inherited executors
• PR #1692 - Fixed #1662: Possible exception source in coalescing_message_handler
• Issue #1691 - is_executor template specification fails for inherited executors
• PR #1690 - added macro for non-intrusive serialization of classes without a default c-tor
• PR #1689 - Replace value_or_error with custom storage, unify future_data state
• Issue #1688 - Add timer counters for tfunc_total and exec_total
• PR #1687 - Fixed interval timer
• PR #1686 - Fixing cmake warnings about not existing pseudo target dependencies
• PR #1685 - Converting partitioners to use bulk async execute
• PR #1684 - Adds a tool for inspect that checks for character limits
• PR #1683 - Change project name to (uppercase) HPX
• PR #1682 - Counter shortnames
- PR #1680\(^{4663}\) - Extended Non-intrusive Serialization to Ease Usage for Library Developers
- PR #1679\(^{4664}\) - Working on 1544: More executor changes
- PR #1678\(^{4665}\) - Transpose fixes
- PR #1677\(^{4666}\) - Improve Boost compatibility check
- PR #1676\(^{4667}\) - 1d stencil fix
- Issue #1675\(^{4668}\) - hpx project name is not HPX
- PR #1674\(^{4669}\) - Fixing the MPI parcelport
- PR #1673\(^{4670}\) - added move semantics to map/vector deserialization
- PR #1672\(^{4671}\) - Vs2015 await
- PR #1671\(^{4672}\) - Adapt transform for #1668
- PR #1670\(^{4673}\) - Started to work on #1668
- PR #1669\(^{4674}\) - Add this_thread_executors
- Issue #1667\(^{4675}\) - Apple build instructions in docs are out of date
- PR #1666\(^{4676}\) - Apex integration
- PR #1665\(^{4677}\) - Fixes an error with the whitespace check that showed the incorrect location of the error
- Issue #1664\(^{4678}\) - Inspect tool found incorrect endline whitespace
- PR #1663\(^{4679}\) - Improve use of locks
- Issue #1662\(^{4680}\) - Possible exception source in coalescing_message_handler
- PR #1661\(^{4681}\) - Added support for 128bit number serialization
- PR #1660\(^{4682}\) - Serialization 128bits
- PR #1659\(^{4683}\) - Implemented inner_product and adjacent_diff algos
- PR #1658\(^{4684}\) - Add serialization for std::set (as there is for std::vector and std::map)
- PR #1657\(^{4685}\) - Use of shared_ptr in io_service_pool changed to unique_ptr

• Issue #1656 - 1d_stencil codes all have wrong factor
• PR #1654 - When using runtime_mode_connect, find the correct localhost public ip address
• PR #1653 - Fixing 1617
• PR #1652 - Remove traits::action_may_require_id_splitting
• PR #1651 - Fixed performance counters related to AGAS cache timings
• PR #1650 - Remove leftovers of traits::type_size
• PR #1649 - Shorten target names on Windows to shorten used path names
• PR #1648 - Fixing problems introduced by merging #1623 for older compilers
• PR #1647 - Simplify running automatic builds on Windows
• Issue #1646 - Cache insert and update performance counters are broken
• Issue #1644 - Remove leftovers of traits::type_size
• Issue #1643 - Remove traits::action_may_require_id_splitting
• PR #1642 - Adds spell checker to the inspect tool for qbk and doxygen comments
• PR #1640 - First step towards fixing 688
• PR #1639 - Re-apply remaining changes from limit_dataflow_recursion branch
• PR #1638 - This fixes possible deadlock in the test ignore_while_locked_1485
• PR #1637 - Fixing hpx::wait_all() invoked with two vector<future<T>>
• PR #1636 - Partially re-apply changes from limit_dataflow_recursion branch
• PR #1635 - Adding missing test for #1572
• PR #1634 - Revert “Limit recursion-depth in dataflow to a configurable constant”
• PR #1633 - Add command line option to ignore batch environment
• PR #1632 - hpx::lcos::queue exhibits strange behavior
• PR #1630 - Fixed endline_whitespace_check.cpp to detect lines with only whitespace
• Issue #1629[^709] - Inspect trailing whitespace checker problem
• PR #1628[^710] - Removed meaningless const qualifiers. Minor icpc fix.
• PR #1627[^711] - Fixing the queue LCO and add example demonstrating its use
• PR #1626[^712] - Deprecating get_gid(), add get_id() and get_unmanaged_id()
• PR #1625[^713] - Allowing to specify whether to send credits along with message
• Issue #1624[^714] - Lifetime issue
• Issue #1623[^715] - hpx::wait_all() invoked with two vector<future<T>> fails
• PR #1622[^716] - Executor partitioners
• PR #1621[^717] - Clean up coroutines implementation
• Issue #1620[^718] - Revert #1535
• PR #1619[^719] - Fix result type calculation for hpx::make_continuation
• PR #1618[^720] - Fixing RDTSC on Xeon/Phi
• Issue #1617[^721] - hpx cmake not working when run as a subproject
• Issue #1616[^722] - cmake problem resulting in RDTSC not working correctly for Xeon Phi creates very strange results for duration counters
• Issue #1615[^723] - hpx::make_continuation requires input and output to be the same
• PR #1614[^724] - Fixed remove copy test
• Issue #1613[^725] - Dataflow causes stack overflow
• PR #1612[^726] - Modified foreach partitioner to use bulk execute
• PR #1611[^727] - Limit recursion-depth in dataflow to a configurable constant
• PR #1610[^728] - Increase timeout for CircleCI
• PR #1609[^729] - Refactoring thread manager, mainly extracting thread pool
• PR #1608[^730] - Fixed running multiple localities without localities parameter
• PR #1607[^731] - More algorithm fixes to adjacentfind

2.10. Releases
• PR #1555 - Remove the necessity to specify archive flags on the receiving end
• PR #1554 - Removing obsolete Boost.Serialization macros
• PR #1553 - Properly fix HPX_DEFINE_*_ACTION macros
• PR #1552 - Fixed algorithms relying on copy_if implementation
• PR #1551 - Pxs - Modifying FindOrangeFS.cmake based on OrangeFS 2.9.X
• Issue #1550 - Passing plain identifier inside HPX_DEFINEPLAIN_ACTION_1
• PR #1549 - Fixing intel14/libstdc++4.4
• PR #1548 - Moving raw_ptr to detail namespace
• PR #1547 - Adding support for executors to future.then
• PR #1546 - Executor traits result types
• PR #1545 - Integrate executors with dataflow
• PR #1543 - Fix potential zero-copy for primarynamespace::bulk_service_async et.al.
• PR #1542 - Merging HPX0.9.10 into pxfs branch
• PR #1541 - Removed stale cmake tests, unused since the great cmake refactoring
• PR #1540 - Fix idle-rate on platforms without TSC
• PR #1539 - Reporting situation if zero-copy-serialization was performed by a parcel generated from a plain apply/async
• PR #1538 - Changed return type of bulk executors and added test
• Issue #1537 - Incorrect cpuid config tests
• PR #1536 - Changed return type of bulk executors and added test
• PR #1535 - Make sure promise::get_gid() can be called more than once
• PR #1534 - Fixed async_callback with bound callback
• PR #1533 - Updated the link in the documentation to a publically-accessible URL
• PR #1532 - Make sure sync primitives are not copyable nor movable

• PR #1531 - Fix unwrapped issue with future ranges of void type
• PR #1530 - Serialization complex
• Issue #1528 - Unwrapped issue with future<void>
• Issue #1527 - HPX does not build with Boost 1.58.0
• PR #1526 - Added support for boost.multi_array serialization
• PR #1525 - Properly handle deferred futures, fixes #1506
• PR #1524 - Making sure invalid action argument types generate clear error message
• Issue #1522 - Need serialization support for boost multi array
• Issue #1521 - Remote async and zero-copy serialization optimizations don’t play well together
• PR #1520 - Fixing UB while registering polymorphic classes for serialization
• PR #1519 - Making detail::condition_variable safe to use
• PR #1518 - Fix when_some bug missing indices in its result
• Issue #1517 - Typo may affect CMake build system tests
• PR #1516 - Fixing Posix context
• PR #1515 - Fixing Posix context
• PR #1514 - Correct problems with loading dynamic components
• PR #1513 - Fixing intel glibc4 4
• Issue #1508 - memory and papi counters do not work
• Issue #1507 - Unrecognized Command Line Option Error causing exit status 0
• Issue #1506 - Properly handle deferred futures
• PR #1505 - Adding #include - would not compile without this
• Issue #1502 - boost::filesystem::exists throws unexpected exception
• Issue #1501 - hwloc configuration options are wrong for MIC

• Issue #1414 - Correct directory for dispatch_gcc46.hpp iteration
• Issue #1410 - Set operation algorithms
• Issue #1389 - Parallel algorithms relying on scan partitioner break for small number of elements
• Issue #1325 - Exceptions thrown during parcel handling are not handled correctly
• Issue #1315 - Errors while running performance tests
• Issue #1309 - hpx::vector partitions are not easily extendable by applications
• PR #1300 - Added serialization/de-serialization to examples.tuplespace
• Issue #1251 - hpx::threads::get_thread_count doesn’t consider pending threads
• Issue #1008 - Decrease in application performance overtime; occasional spikes of major slowdown
• Issue #1001 - Zero copy serialization raises assert
• Issue #721 - Make HPX usable for Xeon Phi
• Issue #524 - Extend scheduler to support threads which can’t be stolen

**HPX V0.9.10 (Mar 24, 2015)**

**General changes**

This is the 12th official release of HPX. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run HPX applications on up to ~24k cores. We have also shown that HPX can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of HPX. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel-ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies
and to improve the available networking bandwidth. Please note that in this release we disabled the ibverbs and ipc parcel ports as those have not been ported to the new plugin system yet (see Issue #839).

Another corner stone of this release is our work towards a complete implementation of __cpp11_n4104__ (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [link hpx.manual.parallel.parallel_algorithms Parallel Algorithms] for more details). We also implemented some extensions to __cpp11_n4104__ allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of hpx::vector which is a distributed data structure closely aligned to the functionality of std::vector. The difference is that hpx::vector stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with hpx::vector. At this point we have implemented only a few of the parallel algorithms to support distributed data structures (like hpx::vector) for testing purposes (see Issue #1338 for a documentation of our progress).

**Breaking changes**

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- Move to Variadics- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (hpx::async_continue, hpx::apply_continue, hpx::when_each, hpx::wait_each, synchronous invocation of actions).
- Changes to Macros- We also removed the macros HPX_STD_FUNCTION and HPX_STD_TUPLE. This shouldn’t affect any user code as we replaced HPX_STD_FUNCTION with hpx::util::function_nonser which was the default expansion used for this macro. All HPX API functions which expect a hpx::util::function_nonser (or a hpx::util::unique_function_nonser) can now be transparently called with a compatible std::function instead. Similarly, HPX_STD_TUPLE was replaced by its default expansion as well: hpx::util::tuple.
- Changes to hpx::unique_future- hpx::unique_future, which was deprecated in the previous release for hpx::future is now completely removed from HPX. This completes the transition to a completely standards conforming implementation of hpx::future.
- Changes to Supported Compilers. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our Prerequisites page for more details.

