The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated

as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

template<typename **FwdIter**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
FwdIter **search_n**(*FwdIter* first, *std*::size_t count, *FwdIter2* s_first, Sent s_last, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = count.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.

- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns The *search_n* algorithm returns *FwdIter*. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [s_first, s_last) in range [first, first+count). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally, if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

template<typename **ExPolicy**, typename **FwdIter**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type **search_n**(*ExPolicy* &&policy, *FwdIter* first, *std*::size_t count, *FwdIter2* s_first, *Sent2* s_last, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = count.

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns The *search_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [s_first, s_last) in range [first, first+count). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
hpx::*traits*::range_iterator_t<*Rng1*> **search_n**(*Rng1* &&rng1, *std*::size_t count, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng1>> **search_n**(ExPolicy &&policy, Rng1 &&rng1, std::size_t count, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.

- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

hpx::ranges::set_difference

Defined in header hpx/algorithm.hpp[652].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

[652] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Functions

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_difference_result<*Iter1*, *Iter3*>>::type **set_difference**(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns a *hpx::future<ranges::set_difference_result<Iter1, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_difference_result<Iter1, Iter3>* otherwise. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_difference_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *Iter3*>> **se**

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns a *hpx::future<ranges::set_difference_result<Iter1, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_difference_result<Iter1, Iter3>* otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
set_difference_result<*Iter1*, *Iter3*> **set_difference**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
set_difference_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *Iter3*> **set_difference**(*Rng1* &&rng1, *Rng2* &&rng2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::set_intersection

Defined in header hpx/algorithm.hpp[653].

namespace **ranges**

Functions

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_intersection_result<*Iter1*, *Iter2*, *Iter3*>>::type **set_intersectio**

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

[653] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_intersection* algorithm returns a *hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>* otherwise. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_intersection_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*trai*

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_intersection* algorithm returns a *hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>* otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
set_intersection_result<*Iter1*, *Iter2*, *Iter3*> **set_intersection**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`Iter1`** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **`Sent1`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **`Iter2`** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **`Sent2`** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **`Iter3`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **`Proj1`** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **`Proj2`** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **`first1`** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **`last1`** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **`first2`** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **`last2`** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.
- **`op`** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **`proj1`** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **`proj2`** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_intersection* algorithm returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>*. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
set_intersection_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*traits*::range_iterator_t<*Rng2*>, *Iter3*> **set_intersectio**

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal.

The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_intersection* algorithm returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::set_symmetric_difference

Defined in header hpx/algorithm.hpp[654].

namespace **ranges**

Functions

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

[654] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_symmetric_difference_result<*Iter1*, *Iter2*, *Iter3*>>::type **set_sym**

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_symmetric_difference* algorithm returns a *hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>* otherwise. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_symmetric_difference_result<*hpx*::*traits*::range_iterator_t<*Rng1*>

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`Rng1`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Rng2`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_symmetric_difference* algorithm returns a *hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>* otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
set_symmetric_difference_result<*Iter1*, *Iter2*, *Iter3*> **set_symmetric_difference**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`Iter1`** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **`Sent1`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **`Iter2`** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **`Sent2`** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **`Iter3`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **`Proj1`** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **`Proj2`** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **`first1`** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **`last1`** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **`first2`** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **`last2`** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.
- **`op`** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **`proj1`** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **`proj2`** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_symmetric_difference* algorithm returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>*. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
set_symmetric_difference_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*traits*::range_iterator_t<*Rng2*>, *Iter3*> **set_sym**

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.

- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_symmetric_difference* algorithm returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::set_union

Defined in header hpx/algorithm.hpp[655].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

[655] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Functions

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_union_result<*Iter1*, *Iter2*, *Iter3*>>::type **set_union**(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_union* algorithm returns a *hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_union_result<Iter1, Iter2, Iter3>* otherwise. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_union_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*traits*::ran

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_union* algorithm returns a *hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_union_result<Iter1, Iter2, Iter3>* otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
set_union_result<*Iter1*, *Iter2*, *Iter3*> **tag_fallback_invoke**(set_union_t, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_union* algorithm returns *ranges::set_union_result<Iter1, Iter2, Iter3>*. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_union_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*traits*::range_iterator_t<*Rng2*>, *Iter3*> **set_union**(*Rng1* &&rng1, *Rng2* &&rng2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_union* algorithm returns *ranges::set_union_result<Iter1, Iter2, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::shift_left

Defined in header hpx/algorithm.hpp[656].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**, typename **Size**>
FwdIter **shift_left**(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

[656] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns *FwdIter*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Size**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **shift_left**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

template<typename **Rng**, typename **Size**>
hpx::*traits*::range_iterator_t<*Rng*> **shift_left**(*Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns *hpx::traits::range_iterator_t<Rng>*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **Rng**, typename **Size**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*traits*::range_iterator_t<*Rng*>> **shift_left**(*ExPolicy* &&policy, *Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::shift_right

Defined in header hpx/algorithm.hpp[657].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**, typename **Size**>
FwdIter **shift_right**(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

[657] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns *FwdIter*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Size**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **shift_right**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

template<typename **Rng**, typename **Size**>
hpx::*traits*::range_iterator_t<*Rng*> **shift_right**(*Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns *hpx::traits::range_iterator_t<Rng>*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **Rng**, typename **Size**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*traits*::range_iterator_t<*Rng*>> **shift_right**(*ExPolicy* &&policy, *Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::sort

Defined in header hpx/algorithm.hpp[658].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>
RandomIt **sort**(*RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = detail::distance(first, last) comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

[658] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **ExPolicy**, typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *RandomIt*>::type **sort**(*ExPolicy* &&policy, *RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: O(N log(N)), where N = detail::distance(first, last) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **Rng**, typename **Comp**, typename **Proj**>
hpx::*traits*::range_iterator_t<*Rng*> **sort**(*Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = std::distance(begin(rng), end(rng)) comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns *hpx::traits::range_iterator_t<Rng>*. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*traits*::range_iterator_t<*Rng*>> **sort**(*ExPolicy* &&policy, *Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: O(N log(N)), where N = std::distance(begin(rng), end(rng)) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. It returns *last*.

hpx::ranges::stable_sort

Defined in header hpx/algorithm.hpp[659].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>
RandomIt **stable_sort**(*RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

[659] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Returns The *stable_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **ExPolicy**, typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *RandomIt*>::type **stable_sort**(*ExPolicy* &&policy, *RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *stable_sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise.

The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>
hpx::*traits*::range_iterator_t<*Rng*> **stable_sort**(*Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *stable_sort* algorithm returns *hpx::traits::range_iterator_t<Rng>*. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*traits*::range_iterator_t<*Rng*>> **stable_sort**(*ExPolicy* &&policy, *Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *stable_sort* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. It returns *last*.

namespace **hpx**

namespace **ranges**

[660] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Functions

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
bool **starts_with**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> **starts_with**(*ExPolicy* &&policy, *FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
bool **starts_with**(*Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, bool>::type **starts_with**(*ExPolicy* &&policy, *Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `Rng1` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- `Rng2` – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- `Pred` – The binary predicate that compares the projected elements.
- `Proj1` – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- `Proj2` – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng1` – Refers to the source range.
- `rng2` – Refers to the destination range.
- `pred` – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- `proj1` – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- `proj2` – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

hpx::ranges::swap_ranges

Defined in header hpx/algorithm.hpp[661].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

[661] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Functions

template<typename **InIter1**, typename **Sent1**, typename **InIter2**, typename **Sent2**>
swap_ranges_result<*InIter1*, *InIter2*> **swap_ranges**(*InIter1* first1, *Sent1* last1, *InIter2* first2, *Sent2* last2)

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns The *swap_ranges* algorithm returns *swap_ranges_result<InIter1, InIter2>*. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, swap_ranges_result<*FwdIter1*, *FwdIter2*>>::type **swap_ranges**(*ExPolicy* &&policy, *FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2)

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in

unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns The *swap_ranges* algorithm returns a *hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter2* otherwise. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

template<typename **Rng1**, typename **Rng2**>
swap_ranges_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*traits*::range_iterator_t<*Rng2*>> **swap_ranges**(*Rng1* &&rng1, *Rng2* &&rng2)

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns The *swap_ranges* algorithm returns *swap_ranges_result<* hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, swap_ranges_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*traits*::range

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns The *swap_ranges* algorithm returns a *hpx::future<swap_ranges_result<* hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>> if the execution policy is of type *parallel_task_policy* and returns *swap_ranges_result<* hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>. otherwise. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

hpx::ranges::transform

Defined in header hpx/algorithm.hpp[662].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **F**, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::unary_transform_result<*FwdIter1*, *FwdIter2*>>::type **transform(**

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.

[662] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns a *hpx::future<ranges::unary_transform_result<FwdIter1, FwdIter2> >* if the execution policy is of type *parallel_task_policy* and returns *ranges::unary_transform_result<FwdIter1, FwdIter2>* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter**, typename **F**, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::unary_transform_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *FwdIt*

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *range_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns a *hpx::future<ranges::unary_transform_result<range_iterator<Rng>::ty* FwdIter>> if the execution policy is of type *parallel_task_policy* and returns *ranges::unary_transform_result<range_iterator<Rng>::type*, FwdIter> otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **FwdIter3**, typename **F**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::binary_transform_result<*FwdIter1*, *FwdIter2*, *FwdIter3*>>::type t

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at first2, and stores the result in another range, beginning at dest.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns A *hpx::future<ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>* if the execution policy is of type *parallel_task_policy* and returns *ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **FwdIter**, typename **F**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::binary_transform_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*:

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly min(last2-first2, last1-first1) applications of *f*

Note: The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types range_iterator<Rng1>::type and range_iterator<Rng2>::type can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns a *hpx::future<ranges::binary_transform_result<* hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter> > if the execution policy is of type *parallel_task_policy* and returns *ranges::binary_transform_result<* hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter> otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **F**, typename **Proj** = *hpx*::identity>
ranges::unary_transform_result<*FwdIter1*, *FwdIter2*> **transform**(*FwdIter1* first, *Sent1* last, *FwdIter2* dest, *F* &&f, *Proj* &&proj = *Proj*())

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

Note: Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns *ranges::unary_transform_result<FwdIter1, FwdIter2>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **FwdIter**, typename **F**, typename **Proj** = *hpx*::identity>
ranges::unary_transform_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *FwdIter*> **transform**(*Rng* &&rng, *FwdIter* dest, *F* &&f, *Proj* &&proj = *Proj*())

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

Note: Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *range_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns *ranges::unary_transform_result<range_iterator<Rng>::type*, FwdIter>. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **FwdIter3**, typename **F**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
ranges::binary_transform_result<*FwdIter1*, *FwdIter2*, *FwdIter3*> **transform**(*FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2, *FwdIter3* dest, *F* &&f, *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at first2, and stores the result in another range, beginning at dest.

Note: Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns *ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **FwdIter**, typename **F**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>
ranges::binary_transform_result<*hpx*::*traits*::range_iterator_t<*Rng1*>, *hpx*::*traits*::range_iterator_t<*Rng2*>, *FwdIter*> **trans**

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

Note: Complexity: Exactly min(last2-first2, last1-first1) applications of *f*

Note: The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types range_iterator<Rng1>::type and range_iterator<Rng2>::type can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns *ranges::binary_transform_result*< hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter>. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

hpx::ranges::transform_exclusive_scan

Defined in header hpx/algorithm.hpp[663].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

[663] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Functions

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*InIter*>::value_type>
transform_exclusive_scan_result<*InIter*, *OutIter*> **transform_exclusive_scan**(*InIter* first, *Sent* last, *OutIter* dest, *T* init, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where 1 < K+1 = M <= N.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_exclusive_scan* algorithm returns *transform_exclusive_scan_result<InIter, OutIter>*. The *transform_exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*FwdIter1*>::value_type>
parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_exclusive_result<*FwdIter1*, *FwdIter2*>>::type **transform_excl**

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_exclusive_scan* algorithm returns a *hpx::future<transform_exclusive_result<FwdIter1*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_exclusive_result<FwdIter1*, FwdIter2> otherwise. The *transform_exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*hpx*::*traits*::range_iterator_t<*Rng*>>::value_type>

transform_exclusive_scan_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*> **transform_exclusive_scan**(*Rng* &&rng, *O* dest, *T* init, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_exclusive_scan* algorithm returns a returns *transform_exclusive_scan_result*< traits::range_iterator_t<Rng>, O>. The *transform_exclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*hpx*::*traits*::range_iterator_t<*Rng*>>::value_type>
parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_exclusive_scan_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*>>

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
- a1 when N is 1

- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_exclusive_scan* algorithm returns a *hpx::future<transform_exclusive_scan_result*< traits::range_iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_exclusive_scan_result*< traits::range_iterator_t<Rng>, O> otherwise. The *transform_exclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::transform_inclusive_scan

Defined in header hpx/algorithm.hpp[664].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **BinOp**, typename **UnOp**>
transform_inclusive_scan_result<*InIter*, *OutIter*> **transform_inclusive_scan**(*InIter* first, *Sent* last, *OutIter* dest, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

[664] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **BinOp**, typename **UnOp**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_result<*FwdIter1*, *FwdIter2*>>::type **transform_incl**

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_inclusive_scan* algorithm returns a *hpx::future<transform_inclusive_result<FwdIter1*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result<FwdIter1*, FwdIter2> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**>
transform_inclusive_scan_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*> **transform_inclusive_scan**(*Rng* &&rng, *O* dest, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_inclusive_scan* algorithm returns a returns *transform_inclusive_scan_result*< traits::range_iterator_t<Rng>, O>. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_scan_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*>>:

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_inclusive_scan* algorithm returns a *hpx::future*<*transform_inclusive_scan_result*< traits::range_iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_scan_result*< traits::range_iterator_t<Rng>, O> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*InIter*>::value_type>
transform_inclusive_scan_result<*InIter*, *OutIter*> **transform_inclusive_scan**(*InIter* first, *Sent* last, *OutIter* dest, *BinOp* &&binary_op, *UnOp* &&unary_op, *T* init)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:
- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where 1 < K+1 = M <= N.

Template Parameters
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.
- **init** – The initial value for the generalized sum.

Returns The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*FwdIter1*>::value_type>
parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_result<*FwdIter1*, *FwdIter2*>>::type **transform_incl**

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.
- **init** – The initial value for the generalized sum.

Returns The *transform_inclusive_scan* algorithm returns a *hpx::future<transform_inclusive_result<FwdIter1*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result<FwdIter1*, FwdIter2> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*hpx*::*traits*::range_iterator_t<*Rng*>>::value_type>
transform_inclusive_scan_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*> **transform_inclusive_scan**(*Rng* &&rng, *O* dest, *BinOp* &&binary_op, *UnOp* &&unary_op, *T* init)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.
- **init** – The initial value for the generalized sum.

Returns The *transform_inclusive_scan* algorithm returns a returns *transform_inclusive_scan_result*< traits::range_iterator_t<Rng>, O>. The *trans-*

form_inclusive_scan algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*hpx*::*traits*::range_iterator_t<*Rng*>>::value_type>
parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_scan_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*>>:

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.

- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.
- **init** – The initial value for the generalized sum.

Returns The *transform_inclusive_scan* algorithm returns a *hpx::future<transform_inclusive_scan_result*< traits::range_iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_scan_result*< traits::range_iterator_t<Rng>, O> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::transform_reduce

Defined in header hpx/algorithm.hpp[665].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[665] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Functions

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **T**, typename **Reduce**, typename **Convert**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> **transform_reduce**(*ExPolicy* &&policy, *Iter* first, *Sent* last, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Iter**, typename **Sent**, typename **T**, typename **Reduce**, typename **Convert**>
T **transform_reduce**(*Iter* first, *Sent* last, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> **transform_reduce**(*ExPolicy* &&policy, *Iter* first, *Sent* last, *Iter2* first2, *T* init)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**>
T **transform_reduce**(*Iter* first, *Sent* last, *Iter2* first2, *T* init)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- `Iter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- `Sent` – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- `Iter2` – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- `T` – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- `first` – Refers to the beginning of the first sorted range the algorithm will be applied to.
- `last` – Refers to the end of the second sorted range the algorithm will be applied to.
- `first2` – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- `init` – The initial value for the generalized sum.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>
T **transform_reduce**(*Iter* first, *Sent* last, *Iter2* first2, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Rng**, typename **T**, typename **Reduce**, typename **Convert**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> **transform_reduce**(*ExPolicy* &&policy, *Rng* &&rng, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:

- b1, …, bN may be any permutation of a1, …, aN and
- 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Rng**, typename **T**, typename **Reduce**, typename **Convert**>
T **transform_reduce**(*Rng* &&rng, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Rng**, typename **Iter2**, typename **T**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> **transform_reduce**(*ExPolicy* &&policy, *Rng* &&rng, *Iter2* first2, *T* init)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

template<typename **Rng**, typename **Iter2**, typename **T**>
T **transform_reduce**(*Rng* &&rng, *Iter2* first2, *T* init)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

Note: Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns The *transform_reduce* algorithm returns *T*.

template<typename **ExPolicy**, typename **Rng**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> **transform_reduce**(*ExPolicy* &&policy, *Rng* &&rng, *Iter2* first2, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

template<typename **Rng**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>
T **transform_reduce**(*Rng* &&rng, *Iter2* first2, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

Note: Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns The *transform_reduce* algorithm returns *T*.

hpx::ranges::uninitialized_copy, hpx::ranges::uninitialized_copy_n

Defined in header hpx/algorithm.hpp[666].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **InIter**, typename **Sent1**, typename **FwdIter**, typename **Sent2**>
hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> **uninitialized_copy**(*InIter* first1, *Sent1* last1, *FwdIter* first2, *Sent2* last2)

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

[666] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type **uninitialized**

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy* algorithm returns a *hpx::future<in_out_result<InIter, FwdIter>>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**>
hpx::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, typename *hpx*::*traits*::range_trait

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns The *uninitialized_copy* algorithm returns an *in_out_result<typename* hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns The *uninitialized_copy* algorithm returns a *hpx::future<in_out_result<InIter, FwdIter>>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<* typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type> otherwise. The *uninitialized_copy* algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **InIter**, typename **Size**, typename **FwdIter**, typename **Sent2**>
hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> **uninitialized_copy_n**(*InIter* first1, *Size* count, *FwdIter* first2, *Sent2* last2)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**, typename **Sent2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type **uninitialized**

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.

- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy_n* algorithm returns a *hpx::future<in_out_result<FwdIter1, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::uninitialized_default_construct, hpx::ranges::uninitialized_default_construct_n

Defined in header hpx/algorithm.hpp[667].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**>
FwdIter **uninitialized_default_construct**(*FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_default_construct* algorithm returns a returns *FwdIter*. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

[667] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **uninitialized_default_construct**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_default_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_default_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **Rng**>
hpx::*traits*::range_traits<*Rng*>::iterator_type **uninitialized_default_construct**(*Rng* &&rng)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters **rng** – Refers to the range to which will be default constructed.