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release.

- Issue #1402 - Internal shared_future serialization copies
- Issue #1399 - Build takes unusually long time...
- Issue #1398 - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
- Issue #1397 - Completely remove hpx::unique_future
- Issue #1396 - Parallel scan algorithms with different initial values

Chapter 2. What’s so special about HPX?
- Issue #1395: Race Condition - 1d_stencil_8 - SuperMIC
- Issue #1394: "suspending thread while at least one lock is being held" - 1d_stencil_8 - SuperMIC
- Issue #1393: SEGFAULT in 1d_stencil_8 on SuperMIC
- Issue #1392: Fixing #1168
- Issue #1391: Parallel Algorithms for scan partitioner for small number of elements
- Issue #1387: Failure with more than 4 localities
- Issue #1386: Dispatching unhandled exceptions to outer user code
- Issue #1385: Adding Copy algorithms, fixing parallel::copy_if
- Issue #1384: Fixing 1325
- Issue #1383: Fixed #504: Refactor Dataflow LCO to work with futures, this removes the dataflow component as it is obsolete
- Issue #1382: is_sorted, is_sorted_until and is_partitioned algorithms
- Issue #1381: fix for CMake versions prior to 3.1
- Issue #1380: resolved warning in CMake 3.1 and newer
- Issue #1379: Compilation error with papi
- Issue #1378: Towards safer migration
- Issue #1377: HPXConfig.cmake should include TCMALLOC_LIBRARY and TCMALLOC_INCLUDE_DIR
- Issue #1376: Warning on uninitialized member
- Issue #1375: Fixing 1163
- Issue #1374: Fixing the MSVC 12 release builder
- Issue #1373: Modifying parallel search algorithm for zero length searches
- Issue #1372: Modifying parallel search algorithm for zero length searches
- Issue #1371: Avoid holding a lock during agas::inref while doing a credit split
- Issue #1370: --hpx:bind throws unexpected error

HPX Documentation, master

- Issue #1294 📌 - HDF5 build error
- Issue #1275 📌 - The parcelport implementation is non-optimal
- Issue #1267 📌 - Added classes and unit tests for local_file, orangefs_file and pxfs_file
- Issue #1264 📌 - Error “assertion ‘!m_fun’ failed” randomly occurs when using TCP
- Issue #1254 📌 - thread binding seems to not work properly
- Issue #1220 📌 - parallel::copy_if is broken
- Issue #1217 📌 - Find a better way of fixing the issue patched by #1216
- Issue #1168 📌 - Starting HPX on Cray machines using aprun isn’t working correctly
- Issue #1085 📌 - Replace startup and shutdown barriers with broadcasts
- Issue #981 📌 - With SLURM, --hpx:threads=8 should not be necessary
- Issue #857 📌 - hpx::naming::locality leaks parcelport specific information into the public interface
- Issue #850 📌 - “flush” not documented
- Issue #763 📌 - Create buildbot instance that uses std::bind as HPX_STD_BIND
- Issue #680 📌 - Convert parcel ports into a plugin system
- Issue #582 📌 - Make exception thrown from HPX threads available from hpx::init
- Issue #504 📌 - Refactor Dataflow LCO to work with futures
- Issue #196 📌 - Don’t store copies of the locality network metadata in the gva table

HPX V0.9.9 (Oct 31, 2014, codename Spooky)

General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the HPX releases so far. We are especially happy about the large number of people who contributed for the first time to HPX.

- We completed the transition from the older (non-conforming) implementation of hpx::future to the new and fully conforming version by removing the old code and by renaming the type hpx::unique_future to hpx::future. In order to maintain backwards compatibility with existing code which uses the type hpx::unique_future we support the configuration variable HPX_UNIQUE_FUTURE_ALIAS. If this variable is set to ON while running cmake it will additionally define a template alias for this type.

2.10. Releases
• We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: *Building HPX*. Please revisit your build scripts to adapt to the changes. The most notable changes are:

  – `HPX_NO_INSTALL` is no longer necessary.
  – For external builds, you need to set `HPX_DIR` instead of `HPX_ROOT` as described here: *Using HPX with CMake-based projects*.
  – IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
  – Building HPX statically (without dynamic libraries) is now supported (`-DHPX_STATIC_LINKING=On`).
  – Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section *CMake options* for more information).
  – This also fixes a long list of issues, for more information see Issue #1204\(^{5023}\).

• We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably N4409\(^{5024}\) (Working Draft, Technical Specification for C++ Extensions for Parallelism), N4411\(^{5025}\) (Task Region Rev. 3), and N4313\(^{5026}\) (Working Draft, Technical Specification for C++ Extensions for Concurrency).

• We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at *HPX Buildbot Website*\(^{5027}\).

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release.

• Issue #1296\(^{5028}\) - Rename `make_error_future` to `make_exceptional_future`, adjust to N4123
• Issue #1295\(^{5029}\) - building issue
• Issue #1293\(^{5030}\) - Transpose example
• Issue #1292\(^{5031}\) - Wrong abs() function used in example
• Issue #1291\(^{5032}\) - non-synchronized shift operators have been removed
• Issue #1290\(^{5033}\) - RDTSCP is defined as true for Xeon Phi build
• Issue #1289\(^{5034}\) - Fixing 1288
• Issue #1288\(^{5035}\) - Add new performance counters
• Issue #1287\(^{5036}\) - Hierarchy scheduler broken performance counters

• Issue #1286 - Algorithm cleanup
• Issue #1285 - Broken Links in Documentation
• Issue #1284 - Uninitialized copy
• Issue #1283 - missing boost::scoped_ptr includes
• Issue #1282 - Update documentation of build options for schedulers
• Issue #1281 - reset idle rate counter
• Issue #1280 - Bug when executing on Intel MIC
• Issue #1279 - Add improved when_all/wait_all
• Issue #1278 - Implement improved when_all/wait_all
• Issue #1277 - feature request: get access to argc argv and variables_map
• Issue #1276 - Remove merging map
• Issue #1274 - Weird (wrong) string code in papi.cpp
• Issue #1273 - Sequential task execution policy
• Issue #1272 - Avoid CMake name clash for Boost.Thread library
• Issue #1271 - Updates on HPX Test Units
• Issue #1270 - hpx/util/safe_lexical_cast.hpp is added
• Issue #1269 - Added default value for “LIB” cmake variable
• Issue #1268 - Memory Counters not working
• Issue #1266 - FindHPX.cmake is not installed
• Issue #1265 - apply_remote test takes too long
• Issue #1263 - Chrono cleanup
• Issue #1261 - Need make install for papi counters and this builds all the examples
• Issue #1260 - Documentation of Stencil example claims

2.10. Releases
- Issue #1259 - Avoid double-linking Boost on Windows
- Issue #1257 - Adding additional parameter to create_thread
- Issue #1256 - added buildbot changes to release notes
- Issue #1255 - Cannot build MiniGhost
- Issue #1253 - hpx::thread defects
- Issue #1252 - HPX_PREFIX is too fragile
- Issue #1250 - switch_to_fiber_emulation does not work properly
- Issue #1249 - Documentation is generated under Release folder
- Issue #1248 - Fix usage of hpx_generic_coroutine_context and get tests passing on powerpc
- Issue #1247 - Dynamic linking error
- Issue #1246 - Make cpuid.cpp C++11 compliant
- Issue #1245 - HPX fails on startup (setting thread affinity mask)
- Issue #1244 - HPX_WITH_RDTSC configure test fails, but should succeed
- Issue #1243 - CTest dashboard info for CSCS CDash drop location
- Issue #1242 - Mac fixes
- Issue #1241 - Failure in Distributed with Boost 1.56
- Issue #1240 - Fix a race condition in examples.diskperf
- Issue #1239 - fix wait_each in examples.diskperf
- Issue #1238 - Fixed #1237: hpx::util::portable_binary_iarchive failed
- Issue #1237 - hpx::util::portable_binary_iarchive faileds
- Issue #1235 - Fixing clang warnings and errors
- Issue #1234 - TCP runs fail: Transport endpoint is not connected
- Issue #1233 - Making sure the correct number of threads is registered with AGAS

https://github.com/STEllAR-GROUP/hpx/issues/1233
• Issue #1232 - Fixing race in wait_xxx
• Issue #1231 - Parallel minmax
• Issue #1230 - Distributed run of 1d_stencil_8 uses less threads than spec. & sometimes gives errors
• Issue #1229 - Unstable number of threads
• Issue #1228 - HPX link error (cmake / MPI)
• Issue #1226 - Warning about struct/class thread_counters
• Issue #1225 - Adding parallel::replace etc
• Issue #1224 - Extending dataflow to pass through non-future arguments
• Issue #1223 - Remaining find algorithms implemented, N4071
• Issue #1222 - Merging all the changes
• Issue #1221 - No error output when using mpirun with hpx
• Issue #1219 - Adding new AGAS cache performance counters
• Issue #1216 - Fixing using futures (clients) as arguments to actions
• Issue #1215 - Error compiling simple component
• Issue #1214 - Stencil docs
• Issue #1213 - Using more than a few dozen MPI processes on SuperMike results in a seg fault before getting to hpx_main
• Issue #1212 - Parallel rotate
• Issue #1211 - Direct actions cause the future’s shared_state to be leaked
• Issue #1210 - Refactored local::promise to be standard conformant
• Issue #1209 - Improve command line handling
• Issue #1208 - Adding parallel::reverse and parallel::reverse_copy
• Issue #1207 - Add copy_backward and move_backward
• Issue #1206 - N4071 additional algorithms implemented

2.10. Releases
• Issue #1204 - Cmake simplification and various other minor changes
• Issue #1203 - Implementing new launch policy for (local) async: `hpx::launch::fork`.
• Issue #1202 - Failed assertion in connection_cache.hpp
• Issue #1201 - pkg-config doesn't add mpi link directories
• Issue #1200 - Error when querying time performance counters
• Issue #1199 - library path is now configurable (again)
• Issue #1198 - Error when querying performance counters
• Issue #1197 - tests fail with intel compiler
• Issue #1196 - Silence several warnings
• Issue #1195 - Rephrase initializers to work with VC++ 2012
• Issue #1194 - Simplify parallel algorithms
• Issue #1193 - Adding parallel::equal
• Issue #1192 - HPX(out_of_memory) on including `<hpx/hpx.hpp>`
• Issue #1191 - Fixing #1189
• Issue #1190 - Chrono cleanup
• Issue #1189 - Deadlock .. somewhere? (probably serialization)
• Issue #1188 - Removed future::get_status()
• Issue #1186 - Fixed FindOpenCL to find current AMD APP SDK
• Issue #1184 - Tweaking future unwrapping
• Issue #1183 - Extended parallel::reduce
• Issue #1182 - future::unwrap hangs for launch::deferred
• Issue #1181 - Adding all_of, any_of, and none_of and corresponding documentation
• Issue #1180 - hpx::cout defect

5121 https://github.com/STEllAR-GROUP/hpx/issues/1189
5122 https://github.com/STEllAR-GROUP/hpx/issues/1188
5123 https://github.com/STEllAR-GROUP/hpx/issues/1186
5124 https://github.com/STEllAR-GROUP/hpx/issues/1184
5125 https://github.com/STEllAR-GROUP/hpx/issues/1183
5126 https://github.com/STEllAR-GROUP/hpx/issues/1182
5127 https://github.com/STEllAR-GROUP/hpx/issues/1181
5128 https://github.com/STEllAR-GROUP/hpx/issues/1180
• Issue #1179 - `hpx::async` does not work for member function pointers when called on types with self-defined unary operator*

• Issue #1178 - Implemented variadic `hpx::util::zip_iterator`

• Issue #1177 - MPI parcelport defect

• Issue #1176 - `HPX_DEFINE_COMPONENT_CONST_ACTION_TPL` does not have a 2-argument version

• Issue #1175 - Create `util::zip_iterator` working with `util::tuple<>`

• Issue #1174 - Error Building HPX on linux, `root_certificate_authority.cpp`

• Issue #1173 - `hpx::cout` output lost

• Issue #1172 - HPX build error with Clang 3.4.2

• Issue #1171 - `CMAKE_INSTALL_PREFIX` ignored

• Issue #1170 - Close `hpx_benchmarks` repository on Github

• Issue #1169 - Buildbot emails have syntax error in url

• Issue #1168 - Merge partial implementation of standards proposal N3960

• Issue #1167 - Fixed several compiler warnings

• Issue #1166 - cmake warns: “tests.regressions.actions” does not exist

• Issue #1165 - Want my own serialization of `hpx::future`

• Issue #1164 - Segfault in `hello_world` example

• Issue #1163 - Use `HPX_ASSERT` to aid the compiler

• Issue #1162 - Do not put `-DNDEBUG` into `hpx_application.pc`

• Issue #1161 - Support Clang 3.4.2

• Issue #1160 - Fixed #1159: Rename `when_n/wait_n`, add `when_xxx_n/wait_xxx_n`

• Issue #1159 - Rename `when_n/wait_n`, add `when_xxx_n/wait_xxx_n`

• Issue #1158 - Force inlining fails

• Issue #1157 - changed header of printout to be compatible with python csv module

5152 https://github.com/STEllAR-GROUP/hpx/issues/1156
5153 https://github.com/STEllAR-GROUP/hpx/issues/1155
• Issue #1154\(^{5152}\) - Fixing iostreams
• Issue #1153\(^{5153}\) - Standard manipulators (like std::endl) do not work with hpx::ostream
• Issue #1152\(^{5154}\) - Functions revamp
• Issue #1151\(^{5155}\) - Suppressing cmake 3.0 policy warning for CMP0026
• Issue #1150\(^{5156}\) - Client Serialization error
• Issue #1149\(^{5157}\) - Segfault on Stampede
• Issue #1148\(^{5158}\) - Refactoring mini-ghost
• Issue #1147\(^{5159}\) - N3960 copy_if and copy_n implemented and tested
• Issue #1146\(^{5160}\) - Stencil print
• Issue #1145\(^{5161}\) - N3960 hpx::parallel::copy implemented and tested
• Issue #1144\(^{5162}\) - OpenMP examples 1d_stencil do not build
• Issue #1143\(^{5163}\) - 1d_stencil OpenMP examples do not build
• Issue #1142\(^{5164}\) - Cannot build HPX with gcc 4.6 on OS X
• Issue #1140\(^{5165}\) - Fix OpenMP lookup, enable usage of config tests in external CMake projects.
• Issue #1139\(^{5166}\) - hpx/hpx/config/compiler_specific.hpp
• Issue #1138\(^{5167}\) - clean up pkg-config files
• Issue #1137\(^{5168}\) - Improvements to create binary packages
• Issue #1136\(^{5169}\) - HPX_GCC_VERSION not defined on all compilers
• Issue #1135\(^{5170}\) - Avoiding collision between winsock2.h and windows.h
• Issue #1134\(^{5171}\) - Making sure, that hpx::finalize can be called from any locality
• Issue #1133\(^{5172}\) - 1d stencil examples
• Issue #1131\(^{5173}\) - Refactor unique_function implementation
• Issue #1130\(^{5174}\) - Unique function

^{5174} https://github.com/STEllAR-GROUP/hpx/issues/1130
• Issue #1129  - Some fixes to the Build system on OS X
• Issue #1128  - Action future args
• Issue #1127  - Executor causes segmentation fault
• Issue #1124  - Adding new API functions: register_id_with_basename, unregister_id_with_basename, find_ids_from_basename; adding test
• Issue #1123  - Reduce nesting of try-catch construct in encode_parcel?
• Issue #1122  - Client base fixes
• Issue #1121  - Update hpxrun.py.in
• Issue #1120  - HTTS2 tests compile errors on v110 (VS2012)
• Issue #1119  - Remove references to boost::atomic in accumulator example
• Issue #1118  - Only build test thread_pool_executor_1114_test if HPX_SCHEDULER is set
• Issue #1117  - local_queue_executor linker error on vc110
• Issue #1116  - Disabled performance counter should give runtime errors, not invalid data
• Issue #1115  - Compile error with Intel C++ 13.1
• Issue #1114  - Default constructed executor is not usable
• Issue #1113  - Fast compilation of logging causes ABI incompatibilities between different NDEBUG values
• Issue #1112  - Using thread_pool_executors causes segfault
• Issue #1111  - hpx::threads::get_thread_data always returns zero
• Issue #1110  - Remove unnecessary null pointer checks
• Issue #1109  - More tests adjustments
• Issue #1108  - Clarify build rules for “libboost_atomic-mt.so”?
• Issue #1107  - Remove unnecessary null pointer checks
• Issue #1106  - network_storage benchmark improvements, adding legends to plots and tidying layout
• Issue #1105  - Add more plot outputs and improve instructions doc

2.10. Releases
• Issue #1104[^1104] - Complete quoting for parameters of some CMake commands
• Issue #1103[^1103] - Work on test/scripts
• Issue #1102[^1102] - Changed minimum requirement of window install to 2012
• Issue #1101[^1101] - Changed minimum requirement of window install to 2012
• Issue #1100[^1100] - Changed readme to no longer specify using MSVC 2010 compiler
• Issue #1099[^1099] - Error returning futures from component actions
• Issue #1098[^1098] - Improve storage test
• Issue #1097[^1097] - data_actions quickstart example calls missing function decorate_action of data_get_action
• Issue #1096[^1096] - MPI parcelport broken with new zero copy optimization
• Issue #1095[^1095] - Warning C4005: _WIN32_WINNT: Macro redefinition
• Issue #1094[^1094] - Syntax error for -DHPX_UNIQUE_FUTURE_ALIAS in master
• Issue #1093[^1093] - Syntax error for -DHPX_UNIQUE_FUTURE_ALIAS
• Issue #1092[^1092] - Rename unique_future<> back to future<>
• Issue #1091[^1091] - Inconsistent error message
• Issue #1090[^1090] - On windows 8.1 the examples crashed if using more than one os thread
• Issue #1089[^1089] - Components should be allowed to have their own executor
• Issue #1088[^1088] - Add possibility to select a network interface for the ibverbs parcelport
• Issue #1087[^1087] - ibverbs and ipc parcelport uses zero copy optimization
• Issue #1086[^1086] - Make shell examples copyable in docs
• Issue #1085[^1085] - Implement proper termination detection during shutdown
• Issue #1084[^1084] - Implement thread_specific_ptr for hpx::threads
• Issue #1083[^1083] - make install not working properly
• Issue #1082[^1082] - Complete quoting for parameters of some CMake commands

\textit{HPX V0.9.8 (Mar 24, 2014)}

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.). With the changes below, HPX is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, HPX insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using HPX:

• \textit{HPX} is solidly rooted in a sophisticated theoretical execution model – ParalleX
• \textit{HPX} exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of HPX.
• It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today’s mainstream techniques
• There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing: no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
• There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
• The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
• The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

\textsuperscript{5251} https://github.com/STEllAR-GROUP/hpx/issues/44
General changes

- A major API breaking change for this release was introduced by implementing hpx::future and hpx::shared_future fully in conformance with the C++11 Standard\(^{5252}\). While hpx::shared_future is new and will not create any compatibility problems, we revised the interface and implementation of the existing hpx::future. For more details please see the mailing list archive\(^{5253}\). To avoid any incompatibilities for existing code we named the type which implements the std::future interface as hpx::unique_future. For the next release this will be renamed to hpx::future, making it full conforming to C++11 Standard\(^{5254}\).

- A large part of the code base of HPX has been refactored and partially re-implemented. The main changes were related to
  - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
  - The parcel subsystem: these changes improve the performance of the HPX networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
  - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
  - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.

- We added new API functionality like hpx::migrate and hpx::copy_component which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.

- We removed the use of C++11 move emulation (using Boost.Move), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.

- We improved the reference counting scheme used by HPX which helps managing distributed objects and memory. This improves the overall stability of HPX and further simplifies writing real world applications.

- The minimal Boost version required to use HPX is now V1.49.0.

- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the XPI specification\(^{5255}\).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1086\(^{5256}\) - Expose internal boost::shared_array to allow user management of array lifetime
- Issue #1083\(^{5257}\) - Make shell examples copyable in docs
- Issue #1080\(^{5258}\) - /threads\{locality#*/total\}/count/cumulative broken
- Issue #1079\(^{5259}\) - Build problems on OS X

• Issue #1078 - Improve robustness of component loading
• Issue #1077 - Fix a missing enum definition for ‘take’ mode
• Issue #1076 - Merge Jb master
• Issue #1075 - Unknown CMake command “add_hpx_pseudo_target”
• Issue #1074 - Implement apply_continue_callback and apply_colocated_callback
• Issue #1073 - The new apply_colocated and async_colocated functions lead to automatic registered functions
• Issue #1071 - Remove deferred_packaged_task
• Issue #1069 - serialize_buffer with allocator fails at destruction
• Issue #1068 - Coroutine include and forward declarations missing
• Issue #1067 - Add allocator support to util::serialize_buffer
• Issue #1066 - Allow for MPI_Init being called before HPX launches
• Issue #1065 - AGAS cache isn’t used/populated on worker localities
• Issue #1064 - Reorder includes to ensure ws2 includes early
• Issue #1063 - Add std::runtime::suspend and std::runtime::resume
• Issue #1062 - Fix async_continue to properly handle return types
• Issue #1061 - Implement async_colocated and apply_colocated
• Issue #1060 - Implement minimal component migration
• Issue #1058 - Remove HPX_UTIL_TUPLE from code base
• Issue #1057 - Add performance counters for threading subsystem
• Issue #1055 - Thread allocation uses two memory pools
• Issue #1053 - Work stealing flawed
• Issue #1052 - Fix a number of warnings
• Issue #1049 - Fixes for TLS on OSX and more reliable test running