Returns The *uninitialized_default_construct* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **Rng**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::type **uninitial**

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be default constructed

Returns The *uninitialized_default_construct* algorithm returns a *hpx::future<typename* hpx::traits::range_traits<Rng>::iterator_type>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename* hpx::traits::range_traits<Rng>::iterator_type otherwise. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **FwdIter**, typename **Size**>
FwdIter **uninitialized_default_construct_n**(*FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_default_construct_n* algorithm returns a returns *FwdIter*. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type **uninitialized_default_construct_n**(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_default_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns

FwdIter otherwise. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::uninitialized_fill, hpx::ranges::uninitialized_fill_n

Defined in header hpx/algorithm.hpp[668].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**, typename **T**>
FwdIter **uninitialized_fill**(*FwdIter* first, *Sent* last, *T* const &value)

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **T**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **uninitialized_fill**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *T* const &value)

[668] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **Rng**, typename **T**>
hpx::*traits*::range_traits<*Rng*>::iterator_type **uninitialized_fill**(*Rng* &&rng, *T* const &value)

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **T**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, typename *hpx*::*traits*::range_traits<Rng1>::iterator_type>::type **uninitia**

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters
- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a *hpx::future<typename* hpx::traits::range_traits<Rng>::iterator_type>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename* hpx::traits::range_traits<Rng>::iterator_type otherwise. The *uninitialized_fill* algorithm returns the iterator to one past the last element filled in the range.

template<typename **FwdIter**, typename **Size**, typename **T**>
FwdIter **uninitialized_fill_n**(*FwdIter* first, *Size* count, *T* const &value)

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns The *uninitialized_fill_n* algorithm returns a returns *FwdIter*. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**, typename **T**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **uninitialized_fill_n**(*ExPolicy* &&policy, *FwdIter* first, *Size* count, *T* const &value)

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

- **value** – The value to be assigned.

Returns The *uninitialized_fill_n* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns FwdIter otherwise. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

namespace **ranges**

Functions

template<typename **InIter**, typename **Sent1**, typename **FwdIter**, typename **Sent2**>
hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> **uninitialized_move**(*InIter* first1, *Sent1* last1, *FwdIter* first2, *Sent2* last2)

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

[669] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

Returns The *uninitialized_move* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type **uninitialized**

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_move* algorithm returns a *hpx::future<in_out_result<InIter, FwdIter>>*, if the execution policy is of type *sequenced_task_policy* or *paral-*

lel_task_policy and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **Rng1**, typename **Rng2**>
hpx::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, typename *hpx*::*traits*::range_trait

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns The *uninitialized_move* algorithm returns an *in_out_result<typename* hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*:

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns The *uninitialized_move* algorithm returns a *hpx::future<in_out_result<InIter, FwdIter>>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result*< typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type> otherwise. The *uninitialized_move* algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **InIter**, typename **Size**, typename **FwdIter**, typename **Sent2**>
hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> **uninitialized_move_n**(*InIter* first1, *Size* count, *FwdIter* first2, *Sent2* last2)

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_move_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**, typename **Sent2**>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type **uninitialized**

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_move_n* algorithm returns a *hpx::future<in_out_result<FwdIter1, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**>
FwdIter **uninitialized_value_construct**(*FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_value_construct* algorithm returns a returns *FwdIter*. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **uninitialized_value_construct**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

[670] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_value_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **Rng**>
hpx::*traits*::range_traits<*Rng*>::iterator_type **uninitialized_value_construct**(*Rng* &&rng)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters **rng** – Refers to the range to which will be value constructed.

Returns The *uninitialized_value_construct* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **Rng**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::type **uninitial**

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be value consutrcted

Returns The *uninitialized_value_construct* algorithm returns a *hpx::future<typename* hpx::traits::range_traits<Rng>::iterator_type>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename* hpx::traits::range_traits<Rng>::iterator_type otherwise. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **FwdIter**, typename **Size**>
FwdIter **uninitialized_value_construct_n**(*FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_value_construct_n* algorithm returns a returns *FwdIter*. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **uninitialized_value_construct_n**(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_value_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
subrange_t<*FwdIter*, *Sent*> **unique**(*FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

[671] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/algorithm.hpp

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*FwdIter*, *Sent*>>::type **unique**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

template<typename **Rng**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
subrange_t<*hpx*::*traits*::range_iterator_t<*Rng*>, *hpx*::*traits*::range_iterator_t<*Rng*>> **unique**(*Rng* &&rng, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique* algorithm returns *subrange_t<hpx::traits::range_iterator_t<Rng>*, hpx::traits::range_iterator_t<Rng>>. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

template<typename **ExPolicy**, typename **Rng**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*hpx*::*traits*::range_iterator_t<*Rng*>, *hpx*::*traits*::range_iterator_

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be

dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique* algorithm returns a *hpx::future* <subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t<hpx::traits::range_iterator_t<Rng>,* hpx::traits::range_iterator_t<Rng>> otherwise. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

template<typename **InIter**, typename **Sent**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
unique_copy_result<*InIter*, *O*> **unique_copy**(*InIter* first, *Sent* last, *O* dest, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter1* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique_copy* algorithm returns a returns unique_copy_result<InIter, O>. The *unique_copy* algorithm returns an in_out_result with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, unique_copy_result<*FwdIter*, *O*>>::type **unique_copy**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *O* dest, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique_copy* algorithm returns returns a hpx::future< unique_copy_result<FwdIter, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result<FwdIter, O>* otherwise. The *unique_copy* algorithm returns an in_out_result with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

template<typename **Rng**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
unique_copy_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*> **unique_copy**(*Rng* &&rng, *O* dest, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be

equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique_copy* algorithm returns *unique_copy_result*< hpx::traits::range_iterator_t<Rng>, O>. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, unique_copy_result<*hpx*::*traits*::range_iterator_t<*Rng*>, *O*>> **unique_cop**

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of

CopyConstructible. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters
- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique_copy* algorithm returns a *hpx::future<unique_copy_result<* hpx::traits::range_iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result<* hpx::traits::range_iterator_t<Rng>, O> otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx/parallel/util/range.hpp

Defined in header hpx/parallel/util/range.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **util**

Typedefs

template<typename **Iterator**, typename **Sentinel** = *Iterator*>

using **range** = *hpx*::*util*::iterator_range<*Iterator*, *Sentinel*>

Functions

template<typename **Iter**, typename **Sent**>
range<*Iter*, *Sent*> **concat**(*range*<*Iter*, *Sent*> const &it1, *range*<*Iter*, *Sent*> const &it2)

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**>
range<*Iter2*, *Iter2*> **init_move**(*range*<*Iter2*, *Sent2*> const &dest, *range*<*Iter1*, *Sent1*> const &src)

Move objects from the range src to dest.

Parameters
- **dest** – **[in]** : range where move the objects
- **src** – **[in]** : range from where move the objects

Returns range with the objects moved and the size adjusted

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**>
range<*Iter2*, *Sent2*> **uninit_move**(*range*<*Iter2*, *Sent2*> const &dest, *range*<*Iter1*, *Sent1*> const &src)

Move objects from the range src creating them in dest.

Parameters
- **dest** – **[in]** : range where move and create the objects
- **src** – **[in]** : range from where move the objects

Returns range with the objects moved and the size adjusted

template<typename **Iter**, typename **Sent**>
void **destroy_range**(*range*<*Iter*, *Sent*> r)

destroy a range of objects

Parameters **r** – **[in]** : range to destroy

template<typename **Iter**, typename **Sent**>
range<*Iter*, *Sent*> **init**(*range*<*Iter*, *Sent*> const &r, typename *std*::iterator_traits<*Iter*>::value_type &val)

initialize a range of objects with the object val moving across them

Parameters
- **r** – **[in]** : range of elements not initialized
- **val** – **[in]** : object used for the initialization

Returns range initialized

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Compare**>
bool **is_mergeable**(*range*<*Iter1*, *Sent1*> const &src1, *range*<*Iter2*, *Sent2*> const &src2, *Compare* comp)

: indicate if two ranges have a possible merge

Remark

Parameters
- **src1** – **[in]** : first range
- **src2** – **[in]** : second range
- **comp** – **[in]** : object for to compare elements

Returns true : they can be merged false : they can't be merged

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Sent3**, typename **Compare**>

range<*Iter3*, *Sent3*> **full_merge**(*range*<*Iter3*, *Sent3*> const &dest, *range*<*Iter1*, *Sent1*> const &src1, *range*<*Iter2*, *Sent2*> const &src2, *Compare* comp)

Merge two contiguous ranges src1 and src2 , and put the result in the range dest, returning the range merged.

Parameters

- **dest** – **[in]** : range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2
- **src1** – **[in]** : first range to merge
- **src2** – **[in]** : second range to merge
- **comp** – **[in]** : comparison object

Returns range with the elements merged and the size adjusted

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Value**, typename **Compare**>
range<*Value**> **uninit_full_merge**(*range*<*Value**> const &dest, *range*<*Iter1*, *Sent1*> const &src1, *range*<*Iter2*, *Sent2*> const &src2, *Compare* comp)

Merge two contiguous ranges src1 and src2 , and create and move the result in the uninitialized range dest, returning the range merged.

Parameters

- **dest** – **[in]** : range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2. Initially is un-initialize memory
- **src1** – **[in]** : first range to merge
- **src2** – **[in]** : second range to merge
- **comp** – **[in]** : comparison object

Returns range with the elements merged and the size adjusted

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Compare**>
range<*Iter2*, *Sent2*> **half_merge**(*range*<*Iter2*, *Sent2*> const &dest, *range*<*Iter1*, *Sent1*> const &src1, *range*<*Iter2*, *Sent2*> const &src2, *Compare* comp)

: Merge two buffers. The first buffer is in a separate memory

Parameters

- **dest** – **[in]** : range where finish the two buffers merged
- **src1** – **[in]** : first range to merge in a separate memory
- **src2** – **[in]** : second range to merge, in the final part of the range where deposit the final results
- **comp** – **[in]** : object for compare two elements of the type pointed by the Iter1 and Iter2

Returns : range with the two buffers merged

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Sent3**, typename **Compare**>
bool **in_place_merge_uncontiguous**(*range*<*Iter1*, *Sent1*> const &src1, *range*<*Iter2*, *Sent2*> const &src2, *range*<*Iter3*, *Sent3*> &aux, *Compare* comp)

: merge two non contiguous buffers src1 , src2, using the range aux as auxiliary memory

---

Remark

Parameters

- **src1** – **[in]** : first range to merge
- **src2** – **[in]** : second range to merge

- **aux** – **[in]** : auxiliary range used in the merge
- **comp** – **[in]** : object for to compare elements

Returns true : not changes done false : changes in the buffers

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Compare**>
range<*Iter1*, *Sent1*> **in_place_merge**(*range*<*Iter1*, *Sent1*> const &src1, *range*<*Iter1*, *Sent1*> const &src2, *range*<*Iter2*, *Sent2*> &buf, *Compare* comp)

: merge two contiguous buffers (src1, src2) using buf as auxiliary memory

---

Remark

Parameters

- **src1** – **[in]** : first range to merge
- **src2** – **[in]** : second range to merge
- **buf** – **[in]** : auxiliary memory used in the merge
- **comp** – **[in]** : object for to compare elements

Returns true : not changes done false : changes in the buffers

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Compare**>
void **merge_flow**(*range*<*Iter1*, *Sent1*> rng1, *range*<*Iter2*, *Sent2*> rbuf, *range*<*Iter1*, *Sent1*> rng2, *Compare* cmp)

namespace **assertion**

HPX_CURRENT_SOURCE_LOCATION, hpx::source_location

Defined in header hpx/source_location.hpp[672].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_CURRENT_SOURCE_LOCATION()

namespace **hpx**

Functions

std::ostream &**operator<<**(*std*::ostream &os, *source_location* const &loc)

struct **source_location**

#include <source_location.hpp> This contains the location information where *HPX_ASSERT* has been called The source_location class represents certain information about the source code, such as file names, line numbers, and function names. Previously, functions that desire to obtain this information about the call site (for logging, testing, or debugging purposes) must use macros so that predefined macros like and are expanded in the context of the caller. The source_location class provides a better alternative. source_location meets the *DefaultConstructible*, *CopyConstructible*, *CopyAssignable* and *Destructible* requirements. Lvalue of source_location meets the Swappable requirement. Additionally, the following conditions are true:

- ```
  std::is_nothrow_move_constructible_v<std::source_location>
  ```

- ```
  std::is_nothrow_move_assignable_v<std::source_location>
  ```

- ```
  std::is_nothrow_swappable_v<std::source_location>
  ```

It is intended that *source_location* has a small size and can be copied efficiently. It is unspecified whether the copy/move constructors and the copy/move assignment operators of source_location are trivial and/or constexpr.

return the column number represented by this object

namespace **assertion**

Typedefs

using **instead** = *hpx*::*source_location*

HPX_ASSERT, HPX_ASSERT_MSG

Defined in header hpx/assert.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_ASSERT(expr)
This macro asserts that *expr* evaluates to true.

If `expr` evaluates to false, The source location and `msg` is being printed along with the expression and additional. Afterwards the program is being aborted. The assertion handler can be customized by calling hpx::assertion::set_assertion_handler().

Asserts are enabled if *HPX_DEBUG* is set. This is the default for `CMAKE_BUILD_TYPE=Debug`

Parameters

- **expr** – The expression to assert on. This can either be an expression that's convertible to bool or a callable which returns bool
- **msg** – The optional message that is used to give further information if the assert fails. This should be convertible to a std::string

HPX_ASSERT_MSG(expr, msg)

See also:

HPX_ASSERT

namespace **hpx**

namespace **assertion**

Typedefs

using **assertion_handler** = void (*)(*hpx*::*source_location* const &loc, const char *expr, *std*::string const &msg)

The signature for an assertion handler.

Functions

void **set_assertion_handler**(*assertion_handler* handler)

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

Note: This function is not thread safe

async_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::async

Defined in header hpx/future.hpp[673].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[673] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

Functions

template<typename **F**, typename ...**Ts**>
decltype(auto) **async**(*F* &&f, *Ts*&&... ts)

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns an *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being hpx::launch::async | *hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the async flag is set (i.e. (policy & *hpx::launch::async*) != 0), then async executes the callable object f on a new thread of execution (with all thread-locals initialized) as if spawned by hpx::thread(std::forward<F>(f), std::forward<Ts>(ts)…), except that if the function f returns a value or throws an exception, it is stored in the shared state accessible through the hpx::future that async returns to the caller.
- If the deferred flag is set (i.e. (policy & *hpx::launch::deferred*) != 0), then async converts f and ts… the same way as by hpx::thread constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the hpx::future that async returned to the caller will cause the copy of f to be invoked (as an rvalue) with the copies of ts… (also passed as rvalues) in the current thread (which does not have to be the thread that originally called hpx::async). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same hpx::future will return the result immediately.
- If neither *hpx::launch::async* nor *hpx::launch::deferred*, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the *hpx::launch::async* and *hpx::launch::deferred* flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to hpx::async synchronizes-with (as defined in std::memory_order) the call to f, and the completion of f is sequenced-before making the shared state ready. If the async policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<Ts>::type is not constructible from its corresponding argument, the program is ill-formed.

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to f

Returns hpx::future referring to the shared state created by this call to *hpx::async*.

hpx::dataflow

Defined in header hpx/future.hpp[674].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[674] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

Functions

template<typename **F**, typename ...**Ts**>
decltype(auto) **dataflow**(*F* &&f, *Ts*&&... ts)

The function template *dataflow* runs the function f asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a `hpx::future` that will eventually hold the result of that function call. Its behavior is similar to `hpx::async` with the exception that if one of the arguments is a *future*, then `hpx::dataflow` will wait for the *future* to be ready to launch the thread. Hence, the operation is delayed until all the arguments are ready.

hpx::launch

Defined in header hpx/future.hpp[675].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

struct **launch** : public detail::policy_holder<>

#include <launch_policy.hpp> Launch policies for *hpx::async* etc.

Public Functions

inline constexpr **launch**() noexcept

Default constructor. This creates a launch policy representing all possible launch modes

inline constexpr **launch**(detail::async_policy p) noexcept

Create a launch policy representing asynchronous execution.

inline constexpr **launch**(detail::fork_policy p) noexcept

Create a launch policy representing asynchronous execution. The new thread is executed in a preferred way

inline constexpr **launch**(detail::sync_policy p) noexcept

Create a launch policy representing synchronous execution.

inline constexpr **launch**(detail::deferred_policy p) noexcept

Create a launch policy representing deferred execution.

inline constexpr **launch**(detail::apply_policy p) noexcept

Create a launch policy representing fire and forget execution.

template<typename **F**>
inline constexpr **launch**(detail::select_policy<*F*> const &p) noexcept

Create a launch policy representing fire and forget execution.

template<typename **Launch**, typename **Enable** = *std*::enable_if_t<*hpx*::*traits*::is_launch_policy_v<*Launch*>>>
inline constexpr **launch**(*Launch* l, *threads*::*thread_priority* priority, *threads*::*thread_stacksize* stacksize, *threads*::*thread_schedule_hint* hint) noexcept

[675] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

Public Static Attributes

static const detail::async_policy **async**

Predefined launch policy representing asynchronous execution.

static const detail::fork_policy **fork**

Predefined launch policy representing asynchronous execution.The new thread is executed in a preferred way

static const detail::sync_policy **sync**

Predefined launch policy representing synchronous execution.

static const detail::deferred_policy **deferred**

Predefined launch policy representing deferred execution.

static const detail::apply_policy **apply**

Predefined launch policy representing fire and forget execution.

static const detail::select_policy_generator **select**

Predefined launch policy representing delayed policy selection.

hpx::post

Defined in header hpx/future.hpp[676].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename **F**, typename ...**Ts**>
bool **post**(*F* &&f, *Ts*&&... ts)

Runs the function `f` asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an `hpx::future` that would hold the result of that function call).

`hpx::post` is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the post function enables the launch of a new thread without the overhead of creating a future.

Note: `hpx::post` is similar to `hpx::async` but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

hpx::sync

Defined in header hpx/future.hpp[677].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename **F**, typename ...**Ts**>
decltype(auto) **sync**(*F* &&f, *Ts*&&... ts)

The function template *sync* runs the function *f* synchronously and returns an *hpx::future* that will eventually hold the result of that function call.

[676] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp
[677] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

async_combinators

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/async_combinators/split_future.hpp

Defined in header hpx/async_combinators/split_future.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename ...**Ts**>
inline *tuple*<*future*<*Ts*>...> **split_future**(*future*<*tuple*<*Ts*...>> &&f)

The function *split_future* is an operator allowing to split a given future of a sequence of values (any tuple, std::pair, or std::array) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of *when_all*.

Note: The following cases are special:

```
tuple<future<void> > split_future(future<tuple<> > && f);
array<future<void>, 1> split_future(future<array<T, 0> > && f);
```

here the returned futures are directly representing the futures which were passed to the function.