- Issue #1047\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1047} - Use port ‘0’ for networking when using one locality
- Issue #1046\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1046} - composable\_guard test is broken when having more than one thread
- Issue #1045\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1045} - Security missing headers
- Issue #1044\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1044} - Native TLS on FreeBSD via \_thread
- Issue #1043\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1043} - async et.al. compute the wrong result type
- Issue #1042\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1042} - async et.al. implicitly unwrap reference\_wrappers
- Issue #1041\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1041} - Remove redundant costly Kleene stars from regex searches
- Issue #1040\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1040} - CMake script regex match patterns has unnecessary kleenes
- Issue #1039\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1039} - Remove use of Boost.Move and replace with std:\:move and real rvalue refs
- Issue #1038\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1038} - Bump minimal required Boost to 1.49.0
- Issue #1037\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1037} - Implicit unwrapping of futures in async broken
- Issue #1036\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1036} - Scheduler hangs when user code attempts to “block” OS-threads
- Issue #1035\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1035} - Idle-rate counter always reports 100% idle rate
- Issue #1034\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1034} - Symbolic name registration causes application hangs
- Issue #1033\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1033} - Application options read in from an options file generate an error message
- Issue #1032\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1032} - hpx::id\_type local reference counting is wrong
- Issue #1031\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1031} - Negative entry in reference count table
- Issue #1030\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1030} - Implement condition\_variable
- Issue #1029\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1029} - Deadlock in thread scheduling subsystem
- Issue #1028\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1028} - HPX-thread cumulative count performance counters report incorrect value
- Issue #1027\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1027} - Expose hpx::thread\_interrupted error code as a separate exception type
- Issue #1026\footnote{https://github.com/STEllAR-GROUP/hpx/issues/1026} - Exceptions thrown in asynchronous calls can be lost if the value of the future is never queried

2.10. Releases

\cite{https://github.com/STEllAR-GROUP/hpx/issues/1026}
• Issue #1025\(^{5306}\) - future::wait_for/wait_until do not remove callback
• Issue #1024\(^{5307}\) - Remove dependence to boost assert and create hpx assert
• Issue #1023\(^{5308}\) - Segfaults with tcmalloc
• Issue #1022\(^{5309}\) - prerequisites link in readme is broken
• Issue #1020\(^{5310}\) - HPX Deadlock on external synchronization
• Issue #1019\(^{5311}\) - Convert using BOOST_ASSERT to HPX_ASSERT
• Issue #1018\(^{5312}\) - compiling bug with gcc 4.8.1
• Issue #1017\(^{5313}\) - Possible crash in io_pool executor
• Issue #1016\(^{5314}\) - Crash at startup
• Issue #1014\(^{5315}\) - Implement Increment/Decrement Merging
• Issue #1013\(^{5316}\) - Add more logging channels to enable greater control over logging granularity
• Issue #1012\(^{5317}\) - --hpx:debug-hpx-log and --hpx:debug-agas-log lead to non-thread safe writes
• Issue #1011\(^{5318}\) - After installation, running applications from the build/staging directory no longer works
• Issue #1010\(^{5319}\) - Mergeable decrement requests are not being merged
• Issue #1009\(^{5320}\) - --hpx:list-symbolic-names crashes
• Issue #1007\(^{5321}\) - Components are not properly destroyed
• Issue #1006\(^{5322}\) - Segfault/hang in set_data
• Issue #1003\(^{5323}\) - Performance counter naming issue
• Issue #982\(^{5324}\) - Race condition during startup
• Issue #912\(^{5325}\) - OS X: component type not found in map
• Issue #663\(^{5326}\) - Create a buildbot slave based on Clang 3.2/OSX
• Issue #636\(^{5327}\) - Expose this_locality::apply<act>(p1, p2); for local execution
• Issue #197\(^{5328}\) - Add --console=address option for PBS runs

• Issue #1755329 - Asynchronous AGAS API

**HPX V0.9.7 (Nov 13, 2013)**

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

**General changes**

• Ported HPX to BlueGene/Q
• Improved HPX support for Xeon/Phi accelerators
• Reimplemented hpx::bind, hpx::tuple, and hpx::function for better performance and better compliance with the C++11 Standard. Added hpx::mem_fn.
• Reworked hpx::when_all and hpx::when_any for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added hpx::when_any_swapped.
• Added hpx::copy as a precursor for a migrate functionality
• Added hpx::get_ptr allowing to directly access the memory underlying a given component
• Added the hpx::lcos::broadcast, hpx::lcos::reduce, and hpx::lcos::fold collective operations
• Added hpx::get_locality_name allowing to retrieve the name of any of the localities for the application.
• Added support for more flexible thread affinity control from the HPX command line, such as new modes for --hpx:bind (balanced, scattered, compact), improved default settings when running multiple localities on the same node.
• Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
• Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
• General performance improvements of the code related to threads and futures.

**Bug fixes (closed tickets)**

Here is a list of the important tickets we closed for this release.

• Issue #10055330 - Allow one to disable array optimizations and zero copy optimizations for each parcelport
• Issue #10045331 - Generate new HPX logo image for the docs
• Issue #10025332 - If MPI parcelport is not available, running HPX under mpirun should fail
• Issue #10015333 - Zero copy serialization raises assert
• Issue #10005334 - Can’t connect to a HPX application running with the MPI parcelport from a non MPI parcelport locality
• Issue #9995335 - Optimize hpx::when_n

• Issue #966 - --hpx:print-bind physical core numbers are wrong
• Issue #965 - Deadlock when building in Release mode
• Issue #963 - Not all worker threads are working
• Issue #962 - Problem with SLURM integration
• Issue #961 - --hpx:print-bind outputs incorrect information
• Issue #960 - Fix cut and paste error in documentation of get_thread_priority
• Issue #959 - Change link to boost.atomic in documentation to point to boost.org
• Issue #958 - Undefined reference to intrusive_ptr_release
• Issue #957 - Make tuple standard compliant
• Issue #956 - Segfault with a3382fb
• Issue #955 - --hpx:nodes and --hpx:nodefiles do not work with foreign nodes
• Issue #954 - Make order of arguments for hpx::async and hpx::broadcast consistent
• Issue #953 - Cannot use MKL with HPX
• Issue #952 - register_[pre_]shutdown_function never throw
• Issue #951 - Assert when number of threads is greater than hardware concurrency
• Issue #948 - HPX_HAVE_GENERIC_CONTEXT_COROUTINES conflicts with HPX_HAVE_FIBER_BASED_COROUTINES
• Issue #947 - Need MPI_THREAD_MULTIPLE for backward compatibility
• Issue #946 - HPX does not call MPI_Finalize
• Issue #945 - Segfault with hpx::lcos::broadcast
• Issue #944 - OS X: assertion pu_offset_ < hardware_concurrency failed
• Issue #943 - #include <hpx/hpx_main.hpp> does not work
• Issue #942 - Make the BG/Q work with -O3
• Issue #940 - Use separator when concatenating locality name

• Issue #911 - Update OS X build instructions
• Issue #910 - Want like to specify MPI_ROOT instead of compiler wrapper script
• Issue #909 - Warning about void* arithmetic
• Issue #908 - Buildbot for MIC is broken
• Issue #906 - Can’t use --hpx:bind=balanced with multiple MPI processes
• Issue #905 - --hpx:bind documentation should describe full grammar
• Issue #904 - Add hpx::lcos::fold and hpx::lcos::inverse_fold collective operation
• Issue #903 - Add hpx::when_any_swapped()
• Issue #902 - Add hpx::lcos::reduce collective operation
• Issue #901 - Web documentation is not searchable
• Issue #900 - Web documentation for trunk has no index
• Issue #898 - Some tests fail with GCC 4.8.1 and MPI parcel port
• Issue #897 - HWLOC causes failures on Mac
• Issue #896 - pu-offset leads to startup error
• Issue #895 - hpx::get_locality_name not defined
• Issue #894 - Race condition at shutdown
• Issue #893 - --hpx:print-bind switches std::cout to hexadecimal mode
• Issue #892 - hwloc_topology_load can be expensive – don’t call multiple times
• Issue #891 - The documentation for get_locality_name is wrong
• Issue #890 - --hpx:print-bind should not exit
• Issue #889 - --hpx:debug-hpx-log=FILE does not work
• Issue #888 - MPI parcelport does not exit cleanly for --hpx:print-bind
• Issue #887 - Choose thread affinities more cleverly

2.10. Releases
• Issue #886 - Logging documentation is confusing
• Issue #885 - Two threads are slower than one
• Issue #884 - is_callable failing with member pointers in C++11
• Issue #883 - Need help with is_callable_test
• Issue #882 - tests.regressions.lcos.future_hang_on_get does not terminate
• Issue #881 - tests/regressions/block_matrix/matrix.hh won’t compile with GCC 4.8.1
• Issue #880 - HPX does not work on OS X
• Issue #878 - future::unwrap triggers assertion
• Issue #877 - “make tests” has build errors on Ubuntu 12.10
• Issue #876 - tcmalloc is used by default, even if it is not present
• Issue #875 - global_fixture is defined in a header file
• Issue #874 - Some tests take very long
• Issue #873 - Add block-matrix code as regression test
• Issue #872 - HPX documentation does not say how to run tests with detailed output
• Issue #871 - All tests fail with “make test”
• Issue #870 - Please explicitly disable serialization in classes that don’t support it
• Issue #868 - boost_any test failing
• Issue #867 - Reduce the number of copies of hpx::function arguments
• Issue #863 - Futures should not require a default constructor
• Issue #862 - value_or_error shall not default construct its result
• Issue #861 - HPX_UNUSED macro
• Issue #860 - Add functionality to copy construct a component
• Issue #859 - hpx::endl should flush

5450 https://github.com/STEllAR-GROUP/hpx/issues/859
• Issue #858: Create `hpx::get_ptr<>` allowing to access component implementation
• Issue #855: Implement `hpx::INVOKE`
• Issue #854: `hpx/hpx.hpp` does not include `hpx/include/iostreams.hpp`
• Issue #853: Feature request: null future
• Issue #852: Feature request: Locality names
• Issue #851: `hpx::cout` output does not appear on screen
• Issue #849: All tests fail on OS X after installing
• Issue #848: Update OS X build instructions
• Issue #846: Update `hpx_external_example`
• Issue #845: Issues with having both debug and release modules in the same directory
• Issue #844: Create configuration header
• Issue #843: Tests should use CTest
• Issue #842: Remove `buffer_pool` from MPI parcelport
• Issue #841: Add possibility to broadcast an index with `hpx::lcos::broadcast`
• Issue #838: Simplify `util::tuple`
• Issue #837: Adopt `boost::tuple` tests for `util::tuple`
• Issue #836: Adopt `boost::function` tests for `util::function`
• Issue #835: Tuple interface missing pieces
• Issue #833: Partially preprocessing files not working
• Issue #832: Native papi counters do not work with wild cards
• Issue #831: Arithmetics counter fails if only one parameter is given
• Issue #830: Convert `hpx::util::function` to use new scheme for serializing its base pointer
• Issue #829: Consistently use `decay<T>` instead of `remove_const<remove_reference<T>>`

2.10. Releases
• Issue #828 - Update future implementation to N3721 and N3722
• Issue #827 - Enable MPI parcelport for bootstrapping whenever application was started using mpirun
• Issue #826 - Support command line option --hpz:print-bind even if --hpz::bind was not used
• Issue #825 - Memory counters give segfault when attempting to use thread wild cards or numbers only total works
• Issue #824 - Enable lambda functions to be used with hpx::async/hpx::apply
• Issue #823 - Using a hashing filter
• Issue #822 - Silence unused variable warning
• Issue #821 - Detect if a function object is callable with given arguments
• Issue #820 - Allow wildcards to be used for performance counter names
• Issue #819 - Make the AGAS symbolic name registry distributed
• Issue #818 - Add future::then() overload taking an executor
• Issue #817 - Fixed typo
• Issue #815 - Create an lco that is performing an efficient broadcast of actions
• Issue #814 - Papi counters cannot specify thread#* to get the counts for all threads
• Issue #813 - Scoped unlock
• Issue #811 - simple_central_tuplspce_client run error
• Issue #810 - ostream error when << any objects
• Issue #809 - Optimize parcel serialization
• Issue #808 - HPX applications throw exception when executed from the build directory
• Issue #807 - Create performance counters exposing overall AGAS statistics
• Issue #795 - Create timed make_ready_future
• Issue #794 - Create heterogeneous when_all/when_any/etc.
• Issue #792 - Make HPX usable for Xeon Phi
- Issue #694\(^{5497}\) - CMake should complain if you attempt to build an example without its dependencies
- Issue #692\(^{5498}\) - SLURM support broken
- Issue #683\(^{5499}\) - python/hpx/process.py imports epoll on all platforms
- Issue #619\(^{5500}\) - Automate the doc building process
- Issue #600\(^{5501}\) - GTC performance broken
- Issue #577\(^{5502}\) - Allow for zero copy serialization/networking
- Issue #551\(^{5503}\) - Change executable names to have debug postfix in Debug builds
- Issue #544\(^{5504}\) - Write a custom .lib file on Windows pulling in hpx_init and hpx.dll, phase out hpx_init
- Issue #534\(^{5505}\) - hpx::init should take functions by std::function and should accept all forms of hpx_main
- Issue #508\(^{5506}\) - FindPackage fails to set FO0_LIBRARY_DIR
- Issue #506\(^{5507}\) - Add cmake support to generate ini files for external applications
- Issue #470\(^{5508}\) - Changing build-type after configure does not update boost library names
- Issue #453\(^{5509}\) - Document hpx_run_tests.py
- Issue #445\(^{5510}\) - Significant performance mismatch between MPI and HPX in SMP for allgather example
- Issue #443\(^{5511}\) - Make docs viewable from build directory
- Issue #421\(^{5512}\) - Support multiple HPX instances per node in a batch environment like PBS or SLURM
- Issue #316\(^{5513}\) - Add message size limitation
- Issue #249\(^{5514}\) - Clean up locking code in big boot barrier
- Issue #136\(^{5515}\) - Persistent CMak variables need to be marked as cache variables

**HPX V0.9.6 (Jul 30, 2013)**

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

**General changes**

The major new features in this release are:

- We further consolidated the API exposed by HPX. We aligned our APIs as much as possible with the existing C++11 Standard\(^{5516}\) and related proposals to the C++ standardization committee (such as N3632\(^{5517}\) and N3857\(^{5518}\)).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported HPX to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.
- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).
- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal N3562\(^{5519}\). This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance The Linda Coordination Language\(^{5520}\)).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- **Issue #806** - make (all) in examples folder does nothing
- **Issue #805** - Adding the introduction and fixing DOCBOOK dependencies for Windows use
- **Issue #804** - Add stackless (non-suspendable) thread type
- **Issue #803** - Create proper serialization support functions for util::tuple
- **Issue #800** - Add possibility to disable array optimizations during serialization
- **Issue #798** - HPX_LIMIT does not work for local dataflow
- **Issue #797** - Create a parcelport which uses MPI
- **Issue #796** - Problem with Large Numbers of Threads
- **Issue #793** - Changing dataflow test case to hang consistently
- **Issue #792** - CMake Error
- **Issue #791** - Problems with local::dataflow
- **Issue #790** - wait_for() doesn’t compile
- **Issue #789** - HPX with Intel compiler segfaults
- **Issue #788** - Intel compiler support
- **Issue #787** - Fixed SFINAE specializations
- **Issue #786** - Memory issues during benchmarking.
- **Issue #785** - Create an API allowing to register external threads with HPX
- **Issue #784** - util::plugin is throwing an error when a symbol is not found
- **Issue #783** - How does hpx::bind work?
- **Issue #782** - Added quotes around STRING REPLACE potentially empty arguments
- **Issue #781** - Make sure no exceptions propagate into the thread manager

[Links to GitHub issues for each ticket]
• Issue #780⁵⁵⁴² - Allow arithmetics performance counters to expand its parameters
• Issue #779⁵⁵⁴³ - Test case for 778
• Issue #778⁵⁵⁴⁴ - Swapping futures segfaults
• Issue #777⁵⁵⁴⁵ - hpx::lcos::details::when_xxx don’t restore completion handlers
• Issue #776⁵⁵⁴⁶ - Compiler chokes on dataflow overload with launch policy
• Issue #775⁵⁵⁴⁷ - Runtime error with local dataflow (copying futures?)
• Issue #774⁵⁵⁴⁸ - Using local dataflow without explicit namespace
• Issue #773⁵⁵⁴⁹ - Local dataflow with unwrap: functor operators need to be const
• Issue #772⁵⁵⁵⁰ - Allow (remote) actions to return a future
• Issue #771⁵⁵⁵¹ - Setting HPX_LIMIT gives huge boost MPL errors
• Issue #770⁵⁵⁵² - Add launch policy to (local) dataflow
• Issue #769⁵⁵⁵³ - Make compile time configuration information available
• Issue #768⁵⁵⁵⁴ - Const correctness problem in local dataflow
• Issue #767⁵⁵⁵⁵ - Add launch policies to async
• Issue #766⁵⁵⁵⁶ - Mark data structures for optimized (array based) serialization
• Issue #765⁵⁵⁵⁷ - Align hpx::any with N3508: Any Library Proposal (Revision 2)
• Issue #764⁵⁵⁵⁸ - Align hpx::future with newest N3558: A Standardized Representation of Asynchronous Operations
• Issue #762⁵⁵⁵⁹ - added a human readable output for the ping pong example
• Issue #761⁵⁵⁶⁰ - Ambiguous typename when constructing derived component
• Issue #760⁵⁵⁶¹ - Simple components can not be derived
• Issue #759⁵⁵⁶² - make install doesn’t give a complete install
• Issue #758⁵⁵⁶³ - Stack overflow when using locking_hook<> 
• Issue #757⁵⁵⁶⁴ - copy paste error; unsupported function overloading

• Issue #756\(^{5565}\) - GTCTX runtime issue in Gordon
• Issue #755\(^{5566}\) - Papi counters don’t work with reset and evaluate API’s
• Issue #753\(^{5567}\) - cmake bugfix and improved component action docs
• Issue #752\(^{5568}\) - hpx simple component docs
• Issue #750\(^{5569}\) - Add hpx::util::any
• Issue #749\(^{5570}\) - Thread phase counter is not reset
• Issue #748\(^{5571}\) - Memory performance counter are not registered
• Issue #747\(^{5572}\) - Create performance counters exposing arithmetic operations
• Issue #745\(^{5573}\) - apply_callback needs to invoke callback when applied locally
• Issue #744\(^{5574}\) - CMake fixes
• Issue #743\(^{5575}\) - Problem Building github version of HPX
• Issue #742\(^{5576}\) - Remove HPX_STD_BIND
• Issue #741\(^{5577}\) - assertion ‘px != 0’ failed: HPX(assertion_failure) for low numbers of OS threads
• Issue #739\(^{5578}\) - Performance counters do not count to the end of the program or evaluation
• Issue #738\(^{5579}\) - Dedicated AGAS server runs don’t work; console ignores -a option.
• Issue #737\(^{5580}\) - Missing bind overloads
• Issue #736\(^{5581}\) - Performance counter wildcards do not always work
• Issue #735\(^{5582}\) - Create native ibverbs parcelport based on rdma operations
• Issue #734\(^{5583}\) - Threads stolen performance counter total is incorrect
• Issue #733\(^{5584}\) - Test benchmarks need to be checked and fixed
• Issue #732\(^{5585}\) - Build fails with Mac, using mac ports clang-3.3 on latest git branch
• Issue #731\(^{5586}\) - Add global start/stop API for performance counters
• Issue #730\(^{5587}\) - Performance counter values are apparently incorrect

• Issue #729\textsuperscript{5588} - Unhandled switch
• Issue #728\textsuperscript{5589} - Serialization of hpx::util::function between two localities causes seg faults
• Issue #727\textsuperscript{5590} - Memory counters on Mac OS X
• Issue #725\textsuperscript{5591} - Restore original thread priority on resume
• Issue #724\textsuperscript{5592} - Performance benchmarks do not depend on main HPX libraries
• Issue #723\textsuperscript{5593} - [teletype]–hpx:nodes=`\textbackslash cat $PBS\_NODEFILE` works; –hpx:nodefile=$PBS\_NODEFILE does not.[c++]
• Issue #722\textsuperscript{5594} - Fix binding const member functions as actions
• Issue #719\textsuperscript{5595} - Create performance counter exposing compression ratio
• Issue #718\textsuperscript{5596} - Add possibility to compress parcel data
• Issue #717\textsuperscript{5597} - strip_credit_from_gid has misleading semantics
• Issue #716\textsuperscript{5598} - Non-option arguments to programs run using pbsdsh must be before --hpx:nodes, contrary to directions
• Issue #715\textsuperscript{5599} - Re-thrown exceptions should retain the original call site
• Issue #714\textsuperscript{5600} - failed assertion in debug mode
• Issue #713\textsuperscript{5601} - Add performance counters monitoring connection caches
• Issue #712\textsuperscript{5602} - Adjust parcel related performance counters to be connection type specific
• Issue #711\textsuperscript{5603} - configuration failure
• Issue #710\textsuperscript{5604} - Error “timed out while trying to find room in the connection cache” when trying to start multiple localities on a single computer
• Issue #709\textsuperscript{5605} - Add new thread state ‘staged’ referring to task descriptions
• Issue #708\textsuperscript{5606} - Detect/mitigate bad non-system installs of GCC on Redhat systems
• Issue #707\textsuperscript{5607} - Many examples do not link with Git HEAD version
• Issue #706\textsuperscript{5608} - hpx::init removes portions of non-option command line arguments before last = sign
• Issue #705\textsuperscript{5609} - Create rolling average and median aggregating performance counters