Parameters **f** – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports *hpx::tuple<>*, *std::pair<T1, T2>*, and *std::array<T, N>*

Returns Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

template<typename **T**>
inline *std*::vector<*future*<*T*>> **split_future**(*future*<*std*::vector<*T*>> &&f, *std*::size_t size)

The function *split_future* is an operator allowing to split a given future of a sequence of values (any std::vector) into a std::vector of futures where each future represents one of the values from the original std::vector. In some sense this function provides the inverse operation of *when_all*.

Parameters

- **f** – [in] A future holding an arbitrary sequence of values stored in a std::vector.
- **size** – [in] The number of elements the vector will hold once the input future has become ready

Returns Returns a std::vector of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

hpx::wait_all

Defined in header hpx/future.hpp[678].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **InputIter**>
void **wait_all**(*InputIter* first, *InputIter* last)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all* should wait.
- **last** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_all* should wait.

template<typename **R**>
void **wait_all**(*std*::vector<*future*<*R*>> &&futures)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all* should wait.

template<typename **R**, *std*::size_t **N**>

[678] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

void **wait_all**(*std*::array<*future*<*R*>, *N*> &&futures)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all* should wait.

template<typename **T**>
void **wait_all**(*hpx*::*future*<*T*> const &f)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after the future has become ready. The input future is still valid after *wait_all* returns.

Note: The function wait_all will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters **f** – A *future* or *shared_future* for which *wait_all* should wait.

template<typename ...**T**>
void **wait_all**(*T*&&... futures)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_all* should wait.

template<typename **InputIter**>
void **wait_all_n**(*InputIter* begin, *std*::size_t count)

The function *wait_all_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all_n* returns after all futures have become ready. All input futures are still valid after *wait_all_n* returns.

Note: The function wait_all_n will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_n_nothrow* instead.

Parameters

- **`begin`** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_n* should wait.
- **`count`** – The number of elements in the sequence starting at *first*.

Returns The function *wait_all_n* will return an iterator referring to the first element in the input sequence after the last processed element.

hpx::wait_any

Defined in header hpx/future.hpp[679].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **InputIter**>
void **wait_any**(*InputIter* first, *InputIter* last)

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

- **`first`** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_any* should wait.
- **`last`** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_any* should wait.

[679] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

template<typename **R**>
void **wait_any**(*std*::vector<*future*<*R*>> &futures)

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters **futures** – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

template<typename **R**, *std*::size_t **N**>
void **wait_any**(*std*::array<*future*<*R*>, *N*> &futures)

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters **futures** – [in] Amn array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

template<typename ...**T**>
void **wait_any**(*T*&&... futures)

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_any* should wait.

template<typename **InputIter**>

void **wait_any_n**(*InputIter* first, *std*::size_t count)

The function *wait_any_n* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any_n* returns after at least one future has become ready. All input futures are still valid after *wait_any_n* returns.

Note: The function wait_any_n will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_n_nothrow* instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_any_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

hpx::wait_each

Defined in header hpx/future.hpp[680].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **F**, typename **Future**>
void **wait_each**(*F* &&f, *std*::vector<*Future*> &&futures)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_each* should wait.

[680] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

template<typename **F**, typename **Iterator**>
void **wait_each**(*F* &&f, *Iterator* begin, *Iterator* end)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

template<typename **F**, typename ...**T**>
void **wait_each**(*F* &&f, *T*&&... futures)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_each* should wait.

template<typename **F**, typename **Iterator**>
void **wait_each_n**(*F* &&f, *Iterator* begin, *std*::size_t count)

The function *wait_each* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

hpx::wait_some

Defined in header hpx/future.hpp[681].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **InputIter**>
void **wait_some**(*std*::size_t n, *InputIter* first, *InputIter* last)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

template<typename **R**>

[681] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

void **wait_some**(*std*::size_t n, *std*::vector<*future*<*R*>> &&futures)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_some* should wait.

template<typename **R**, *std*::size_t **N**>
void **wait_some**(*std*::size_t n, *std*::array<*future*<*R*>, *N*> &&futures)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_some* should wait.

template<typename ...**T**>
void **wait_some**(*std*::size_t n, *T*&&... futures)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The function *wait_all* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_some* should wait.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

template<typename **InputIter**>
void **wait_some_n**(*std*::size_t n, *InputIter* first, *std*::size_t count)

The function *wait_some_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The function *wait_some_n* returns after *n* futures have become ready. All input futures are still valid after *wait_some_n* returns.

Note: The function wait_some_n will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_n_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

hpx::when_all

Defined in header hpx/future.hpp[682].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

[682] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

Functions

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>
hpx::*future*<*Container*> **when_all**(*InputIter* first, *InputIter* last)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Calling this version of *when_all* where first == last, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

- `first` – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- `last` – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

Returns Returns a future holding the same list of futures as has been passed to *when_all*.

- future<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename **Range**>
hpx::*future*<*Range*> **when_all**(*Range* &&values)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Calling this version of *when_all* where the input container is empty, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters `values` – [in] A range holding an arbitrary amount of *future* or *shared_future* objects for which *when_all* should wait.

Returns Returns a future holding the same list of futures as has been passed to when_all.

- future<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type.

template<typename ...**T**>
hpx::*future*<*hpx*::*tuple*<*hpx*::*future*<*T*>...>> **when_all**(*T*&&... futures)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It

AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters **`futures`** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_all* should wait.

Returns Returns a future holding the same list of futures as has been passed to *when_all*.

- future<tuple<future<T0>, future<T1>, future<T2>…>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- future<tuple<>> if *when_all* is called with zero arguments. The returned future will be initially ready.

template<typename **`InputIter`**, typename **`Container`** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>
hpx::*future*<*Container*> **`when_all_n`**(*InputIter* begin, *std*::size_t count)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: None of the futures in the input sequence are invalidated.

Parameters

- **`begin`** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_n* should wait.
- **`count`** – [in] The number of elements in the sequence starting at *first*.

Throws `This` – function will throw errors which are encountered while setting up the requested operation only. Errors encountered while executing the operations delivering the results to be stored in the futures are reported through the futures themselves.

Returns Returns a future holding the same list of futures as has been passed to *when_all_n*.

- future<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output vector will be the same as given by the input iterator.

hpx::when_any

Defined in header hpx/future.hpp[683].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>
future<*when_any_result*<*Container*>> **when_any**(*InputIter* first, *InputIter* last)

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<*when_any_result*<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename **Range**>
future<*when_any_result*<*Range*>> **when_any**(*Range* &values)

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters **values** – [in] A range holding an arbitrary amount of *futures* or *shared_future* objects for which *when_any* should wait.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<*when_any_result*<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename ...**T**>
future<*when_any_result*<*tuple*<*future*<*T*>...>>> **when_any**(*T*&&... futures)

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given

[683] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_any* should wait.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to when_any and an index pointing to a ready future..

- future<*when_any_result*<tuple<future<T0>, future<T1>…>>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- future<*when_any_result*<tuple<>>> if *when_any* is called with zero arguments. The returned future will be initially ready.

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>
future<*when_any_result*<*Container*>> **when_any_n**(*InputIter* first, *std*::size_t count)

function *when_any_n* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Note: None of the futures in the input sequence are invalidated.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_any_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<*when_any_result*<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename **Sequence**>

struct **when_any_result**

#include <when_any.hpp> Result type for *when_any*, contains a sequence of futures and an index pointing to a ready future.

Public Members

std::size_t **index**

The index of a future which has become ready.

Sequence **futures**

The sequence of futures as passed to hpx::when_any

hpx::when_each

Defined in header hpx/future.hpp[684].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **F**, typename **Future**>
future<void> **when_each**(*F* &&f, *std*::vector<*Future*> &&futures)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_each* should wait.

Returns Returns a future representing the event of all input futures being ready.

template<typename **F**, typename **Iterator**>
future<*Iterator*> **when_each**(*F* &&f, *Iterator* begin, *Iterator* end)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

[684] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

Returns Returns a future representing the event of all input futures being ready.

template<typename **F**, typename ...**Ts**>
future<void> **when_each**(*F* &&f, *Ts*&&... futures)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_each* should wait.

Returns Returns a future representing the event of all input futures being ready.

template<typename **F**, typename **Iterator**>
future<*Iterator*> **when_each_n**(*F* &&f, *Iterator* begin, *std*::size_t count)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns Returns a future holding the iterator pointing to the first element after the last one.

hpx::when_some

Defined in header hpx/future.hpp[685].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>
future<*when_some_result*<*Container*>> **when_some**(*std*::size_t n, Iterator first, Iterator last)

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note: Calling this version of *when_some* where first == last, returns a future with an empty container that is immediately ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

Returns Returns a *when_some_result* holding the same list of futures as has been passed to when_some and indices pointing to ready futures.

- future<*when_some_result*<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename **Range**>
future<*when_some_result*<*Range*>> **when_some**(*std*::size_t n, *Range* &&futures)

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

[685] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

Note: The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A container holding an arbitrary amount of *future* or *shared_future* objects for which *when_some* should wait.

Returns Returns a *when_some_result* holding the same list of futures as has been passed to when_some and indices pointing to ready futures.

- future<*when_some_result*<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename ...**Ts**>
future<*when_some_result*<*tuple*<*future*<T>...>>> **when_some**(*std*::size_t n, *Ts*&&... futures)

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_some* should wait.

Returns Returns a *when_some_result* holding the same list of futures as has been passed to when_some and an index pointing to a ready future..

- future<*when_some_result*<tuple<future<T0>, future<T1>…>>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- future<*when_some_result*<tuple<>>> if *when_some* is called with zero arguments. The returned future will be initially ready.

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>
future<*when_some_result*<*Container*>> **when_some_n**(*std*::size_t n, Iterator first, *std*::size_t count)

The function *when_some_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The future returned by the function *when_some_n* becomes ready when at least *n* argument futures have become ready.

Note: Calling this version of *when_some_n* where count == 0, returns a future with the same elements as the arguments that is immediately ready. Possibly none of the futures in that container are ready. Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some_n* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

Returns Returns a *when_some_result* holding the same list of futures as has been passed to when_some and indices pointing to ready futures.

- future<*when_some_result*<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename **Sequence**>

struct **when_some_result**

#include <when_some.hpp> Result type for *when_some*, contains a sequence of futures and indices pointing to ready futures.

Public Members

std::vector<*std*::size_t> **indices**

List of indices of futures that have become ready.

Sequence **futures**

The sequence of futures as passed to hpx::when_some.

async_cuda

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Default Implementation without the extra intel code_location parameter. Removes the reference for trivial types to make the function matching easier (see sycl_stream.cpp test)

Public Functions

inline explicit **sycl_executor**(cl::sycl::default_selector selector)

Create a SYCL executor (based on a sycl queue)

~sycl_executor() = default

inline *future_type* **get_future**()

Get future for this command_queue (NOTE will be more efficient if an event is provided — otherwise a dummy kernel must be submitted to get an event)

inline *future_type* **get_future**(cl::sycl::event event)

Get future for that becomes ready when the given event completes.

template<typename ...**Params**>
inline void **post**(*queue_function_ptr_t*<*Params*...> &&queue_member_function, *Params*&&... args)

Invoke queue member function given queue and parameters — do not use event to return a hpx::future (One way)

template<typename ...**Params**>
inline *hpx*::*future*<void> **async_execute**(*queue_function_ptr_t*<*Params*...> &&queue_member_function, *Params*&&... args)

Invoke queue member function given queue and parameters — hpx::future tied to the sycl event / (two way)

template<typename **F**, typename ...**Ts**>
inline decltype(auto) friend **tag_invoke**(*hpx*::*parallel*::*execution*::*post_t*, *sycl_executor* &exec, *F* &&f, *Ts*&&... ts)

inline decltype(auto) friend **tag_invoke**(*hpx*::*parallel*::*execution*::*async_execute_t*, *sycl_executor* &exec, *F* &&f, *Ts*&&... ts)

inline cl::sycl::device **get_device**() const

Return the device used by the underlying SYCL queue.

inline cl::sycl::context **get_context**() const

Return the context used by the underlying SYCL queue.

Protected Attributes

cl::sycl::queue **command_queue**

cache

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/cache/local_cache.hpp

Defined in header hpx/cache/local_cache.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

template<typename **Key**, typename **Entry**, typename **UpdatePolicy** = *std*::less<*Entry*>, typename **InsertPolicy** = policies::always<*Entry*>, typename **CacheStorage** = *std*::map<*Key*, *Entry*>, typename **Statistics** = *statistics*::*no_statistics*>
class **local_cache**

#include <hpx/cache/local_cache.hpp> The local_cache implements the basic functionality needed for a local (non-distributed) cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache, must model the CacheEntry concept
- **UpdatePolicy** – A (optional) type specifying a (binary) function object used to sort the cache entries based on their 'age'. The 'oldest' entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is std::less<Entry>. The function object will be invoked using 2 entry instances of the type *Entry*. This type must model the UpdatePolicy model.
- **InsertPolicy** – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is *policies::always*, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the InsertPolicy model.
- **CacheStorage** – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container.The default is a std::map<Key, Entry>.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **update_policy_type** = *UpdatePolicy*

using **insert_policy_type** = *InsertPolicy*

using **storage_type** = *CacheStorage*

using **statistics_type** = *Statistics*

using **value_type** = typename *entry_type*::value_type

using **size_type** = typename *storage_type*::size_type

using **storage_value_type** = typename *storage_type*::value_type

Public Functions

inline explicit **local_cache**(*size_type* max_size = 0, *update_policy_type* const &up = *update_policy_type*(), *insert_policy_type* const &ip = *insert_policy_type*())

Construct an instance of a *local_cache*.

Parameters

- **max_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.
- **up** – [in] An instance of the *UpdatePolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *UpdatePolicy* template parameter.
- **ip** – [in] An instance of the *InsertPolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *InsertPolicy* template parameter.

local_cache(*local_cache* const &other) = default

local_cache(*local_cache* &&other) = default

local_cache &**operator=**(*local_cache* const &other) = default

local_cache &**operator=**(*local_cache* &&other) = default

~local_cache() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

Note: The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline bool **reserve**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters **max_size** – [in] The new maximum size this cache will be allowed to grow to.

Returns This function returns *true* if successful. It returns *false* if the new *max_size* is smaller than the current limit and the cache could not be shrunk to the new maximum size.

inline bool **holds_key**(*key_type* const &k) const

Check whether the cache currently holds an entry identified by the given key.

Note: This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters **k** – [in] The key for the entry which should be looked up in the cache.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &k, *key_type* &realkey, *entry_type* &val)

Get a specific entry identified by the given key.

Note: The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &k, *entry_type* &val)

Get a specific entry identified by the given key.

Note: The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

Parameters
- **k** – [in] The key for the entry which should be retrieved from the cache.
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &k, *value_type* &val)

Get a specific entry identified by the given key.

Note: The function will call the entry's *entry::touch* function if the value corresponding to the provided is found in the cache.

Parameters
- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **insert**(*key_type* const &k, *value_type* const &val)

Insert a new element into this cache.

Note: This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the newly constructed entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters
- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

Returns This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

inline bool **insert**(*key_type* const &k, *value_type* &&val)

template<typename **Entry_**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>, int> = 0>
inline bool **insert**(*key_type* const &k, *Entry_* &&e)

Insert a new entry into this cache.

Note: This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the provided entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters
- **k** – [in] The key for the entry which should be added to the cache.

- **e** – [in] The entry which should be added to the cache.

Returns This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

template<typename **Value**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Value*>, *value_type*>, int> = 0>
inline bool **update**(*key_type* const &k, *Value* &&val)

Update an existing element in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **F**, typename **Value**, typename = *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Value*>, *value_type*>>>
inline bool **update_if**(*key_type* const &k, *Value* &&val, *F* &&f)

Update an existing element in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **Entry_**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>, int> = 0>

inline bool **update**(*key_type* const &k, *Entry_* &&e)

Update an existing entry in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the whole cache entry, while the other overload retplaces the cached value only, leaving the cache entry properties untouched.

Parameters
- **k** – [in] The key for the entry which should be updated in the cache.
- **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **Func** = policies::always<*storage_value_type*>>
inline *size_type* **erase**(*Func* &&ep = *Func*())

Remove stored entries from the cache for which the supplied function object returns true.

Parameters **ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*. Even then the entry might not be removed from the cache as its *entry::remove* function might return false.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline *size_type* **erase**()

Remove all stored entries from the cache.

Note: All entries are considered for removal, but in the end an entry might not be removed from the cache as its *entry::remove* function might return false. This function is very useful for instance in conjunction with an entry's *entry::remove* function enforcing additional criteria like entry expiration, etc.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline void **clear**()

Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr *statistics_type* const &**get_statistics**() const noexcept

Allow to access the embedded statistics instance.

Returns This function returns a reference to the statistics instance embedded inside this cache

inline *statistics_type* &**get_statistics**() noexcept

hpx/cache/lru_cache.hpp

Defined in header hpx/cache/lru_cache.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

template<typename **Key**, typename **Entry**, typename **Statistics** = *statistics*::*no_statistics*>

class **lru_cache**

#include <hpx/cache/lru_cache.hpp> The lru_cache implements the basic functionality needed for a local (non-distributed) LRU cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **statistics_type** = *Statistics*

using **entry_pair** = *std*::pair<*key_type*, *entry_type*>

using **storage_type** = *std*::list<*entry_pair*>

using **map_type** = *std*::map<*Key*, typename *storage_type*::iterator>

using **size_type** = *std*::size_t

Public Functions

inline explicit **lru_cache**(*size_type* max_size = 0)

Construct an instance of a *lru_cache*.

Parameters **max_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.

lru_cache(*lru_cache* const &other) = default

lru_cache(*lru_cache* &&other) = default

lru_cache &**operator=**(*lru_cache* const &other) = default

lru_cache &**operator=**(*lru_cache* &&other) = default

~lru_cache() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

Note: The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline void **reserve**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters **max_size** – [in] The new maximum size this cache will be allowed to grow to.

inline bool **holds_key**(*key_type* const &key) const

Check whether the cache currently holds an entry identified by the given key.

Note: This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters **key** – [in] The key for the entry which should be looked up in the cache.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &key, *key_type* &realkey, *entry_type* &entry)

Get a specific entry identified by the given key.

Note: The function will "touch" the entry and mark it as recently used if the key was found in the cache.

Parameters
- **key** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &key, *entry_type* const &entry)

Get a specific entry identified by the given key.

Note: The function will "touch" the entry and mark it as recently used if the key was found in the cache.

Parameters
- **key** – [in] The key for the entry which should be retrieved from the cache.
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

template<typename **Entry_**, typename = *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>>>
inline bool **insert**(*key_type* const &key, *Entry_* &&entry)

Insert a new entry into this cache.

Note: This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior

Parameters
- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

template<typename **Entry_**, typename = *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>>>
inline void **update**(*key_type* const &key, *Entry_* &&entry)

Update an existing element in this cache.

Note: The function will "touch" the entry and mark it as recently used if the key was found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters
- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

template<typename **F**, typename **Entry_**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>, int> = 0>
inline bool **update_if**(*key_type* const &key, *Entry_* &&entry, *F* &&f)

Update an existing element in this cache.

Note: The function will "touch" the entry and mark it as recently used if the key was found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters
- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **Func**>
inline *size_type* **erase**(*Func* const &ep)

Remove stored entries from the cache for which the supplied function object returns true.