• Issue #704 - Create performance counter to expose thread queue waiting time
• Issue #703 - Add support to HPX build system to find librtool.a and related headers
• Issue #699 - Generalize instrumentation support
• Issue #698 - compilation failure with hwloc absent
• Issue #697 - Performance counter counts should be zero indexed
• Issue #696 - Distributed problem
• Issue #695 - Bad perf counter time printed
• Issue #693 - --help doesn’t print component specific command line options
• Issue #692 - SLURM support broken
• Issue #691 - exception while executing any application linked with hwloc
• Issue #690 - thread_id_test and thread_launcher_test failing
• Issue #689 - Make the buildbots use hwloc
• Issue #687 - compilation error fix (hwloc_topology)
• Issue #686 - Linker Error for Applications
• Issue #684 - Pinning of service thread fails when number of worker threads equals the number of cores
• Issue #682 - Add performance counters exposing number of stolen threads
• Issue #681 - Add apply_continue for asynchronous chaining of actions
• Issue #679 - Remove obsolete async_callback API functions
• Issue #678 - Add new API for setting/trIGGERING LCOs
• Issue #677 - Add async_continue for true continuation style actions
• Issue #676 - Buildbot for gcc 4.4 broken
• Issue #675 - Partial preprocessing broken
• Issue #674 - HPX segfaults when built with gcc 4.7

- Issue #383 - Change result type detection for hpx::util::bind to use result_of protocol
- Issue #341 - Consolidate route code
- Issue #219 - Only copy arguments into actions once
- Issue #177 - Implement distributed AGAS
- Issue #43 - Support for Darwin (Xcode + Clang)

**HPX V0.9.5 (Jan 16, 2013)**

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

**General changes**

This release is continuing along the lines of code and API consolidation, and overall usability improvements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported HPX to the Android platform. HPX applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported HPX to Mac OSX (using the Clang compiler). Thanks to Pyry Jahkola for contributing the corresponding patches. Please see the section macos_installation for more details.

We made a special effort to make HPX usable in highly concurrent use cases. Many of the HPX API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. HPX actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like hpx::bind.

All of the API has been aligned as much as possible with established paradigms. HPX now mirrors many of the facilities as defined in the C++11 Standard, such as hpx::thread, hpx::function, hpx::future, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of HPX we perform after the move to Github. This step has enabled a wider participation from the community and further encourages us in our decision to release HPX as a true open source library (HPX is licensed under the very liberal Boost Software License).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX’ releases so far.

- Issue #6665663 - Segfault on calling hpx::finalize twice
- Issue #6655664 - Adding declaration num_of_cores
- Issue #6625665 - pkgconfig is building wrong
- Issue #6605666 - Need uninterrupt function
- Issue #6595667 - Move our logging library into a different namespace
- Issue #6585668 - Dynamic performance counter types are broken
- Issue #6575669 - HPX v0.9.5 (RC1) hello_world example segfaulting
- Issue #6565670 - Define the affinity of parcel-pool, io-pool, and timer-pool threads
- Issue #6545671 - Integrate the Boost auto_index tool with documentation
- Issue #6535672 - Make HPX build on OS X + Clang + libc++
- Issue #6515673 - Add fine-grained control for thread pinning
- Issue #6505674 - Command line no error message when using -hpx:(anything)
- Issue #6455675 - Command line aliases don’t work in [teletype]`@file` `[c++]`
- Issue #6445676 - Terminated threads are not always properly cleaned up
- Issue #6405677 - future_data<T>::set_on_completed_ used without locks
- Issue #6385678 - hpx build with intel compilers fails on linux
- Issue #6375679 - `--copy-dt-needed-entries` breaks with gold
- Issue #6355680 - Boost V1.53 will add Boost.Lockfree and Boost.Atomic
- Issue #6335681 - Re-add examples to final 0.9.5 release
- Issue #6325682 - Example thread_aware_timer is broken
- Issue #6315683 - FFT application throws error in parcellayer

[5683](https://github.com/STEllAR-GROUP/hpx/issues/631)
• Issue #630^[5684] - Event synchronization example is broken
• Issue #629^[5685] - Waiting on futures hangs
• Issue #628^[5686] - Add an HPX_ALWAYS_ASSERT macro
• Issue #625^[5687] - Port coroutines context switch benchmark
• Issue #621^[5688] - New INI section for stack sizes
• Issue #618^[5689] - pkg_config support does not work with a HPX debug build
• Issue #617^[5690] - hpx/external/logging/boost/logging/detail/cache_before_init.hpp:139:67: error: ‘get_thread_id’ was not declared in this scope
• Issue #616^[5691] - Change wait_xxx not to use locking
• Issue #615^[5692] - Revert visibility ‘fix’ (fb0b6b8245dad1127b0c25ebaf9d386b3945c1a9)
• Issue #614^[5693] - Fix Dataflow linker error
• Issue #613^[5694] - find_here should throw an exception on failure
• Issue #612^[5695] - Thread phase doesn’t show up in debug mode
• Issue #611^[5696] - Make stack guard pages configurable at runtime (initialization time)
• Issue #610^[5697] - Co-Locate Components
• Issue #609^[5698] - future_overhead
• Issue #608^[5699] - --hpx:list-counter-infos problem
• Issue #607^[5700] - Update Boost.Context based backend for coroutines
• Issue #606^[5701] - 1d_wave_equation is not working
• Issue #605^[5702] - Any C++ function that has serializable arguments and a serializable return type should be re- movable
• Issue #604^[5703] - Connecting localities isn’t working anymore
• Issue #603^[5704] - Do not verify any ini entries read from a file
• Issue #602^[5705] - Rename argument_size to type_size/ added implementation to get parcel size
• Issue #599\textsuperscript{5706} - Enable locality specific command line options
• Issue #598\textsuperscript{5707} - Need an API that accesses the performance counter reporting the system uptime
• Issue #597\textsuperscript{5708} - compiling on ranger
• Issue #595\textsuperscript{5709} - I need a place to store data in a thread self pointer
• Issue #594\textsuperscript{5710} - 32/64 interoperability
• Issue #593\textsuperscript{5711} - Warn if logging is disabled at compile time but requested at runtime
• Issue #592\textsuperscript{5712} - Add optional argument value to \texttt{--hpx:list-counters} and \texttt{--hpx:list-counter-infos}
• Issue #591\textsuperscript{5713} - Allow for wildcards in performance counter names specified with \texttt{--hpx:print-counter}
• Issue #590\textsuperscript{5714} - Local promise semantic differences
• Issue #589\textsuperscript{5715} - Create API to query performance counter names
• Issue #587\textsuperscript{5716} - Add get_num_localities and get_num_threads to AGAS API
• Issue #586\textsuperscript{5717} - Adjust local AGAS cache size based on number of localities
• Issue #585\textsuperscript{5718} - Error while using counters in HPX
• Issue #584\textsuperscript{5719} - counting argument size of actions, initial pass.
• Issue #581\textsuperscript{5720} - Remove \texttt{RemoteResult} template parameter for future<>
• Issue #580\textsuperscript{5721} - Add possibility to hook into actions
• Issue #578\textsuperscript{5722} - Use angle brackets in HPX error dumps
• Issue #576\textsuperscript{5723} - Exception incorrectly thrown when \texttt{--help} is used
• Issue #575\textsuperscript{5724} - HPX(bad_component_type) with gcc 4.7.2 and boost 1.51
• Issue #574\textsuperscript{5725} - \texttt{--hpx:connect} command line parameter not working correctly
• Issue #571\textsuperscript{5726} - \texttt{hpx::wait()} (callback version) should pass the future to the callback function
• Issue #570\textsuperscript{5727} - \texttt{hpx::wait} should operate on \texttt{boost::arrays} and \texttt{std::lists}
• Issue #569\textsuperscript{5728} - Add a logging sink for Android

• Issue #568 [5729] - 2-argument version of `HPX_DEFINE_COMPONENT_ACTION`
• Issue #567 [5730] - Connecting to a running HPX application works only once
• Issue #565 [5731] - HPX doesn’t shutdown properly
• Issue #564 [5732] - Partial preprocessing of new component creation interface
• Issue #563 [5733] - Add `hpx::start/hpx::stop` to avoid blocking main thread
• Issue #562 [5734] - All command line arguments swallowed by `hpx`
• Issue #561 [5735] - Boost.Tuple is not move aware
• Issue #558 [5736] - `boost::shared_ptr<>` style semantics/syntax for client classes
• Issue #556 [5737] - Creation of partially preprocessed headers should be enabled for Boost newer than V1.50
• Issue #555 [5738] - `BOOST_FORCEINLINE` does not name a type
• Issue #554 [5739] - Possible race condition in thread `get_id()`
• Issue #552 [5740] - Move enable `client_base`
• Issue #550 [5741] - Add stack size category ‘huge’
• Issue #549 [5742] - ShenEOS run seg-faults on single or distributed runs
• Issue #545 [5743] - `AUTOGEN` broken for `add_hpx_component`
• Issue #542 [5744] - FindHPX_HDF5 still searches multiple times
• Issue #541 [5745] - Quotes around application name in `hpx::init`
• Issue #539 [5746] - Race condition occurring with new lightweight threads
• Issue #535 [5747] - `hpx_run_tests.py` exits with no error code when tests are missing
• Issue #530 [5748] - Thread description(<unknown>) in logs
• Issue #523 [5749] - Make thread objects more lightweight
• Issue #521 [5750] - `hpx::error_code` is not usable for lightweight error handling
• Issue #520 [5751] - Add full user environment to HPX logs

2.10. Releases
HPX Documentation, master

- Issue #519\(^{5752}\) - Build succeeds, running fails
- Issue #517\(^{5753}\) - Add a guard page to linux coroutine stacks
- Issue #516\(^{5754}\) - hpx::thread::detach suspends while holding locks, leads to hang in debug
- Issue #514\(^{5755}\) - Preprocessed headers for <hpx/apply.hpp> don’t compile
- Issue #513\(^{5756}\) - Buildbot configuration problem
- Issue #512\(^{5757}\) - Implement action based stack size customization
- Issue #511\(^{5758}\) - Move action priority into a separate type trait
- Issue #510\(^{5759}\) - trunk broken
- Issue #507\(^{5760}\) - no matching function for call to boost::scoped_ptr<hpx::threads::topology>::scoped_ptr(hpx::threads::topology*)
- Issue #505\(^{5761}\) - undefined_symbol regression test currently failing
- Issue #502\(^{5762}\) - Adding OpenCL and OCLM support to HPX for Windows and Linux
- Issue #501\(^{5763}\) - find_package(HPX) sets cmake output variables
- Issue #500\(^{5764}\) - wait_any/wait_all are badly named
- Issue #499\(^{5765}\) - Add support for disabling pbs support in pbs runs
- Issue #498\(^{5766}\) - Error during no-cache runs
- Issue #496\(^{5767}\) - Add partial preprocessing support to cmake
- Issue #495\(^{5768}\) - Support HPX modules exporting startup/shutdown functions only
- Issue #494\(^{5769}\) - Allow modules to specify when to run startup/shutdown functions
- Issue #493\(^{5770}\) - Avoid constructing a string in make_success_code
- Issue #492\(^{5771}\) - Performance counter creation is no longer synchronized at startup
- Issue #491\(^{5772}\) - Performance counter creation is no longer synchronized at startup
- Issue #490\(^{5773}\) - Shenaeos on_completed_bulk seg fault in distributed
- Issue #489\(^{5774}\) - compiling issue with g++44

\(^{5773}\) https://github.com/STEllAR-GROUP/hpx/issues/490
\(^{5774}\) https://github.com/STEllAR-GROUP/hpx/issues/489
- Issue #488 - Adding OpenCL and OCLM support to HPX for the MSVC platform
- Issue #487 - FindHPX.cmake problems
- Issue #485 - Change distributing_factory and binpacking_factory to use bulk creation
- Issue #484 - Change HPX_DONT_USE_PREPROCESSED_FILES to HPX_USE_PREPROCESSED_FILES
- Issue #483 - Memory counter for Windows
- Issue #479 - strange errors appear when requesting performance counters on multiple nodes
- Issue #477 - Create (global) timer for multi-threaded measurements
- Issue #472 - Add partial preprocessing using Wave
- Issue #471 - Segfault stack traces don’t show up in release
- Issue #468 - External projects need to link with internal components
- Issue #462 - Startup/shutdown functions are called more than once
- Issue #458 - Consolidate hpx::util::high_resolution_timer and hpx::util::high_resolution_clock
- Issue #457 - index out of bounds in allgather_and_gate on 4 cores or more
- Issue #448 - Make HPX compile with clang
- Issue #447 - ‘make tests’ should execute tests on local installation
- Issue #446 - Remove SVN-related code from the codebase
- Issue #444 - race condition in smp
- Issue #441 - Patched Boost.Serialization headers should only be installed if needed
- Issue #439 - Components using HPX_REGISTER_STARTUP_MODULE fail to compile with MSVC
- Issue #436 - Verify that no locks are being held while threads are suspended
- Issue #435 - Installing HPX should not clobber existing Boost installation
- Issue #434 - Logging external component failed (Boost 1.50)
- Issue #433 - Runtime crash when building all examples

2.10. Releases
• Issue #432 - Dataflow hangs on 512 cores/64 nodes
• Issue #430 - Problem with distributing factory
• Issue #424 - File paths referring to XSL-files need to be properly escaped
• Issue #417 - Make dataflow LCOs work out of the box by using partial preprocessing
• Issue #413 - hpx_svnversion.py fails on Windows
• Issue #412 - Make hpx::error_code equivalent to hpx::exception
• Issue #398 - HPX clobbers out-of-tree application specific CMake variables (specifically \texttt{CMAKE\_BUILD\_TYPE})
• Issue #394 - Remove code generating random port numbers for network
• Issue #378 - ShenEOS scaling issues
• Issue #354 - Create a coroutines wrapper for Boost.Context
• Issue #349 - Commandline option \texttt{--localities=N/-lN} should be necessary only on AGAS locality
• Issue #334 - Add auto_index support to cmake based documentation toolchain
• Issue #318 - Network benchmarks
• Issue #317 - Implement network performance counters
• Issue #310 - Duplicate logging entries
• Issue #230 - Add compile time option to disable thread debugging info
• Issue #171 - Add an INI option to turn off deadlock detection independently of logging
• Issue #170 - OSHL internal counters are incorrect
• Issue #103 - Better diagnostics for multiple component/action registrations under the same name
• Issue #48 - Support for Darwin (Xcode + Clang)
• Issue #21 - Build fails with GCC 4.6

**HPX V0.9.0 (Jul 5, 2012)**

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

**General changes**

- Significant improvements made to the usability of HPX in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a packaged_task as defined by the C++11 Standard[^5819].
- HPX now exposes `hpx::thread` which is compliant to the C++11 std::thread type except that it (purely locally) represents an HPX thread. This new type does not expose any of the remote capabilities of the underlying HPX-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 std::future<> type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will ’return’ to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 std::promise<> and std::packaged_task<> types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- `hpx::thread` and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.
- HPX now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- HPX now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- HPX continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write is own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal HPX program now looks like this:

```cpp
#include <hpx/hpx_init.hpp>

int hpx_main()
{
    return hpx::finalize();
}
```

[^5819]: http://www.open-std.org/jtc1/sc22/wg21

---

# 2.10. Releases

1707
int main()
{
    return hpx::init();
}

This removes the immediate dependency on the Boost.Program_options library.

Note: This minimal version of an HPX program does not support any of the default command line arguments (such as --help, or command line options related to PBS). It is suggested to always pass argc and argv to HPX as shown in the example below.

- In order to support those, but still not to depend on Boost.Program_options, the minimal program can be written as:

```cpp
#include <hpx/hpx_init.hpp>

// The arguments for hpx_main can be left off, which very similar to the behavior of `main()` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: hpx::components::binpacking_factory which is equivalent to the existing hpx::components::distributing_factory component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to create, and one based on an arbitrary performance counter which will be queried for all relevant localities.
- Added API functions allowing to access elements of the diagnostic information embedded in the given exception: hpx::get_locality_id, hpx::get_host_name, hpx::get_process_id, hpx::get_function_name, hpx::get_file_name, hpx::get_line_number, hpx::get_os_thread, hpx::get_thread_id, and hpx::get_thread_description.

5821 https://www.boost.org/doc/html/program_options.html
Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- **Issue #71** - GIDs that are not serialized via `handle_gid<>` should raise an exception
- **Issue #105** - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
- **Issue #107** - Nasty threadmanger race condition (reproducible in sheneos_test)
- **Issue #108** - Add millisecond resolution to HPX logs on Linux
- **Issue #110** - Shutdown hang in distributed with release build
- **Issue #116** - Don't use TSS for the applier and runtime pointers
- **Issue #162** - Move local synchronous execution shortcut from `hpx::function` to the applier
- **Issue #172** - Cache sources in CMake and check if they change manually
- **Issue #178** - Add an INI option to turn off ranged-based AGAS caching
- **Issue #187** - Support for disabling performance counter deployment
- **Issue #202** - Support for sending performance counter data to a specific file
- **Issue #218** - boost.coroutines allows different stack sizes, but stack pool is unaware of this
- **Issue #231** - Implement movable `boost::bind`
- **Issue #232** - Implement movable `boost::function`
- **Issue #236** - Allow binding `hpx::util::function` to actions
- **Issue #239** - Replace `hpx::function` with `hpx::util::function`
- **Issue #240** - Can't specify RemoteResult with lcos::async
- **Issue #242** - REGISTER_TEMPLATE support for plain actions
- **Issue #243** - `handle_gid<>` support for `hpx::util::function`
- **Issue #245** - `*_c_cache` code throws an exception if the queried GID is not in the local cache
- **Issue #246** - Undefined references in dataflow/adaptive1d example

General changes

- HPX does not need to be installed anymore to be functional.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- Issue #295\(^\text{5884}\) - Don’t require install path to be known at compile time.
- Issue #371\(^\text{5885}\) - Add hpx iostreams to standard build.
- Issue #384\(^\text{5886}\) - Fix compilation with GCC 4.7.
- Issue #390\(^\text{5887}\) - Remove keep_factory_alive startup call from ShenEOS; add shutdown call to H5close.
- Issue #393\(^\text{5888}\) - Thread affinity control is broken.

Bug fixes (commits)

Here is a list of the important commits included in this point release:

- r7642 - External: Fix backtrace memory violation.
- r7775 - Components: Fix symbol visibility bug with component startup providers. This prevents one components providers from overriding another components.
- r7778 - Components: Fix startup/shutdown provider shadowing issues.

HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed hpx::lcos::eager_future<> and hpx::lcos::lazy_future<> into hpx::lcos::packaged_task and hpx::lcos::deferred_packaged_task. Split hpx::lcos::promise into hpx::lcos::packaged_task and hpx::lcos::future. Added ‘local’ futures (in namespace hpx::lcos::local).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.

\(^{5884}\) https://github.com/STEllAR-GROUP/hpx/issues/295
\(^{5885}\) https://github.com/STEllAR-GROUP/hpx/issues/371
\(^{5886}\) https://github.com/STEllAR-GROUP/hpx/issues/384
\(^{5887}\) https://github.com/STEllAR-GROUP/hpx/issues/390
\(^{5888}\) https://github.com/STEllAR-GROUP/hpx/issues/393
• Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.

• Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.

• Added more automated tests to verify proper functioning of HPX.

• Started to create documentation for HPX and its API.

• Added documentation toolchain to the build system.

• Added dataflow LCO.

• Changed default HPX command line options to have hpx: prefix. For instance, the former option --threads is now --hpx:threads. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section HPX Command Line Options for a full list of available options.

• Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section HPX Command Line Options for a detailed description of command line option aliasing.

• Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.

• Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).

• Improved support for Windows builds with CMake.

• Added support for components to register their own command line options.

• Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an HPX thread.

• Added two new experimental thread schedulers: hierarchy_scheduler and periodic_priority_scheduler. These can be activated by using the command line options --hpx:queuing=hierarchy or --hpx:queuing=periodic.

Example applications

• Graph500 performance benchmark\(^5889\) (thanks to Matthew Anderson for contributing this application).

• GTC (Gyrokinetic Toroidal Code)\(^5890\): a skeleton for particle in cell type codes.

• Random Memory Access: an example demonstrating random memory accesses in a large array

• ShenEOS example\(^5891\), demonstrating partitioning of large read-only data structures and exposing an interpolation API.

• Sine performance counter demo.

• Accumulator examples demonstrating how to write and use HPX components.

• Quickstart examples (like hello_world, fibonacci, quicksort, factorial, etc.) demonstrating simple HPX concepts which introduce some of the concepts in HPX.

• Load balancing and work stealing demos.

---

\(^5889\) [http://www.graph500.org/](http://www.graph500.org/)

\(^5891\) [http://stellarcollapse.org/equationofstate](http://stellarcollapse.org/equationofstate)
API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding `hpx::find_remote_localities`, and `hpx::get_num_localities`.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