Parameters **ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline *size_type* **erase**()

Remove all stored entries from the cache.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline *size_type* **clear**()

Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr *statistics_type* const &**get_statistics**() const noexcept

Allow to access the embedded statistics instance.

Returns This function returns a reference to the statistics instance embedded inside this cache inline *statistics_type* &**get_statistics**() noexcept

hpx/cache/entries/entry.hpp

Defined in header hpx/cache/entries/entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

class **entry**

#include <hpx/cache/entries/entry.hpp>

Template Parameters

- **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.
- **Derived** – The (optional) type for which this type is used as a base class.

Public Types

using **value_type** = Value

Public Functions

entry() = default

Any cache entry has to be default constructible.

inline explicit **entry**(*value_type* const &val) noexcept(*std*::is_nothrow_copy_constructible_v<*value_type*>)

Construct a new instance of a cache entry holding the given value.

inline explicit **entry**(*value_type* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline *value_type* &**get**() noexcept

Get a reference to the stored data value.

Note: This function is part of the CacheEntry concept

inline constexpr *value_type* const &**get**() const noexcept

Public Static Functions

static inline constexpr bool **touch**() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

Note: It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return *true* to indicate this to the cache, forcing to reorder the cache entries.

Note: This function is part of the CacheEntry concept

Returns This function should return true if the cache needs to update it's internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy static inline constexpr bool **insert**() noexcept

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

static inline constexpr bool **remove**() noexcept

The function *remove* is called by a cache holding this instance whenever it is about to be removed from the cache.

Note: This function is part of the CacheEntry concept

Returns The return value can be used to avoid removing this instance from the cache. If the value is *true* it is ok to remove the entry, other wise it will stay in the cache.

static inline constexpr *std*::size_t **get_size**() noexcept

Return the 'size' of this entry. By default the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

Private Members

value_type **value_**

Friends

inline friend bool **operator<**(*entry* const &lhs, *entry* const &rhs) noexcept(noexcept(*std*::declval<*value_type* const&>() < *std*::declval<*value_type* const&>()))

Forwarding operator< allowing to compare entries instead of the values.

hpx/cache/entries/fifo_entry.hpp

Defined in header hpx/cache/entries/fifo_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **fifo_entry** : public *hpx*::*util*::*cache*::*entries*::*entry*<*Value*, *fifo_entry*<*Value*>>

#include <hpx/cache/entries/fifo_entry.hpp> The fifo_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently inserted entries are discarded from the cache first.

Note: The fifo_entry conforms to the CacheEntry concept.

Note: This type can be used to model a 'last in first out' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

fifo_entry() = default

Any cache entry has to be default constructible.

inline explicit **fifo_entry**(*Value* const &val) noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value* const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **fifo_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr bool **insert**()

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

inline constexpr *time_point* const &**get_creation_time**() const noexcept

Private Types

using **base_type** = *entry*<*Value*, *fifo_entry*<*Value*>>

using **time_point** = *std*::chrono::steady_clock::time_point

Private Members

time_point **insertion_time_**

Friends

inline friend bool **operator<**(*fifo_entry* const &lhs, *fifo_entry* const &rhs) noexcept(noexcept(*std*::declval<*time_point* const&>() < *std*::declval<*time_point* const&>()))

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been created earlier (FIFO).

hpx/cache/entries/lfu_entry.hpp

Defined in header hpx/cache/entries/lfu_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lfu_entry** : public *hpx*::*util*::*cache*::*entries*::*entry*<*Value*, *lfu_entry*<*Value*>>

#include <hpx/cache/entries/lfu_entry.hpp> The lfu_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least frequently used entries are discarded from the cache first.

Note: The lfu_entry conforms to the CacheEntry concept.

Note: This type can be used to model a 'most frequently used' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

lfu_entry() = default

Any cache entry has to be default constructible.

inline explicit **lfu_entry**(*Value* const &val)
noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value* const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lfu_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns This function should return true if the cache needs to update it's internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

inline constexpr unsigned long const &**get_access_count**() const noexcept

Private Types

using **base_type** = *entry*<*Value*, *lfu_entry*<*Value*>>

Private Members

unsigned long **ref_count_** = 0

Friends

inline friend bool **operator<**(*lfu_entry* const &lhs, *lfu_entry* const &rhs) noexcept

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less frequently (LFU).

hpx/cache/entries/lru_entry.hpp

Defined in header hpx/cache/entries/lru_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lru_entry** : public *hpx*::*util*::*cache*::*entries*::*entry*<*Value*, *lru_entry*<*Value*>>

#include <hpx/cache/entries/lru_entry.hpp> The lru_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently used entries are discarded from the cache first.

Note: The lru_entry conforms to the CacheEntry concept.

Note: This type can be used to model a 'most recently used' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

inline **lru_entry**()

Any cache entry has to be default constructible.

inline explicit **lru_entry**(*Value* const &val) noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value* const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lru_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**()

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns This function should return true if the cache needs to update it's internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

inline constexpr *time_point* const &**get_access_time**() const noexcept

Returns the last access time of the entry.

Private Types

using **base_type** = *entry*<*Value*, *lru_entry*<*Value*>>

using **time_point** = *std*::chrono::steady_clock::time_point

Private Members

time_point **access_time_**

Friends

inline friend bool **operator<**(*lru_entry* const &lhs, *lru_entry* const &rhs) noexcept(noexcept(*std*::declval<*time_point* const&>() < *std*::declval<*time_point* const&>()))

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less recently (LRU).

hpx/cache/entries/size_entry.hpp

Defined in header hpx/cache/entries/size_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

class **size_entry**

#include <hpx/cache/entries/size_entry.hpp> The size_entry type can be used to store values in a cache which have a size associated (such as files, etc.). Using this type as the cache's entry type makes sure that the entries with the biggest size are discarded from the cache first.

Note: The size_entry conforms to the CacheEntry concept.

Note: This type can be used to model a 'discard smallest first' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters

- **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.
- **Derived** – The (optional) type for which this type is used as a base class.

Public Functions

size_entry() = default

Any cache entry has to be default constructible.

inline explicit **size_entry**(Value const &val, *std*::size_t size = 0) noexcept(*std*::is_nothrow_constructible_v<*base_type*, Value const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **size_entry**(Value &&val, *std*::size_t size = 0) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr *std*::size_t **get_size**() const noexcept

Return the 'size' of this entry.

Private Types

using **derived_type** = typename detail::size_derived<Value, Derived>::type

using **base_type** = *entry*<Value, *derived_type*>

Private Members

std::size_t **size_** = 0

Friends

inline friend constexpr friend bool operator< (size_entry const &lhs, size_entry const &rhs) noexcept

Compare the 'age' of two entries. An entry is 'older' than another entry if it has a bigger size.

hpx/cache/statistics/local_statistics.hpp

Defined in header hpx/cache/statistics/local_statistics.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **statistics**

class **local_statistics** : public *hpx*::*util*::*cache*::*statistics*::*no_statistics*

class **no_statistics**

Subclassed by *hpx::util::cache::statistics::local_statistics*

Public Static Functions

static inline constexpr void **got_hit**() noexcept

The function *got_hit* will be called by a cache instance whenever a entry got touched.

static inline constexpr void **got_miss**() noexcept

The function *got_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

static inline constexpr void **got_insertion**() noexcept

The function *got_insertion* will be called by a cache instance whenever a new entry has been inserted.

static inline constexpr void **got_eviction**() noexcept

The function *got_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

static inline constexpr void **clear**() noexcept

Reset all statistics.

static inline constexpr *std*::int64_t **get_get_entry_count**(bool) noexcept

The function *get_get_entry_count* returns the number of invocations of the get_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_insert_entry_count**(bool) noexcept

The function *get_insert_entry_count* returns the number of invocations of the insert_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_update_entry_count**(bool) noexcept

The function *get_update_entry_count* returns the number of invocations of the update_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_erase_entry_count**(bool) noexcept

The function *get_erase_entry_count* returns the number of invocations of the erase() API function of the cache.

static inline constexpr *std*::int64_t **get_get_entry_time**(bool) noexcept

The function *get_get_entry_time* returns the overall time spent executing of the get_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_insert_entry_time**(bool) noexcept

The function *get_insert_entry_time* returns the overall time spent executing of the insert_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_update_entry_time**(bool) noexcept

The function *get_update_entry_time* returns the overall time spent executing of the update_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_erase_entry_time**(bool) noexcept

The function *get_erase_entry_time* returns the overall time spent executing of the erase() API function of the cache.

struct **update_on_exit**

#include <no_statistics.hpp> Helper class to update timings and counts on function exit.

Public Functions

inline constexpr **update_on_exit**(*no_statistics* const&, *method*) noexcept

compute_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/compute_local/vector.hpp

Defined in header hpx/compute_local/vector.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **compute**

Functions

template<typename **T**, typename **Allocator**>
void **swap**(*vector*<*T*, *Allocator*> &x, *vector*<*T*, *Allocator*> &y) noexcept

Effects: x.swap(y);.

template<typename **T**, typename **Allocator** = *std*::allocator<*T*>>

class **vector**

Public Types

using **value_type** = *T*

Member types (FIXME: add reference to std.

using **iterator** = detail::iterator<*T*, *Allocator*>

using **const_iterator** = detail::iterator<*T* const, *Allocator*>

using **reverse_iterator** = detail::reverse_iterator<*T*, *Allocator*>

using **const_reverse_iterator** = detail::const_reverse_iterator<*T*, *Allocator*>

Public Functions

inline explicit **vector**(*Allocator* const &alloc = *Allocator*())

inline **vector**(*size_type* count, *T* const &value, *Allocator* const &alloc = *Allocator*())

inline explicit **vector**(*size_type* count, *Allocator* const &alloc = *Allocator*())

template<typename **InIter**, typename **Enable** = typename *std*::enable_if<*hpx*::*traits*::is_input_iterator<*InIter*>::value>::type>
inline **vector**(*InIter* first, *InIter* last, *Allocator* const &alloc)

inline **vector**(*vector* const &other)

inline **vector**(*vector* const &other, *Allocator* const &alloc)

inline **vector**(*vector* &&other) noexcept inline **vector**(*vector* &&other, *Allocator* const &alloc)

inline **vector**(*std*::initializer_list<*T*> init, *Allocator* const &alloc)

inline **~vector**()

inline *vector* &**operator=**(*vector* const &other)

inline *vector* &**operator=**(*vector* &&other) noexcept

inline *allocator_type* **get_allocator**() const noexcept

Returns the allocator associated with the container.

inline *reference* **operator[]**(*size_type* pos)

inline *const_reference* **operator[]**(*size_type* pos) const

inline *pointer* **data**() noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data()*; *data()* + size()) is always a valid range, even if the container is empty (*data()* is not dereference-able in that case).

inline *const_pointer* **data**() const noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data()*; *data()* + size()) is always a valid range, even if the container is empty (*data()* is not dereference-able in that case).

inline *T* ***device_data**() const noexcept

Returns a raw pointer corresponding to the address of the data allocated on the device.

inline *std*::size_t **size**() const noexcept

inline *std*::size_t **capacity**() const noexcept

inline bool **empty**() const noexcept

Returns: size() == 0.

inline void **resize**(*size_type*, *T* const&)

Effects: If size <= size(), equivalent to calling pop_back() size() - size times. If size() < size, appends size - size() copies of val to the sequence.

Requires: T shall be CopyInsertable into *this.

Remarks: If an exception is thrown there are no effects.

inline *iterator* **begin**() noexcept

inline *iterator* **end**() noexcept

inline *const_iterator* **cbegin**() const noexcept

inline *const_iterator* **cend**() const noexcept

inline *const_iterator* **begin**() const noexcept

inline *const_iterator* **end**() const noexcept

inline void **swap**(*vector* &other) noexcept

Effects: Exchanges the contents and capacity() of *this with that of x.

Complexity: Constant time.

inline void **clear**() noexcept

Effects: Erases all elements in the range [begin(),end()). Destroys all elements in 'a'. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

Post: a.empty() returns true.

Complexity: Linear.

Public Static Functions

static inline void **resize**(*size_type*)

Effects: If size <= size(), equivalent to calling pop_back() size()
- size times. If size() < size, appends size - size() default-inserted elements to the sequence.
Requires: T shall be MoveInsertable and DefaultInsertable into *this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable T there are no effects.

class **block_fork_join_executor**

#include <block_fork_join_executor.hpp> An executor with fork-join (blocking) semantics.

The *block_fork_join_executor* creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a fork_join_executor hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of bulk_(a)sync_execute.

This behaviour is similar to the plain *fork_join_executor* except that the *block_fork_join_executor* creates a hierarchy of fork_join_executors, one for each target used to initialize it.

Public Functions

inline explicit **block_fork_join_executor**(*threads*::*thread_priority* priority = *threads*::*thread_priority*::*bound*, *threads*::*thread_stacksize* stacksize = *threads*::*thread_stacksize*::*small_*, fork_join_executor::loop_schedule const schedule = fork_join_executor::loop_schedule::static_, *std*::chrono::nanoseconds yield_delay = *std*::chrono::milliseconds(1))

Construct a *block_fork_join_executor*.

Note: This constructor will create one fork_join_executor for each numa domain

Parameters

- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

inline explicit **block_fork_join_executor**(*std*::vector<*compute*::*host*::target> const &targets, *threads*::*thread_priority* priority = *threads*::*thread_priority*::*bound*, *threads*::*thread_stacksize* stacksize = *threads*::*thread_stacksize*::*small_*, fork_join_executor::loop_schedule const schedule = fork_join_executor::loop_schedule::static_, *std*::chrono::nanoseconds yield_delay = *std*::chrono::milliseconds(1))

Construct a *block_fork_join_executor*.

Note: This constructor will create one fork_join_executor for each given target

Parameters

- **targets** – The list of targets to use for thread placement
- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Enums

enum class **thread_schedule_state** : *std*::int8_t

The *thread_schedule_state* enumerator encodes the current state of a *thread* instance

Values:

enumerator **unknown**

enumerator **active**

thread is currently active (running, has resources)

enumerator **pending**

thread is pending (ready to run, but no hardware resource available)

enumerator **suspended**

thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator **depleted**

thread has been depleted (deeply suspended, it is not known to the thread-manager) enumerator **terminated**

thread has been stopped an may be garbage collected

enumerator **staged**

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator **pending_do_not_schedule**

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)

enumerator **pending_boost**

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator **deleted**

thread has been stopped and was deleted

enum class **thread_priority** : *std*::int8_t

This enumeration lists all possible thread-priorities for HPX threads.

Values:

enumerator **unknown**

enumerator **default_**

Will assign the priority of the task to the default (normal) priority.

enumerator **low**

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator **normal**

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator **high_recursive**

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator **boost**

Same as *thread_priority_high* except that the thread will fall back to *thread_priority_normal* if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator **bound**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enum class **thread_restart_state** : *std*::int8_t

The *thread_restart_state* enumerator encodes the reason why a thread is being restarted

Values:

enumerator **unknown**

enumerator **signaled**

The thread has been signaled.

enumerator **timeout**

The thread has been reactivated after a timeout.

enumerator **terminate**

The thread needs to be terminated.

enumerator **abort**

The thread needs to be aborted.

enum class **thread_stacksize** : *std*::int8_t

A *thread_stacksize* references any of the possible stack-sizes for HPX threads.

Values:

enumerator **unknown**

enumerator **small_**

use small stack size (the underscore is to work around 'small' being defined to char on Windows)

enumerator **medium**

use medium sized stack size

enumerator **large**

use large stack size

enumerator **huge**

use very large stack size

enumerator **nostack**

this thread does not suspend (does not need a stack)

enumerator **current**

use size of current thread's stack

enumerator **default_**

use default stack size

enumerator **minimal**

use minimally stack size

enumerator **maximal**

use maximally stack size

enum class **thread_schedule_hint_mode** : *std*::int8_t

The type of hint given when creating new tasks.

Values:

enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically indices will wrap around when too large.

enum class **thread_placement_hint** : *std*::int8_t

The type of hint given to the scheduler related to thread placement

The type of hint given to the scheduler related running a thread as a child directly in the context of the parent thread

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator **depth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator **breadth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class **thread_sharing_hint** : *std*::int8_t

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what sharing methods to use.

enumerator **do_not_share_function**

A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator **do_not_combine_tasks**

A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class **thread_execution_hint** : *std*::int8_t

Values:

enumerator **none**

No hint is specified. Always run the thread in its own execution environment.

enumerator **run_as_child**

Attempt to run the thread in the execution context of the parent thread.

Functions

std::ostream &**operator<<**(*std*::ostream &os, *thread_schedule_state* t)

char const ***get_thread_state_name**(*thread_schedule_state* state) noexcept

Returns the name of the given state.

Get the readable string representing the name of the given thread_state constant.

Parameters **state** – this represents the thread state.

std::ostream &**operator<<**(*std*::ostream &os, *thread_priority* t) char const ***get_thread_priority_name**(*thread_priority* priority) noexcept

Return the thread priority name.

Get the readable string representing the name of the given thread_priority constant.

Parameters **priority** – this represents the thread priority.

std::ostream &**operator<<**(*std*::ostream &os, *thread_restart_state* t)

char const ***get_thread_state_ex_name**(*thread_restart_state* state) noexcept

Get the readable string representing the name of the given thread_restart_state constant.

char const ***get_thread_state_name**(thread_state state) noexcept

Get the readable string representing the name of the given thread_state constant.

std::ostream &**operator<<**(*std*::ostream &os, *thread_stacksize* t)

char const ***get_stack_size_enum_name**(*thread_stacksize* size) noexcept

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters **size** – this represents the stack size

constexpr bool **do_not_share_function**(*thread_sharing_hint* hint) noexcept

constexpr bool **do_not_combine_tasks**(*thread_sharing_hint* hint) noexcept

constexpr *thread_sharing_hint* **operator|**(*thread_sharing_hint* lhs, *thread_sharing_hint* rhs) noexcept

constexpr bool **run_as_child**(*thread_execution_hint* hint) noexcept

Variables

constexpr *thread_execution_hint* **default_runs_as_child_hint** = *thread_execution_hint*::*none*

Default value to use for runs-as-child mode (if *true*, then futures will attempt to execute associated threads directly if they have not started running).

struct **thread_schedule_hint**

#include <thread_enums.hpp> A hint given to a scheduler to guide where a task should be scheduled.