```
/object{parentname#parentindex/instance#index}/counter#parameters
```

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.
- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #31\(^{5892}\) - Specialize handle_gid<> for examples and tests
- Issue #72\(^{5893}\) - Fix AGAS reference counting
- Issue #104\(^{5894}\) - heartbeat throws an exception when decrefing the performance counter it’s watching
- Issue #111\(^{5895}\) - throttle causes an exception on the target application
- Issue #142\(^{5896}\) - One failed component loading causes an unrelated component to fail
- Issue #165\(^{5897}\) - Remote exception propagation bug in AGAS reference counting test
- Issue #186\(^{5898}\) - Test credit exhaustion/splitting (e.g. prepare_gid and symbol NS)
- Issue #188\(^{5899}\) - Implement remaining AGAS reference counting test cases
- Issue #258\(^{5900}\) - No type checking of GIDs in stubs classes
- Issue #271\(^{5901}\) - Seg fault/shared pointer assertion in distributed code

\textsuperscript{5940} https://github.com/STEllAR-GROUP/hpx/issues/364
General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see ‘API changes’ below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal HPX parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running HPX applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os_thread_num, balancing/px_thread_phase, examples demonstrating load balancing and work stealing.

API changes

- Added hpx::find_all_localities.
- Added hpx::terminate for non-graceful termination of applications.
- Added hpx::lcos::async functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (hpx::agas::*).
- Renamed hpx::components::wait to hpx::lcos::wait.
- Renamed hpx::lcos::future_value to hpx::lcos::promise.
- Renamed hpx::lcos::recursive_mutex to hpx::lcos::local_recursive_mutex, hpx::lcos::mutex to hpx::lcos::local_mutex
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.
• Removed `hpx::process` (this will be replaced by a real process implementation in the future).
• Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
• Removed deprecated `hpx::naming::full_address`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

• Issue #28\(^{5941}\) - Integrate Windows/Linux CMake code for HPX core
• Issue #32\(^{5942}\) - `hpx::cout()` should be `hpx::cout`
• Issue #33\(^{5943}\) - AGAS V2 legacy client does not properly handle `error_code`
• Issue #60\(^{5944}\) - AGAS: allow for registerid to optionally take ownership of the gid
• Issue #62\(^{5945}\) - adaptive1d compilation failure in Fusion
• Issue #64\(^{5946}\) - Parcel subsystem doesn’t resolve domain names
• Issue #83\(^{5947}\) - No error handling if no console is available
• Issue #84\(^{5948}\) - No error handling if a hosted locality is treated as the bootstrap server
• Issue #90\(^{5949}\) - Add general commandline option `-N`
• Issue #91\(^{5950}\) - Add possibility to read command line arguments from file
• Issue #92\(^{5951}\) - Always log exceptions/errors to the log file
• Issue #93\(^{5952}\) - Log the command line/program name
• Issue #95\(^{5953}\) - Support for distributed launches
• Issue #97\(^{5954}\) - Attempt to create a bad component type in AMR examples
• Issue #100\(^{5955}\) - factorial and factorial_get examples trigger AGAS component type assertions
• Issue #101\(^{5956}\) - Segfault when `hpx::process::here()` is called in fibonacci2
• Issue #102\(^{5957}\) - unknown_component_address in int_object_semaphore_client
• Issue #114\(^{5958}\) - marduk raises assertion with default parameters

• Issue #115 - Logging messages for SMP runs (on the console) shouldn’t be buffered
• Issue #119 - marduk linking strategy breaks other applications
• Issue #121 - pbsdsh problem
• Issue #123 - marduk, dataflow and adaptive1d fail to build
• Issue #124 - Lower default preprocessing arity
• Issue #125 - Move hpx::detail::diagnostic_information out of the detail namespace
• Issue #126 - Test definitions for AGAS reference counting
• Issue #128 - Add averaging performance counter
• Issue #129 - Error with endian.hpp while building adaptive1d
• Issue #130 - Bad initialization of performance counters
• Issue #131 - Add global startup/shutdown functions to component modules
• Issue #132 - Avoid using auto_ptr
• Issue #133 - On Windows hpx.dll doesn’t get installed
• Issue #134 - HPX_LIBRARY does not reflect real library name (on Windows)
• Issue #135 - Add detection of unique_ptr to build system
• Issue #137 - Add command line option allowing to repeatedly evaluate performance counters
• Issue #139 - Logging is broken
• Issue #140 - CMake problem on windows
• Issue #141 - Move all non-component libraries into $PREFIX/lib/hpx
• Issue #143 - adaptive1d throws an exception with the default command line options
• Issue #146 - Early exception handling is broken
• Issue #147 - Sheneos doesn’t link on Linux
• Issue #149 - sheneos_test hangs

2.13 About HPX

2.13.1 History

The development of High Performance ParalleX (HPX) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the Center for Computation and Technology (CCT), a multi-disciplinary research institute at Louisiana State University (LSU). The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of HPX. In 2011 we decided to formalize our collective research efforts by creating the STE||AR group (Systems Technology, Emergent Parallelism, and Algorithm Research). Over time, the team grew to include researchers around the country and the world. In 2014, the STE||AR Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the HPX project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by HPX is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the Boost collection of C++ libraries. We steer the development of HPX with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about STE||AR and ParalleX, see People and Why HPX.

2.13.2 People

The STE||AR\textsuperscript{6027} Group (pronounced as stellar) stands for “Systems Technology, Emergent Parallelism, and Algorithm Research”. We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the STE||AR\textsuperscript{6028} Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. HPX, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use HPX for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

HPX is based on ParalleX which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- \textit{Starvation}: due to lack of usable application parallelism and means of managing it,
- \textit{Overhead}: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- \textit{Latency}: from remote access across system or to local memories,
- \textit{Contention}: due to multicore chip I/O pins, memory banks, and system interconnects.

The ParalleX model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on HPX is centered around implementing the concepts as defined by the ParalleX model. HPX is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of HPX (and ParalleX) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

Acknowledgements

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Panos Syskakis for benchmarking and optimizing our parallel algorithms.
- Shreyas Atre, for contributing fixes to our implementation of senders/receivers and extending our coroutines integration with senders/receivers.
- Alexander Neumann, for contributing fixes to the cmake build system.
- Dimitra Karatza, for her work on refactoring the documentation and providing a new user-friendly environment during and after Google Season of Docs 2021.

HPX Documentation, master

- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of hwloc in HPX.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell (Swiss National Supercomputing Centre⁶⁰⁵⁸), for her tireless work on refactoring our CMake setup and modularizing HPX.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing HPX builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the HPX runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.
- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an HPX backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg (Swiss National Supercomputing Centre⁶⁰⁵⁹), for his tireless help cleaning up and maintaining HPX.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylanx.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in HPX and the fixes he provided. Chris also contributed support for RISC-V architectures.
- Shoshana Jakobovits, for her work on the resource partitioner.
- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.

⁶⁰⁵⁹ https://www.cscs.ch

Chapter 2. What’s so special about HPX?
• Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.

• Zach Byerly (Louisiana State University (LSU)6060), who in his work developing applications on top of HPX opened tickets and contributed to the HPX examples.

• Daniel Estermann, for his work porting HPX to the Raspberry Pi.

• Alireza Kheirkhahan (Louisiana State University (LSU)6061), who built and administered our local cluster as well as his work in distributed IO.

• Abhimanyu Rawat, who worked on stack overflow detection.

• David Pfander, who improved signal handling in HPX, provided his optimization expertise, and worked on incorporating the Vc vectorization into HPX.

• Denis Demidov, who contributed his insights with VexCL.

• Khalid Hasanov, who contributed changes which allowed to run HPX on 64Bit power-pc architectures.

• Zahra Khatami (Louisiana State University (LSU)6062), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.

• Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for HPX.Compute.

• Minh-Khanh Do, who contributed the implementation of several segmented algorithms.

• Bibek Wagle (Louisiana State University (LSU)6063), who worked on fixing and analyzing the performance of the parcel coalescing plugin in HPX.

• Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.

• Andreas Schaefer, who worked on integrating his library (LibGeoDecomp6064) with HPX. He reported various problems and submitted several patches to fix issues allowing for a better integration with LibGeoDecomp6065.

• Satyaki Upadhyay, who contributed several examples to HPX.

• Brandon Cordes, who contributed several improvements to the inspect tool.

• Harris Brakmic, who contributed an extensive build system description for building HPX with Visual Studio.

• Parsa Amini (Louisiana State University (LSU)6066), who refactored and simplified the implementation of AGAS in HPX and who works on its implementation and optimization.

• Luis Martinez de Bartolome who implemented a build system extension for HPX integrating it with the Conan6067 C/C++ package manager.

• Vinay C Amatya (Louisiana State University (LSU)6068), who contributed to the documentation and provided some of the HPX examples.

• Kevin Huck and Nick Chaimov (University of Oregon6069), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with HPX.

• Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for HPX.
• Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs (HPXCL\(^{6070}\)).

• Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.

• Nidhi Makhijani who helped cleaning up some enum consistencies in HPX and contributed to the resource manager used in the thread scheduling subsystem. She also worked on HPX in the context of the Google Summer of Code 2015.

• Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on HPX in the context of the Google Summer of Code program 2015.

• Daniel Bourgeois (Center for Computation and Technology (CCT)\(^{6071}\)) who contributed to HPX the implementation of several parallel algorithms (as proposed by N4313\(^{6072}\)).

• Anuj Sharma and Christopher Bross (Department of Computer Science 3 - Computer Architecture\(^{6073}\), who worked on HPX in the context of the Google Summer of Code\(^{6074}\) program 2014.

• Martin Stumpf (Department of Computer Science 3 - Computer Architecture\(^{6075}\), who rebuilt our contiguous testing infrastructure (see the HPX Buildbot Website\(^{6076}\)). Martin is also working on HPXCL\(^{6077}\) (mainly all work related to OpenCL\(^{6078}\)) and implementing an HPX backend for POCL\(^{6079}\), a portable computing language solution based on OpenCL\(^{6080}\).

• Grant Mercer (University of Nevada, Las Vegas\(^{6081}\), who helped creating many of the parallel algorithms (as proposed by N4313\(^{6082}\)).

• Damond Howard (Louisiana State University (LSU)\(^{6083}\), who works on HPXCL\(^{6084}\) (mainly all work related to CUDA\(^{6085}\)).

• Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.

• Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating HPX as a backend for NT2\(^{6086}\). He also contributed an implementation of an API similar to Fortran co-arrays on top of HPX.

• John Biddiscombe (Swiss National Supercomputing Centre\(^{6087}\), who helped with the BlueGene/Q port of HPX, implemented the parallel sort algorithm, and made several other contributions.

• Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make HPX more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.

• Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling HPX.

• Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.
• Patricia Grubel (New Mexico State University), who contributed the description of the different HPX thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.

• Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.

• Agustin Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.

• Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the iostreams module. He also contributed a complete rewrite of the serialization infrastructure replacing Boost.Serialization inside HPX.

• Pyry Jahkola, who contributed the Mac OS build system and build documentation on how to build HPX using Clang and libc++.

• Mario Mulansky, who created an HPX backend for his Boost.Odeint library, and who submitted several test cases allowing us to reproduce and fix problems in HPX.

• Rekha Raj, who contributed changes to the description of the Windows build instructions.

• Jeremy Kemp how worked on an HPX OpenMP backend and added regression tests.

• Alex Nagelberg for his work on implementing a C wrapper API for HPX.

• Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in HPX.

• Joseph Kleinhenz, Markus Elfring, Kirill Kropivyansky, Alexander Neundorf, Bryant Lam, and Alex Hirsch who improved our CMake.

• Tapaswni Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, Islada, Alex Myczko, and Avyav Kumar who improved the documentation.

• Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikei Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penu-chot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Daiß who contributed to the general improvement of HPX.

HPX Funding Acknowledgements lists current and past funding sources for HPX. Special thanks to Google Summer of Code and Google Season of Docs for the continuous support they provide which helps us enhance both our code and our documentation.