A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

Public Functions

inline constexpr **thread_schedule_hint**() noexcept

Construct a default hint with mode thread_schedule_hint_mode::none.

inline explicit constexpr **thread_schedule_hint**(*std*::int16_t thread_hint, *thread_placement_hint* placement = *thread_placement_hint*::*none*, *thread_execution_hint* runs_as_child = *default_runs_as_child_hint*, *thread_sharing_hint* sharing = *thread_sharing_hint*::*none*) noexcept

Construct a hint with mode thread_schedule_hint_mode::thread and the given hint as the local thread number.

inline constexpr **thread_schedule_hint**(*thread_schedule_hint_mode* mode, *std*::int16_t hint, *thread_placement_hint* placement = *thread_placement_hint*::*none*, *thread_execution_hint* runs_as_child = *default_runs_as_child_hint*, *thread_sharing_hint* sharing = *thread_sharing_hint*::*none*) noexcept

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is thread_schedule_hint_mode::none.

inline constexpr *thread_placement_hint* **placement_mode**() const noexcept

inline void **placement_mode**(*thread_placement_hint* bits) noexcept

inline constexpr *thread_sharing_hint* **sharing_mode**() const noexcept

inline void **sharing_mode**(*thread_sharing_hint* bits) noexcept

inline constexpr *thread_execution_hint* **runs_as_child_mode**() const noexcept

inline void **runs_as_child_mode**(*thread_execution_hint* bits) noexcept

Public Members

std::int16_t **hint** = -1

The hint associated with the mode. The interpretation of this hint depends on the given mode.

thread_schedule_hint_mode **mode** = *thread_schedule_hint_mode*::*none*

The mode of the scheduling hint.

std::uint8_t **placement_mode_bits**

The mode of the desired thread placement.

std::uint8_t **sharing_mode_bits**

The mode of the desired sharing hint.

std::uint8_t **runs_as_child_mode_bits**

The thread will run as a child directly in the context of the current thread

hpx/coroutines/thread_id_type.hpp

Defined in header hpx/coroutines/thread_id_type.hpp.

T ***any_cast**(*util*::*basic_any*<*IArch*, *OArch*, *Char*, *Copyable*> *operand) noexcept

Performs type-safe access to the contained object.

Parameters **operand** – target any object

Returns If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

template<typename **T**, typename **IArch**, typename **OArch**, typename **Char**, typename **Copyable**>
T const ***any_cast**(*util*::*basic_any*<*IArch*, *OArch*, *Char*, *Copyable*> const *operand) noexcept

Performs type-safe access to the contained object.

Parameters **operand** – target any object

Returns If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

template<typename **T**, typename **IArch**, typename **OArch**, typename **Char**, typename **Copyable**>
T **any_cast**(*util*::*basic_any*<*IArch*, *OArch*, *Char*, *Copyable*> &operand)

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>* The program is ill-formed if *std::is_constructible_v<T, U&>* is false.

Parameters **operand** – target any object

Returns static_cast<T>(*std::any_cast<U>(&operand))

template<typename **T**, typename **IArch**, typename **OArch**, typename **Char**, typename **Copyable**>
T const &**any_cast**(*util*::*basic_any*<*IArch*, *OArch*, *Char*, *Copyable*> const &operand)

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>* The program is ill-formed if *std::is_constructible_v<T, const U&>* is false.

Parameters **operand** – target any object

Returns static_cast<T>(*std::any_cast<U>(&operand))

struct **bad_any_cast** : public bad_cast

#include <any.hpp> Defines a type of object to be thrown by the value-returning forms of *hpx::any_cast* on failure.

Public Functions

inline **bad_any_cast**(*std*::type_info const &src, *std*::type_info const &dest)

Constructs a new *bad_any_cast* object with an implementation-defined null-terminated byte string which is accessible through *what()*.

inline char const ***what**() const noexcept override

Returns the explanatory string.

Note: Implementations are allowed but not required to override *what()*.

Returns Pointer to a null-terminated string with explanatory information. The string is suitable for conversion and display as a std::wstring. The pointer is guaranteed to be valid at least until the exception object from which it is obtained is destroyed, or until a non-const member function (e.g. copy assignment operator) on the exception object is called.

hpx::ignore, hpx::tuple, hpx::tuple_size, hpx::tuple_element, hpx::make_tuple, hpx::tie, hpx::forward_as_tuple, hpx::tuple_cat, hpx::get

Defined in header hpx/tuple.hpp[687].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

[687] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/tuple.hpp

Functions

template<typename ...**Ts**>
constexpr *tuple*<*util*::decay_unwrap_t<*Ts*>...> **make_tuple**(*Ts*&&... ts)

Provides compile-time indexed access to the types of the elements of the tuple.

template<typename ...**Ts**>
constexpr *tuple*<*Ts*&&...> **forward_as_tuple**(*Ts*&&... ts)

Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

Parameters `ts` – zero or more arguments to construct the tuple from

Returns *hpx::tuple* object created as if by

```
hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)
```

template<typename ...**Ts**>
constexpr *tuple*<*Ts*&...> **tie**(*Ts*&... ts)

Creates a tuple of lvalue references to its arguments or instances of *hpx::ignore*.

Parameters `ts` – zero or more lvalue arguments to construct the tuple from.

Returns *hpx::tuple* object containing lvalue references.

template<typename ...**Tuples**>
constexpr auto **tuple_cat**(*Tuples*&&... tuples)

Constructs a tuple that is a concatenation of all tuples in `tuples`. The behavior is undefined if any type in `std::decay_t<Tuples>...` is not a specialization of `hpx::tuple`. However, an implementation may choose to support types (such as `std::array` and `std::pair`) that follow the tuple-like protocol.

Parameters `tuples` – - zero or more tuples to concatenate

Returns *hpx::tuple* object composed of all elements of all argument tuples constructed from `hpx::get<Is>`(HPX_FORWARD(UTuple,t) for each individual element.

template<*std*::size_t **I**>
util::at_index<*I*, Ts...>::type &**get**() noexcept

Extracts the Ith element from the tuple. I must be an integer value in [0, sizeof…(Ts)).

template<*std*::size_t **I**>
util::at_index<*I*, Ts...>::type const &**get**() const noexcept

Extracts the Ith element from the tuple. I must be an integer value in [0, sizeof…(Ts)).

Variables

constexpr *hpx*::detail::ignore_type **ignore** = {}

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with *hpx::tie* when unpacking a *hpx::tuple*, as a placeholder for the arguments that are not used. While the behavior of *hpx::ignore* outside of *hpx::tie* is not formally specified, some code guides recommend using *hpx::ignore* to avoid warnings from unused return values of [[nodiscard]] functions.

template<typename ...**Ts**>

class **tuple**

#include <tuple.hpp> Class template *hpx::tuple* is a fixed-size collection of heterogeneous values. It is a generalization of *hpx::pair*. If *std::is_trivially_destructible<Ti>::value* is true for every *Ti* in *Ts*, the destructor of tuple is trivial.

Param Ts... the types of the elements that the tuple stores.

template<*std*::size_t **I**, typename **T**, typename **Enable** = void>

struct **tuple_element**

#include <tuple.hpp> Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

template<typename **T**>

struct **tuple_size**

#include <tuple.hpp> Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

hpx::any, hpx::make_any

Defined in header hpx/any.hpp[688].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **error** : *std*::int16_t

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

Values:

enumerator **success**

The operation was successful.

enumerator **no_success**

The operation did failed, but not in an unexpected manner.

enumerator **not_implemented**

The operation is not implemented.

enumerator **out_of_memory**

The operation caused an out of memory condition.

enumerator **bad_action_code**

enumerator **bad_component_type**

The specified component type is not known or otherwise invalid.

enumerator **network_error**

A generic network error occurred.

enumerator **version_too_new**

The version of the network representation for this object is too new.

enumerator **version_too_old**

The version of the network representation for this object is too old.

enumerator **version_unknown**

The version of the network representation for this object is unknown.

enumerator **unknown_component_address**

enumerator **duplicate_component_address**

The given global id has already been registered.

enumerator **invalid_status**

The operation was executed in an invalid status.

enumerator **bad_parameter**

One of the supplied parameters is invalid.

enumerator **internal_server_error**

enumerator **service_unavailable**

enumerator **bad_request**

enumerator **repeated_request**

enumerator **lock_error**

enumerator **duplicate_console**

There is more than one console locality.

enumerator **no_registered_console**

There is no registered console locality available.

enumerator **startup_timed_out**

enumerator **uninitialized_value**

enumerator **bad_response_type**

enumerator **deadlock**

enumerator **assertion_failure**

enumerator **null_thread_id**

Attempt to invoke a API function from a non-HPX thread.

enumerator **invalid_data**

enumerator **yield_aborted**

The yield operation was aborted.

enumerator **dynamic_link_failure**

enumerator **commandline_option_error**

One of the options given on the command line is erroneous.

enumerator **serialization_error**

There was an error during serialization of this object.

enumerator **unhandled_exception**

An unhandled exception has been caught.

enumerator **kernel_error**

The OS kernel reported an error.

enumerator **broken_task**

The task associated with this future object is not available anymore.

enumerator **task_moved**

The task associated with this future object has been moved.

enumerator **task_already_started**

The task associated with this future object has already been started.

enumerator **future_already_retrieved**

The future object has already been retrieved.

enumerator **promise_already_satisfied**

The value for this future object has already been set.

enumerator **future_does_not_support_cancellation**

The future object does not support cancellation.

enumerator **future_can_not_be_cancelled**

The future can't be canceled at this time.

enumerator **no_state**

The future object has no valid shared state.

enumerator **broken_promise**

The promise has been deleted.

enumerator **thread_resource_error**

enumerator **future_cancelled**

enumerator **thread_cancelled**

enumerator **thread_not_interruptable**

enumerator **duplicate_component_id**

The component type has already been registered.

enumerator **unknown_error**

An unknown error occurred.

enumerator **bad_plugin_type**

The specified plugin type is not known or otherwise invalid.

enumerator **filesystem_error**

The specified file does not exist or other filesystem related error.

enumerator **bad_function_call**

equivalent of std::bad_function_call

enumerator **task_canceled_exception**

parallel::task_canceled_exception

enumerator **task_block_not_active**

task_region is not active

enumerator **out_of_range**

Equivalent to std::out_of_range.

enumerator **length_error**

Equivalent to std::length_error.

enumerator **migration_needs_retry**

migration failed because of global race, retry

hpx::error_code

Defined in header hpx/system_error.hpp[689].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Unnamed Group

inline *error_code* **make_error_code**(*error* e, *throwmode* mode = *throwmode*::*plain*)

Returns a new *error_code* constructed from the given parameters.

inline *error_code* **make_error_code**(*error* e, char const *func, char const *file, long line, *throwmode* mode = *throwmode*::*plain*)

inline *error_code* **make_error_code**(*error* e, char const *msg, *throwmode* mode = *throwmode*::*plain*)

Returns error_code(e, msg, mode).

inline *error_code* **make_error_code**(*error* e, char const *msg, char const *func, char const *file, long line, *throwmode* mode = *throwmode*::*plain*)

inline *error_code* **make_error_code**(*error* e, *std*::string const &msg, *throwmode* mode = *throwmode*::*plain*)

Returns error_code(e, msg, mode).

inline *error_code* **make_error_code**(*error* e, *std*::string const &msg, char const *func, char const *file, long line, *throwmode* mode = *throwmode*::*plain*)

inline *error_code* **make_error_code**(*std*::exception_ptr const &e)

Functions

std::error_category const &**get_hpx_category**() noexcept

Returns generic HPX error category used for new errors.

std::error_category const &**get_hpx_rethrow_category**() noexcept

Returns generic HPX error category used for errors re-thrown after the exception has been de-serialized.

inline *error_code* **make_success_code**(*throwmode* mode = *throwmode*::*plain*)

Returns *error_code*(hpx::error::success, "success", mode).

[689] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/system_error.hpp

class **error_code** : public *error_code*

#include <error_code.hpp> A *hpx::error_code* represents an arbitrary error condition.

The class *hpx::error_code* describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

Note: Class *hpx::error_code* is an adjunct to error reporting by exception

---

Public Functions

inline explicit **error_code**(*throwmode* mode = *throwmode*::*plain*)

Construct an object of type *error_code*.

Parameters mode – The parameter `mode` specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws `nothing` –

explicit **error_code**(*error* e, *throwmode* mode = *throwmode*::*plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws `nothing` –

error_code(*error* e, char const *func, char const *file, long line, *throwmode* mode = *throwmode*::*plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter `mode` specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws `nothing` –

error_code(*error* e, char const *msg, *throwmode* mode = *throwmode*::*plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

error_code(*error* e, char const *msg, char const *func, char const *file, long line, *throwmode* mode = *throwmode*::*plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter `mode` specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

error_code(*error* e, *std*::string const &msg, *throwmode* mode = *throwmode*::*plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

error_code(*error* e, *std*::string const &msg, char const *func, char const *file, long line, *throwmode* mode = *throwmode*::*plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter `mode` specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

std::string **get_message**() const

Return a reference to the error message stored in the *hpx::error_code*.

Throws `nothing` –

inline void **clear**()

Clear this *error_code* object. The postconditions of invoking this method are.

- value() == hpx::error::success and category() == *hpx::get_hpx_category()*

error_code(*error_code* const &rhs)

Copy constructor for *error_code*

Note: This function maintains the error category of the left hand side if the right hand side is a success code.

error_code &**operator=**(*error_code* const &rhs)

Assignment operator for *error_code*

Note: This function maintains the error category of the left hand side if the right hand side is a success code.

Private Functions

hpx::exception

Defined in header hpx/exception.hpp[690].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **custom_exception_info_handler_type** = *std*::function<*hpx*::exception_info(*std*::string const&, *std*::string const&, long, *std*::string const&)>

using **pre_exception_handler_type** = *std*::function<void()>

Functions

void **set_custom_exception_info_handler**(*custom_exception_info_handler_type* f)

void **set_pre_exception_handler**(*pre_exception_handler_type* f)

[690] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/exception.hpp

std::string **get_error_what**(exception_info const &xi)

Return the error message of the thrown exception.

The function *hpx::get_error_what* can be used to extract the diagnostic information element representing the error message as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(), *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, hpx::get_error() *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, hpx::error_code, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The error message stored in the exception If the exception instance does not hold this information, the function will return an empty string.

error **get_error**(*hpx*::*exception* const &e)

Return the error code value of the exception thrown.

The function *hpx::get_error* can be used to extract the diagnostic information element representing the error value code as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, hpx::get_error_function_name(), hpx::get_error_file_name(), hpx::get_error_line_number(), *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, hpx::get_error_what(), *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters `e` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: hpx::exception, hpx::error_code, or *std::exception_ptr*.

Throws `nothing` –

Returns The error value code of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return *hpx::naming::invalid_locality_id*.

error **get_error**(*hpx*::*error_code* const &e)

std::string **get_error_function_name**(*hpx*::exception_info const &xi)

Return the function name from which the exception was thrown.

The function *hpx::get_error_function_name* can be used to extract the diagnostic information element representing the name of the function as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()* hpx::get_error_file_name(), hpx::get_error_line_number(), *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, hpx::get_error(), *hpx::get_error_backtrace()*, *hpx::get_error_env()*, hpx::get_error_what(), *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters **xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, hpx::error_code, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The name of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **get_error_file_name**(*hpx*::exception_info const &xi)

Return the (source code) file name of the function from which the exception was thrown.

The function *hpx::get_error_file_name* can be used to extract the diagnostic information element representing the name of the source file as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, hpx::get_error_function_name(), hpx::get_error_line_number(), *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, hpx::get_error(), *hpx::get_error_backtrace()*, *hpx::get_error_env()*, hpx::get_error_what(), *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters **xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, hpx::error_code, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The name of the source file of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

long **get_error_line_number**(*hpx*::exception_info const &xi)

Return the line number in the (source code) file of the function from which the exception was thrown.

The function *hpx::get_error_line_number* can be used to extract the diagnostic information element representing the line number as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, hpx::get_error_function_name(), hpx::get_error_file_name() *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, hpx::get_error(), *hpx::get_error_backtrace()*, *hpx::get_error_env()*, hpx::get_error_what(), *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters **xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, hpx::error_code, *std::exception*, or *std::exception_ptr*.

Throws `nothing` –

Returns The line number of the place where the exception was thrown. If the exception instance does not hold this information, the function will return -1.

class **exception** : public system_error

#include <exception.hpp> A *hpx::exception* is the main exception type used by HPX to report errors.

The *hpx::exception* type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by *hpx::exception_list*

Public Functions

explicit **exception**(*error* e = *hpx*::*error*::*success*)

Construct a *hpx::exception* from a *hpx::error*.

Parameters **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.

explicit **exception**(*std*::system_error const &e)

Construct a *hpx::exception* from a boost::system_error.

explicit **exception**(*std*::error_code const &e)

Construct a *hpx::exception* from a boost::system::error_code (this is new for Boost V1.69). This constructor is required to compensate for the changes introduced as a resolution to LWG3162 (https://cplusplus.github.io/LWG/issue3162).

exception(*error* e, char const *msg, *throwmode* mode = *throwmode*::*plain*)

Construct a *hpx::exception* from a *hpx::error* and an error message.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

exception(*error* e, *std*::string const &msg, *throwmode* mode = *throwmode*::*plain*)

Construct a *hpx::exception* from a *hpx::error* and an error message.

Parameters

- **e** – The parameter `e` holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

~exception() override

Destruct a *hpx::exception*

Throws `nothing` –

error **get_error**() const noexcept

The function get_error() returns the hpx::error code stored in the referenced instance of a *hpx::exception*. It returns the hpx::error code this exception instance was constructed from.

Throws nothing –

error_code **get_error_code**(*throwmode* mode = *throwmode*::*plain*) const noexcept

The function get_error_code() returns a *hpx::error_code* which represents the same error condition as this *hpx::exception* instance.

Parameters **mode** – The parameter mode specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if mode is *throwmode::plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

struct **thread_interrupted** : public *exception*

#include <exception.hpp> A *hpx::thread_interrupted* is the exception type used by HPX to interrupt a running HPX thread.

The hpx::thread_interrupted type is the exception type used by HPX to interrupt a running thread.

A running thread can be interrupted by invoking the interrupt() member function of the corresponding hpx::thread object. When the interrupted thread next executes one of the specified interruption points (or if it is currently blocked whilst executing one) with interruption enabled, then a *hpx::thread_interrupted* exception will be thrown in the interrupted thread. If not caught, this will cause the execution of the interrupted thread to terminate. As with any other exception, the stack will be unwound, and destructors for objects of automatic storage duration will be executed.

If a thread wishes to avoid being interrupted, it can create an instance of *hpx::this_thread::disable_interruption*. Objects of this class disable interruption for the thread that created them on construction, and restore the interruption state to whatever it was before on destruction.

```
void f()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::disable_interruption di2;
            // interruption still disabled
        } // di2 destroyed, interruption state restored
        // interruption still disabled
    } // di destroyed, interruption state restored
    // interruption now enabled
}
```

The effects of an instance of *hpx::this_thread::disable_interruption* can be temporarily reversed by constructing an instance of *hpx::this_thread::restore_interruption*, passing in the *hpx::this_thread::disable_interruption* object in question. This will restore the interruption state to what it was when the *hpx::this_thread::disable_interruption* object was constructed, and then disable interruption again when the *hpx::this_thread::restore_interruption* object is destroyed.

```
void g()
{
```

(continues on next page)

(continued from previous page)

```
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::restore_interruption ri(di);
            // interruption now enabled
        } // ri destroyed, interruption disable again
    } // di destroyed, interruption state restored
    // interruption now enabled
}
```

At any point, the interruption state for the current thread can be queried by calling *hpx::this_thread::interruption_enabled()*.

hpx/errors/exception_fwd.hpp

Defined in header hpx/errors/exception_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_THROWMODE_UNSCOPED_ENUM_DEPRECATION_MSG

namespace **hpx**

Enums

enum class **throwmode** : *std*::uint8_t

Encode error category for new *error_code*.

Values:

enumerator **plain**

enumerator **rethrow**

enumerator **lightweight**

Functions

constexpr bool **operator&**(*throwmode* lhs, *throwmode* rhs) noexcept

Variables

constexpr *throwmode* **plain** = *throwmode*::*plain*

constexpr *throwmode* **rethrow** = *throwmode*::*rethrow*

constexpr *throwmode* **lightweight** = *throwmode*::*lightweight*

constexpr *throwmode* **lightweight_rethrow** = *throwmode*::lightweight_rethrow

error_code **throws**

Predefined *error_code* object used as "throw on error" tag.

The predefined *hpx::error_code* object *hpx::throws* is supplied for use as a "throw on error" tag.

Functions that specify an argument in the form '*error_code*& ec=throws' (with appropriate namespace qualifiers), have the following error handling semantics:

If &ec != &throws and an error occurred: ec.value() returns the implementation specific error number for the particular error that occurred and ec.category() returns the error_category for ec.value().

If &ec != &throws and an error did not occur, ec.clear().

If an error occurs and &ec == &throws, the function throws an exception of type hpx::exception or of a type derived from it. The exception's *get_errorcode()* member function returns a reference to an hpx::error_code object with the behavior as specified above.

hpx/errors/exception_list.hpp

Defined in header hpx/errors/exception_list.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **exception_list** : public *hpx*::*exception*

#include <exception_list.hpp> The class *exception_list* is a container of exception_ptr objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm

The type exception_list::const_iterator fulfills the requirements of a forward iterator.

Public Types

using **iterator** = exception_list_type::const_iterator

bidirectional iterator

Public Functions

inline *std*::size_t **size**() const noexcept

The number of exception_ptr objects contained within the *exception_list*.

Note: Complexity: Constant time.

inline exception_list_type::const_iterator **begin**() const noexcept

An iterator referring to the first exception_ptr object contained within the *exception_list*.

inline exception_list_type::const_iterator **end**() const noexcept

An iterator which is the past-the-end value for the *exception_list*.

HPX_THROW_EXCEPTION, HPX_THROWS_IF

Defined in header hpx/exception.hpp[691].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_THROW_EXCEPTION(errcode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the hpx::error code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
       "simulated error");
}
```

[691] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/exception.hpp

Example:

HPX_THROWS_IF(ec, errcode, f, ...)

Either throw a *hpx::exception* or initialize hpx::error_code from the given parameters.

The macro *HPX_THROWS_IF* can be used to either throw a hpx::exception or to initialize a hpx::error_code from the given parameters. If &ec == &hpx::throws, the semantics of this macro are equivalent to *HPX_THROW_EXCEPTION*. If &ec != &hpx::throws, the hpx::error_code instance `ec` is initialized instead.

The parameter `errcode` holds the hpx::error code from which the new exception should be initialized. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

namespace **hpx**

execution

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/execution/executors/adaptive_static_chunk_size.hpp

Defined in header hpx/execution/executors/adaptive_static_chunk_size.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

Typedefs

typedef *hpx*::*execution*::*experimental*::*adaptive_static_chunk_size* **instead**

namespace **experimental**

struct **adaptive_static_chunk_size**

#include <adaptive_static_chunk_size.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

adaptive_static_chunk_size() = default

Construct a adaptive_static_chunk_size executor parameters object

Note: By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr **adaptive_static_chunk_size**(*std*::size_t chunk_size) noexcept

Construct a adaptive_static_chunk_size executor parameters object

Parameters **chunk_size** – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

hpx::execution::experimental::auto_chunk_size

Defined in header hpx/execution.hpp[692].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **auto_chunk_size**

#include <auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

Public Functions

inline explicit constexpr **auto_chunk_size**(*std*::uint64_t num_iters_for_timing = 0) noexcept

Construct an auto_chunk_size executor parameters object

Note: Default constructed auto_chunk_size executor parameter types will use 80 microseconds as the minimal time for which any of the scheduled chunks should run.

inline explicit **auto_chunk_size**(*hpx*::*chrono*::steady_duration const &rel_time, *std*::uint64_t num_iters_for_timing = 0) noexcept

Construct an auto_chunk_size executor parameters object

Parameters

[692] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/execution.hpp

- **rel_time** – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- **num_iters_for_timing** – [in] The number of iterations to use for the timing operation

hpx/execution/executors/default_parameters.hpp

Defined in header hpx/execution/executors/default_parameters.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **default_parameters**

#include <default_parameters.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

default_parameters() = default

Construct a default_parameters executor parameters object

Note: By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

hpx::execution::experimental::dynamic_chunk_size

Defined in header hpx/execution.hpp[693].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

[693] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/execution.hpp

namespace **experimental**

struct **dynamic_chunk_size**

#include <dynamic_chunk_size.hpp> Loop iterations are divided into pieces of size *chunk_size* and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another If *chunk_size* is not specified, the default chunk size is 1.

Note: This executor parameters type is equivalent to OpenMP's DYNAMIC scheduling directive.

Public Functions

dynamic_chunk_size() = default

Construct an dynamic_chunk_size executor parameters object

Note: Default constructed dynamic_chunk_size executor parameter types will use a chunk size of '1'.

inline explicit constexpr **dynamic_chunk_size**(*std*::size_t chunk_size) noexcept

Construct a dynamic_chunk_size executor parameters object

Parameters chunk_size – [in] The optional chunk size to use as the number of loop iterations to schedule together. The default chunk size is 1.

hpx/execution/executors/execution.hpp

Defined in header hpx/execution/executors/execution.hpp.

struct **measure_iteration_t** : public *hpx*::*functional*::detail::tag_priority<*measure_iteration_t*>

#include <execution_parameters_fwd.hpp> Return the measured execution time for one iteration based on running the given function.

Note: The parameter *f* is expected to be a nullary function returning a `std::size_t` representing the number of iteration the function has already executed (i.e. which don't have to be scheduled anymore).

Param params [in] The executor parameters object to use for determining the chunk size for the given number of tasks *num_tasks*.
Param exec [in] The executor object which will be used for scheduling of the loop iterations.
Param f [in] The function which will be optionally scheduled using the given executor.
Param num_tasks [in] The number of tasks the chunk size should be determined for
Return The execution time for one of the tasks.

Private Functions

template<typename **Parameters**, typename **Executor**, typename **F**>
inline decltype(auto) friend **tag_fallback_invoke**(*measure_iteration_t*, *Parameters* &&params, *Executor* &&exec, *F* &&f, *std*::size_t num_tasks)

struct **null_parameters_t**

struct **processing_units_count_t** : public *hpx*::*functional*::detail::tag_priority<*processing_units_count_t*>

#include <execution_parameters_fwd.hpp> Retrieve the number of (kernel-)threads used by the associated executor.

Note: This calls params.processing_units_count(Executor&&) if it exists; otherwise it forwards the request to the executor parameters object.

Param params [in] The executor parameters object to use as a fallback if the executor does not expose
Param iteration_duration [in] The time one of the tasks require to be executed.
Param num_tasks [in] The number of tasks the number of cores should be determined for
Return The number of cores to use

Private Functions

template<typename **Parameters**, typename **Executor**>
inline decltype(auto) friend **tag_fallback_invoke**(*processing_units_count_t*, *Parameters* &&params, *Executor* &&exec, *hpx*::*chrono*::steady_duration const &iteration_duration, *std*::size_t num_tasks)

template<typename **Parameters**, typename **Executor**>
inline decltype(auto) friend **tag_fallback_invoke**(*processing_units_count_t* tag, *Parameters* &&params, *Executor* &&exec, *std*::size_t num_tasks = 0)

template<typename **Executor**>
inline decltype(auto) friend **tag_fallback_invoke**(*processing_units_count_t*, *Executor* &&exec, *hpx*::*chrono*::steady_duration const &iteration_duration, *std*::size_t num_tasks)

template<typename **Executor**>
inline decltype(auto) friend **tag_fallback_invoke**(*processing_units_count_t* tag, *Executor* &&exec, *std*::size_t num_tasks = 0)

struct **reset_thread_distribution_t** : public *hpx*::*functional*::detail::tag_priority<*reset_thread_distribution_t*>

#include <execution_parameters_fwd.hpp> Reset the internal round robin thread distribution scheme for the given executor.

Note: This calls params.reset_thread_distribution(exec) if it exists; otherwise it does nothing.

Param params [in] The executor parameters object to use for resetting the thread distribution scheme.

Param exec [in] The executor object to use.

Private Functions

template<typename **Parameters**, typename **Executor**>
inline decltype(auto) friend **tag_fallback_invoke**(*reset_thread_distribution_t*, *Parameters* &&params, *Executor* &&exec)

struct **with_processing_units_count_t** : public *hpx*::*functional*::detail::tag_priority<*with_processing_units_count_t*>

#include <execution_parameters_fwd.hpp> Generate a policy that supports setting the number of cores for execution.

hpx::execution::experimental::guided_chunk_size

Defined in header hpx/execution.hpp[694].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **guided_chunk_size**

#include <guided_chunk_size.hpp> Iterations are dynamically assigned to threads in blocks as threads request those until no blocks remain to be assigned. Similar to dynamic_chunk_size except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to *number_of_iterations* / *number_of_cores*. Subsequent blocks are proportional to *number_of_iterations_remaining* / *number_of_cores*. The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

Note: This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

Public Functions

guided_chunk_size() = default

Construct an dynamic_chunk_size executor parameters object

Note: Default constructed dynamic_chunk_size executor parameter types will use a chunk size of '1'.

inline explicit constexpr **guided_chunk_size**(*std*::size_t min_chunk_size) noexcept

Construct a guided_chunk_size executor parameters object

Parameters **min_chunk_size** – [in] The optional minimal chunk size to use as the minimal number of loop iterations to schedule together. The default minimal chunk size is 1.

hpx::execution::experimental::num_cores

Defined in header hpx/execution.hpp[695].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[694] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/execution.hpp

[695] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/execution.hpp

namespace **execution**

namespace **experimental**

struct **num_cores**

#include <num_cores.hpp> Control number of cores in executors which need a functionality for setting the number of cores to be used by an algorithm directly

Public Functions

inline explicit constexpr **num_cores**(*std*::size_t cores = 1) noexcept

Construct a num_cores executor parameters object

Note: make sure the minimal number of cores is and the maximum number of cores is what's available to HPX

hpx::execution::experimental::persistent_auto_chunk_size

Defined in header hpx/execution.hpp[696].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **persistent_auto_chunk_size**

#include <persistent_auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

[696] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/execution.hpp

Public Functions

inline explicit constexpr **persistent_auto_chunk_size**(*std*::uint64_t num_iters_for_timing = 0) noexcept

Construct an persistent_auto_chunk_size executor parameters object

Note: Default constructed persistent_auto_chunk_size executor parameter types will use 0 microseconds as the execution time for each chunk and 80 microseconds as the minimal time for which any of the scheduled chunks should run.

inline explicit **persistent_auto_chunk_size**(*hpx*::*chrono*::steady_duration const &time_cs, *std*::uint64_t num_iters_for_timing = 0) noexcept

Construct an persistent_auto_chunk_size executor parameters object

Parameters

- **time_cs** – The execution time for each chunk.
- **num_iters_for_timing** – [in] The number of iterations to use for measuring the execution time of one iteration

inline **persistent_auto_chunk_size**(*hpx*::*chrono*::steady_duration const &time_cs, *hpx*::*chrono*::steady_duration const &rel_time, *std*::uint64_t num_iters_for_timing = 0) noexcept

Construct an persistent_auto_chunk_size executor parameters object

Parameters

- **rel_time** – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- **time_cs** – The execution time for each chunk.
- **num_iters_for_timing** – [in] The number of iterations to use for measuring the execution time of one iteration

hpx/execution/executors/polymorphic_executor.hpp

template<typename **ExPolicy**, typename **Executor**, typename **Parameters**>

struct **rebind_executor**

#include <rebind_executor.hpp> Rebind the type of executor used by an execution policy. The execution category of Executor shall not be weaker than that of ExecutionPolicy.

Public Types

using **type** = typename policy_type::template rebind<executor_type, parameters_type>::type

The type of the rebound execution policy.

hpx::execution::experimental::static_chunk_size

Defined in header hpx/execution.hpp[697].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

[697] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/execution.hpp

struct **static_chunk_size**

#include <static_chunk_size.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

static_chunk_size() = default

Construct a static_chunk_size executor parameters object

Note: By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr **static_chunk_size**(*std*::size_t chunk_size) noexcept

Construct a static_chunk_size executor parameters object

Parameters **chunk_size** – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

hpx/execution/traits/is_execution_policy.hpp

hpx::*parallel*::*execution*::*sync_invoke_t* **sync_invoke**

struct **async_execute_t** : public *hpx*::*functional*::detail::tag_fallback<*async_execute_t*>

#include <execution.hpp> Customization point for asynchronous execution agent creation.

This asynchronously creates a single function invocation f() using the associated executor.

Note: Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

Note: This is valid for one way executors (calls make_ready_future(exec.sync_execute(f, ts…) if it exists) and for two way executors (calls exec.async_execute(f, ts…) if it exists).

Param exec [in] The executor object to use for scheduling of the function *f*.
Param f [in] The function which will be scheduled using the given executor.
Param ts [in] Additional arguments to use to invoke *f*.
Return f(ts…)'s result through a future

Private Functions

template<typename **Executor**, typename **F**, typename ...**Ts**>
inline decltype(auto) friend **tag_fallback_invoke**(*async_execute_t*, *Executor* &&exec, *F* &&f, *Ts*&&... ts)

struct **async_invoke_t** : public *hpx*::*functional*::detail::tag_fallback<*async_invoke_t*>

#include <execution.hpp> Asynchronously invoke the given set of nullary functions, each on its own execution agent

This creates a group of function invocations whose ordering is given by the execution_category associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This calls exec.async_invoke(fs…) if it exists; otherwise it executes async_execute(fs) for each fs.

Param exec [in] The executor object to use for scheduling of the functions *fs*.
Param fs [in] The functions which will be scheduled using the given executor.
Return The return type of *executor_type::async_invoke* if defined by *executor_type*. Otherwise a future<void> representing finishing the execution of all functions *fs*.

Private Functions

template<typename **Executor**, typename **F**, typename ...**Fs**>
inline decltype(auto) friend **tag_fallback_invoke**(*async_invoke_t*, *Executor* &&exec, *F* &&f, *Fs*&&... fs)

struct **bulk_async_execute_t** : public *hpx*::*functional*::detail::tag_fallback<*bulk_async_execute_t*>

#include <execution.hpp> Bulk form of asynchronous execution agent creation.

This asynchronously creates a group of function invocations f(i) whose ordering is given by the execution_category associated with the executor.

Here *i* takes on all values in the index space implied by shape. All exceptions thrown by invocations of f(i) are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the bulk_async_execute customization points specified in P0443.The bulk_async_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls exec.bulk_async_execute(f, shape, ts…) if it exists; otherwise it executes async_execute(f, shape, ts…) as often as needed.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param f [in] The function which will be scheduled using the given executor.

Param shape [in] The shape objects which defines the iteration boundaries for the arguments to be passed to *f*.

Param ts [in] Additional arguments to use to invoke *f*.

Return The return type of *executor_type::bulk_async_execute* if defined by *executor_type*. Otherwise a vector of futures holding the returned values of each invocation of *f*.

Private Functions

template<typename **Executor**, typename **F**, typename **Shape**, typename ...**Ts**>

struct **sync_execute_t** : public *hpx*::*functional*::detail::tag_fallback<*sync_execute_t*>

#include <execution.hpp> Customization point for synchronous execution agent creation.

This synchronously creates a single function invocation f() using the associated executor. The execution of the supplied function synchronizes with the caller

---

Note: It will call tag_invoke(sync_execute_t, exec, f, ts…) if it exists. For two-way executors it will invoke asynch_execute_t and wait for the task's completion before returning.

Param exec [in] The executor object to use for scheduling of the function *f*.
Param f [in] The function which will be scheduled using the given executor.
Param ts [in] Additional arguments to use to invoke *f*.
Return f(ts…)'s result

Private Functions

template<typename **Executor**, typename **F**, typename ...**Ts**>
inline decltype(auto) friend **tag_fallback_invoke**(*sync_execute_t*, *Executor* &&exec, *F* &&f, *Ts*&&... ts)

struct **sync_invoke_t** : public *hpx*::*functional*::detail::tag_fallback<*sync_invoke_t*>

#include <execution.hpp> Synchronously invoke the given set of nullary functions, each on its own execution agent

This creates a group of function invocations whose ordering is given by the execution_category associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This calls exec.sync_invoke(fs…) if it exists; otherwise it executes sync_execute(fs) for each fs.

Param exec [in] The executor object to use for scheduling of the functions *fs*.
Param fs [in] The functions which will be scheduled using the given executor.
Return The return type of *executor_type::async_invoke* if defined by *executor_type*.

Private Functions

template<typename **Executor**, typename **F**, typename ...**Fs**>
inline decltype(auto) friend **tag_fallback_invoke**(*sync_invoke_t*, *Executor* &&exec, *F* &&f, *Fs*&&... fs)

struct **then_execute_t** : public *hpx*::*functional*::detail::tag_fallback<*then_execute_t*>

#include <execution.hpp> Customization point for execution agent creation depending on a given future.

This creates a single function invocation f() using the associated executor after the given future object has become ready.

Note: This is valid for two way executors (calls exec.then_execute(f, predecessor, ts…) if it exists) and for one way executors (calls predecessor.then(bind(f, ts…))).

Param exec [in] The executor object to use for scheduling of the function *f*.
Param f [in] The function which will be scheduled using the given executor.
Param predecessor [in] The future object the execution of the given function depends on.
Param ts [in] Additional arguments to use to invoke *f*.
Return f(ts…)'s result through a future

Private Functions

template<typename **Executor**, typename **F**, typename **Future**, typename ...**Ts**>
inline decltype(auto) friend **tag_fallback_invoke**(*then_execute_t*, *Executor* &&exec, *F* &&f, *Future* &&predecessor, *Ts*&&... ts)

hpx/execution_base/receiver.hpp

Defined in header hpx/execution_base/receiver.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

Functions

template<typename **R**, typename ...**As**>
void **set_value**(*R* &&r, *As*&&... as)

set_value is a customization point object. The expression `hpx::execution::set_value(r, as...)` is equivalent to:

- `r.set_value(as...)`, if that expression is valid. If the function selected does not send the value(s) `as...` to the Receiver `r`'s value channel, the program is ill-formed (no diagnostic required).
- Otherwise, `set_value(r, as…), if that expression is valid, with overload resolution performed in a context that include the declaration `void set_value();`
- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

template<typename **R**>
void **set_stopped**(*R* &&r)

set_stopped is a customization point object. The expression `hpx::execution::set_stopped(r)` is equivalent to:

- `r.set_stopped()`, if that expression is valid. If the function selected does not signal the Receiver `r`'s done channel, the program is ill-formed (no diagnostic required).
- Otherwise, `set_stopped(r), if that expression is valid, with overload resolution performed in a context that include the declaration `void set_stopped();`
- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

template<typename **R**, typename **E**>
void **set_error**(*R* &&r, *E* &&e)

set_error is a customization point object. The expression `hpx::execution::set_error(r, e)` is equivalent to:

- `r.set_stopped(e)`, if that expression is valid. If the function selected does not send the error `e` the Receiver `r`'s error channel, the program is ill-formed (no diagnostic required).
- Otherwise, `set_error(r, e), if that expression is valid, with overload resolution performed in a context that include the declaration `void set_error();`
- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

template<typename **T**, typename **E**>

struct **is_receiver**

#include <receiver.hpp> Receiving values from asynchronous computations is handled by the `Receiver` concept. A `Receiver` needs to be able to receive an error or be marked as being canceled. As such, the Receiver concept is defined by having the following two customization points defined, which form the completion-signal operations:

- `hpx::execution::experimental::set_stopped` * `hpx::execution::experimental::set_error`

Those two functions denote the completion-signal operations. The Receiver contract is as follows:

- None of a Receiver's completion-signal operation shall be invoked before `hpx::execution::experimental::start` has been called on the operation state object that was returned by connecting a Receiver to a sender `hpx::execution::experimental::connect`.
- Once `hpx::execution::start` has been called on the operation state object, exactly one of the Receiver's completion-signal operation shall complete without an exception before the Receiver is destroyed

Once one of the Receiver's completion-signal operation has been completed without throwing an exception, the Receiver contract has been satisfied. In other words: The asynchronous operation has been completed.

See also:

hpx::execution::experimental::is_receiver_of

template<typename **T**, typename **CS**>

struct **is_receiver_of**

#include <receiver.hpp> The `receiver_of` concept is a refinement of the `Receiver` concept by requiring one additional completion-signal operation:

- `hpx::execution::set_value`

The `receiver_of` concept takes a receiver and an instance of the `completion_signatures<>` class template. The `receiver_of` concept, rather than accepting a receiver and some value types, is changed to take a receiver and an instance of the `completion_signatures<>` class template. A sender uses `completion_signatures<>` to describe the signals with which it completes. The `receiver_of` concept ensures that a particular receiver is capable of receiving those signals.

This completion-signal operation adds the following to the Receiver's contract:

- If `hpx::execution::set_value` exits with an exception, it is still valid to call `hpx::execution::set_error` or `hpx::execution::set_stopped`

namespace **execution**

Typedefs

using **sequenced_task_policy** = detail::sequenced_task_policy_shim<*sequenced_executor*, *hpx*::*traits*::executor_parameters_type_t<*sequenced_executor*>>

Extension: The class sequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may not be parallelized (has to run sequentially).

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the sequenced_policy.

using **sequenced_policy** = detail::sequenced_policy_shim<*sequenced_executor*, *hpx*::*traits*::executor_parameters_type_t<*sequenced_executor*>>

The class sequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.

using **parallel_task_policy** = detail::parallel_task_policy_shim<*parallel_executor*, *hpx*::*traits*::executor_parameters_type_t<*parallel_executor*>>

Extension: The class parallel_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the parallel_policy.

using **parallel_policy** = detail::parallel_policy_shim<*parallel_executor*, *hpx*::*traits*::executor_parameters_type_t<*parallel_executor*>>

The class parallel_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

using **parallel_unsequenced_task_policy** = detail::parallel_unsequenced_task_policy_shim<*parallel_executor*, *hpx*::*traits*::executor_parameters_type_t<*parallel_executor*>>

The class parallel_unsequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

[698] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/execution.hpp

using **parallel_unsequenced_policy** = detail::parallel_unsequenced_policy_shim<*parallel_executor*, *hpx*::*traits*::executor_parameters_type_t<*parallel_executor*>>

The class parallel_unsequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

using **unsequenced_task_policy** = detail::unsequenced_task_policy_shim<*sequenced_executor*, *hpx*::*traits*::executor_parameters_type_t<*sequenced_executor*>>

The class unsequenced_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized.

using **unsequenced_policy** = detail::unsequenced_policy_shim<*sequenced_executor*, *hpx*::*traits*::executor_parameters_type_t<*sequenced_executor*>>

The class unsequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized.

It only contains functions required by the HPX codebase. It also provides some functions only available in Boost.Filesystem when using C++17 filesystem.

namespace **hpx**

namespace **filesystem**

Functions

inline path **initial_path**()

inline *std*::string **basename**(path const &p)

inline path **canonical**(path const &p, path const &base)

inline path **canonical**(path const &p, path const &base, *std*::error_code &ec)

namespace **filesystem**

functional

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::bind, hpx::placeholders::_1, hpx::placeholders::_2, . . . , hpx::placeholders::_9

Defined in header hpx/functional.hpp[699].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

[699] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/functional.hpp

Functions

template<typename **F**, typename ...**Ts**, typename **Enable** = *std*::enable_if_t<!*traits*::is_action_v<*std*::decay_t<*F*>>>>
constexpr detail::bound<*std*::decay_t<*F*>, *util*::make_index_pack_t<sizeof...(*Ts*)>, *util*::decay_unwrap_t<*Ts*>...> **bind**(*F* &&f, *Ts*&&... vs)

The function template *bind* generates a forwarding call wrapper for *f*. Calling this wrapper is equivalent to invoking *f* with some of its arguments bound to *vs*.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of arguments to bind, with the unbound arguments replaced by the placeholders _1, _2, _3… of namespace hpx::placeholders

Returns A function object of unspecified type *T*, for which

```
hpx::is_bind_expression<T>::value == true.
```

namespace **placeholders**

The *hpx::placeholders* namespace contains the placeholder objects [_1, …, _N] where N is an implementation defined maximum number.

When used as an argument in a *hpx::bind* expression, the placeholder objects are stored in the generated function object, and when that function object is invoked with unbound arguments, each placeholder _N is replaced by the corresponding Nth unbound argument.

The types of the placeholder objects are DefaultConstructible and CopyConstructible, their default copy/move constructors do not throw exceptions, and for any placeholder _N, the type hpx::is_placeholder<decltype(_N)> is defined, where hpx::is_placeholder<decltype(_N)> is derived from std::integral_constant<int, N>.

Variables

constexpr detail::placeholder<1> **_1** = {}

constexpr detail::placeholder<2> **_2** = {}

constexpr detail::placeholder<3> **_3** = {}

hpx::bind_back

Defined in header hpx/functional.hpp[700].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

Functions

template<typename **F**, typename ...**Ts**>
constexpr *hpx*::detail::bound_back<*std*::decay_t<*F*>, *util*::make_index_pack_t<sizeof...(*Ts*)>, *util*::decay_unwrap_t<*Ts*>...> **bind**

Function templates `bind_back` generate a forwarding call wrapper for `f`. Calling this wrapper is equivalent to invoking `f` with its last `sizeof...`(Ts) parameters bound to `vs`.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of the arguments to bind to the last `sizeof...`(Ts) parameters of `f`

Returns A function object of type `T` that is unspecified, except that the types of objects returned by two calls to *`hpx::bind_back`* with the same arguments are the same.

template<typename **F**>
constexpr *std*::decay_t<*F*> **bind_back**(*F* &&f)

namespace **serialization**

[700] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/functional.hpp

Functions

template<typename **Archive**, typename **F**, typename ...**Ts**>
void **serialize**(*Archive* &ar, ::*hpx*::detail::bound_back<*F*, *Ts*...> &bound, unsigned int const version = 0)

namespace **util**

Functions

```
template<typename F, typename... Ts>  HPX_DEPRECATED_V (1, 8,
"hpx::util::bind_back is deprecated,
use hpx::bind_back instead") const expr decltype(auto) bind_back(F &&f
```

hpx::bind_front

Defined in header hpx/functional.hpp[701].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

Functions

template<typename **F**, typename ...**Ts**>
constexpr detail::bound_front<*std*::decay_t<*F*>, *util*::make_index_pack_t<sizeof...(*Ts*)>, *util*::decay_unwrap_t<*Ts*>...> **bind_fro**

Function template `bind_front` generates a forwarding call wrapper for `f`. Calling this wrapper is equivalent to invoking `f` with its first `sizeof...`(Ts) parameters bound to `vs`.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of the arguments to bind to the first or `sizeof...`(Ts) parameters of `f`

Returns A function object of type `T` that is unspecified, except that the types of objects returned by two calls to *`hpx::bind_front`* with the same arguments are the same.

template<typename **F**>
constexpr *std*::decay_t<*F*> **bind_front**(*F* &&f)

namespace **serialization**

Defines

HPX_UTIL_REGISTER_FUNCTION_DECLARATION(Sig, F, Name)

HPX_UTIL_REGISTER_FUNCTION(Sig, F, Name)

namespace **hpx**

Top level namespace.

template<typename **Sig**, bool **Serializable** = false>

class **function**

#include <function.hpp> Class template *hpx::function* is a general-purpose polymorphic function wrapper. Instances of *hpx::function* can store, copy, and invoke any CopyConstructible Callable target — functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of *hpx::function*. If an *hpx::function* contains no target, it is called empty. Invoking the target of an empty *hpx::function* results in *hpx::error::bad_function_call* exception being thrown. *hpx::function* satisfies the requirements of CopyConstructible and CopyAssignable.

hpx::function_ref

Defined in header hpx/functional.hpp[703].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

template<typename **Sig**>

class **function_ref**

#include <function_ref.hpp> `function_ref` class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n,f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.

```
using payload = std::optional< /* ... */ >;
// Repeatedly invokes `action` up to `times` repetitions.
// Immediately returns if `action` returns a valid `payload`.
// Returns `std::nullopt` otherwise.
payload retry(size_t times, /* ????? */ action);
```

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, `hpx::function` or a template but it is much simpler with `function_ref` as seen below:

```
payload retry(size_t times, function_ref<payload()> action);
```

Top level namespace.

Functions

template<typename **F**, typename **Tuple**>
constexpr detail::invoke_fused_result_t<*F*, *Tuple*> **invoke_fused**(*F* &&f, *Tuple* &&t) noexcept(noexcept(detail::invoke_fused_impl(detail::fused_index_
HPX_FORWARD(*F*, *f*),
HPX_FORWARD(*Tuple*, *t*))))

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

Note: This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Parameters

- **f** – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to hpx::get.

Throws `std::exception` – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

[705] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/functional.hpp

Returns The result of the callable object when it's called with the content of the given sequenced type.

template<typename **R**, typename **F**, typename **Tuple**>
constexpr *R* **invoke_fused_r**(*F* &&f, *Tuple* &&t) noexcept(noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<*Tuple*>{}, HPX_FORWARD(*F*, *f*), HPX_FORWARD(*Tuple*, *t*))))

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

Note: This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Note: The difference between `hpx::invoke_fused` and `hpx::invoke_fused_r` is that the later allows to specify the return type as well.

Parameters

- **f** – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to hpx::get.

Throws `std::exception` – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

Template Parameters **R** – The result type of the function when it's called with the content of the given sequenced type.

Returns The result of the callable object when it's called with the content of the given sequenced type.

hpx::mem_fn

Defined in header hpx/functional.hpp[706].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

[706] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/functional.hpp

Functions

template<typename **M**, typename **C**>
constexpr detail::mem_fn<*M* *C*::*> **mem_fn**(*M* *C*::* pm) noexcept

Function template *hpx::mem_fn* generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a *hpx::mem_fn*.

Parameters **pm** – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to *hpx::mem_fn* with a pointer to member pm. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of operator() is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm),Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm),Ts&&...>)` . Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...` .

template<typename **R**, typename **C**, typename ...**Ps**>
constexpr detail::mem_fn<*R* (*C*::*)(*Ps*...)> **mem_fn**(*R* (*C*::* pm)(*Ps*...)) noexcept

Function template *hpx::mem_fn* generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a *hpx::mem_fn*.

Parameters **pm** – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to *hpx::mem_fn* with a pointer to member pm. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of operator() is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm),Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm),Ts&&...>)` . Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...` .

template<typename **R**, typename **C**, typename ...**Ps**>
constexpr detail::mem_fn<*R* (*C*::*)(*Ps*...) const> **mem_fn**(*R* (*C*::* pm)(*Ps*...) const) noexcept

Function template *hpx::mem_fn* generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a *hpx::mem_fn*.

Parameters **pm** – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to *hpx::mem_fn* with a pointer to member `pm`. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of operator() is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm),Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm),Ts&&...>)` . Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...` .

hpx::move_only_function

Defined in header hpx/functional.hpp[707].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_UTIL_REGISTER_UNIQUE_FUNCTION_DECLARATION(Sig, F, Name)

HPX_UTIL_REGISTER_UNIQUE_FUNCTION(Sig, F, Name)

namespace **hpx**

Top level namespace.

template<typename **Sig**, bool **Serializable** = false>

class **move_only_function**

#include <move_only_function.hpp> Class template *hpx::move_only_function* is a general-purpose polymorphic function wrapper. *hpx::move_only_function* objects can store and invoke any constructible (not required to be move constructible) Callable target — functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of *hpx::move_only_function*. If an *hpx::move_only_function* contains no target, it is called empty. Unlike *hpx::function*, invoking an empty *hpx::move_only_function* results in undefined behavior.

hpx::move_only_functions supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). *hpx::move_only_function* satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

template<typename **R**, typename ...**Ts**, bool **Serializable**>

class **move_only_function**<*R*(*Ts*...), *Serializable*> : public *util*::detail::basic_function<*R*(*Ts*...), false, *Serializable*>

namespace **experimental**

Functions

template<typename **F**>
auto **scope_fail**(*F* &&f)

The class template scope_fail is a general-purpose scope guard intended to call its exit function when a scope is exited via an exception.

Template Parameters **F** – type of stored exit function

Parameters **f** – stored exit function

hpx::experimental::scope_success

Defined in header hpx/experimental/scope.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

namespace **experimental**

Functions

template<typename **F**>
auto **scope_success**(*F* &&f)

The class template scope_success is a general-purpose scope guard intended to call its exit function when a scope is normally exited.

Template Parameters **F** – type of stored exit function

Parameters **f** – stored exit function

hpx::is_bind_expression

Defined in header hpx/functional.hpp[708].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

Variables

template<typename **T**>

constexpr bool **is_bind_expression_v** = *is_bind_expression*<*T*>::value

template<typename **T**>

struct **is_bind_expression** : public *std*::is_bind_expression<*T*>

#include <is_bind_expression.hpp> If `T` is the type produced by a call to `hpx::bind`, this template is derived from `std::true_type`. For any other type, this template is derived from `std::false_type`.

This template may be specialized for a user-defined type `T` to implement *UnaryTypeTrait* with base characteristic of `std::true_type` to indicate that `T` should be treated by `hpx::bind` as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

Subclassed by *hpx::is_bind_expression< T const >*

template<typename **T**>

[708] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/functional.hpp

struct **is_bind_expression**<*T* const> : public *hpx*::*is_bind_expression*<*T*>

namespace **traits**

Typedefs

typedef *hpx*::*is_bind_expression*<T> **instead**

Functions

template<typename T> HPX_DEPRECATED_V (1, 8, "hpx::traits::is_bind_expression_v is deprecated, use " "hpx::is_bind_expression_v instead") inline const expr bool is_bind_expression_v

hpx::is_placeholder

Defined in header hpx/functional.hpp[709].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

template<typename **T**>

struct **is_placeholder**

#include <is_placeholder.hpp> If T is a standard, Boost, or HPX placeholder (_1, _2, _3, …) then this template is derived from std::integral_constant<int,1>, std::integral_constant<int, 2>, std::integral_constant<int,3>, respectively. Otherwise, it is derived from std::integral_constant<int,0>.

The template may be specialized for any user-defined T type: the specialization must satisfy *UnaryTypeTrait* with base characteristic of std::integral_constant<int,N> with N>0 to indicate that T should be treated as N'th placeholder type. *hpx::bind* uses *hpx::is_placeholder* to detect placeholders for unbound arguments.

namespace **traits**

[709] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/functional.hpp

Functions

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_MAKE_EXCEPTIONAL_FUTURE(T, errorcode, f, msg)

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **R**, typename **U**>
hpx::*future*<*R*> **make_future**(*hpx*::*future*<*U*> &&f)

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

template<typename **R**, typename **U**, typename **Conv**>
hpx::*future*<*R*> **make_future**(*hpx*::*future*<*U*> &&f, *Conv* &&conv)

Converts any future of type U to any other future of type R based on a given conversion function: R conv(U).

template<typename **R**, typename **U**>
hpx::*future*<*R*> **make_future**(*hpx*::*shared_future*<*U*> f)

Converts any *shared_future* of type U to any other future of type R based on an existing conversion path from U to R.

template<typename **R**, typename **U**, typename **Conv**>
hpx::*future*<*R*> **make_future**(*hpx*::*shared_future*<*U*> f, *Conv* &&conv)

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

template<typename **R**>

[710] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

hpx::shared_future<R> **make_shared_future**(hpx::future<R> &&f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

template<typename **R**>
hpx::shared_future<R> &**make_shared_future**(hpx::shared_future<R> &f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

template<typename **R**>
hpx::shared_future<R> &&**make_shared_future**(hpx::shared_future<R> &&f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

template<typename **R**>
hpx::shared_future<R> const &**make_shared_future**(hpx::shared_future<R> const &f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

template<typename **T**, typename **Allocator**, typename ...**Ts**>
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> **make_ready_future_alloc**(Allocator const &a, Ts&&... ts)

Creates a pre-initialized future object with allocator (extension)

template<typename **T**, typename ...**Ts**>
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> **make_ready_future**(Ts&&... ts)

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

template<int **DeductionGuard** = 0, typename **Allocator**, typename **T**>
future<hpx::util::decay_unwrap_t<T>> **make_ready_future_alloc**(Allocator const &a, T &&init)

template<int **DeductionGuard** = 0, typename **T**>
future<hpx::util::decay_unwrap_t<T>> **make_ready_future**(T &&init)

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

template<typename **T**>
future<T> **make_exceptional_future**(std::exception_ptr const &e)

Creates a pre-initialized future object which holds the given error (extension)

template<typename **T**, typename **E**>
future<T> **make_exceptional_future**(E e)

Creates a pre-initialized future object which holds the given error (extension)

template<int **DeductionGuard** = 0, typename **T**>
future<hpx::util::decay_unwrap_t<T>> **make_ready_future_at**(hpx::chrono::steady_time_point const &abs_time, T &&init)

Creates a pre-initialized future object which gets ready at a given point in time (extension)

template<int **DeductionGuard** = 0, typename **T**>
future<hpx::util::decay_unwrap_t<T>> **make_ready_future_after**(hpx::chrono::steady_duration const &rel_time, T &&init)

Creates a pre-initialized future object which gets ready after a given point in time (extension)

template<typename **Allocator**>

inline *future*<void> **make_ready_future_alloc**(*Allocator* const &a)

future<void> **make_ready_future**()

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

inline *future*<void> **make_ready_future_at**(*hpx*::*chrono*::steady_time_point const &abs_time)

Creates a pre-initialized future object which gets ready at a given point in time (extension)

inline *future*<void> **make_ready_future_after**(*hpx*::*chrono*::steady_duration const &rel_time)

Creates a pre-initialized future object which gets ready after a given point in time (extension)

template<typename **R**>

class **future** : public *hpx*::*lcos*::detail::future_base<*future*<*R*>, *R*>

#include <future_fwd.hpp> The class template *hpx::future* provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via hpx::async, *hpx::packaged_task*, or *hpx::promise*) can provide a *hpx::future* object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the *hpx::future*. These methods may block if the asynchronous operation has not yet provided a value.
- When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. hpx::promise::set_value) that is linked to the creator's *hpx::future*. Note that *hpx::future* references shared state that is not shared with any other asynchronous return objects (as opposed to *hpx::shared_future*).

Public Types

using **result_type** = *R*

using **shared_state_type** = typename *base_type*::shared_state_type

Public Functions

constexpr **future**() noexcept = default

future(*future* &&other) noexcept = default

future(*future* const &other) noexcept = delete

inline **future**(*future*<*future*> &&other) noexcept

inline **future**(*future*<*shared_future*<*R*>> &&other) noexcept

template<typename **T**>
inline **future**(*future*<*T*> &&other, *std*::enable_if_t<*std*::is_void_v<*R*> && !*traits*::is_future_v<*T*>, *T*>* = nullptr) noexcept

~future() = default

future &**operator=**(*future* &&other) noexcept = default

future &**operator=**(*future* const &other) noexcept = delete

inline *shared_future*<*R*> **share**() noexcept

inline *hpx*::*traits*::future_traits<*future*>::result_type **get**()

inline *hpx*::*traits*::future_traits<*future*>::result_type **get**(*error_code* &ec)

template<typename **F**>
inline decltype(auto) **then**(*F* &&f, *error_code* &ec = *throws*)

Attaches a continuation to **this*. The behavior is undefined if **this* has no associated shared state (i.e., *valid()==false*).

In cases where *decltype(func(*this))* is *future<R>*, the resulting type is *future<R>* instead of *future<future<R>>*. Effects:

- The continuation is called when the object's shared state is ready (has a value or exception stored).
- The continuation launches according to the specified launch policy or executor.
- When the executor or launch policy is not provided the continuation inherits the parent's launch policy or executor.
- If the parent was created with *std::promise* or with a *packaged_task* (has no associated launch policy), the continuation behaves the same as the third overload with a policy argument of *launch::async* | *launch::deferred* and the same argument for *func*.
- If the parent has a policy of *launch::deferred* and the continuation does not have a specified launch policy or scheduler, then the parent is filled by immediately calling .wait(), and the policy of the antecedent is *launch::deferred*

Note: Postcondition:

- The future object is moved to the parameter of the continuation function.
- valid() == false on original future object immediately after it returns.

Template Parameters

- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.
- **error_code** – The type of error code.

Parameters

- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns An object of type *future<decltype(func(*this))>* that refers to the shared state created by the continuation.

template<typename **T0**, typename **F**>
inline decltype(auto) **then**(*T0* &&t0, *F* &&f, *error_code* &ec = *throws*)

Attaches a continuation to **this*. The behavior is undefined if **this* has no associated shared state (i.e., *valid()==false*). \copydetail *hpx::future::then*(F&& f, error_code& ec = throws)

Note: Postcondition:

- The future object is moved to the parameter of the continuation function.
- valid() == false on original future object immediately after it returns.

Template Parameters

- **T0** – The type of executor or launch policy.

- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.
- **error_code** – The type of error code.

Parameters

- **t0** – The executor or launch policy to be used.
- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns An object of type *future<decltype(func(*this))>* that refers to the shared state created by the continuation.

template<typename **Allocator**, typename **F**>

template<typename **F**>
inline decltype(auto) **then**(*F* &&f, *error_code* &ec = *throws*) const

Attaches a continuation to **this*. The behavior is undefined if **this* has no associated shared state (i.e., *valid()==false*).

In cases where *decltype(func(*this))* is *future<R>*, the resulting type is *future<R>* instead of *future<future<R>>*. Effects:

- The continuation is called when the object's shared state is ready (has a value or exception stored).
- The continuation launches according to the specified launch policy or executor.
- When the executor or launch policy is not provided the continuation inherits the parent's launch policy or executor.
- If the parent was created with *std::promise* or with a *packaged_task* (has no associated launch policy), the continuation behaves the same as the third overload with a policy argument of *launch::async* | *launch::deferred* and the same argument for *func*.
- If the parent has a policy of *launch::deferred* and the continuation does not have a specified launch policy or scheduler, then the parent is filled by immediately calling .wait(), and the policy of the antecedent is *launch::deferred*

Note: Postcondition:

- The future object is moved to the parameter of the continuation function.
- valid() == false on original future object immediately after it returns.

Template Parameters

- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.
- **error_code** – The type of error code.

Parameters

- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns An object of type *future<decltype(func(*this))>* that refers to the shared state created by the continuation.

template<typename **T0**, typename **F**>
inline decltype(auto) **then**(*T0* &&t0, *F* &&f, *error_code* &ec = *throws*) const

Attaches a continuation to **this*. The behavior is undefined if **this* has no associated shared state (i.e., *valid()==false*). \copydetail *hpx::future::then*(F&& f, error_code& ec = throws)

Note: Postcondition:

- The future object is moved to the parameter of the continuation function.
- valid() == false on original future object immediately after it returns.

Template Parameters

- **T0** – The type of executor or launch policy.
- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.
- **error_code** – The type of error code.

Parameters

- **t0** – The executor or launch policy to be used.
- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns An object of type *future<decltype(func(*this))>* that refers to the shared state created by the continuation.

template<typename **Allocator**, typename **F**>
inline auto **then_alloc**(*Allocator* const &alloc, *F* &&f, *error_code* &ec = *throws*) -> decltype(*base_type*::then_alloc(*alloc*, HPX_MOVE(*this), HPX_FORWARD(*F*, *f*), *ec*))

template<typename **Sig**>

class **packaged_task**

#include <packaged_task.hpp> The class template *hpx::packaged_task* wraps any Callable` target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through *hpx::future* objects. Just like hpx::function, *hpx::packaged_task* is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.

template<typename **R**, typename **Allocator**>

struct **uses_allocator**<*hpx*::*promise*<*R*>, *Allocator*> : public true_type

namespace **hpx**

Top level HPX namespace.

template<typename **R**>

class **promise** : public *hpx*::detail::promise_base<*R*>

#include <promise.hpp> The class template *hpx::promise* provides a facility to store a value or an exception that is later acquired asynchronously via a *hpx::future* object created by the *hpx::promise* object. Note that the *hpx::promise* object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- make ready: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- release: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by hpx::async which is not yet ready, this operation does not block.
- abandon: the promise stores the exception of type hpx::future_error with error code hpx::error::broken_promise, makes the shared state ready, and then releases it. The promise is the "push" end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in hpx::memory_order) the successful return from any function that is waiting on the shared state (such as hpx::future::get). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of hpx::shared_future::get must either all be read-only or provide external synchronization.

Construct the io_service pool.

Parameters

- **pool_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

explicit **io_service_pool**(*threads*::*policies*::callback_notifier const &notifier, char const *pool_name = "", char const *name_postfix = "")

Construct the io_service pool.

Parameters

- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

~io_service_pool()

bool **run**(bool join_threads = true, *barrier* *startup = nullptr)

Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete

bool **run**(*std*::size_t num_threads, bool join_threads = true, *barrier* *startup = nullptr)

Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete

void **stop**()

Stop all io_service objects in the pool.

void **join**()

Join all io_service threads in the pool.

void **clear**()

Clear all internal data structures.

void **wait**()

Wait for all work to be done.

bool **stopped**()

asio::io_context &**get_io_service**(int index = -1)

Get an io_service to use.

std::thread &**get_os_thread_handle**(*std*::size_t thread_num)

access underlying thread handle

inline constexpr *std*::size_t **size**() const noexcept

Get number of threads associated with this I/O service.

void **thread_run**(*std*::size_t index, *barrier* *startup = nullptr) const

Activate the thread *index* for this thread pool.

inline constexpr char const ***get_name**() const noexcept

Return name of this pool.

void **init**(*std*::size_t pool_size)

Protected Functions

pack_traversal

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/pack_traversal/pack_traversal.hpp

Defined in header hpx/pack_traversal/pack_traversal.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

template<typename Mapper, typename...
T> < unspecified > map_pack (Mapper &&mapper, T &&... pack)

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:
- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats
map_pack([](int value) {
    return float(value);
},
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

Throws *std*`::exception` – like objects which are thrown by an invocation to the mapper.

Parameters
- **mapper** – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- **pack** – An arbitrary variadic pack which may contain any type.

Returns The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

hpx/pack_traversal/pack_traversal_async.hpp

Defined in header hpx/pack_traversal/pack_traversal_async.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

template<typename **Visitor**, typename ...**T**>
auto **traverse_pack_async**(*Visitor* &&visitor, *T*&&... pack) -> decltype(detail::apply_pack_transform_async(HPX_FORWARD(*Visitor*, *visitor*), HPX_FORWARD(*T*, *pack*)...))

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
    // The synchronous overload is called for each object, // it may
    return false to suspend the current control. // In that case the
    overload below is called. template <typename T> bool
    operator()(async_traverse_visit_tag, T&& element) {
        return true;
    }

    // The asynchronous overload this is called when the //
    synchronous overload returned false. // In addition to the
    current visited element the overload is // called with a
    continuation callable object which resumes the // traversal when
    it's called later. // The continuation next may be stored and
    called later or // dropped completely to abort the traversal
    early. template <typename T, typename N> void
    operator()(async_traverse_detach_tag, T&& element, N&& next) { }

    // The overload is called when the traversal was finished. // As
    argument the whole pack is passed over which we // traversed
    asynchronously. template <typename T> void
    operator()(async_traverse_complete_tag, T&& pack) { }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should must have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

Returns A hpx::intrusive_ptr that references an instance of the given visitor object.

hpx::functional::unwrap, hpx::functional::unwrap_n, hpx::functional::unwrap_all, hpx::unwrap, hpx::unwrap_n, hpx::unwrap_all, hpx::unwrapping, hpx::unwrapping_n, hpx::unwrapping_all

Defined in header hpx/unwrap.hpp[713].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[713] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/unwrap.hpp

Functions

template<typename ...**Args**>
auto **unwrap**(*Args*&&... args) -> decltype(*util*::detail::unwrap_depth_impl<1U>(HPX_FORWARD(*Args*, *args*)...))

A helper function for retrieving the actual result of any hpx::future like type which is wrapped in an arbitrary way.

Unwraps the given pack of arguments, so that any hpx::future object is replaced by its future result type in the argument pack:

- hpx::future<int> -> int
- hpx::future<std::vector<float>> -> std::vector<float>
- std::vector<future<float>> -> std::vector<float>

The function is capable of unwrapping hpx::future like objects that are wrapped inside any container or tuple like type, see hpx::util::map_pack() for a detailed description about which surrounding types are supported. Non hpx::future like types are permitted as arguments and passed through.

```
hpx:unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
    hpx:unwrap(hpx::make_ready_future(1),
               hpx::make_ready_future(2));
```

Note: This function unwraps the given arguments until the first traversed nested hpx::future which corresponds to an unwrapping depth of one. See hpx::unwrap_n() for a function which unwraps the given arguments to a particular depth or hpx::unwrap_all() that unwraps all future like objects recursively which are contained in the arguments.

Parameters **args** – the arguments that are unwrapped which may contain any arbitrary future or non future type.

Throws *std*::exception – like objects in case any of the given wrapped hpx::future objects were resolved through an exception. See hpx::future::get() for details.

Returns Depending on the count of arguments this function returns a hpx::tuple containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

template<*std*::size_t **Depth**, typename ...**Args**>
auto **unwrap_n**(*Args*&&... args) -> decltype(*util*::detail::unwrap_depth_impl<*Depth*>(HPX_FORWARD(*Args*, *args*)...))

An alterntive version of hpx::unwrap(), which unwraps the given arguments to a certain depth of hpx::future like objects.

See unwrap for a detailed description.

Template Parameters **Depth** – The count of hpx::future like objects which are unwrapped maximally.

template<typename ...**Args**>
auto **unwrap_all**(*Args*&&... args) ->
decltype(*util*::detail::unwrap_depth_impl<0U>(HPX_FORWARD(*Args*, *args*)...))

An alterntive version of hpx::unwrap(), which unwraps the given arguments recursively so that all contained hpx::future like objects are replaced by their actual value.

See hpx::unwrap() for a detailed description.

template<typename **T**>
auto **unwrapping**(*T* &&callable) ->
decltype(*util*::detail::functional_unwrap_depth_impl<1U>(HPX_FORWARD(*T*, *callable*)))

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap() function and then passes the result to the given callable object.

```
    return left + right;
});

int i1 = callable(hpx::make_ready_future(1),
                  hpx::make_ready_future(2));
```

See hpx::unwrap() for a detailed description.

Parameters **callable** – the callable object which which is called with the result of the corresponding unwrap function.

template<*std*::size_t **Depth**, typename **T**>
auto **unwrapping_n**(*T* &&callable) ->
decltype(*util*::detail::functional_unwrap_depth_impl<*Depth*>(HPX_FORWARD(*T*, *callable*)))

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap_n() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

template<typename **T**>
auto **unwrapping_all**(*T* &&callable) ->
decltype(*util*::detail::functional_unwrap_depth_impl<0U>(HPX_FORWARD(*T*, *callable*)))

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap_all() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

namespace **functional**

struct **unwrap**

#include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap`. For more information please refer to its documentation.

struct **unwrap_all**

#include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap_all`. For more information please refer to its documentation.

template<*std*::size_t **Depth**>

struct **unwrap_n**

#include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap_n`. For more information please refer to its documentation.

preprocessor

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/preprocessor/cat.hpp

Defined in header hpx/preprocessor/cat.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_CAT(A, B)

Concatenates the tokens `A` and `B` into a single token. Evaluates to `AB`

Parameters

- **A** – First token
- **B** – Second token

hpx/preprocessor/expand.hpp

Defined in header hpx/preprocessor/expand.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_EXPAND(X)

The HPX_PP_EXPAND macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

Example:

```
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

Parameters

- **X** – Token to be expanded twice

hpx/preprocessor/nargs.hpp

Defined in header hpx/preprocessor/nargs.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_NARGS(...)

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

Parameters

- **...** – The variadic number of arguments

hpx/preprocessor/stringize.hpp

Defined in header hpx/preprocessor/stringize.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRINGIZE(X)

The *HPX_PP_STRINGIZE* macro stringizes its argument after it has been expanded.

The passed argument `X` will expand to `"X"`. Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

Parameters

- **X** – The text to be converted to a string literal

hpx/preprocessor/strip_parens.hpp

Defined in header hpx/preprocessor/strip_parens.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRIP_PARENS(X)

For any symbol `X`, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to `X` itself without error.

The original implementation of this macro is from Steven Watanbe as shown in http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976

```
HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))
```

Example Usage:

This produces the following output

```
no_parens
with_parens
```

Parameters

- **X** – Symbol to strip parens from

resiliency

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/resiliency/replay_executor.hpp

Defined in header hpx/resiliency/replay_executor.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

runtime_configuration

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_configuration/component_commandline_base.hpp

Defined in header hpx/runtime_configuration/component_commandline_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_COMMANDLINE_REGISTRY(RegistryType, componentname)

The macro *HPX_REGISTER_COMMANDLINE_REGISTRY* is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_COMMANDLINE_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_COMMANDLINE_OPTIONS()

The macro *HPX_REGISTER_COMMANDLINE_OPTIONS* is used to define the required Hpx.Plugin entry point for the command line option registry. This macro has to be used in not more than one compilation unit of a component module.

HPX_REGISTER_COMMANDLINE_OPTIONS_DYNAMIC()

namespace **hpx**

namespace **components**

struct **component_commandline_base**

#include <component_commandline_base.hpp> The component_commandline_base has to be used as a base class for all component command-line line handling registries.

Public Functions

virtual **~component_commandline_base**() = default

virtual *hpx*::program_options::options_description **add_commandline_options**() = 0

Return any additional command line options valid for this component.

Note: This function will be executed by the runtime system during system startup.

Returns The module is expected to fill a options_description object with any additional command line options this component will handle.

hpx/runtime_configuration/component_registry_base.hpp

Defined in header hpx/runtime_configuration/component_registry_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_COMPONENT_REGISTRY(RegistryType, componentname)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_COMPONENT_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_REGISTRY_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

HPX_REGISTER_REGISTRY_MODULE_DYNAMIC()

namespace **hpx**

namespace **components**

struct **component_registry_base**

#include <component_registry_base.hpp> The component_registry_base has to be used as a base class for all component registries.

Public Functions

virtual **~component_registry_base**() = default

virtual bool **get_component_info**(*std*::vector<*std*::string> &fillini, *std*::string const &filepath, bool is_static = false) = 0

Return the ini-information for all contained components.

Parameters

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

- **filepath** – [in]
- **is_static** – [in]

Returns Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

virtual void **register_component_type**() = 0

Register the component type represented by this component.

hpx/runtime_configuration/plugin_registry_base.hpp

Defined in header hpx/runtime_configuration/plugin_registry_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_PLUGIN_BASE_REGISTRY(PluginType, name)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_PLUGIN_REGISTRY_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

HPX_REGISTER_PLUGIN_REGISTRY_MODULE_DYNAMIC()

namespace **hpx**

namespace **plugins**

struct **plugin_registry_base**

#include <plugin_registry_base.hpp> The plugin_registry_base has to be used as a base class for all plugin registries.

Public Functions

virtual **~plugin_registry_base**() = default

virtual bool **get_plugin_info**(*std*::vector<*std*::string> &fillini) = 0

Return the configuration information for any plugin implemented by this module

Parameters fillini – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all plugins implemented in this module.

Returns Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline virtual void **init**(int*, char***, *util*::runtime_configuration&)

hpx::runtime_mode

Defined in header hpx/init.hpp[714].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **runtime_mode**

A HPX runtime can be executed in two different modes: console mode and worker mode.

Values:

enumerator **invalid**

enumerator **console**

The runtime is the console locality.

enumerator **worker**

The runtime is a worker locality.

enumerator **connect**

The runtime is a worker locality connecting late

enumerator **local**

The runtime is fully local.

enumerator **default_**

The runtime mode will be determined based on the command line arguments

enumerator **last**

Functions

char const ***get_runtime_mode_name**(*runtime_mode* state) noexcept

Get the readable string representing the name of the given runtime_mode constant.

runtime_mode **get_runtime_mode_from_name**(*std*::string const &mode)

Returns the internal representation (runtime_mode constant) from the readable string representing the name.

This represents the internal representation from the readable string representing the name.

Parameters **mode** – this represents the runtime mode

[714] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/init_runtime/include/hpx/init.hpp

runtime_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_local/component_startup_shutdown_base.hpp

Defined in header hpx/runtime_local/component_startup_shutdown_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY(RegistryType, componentname)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS()

This macro is used to define the required Hpx.Plugin entry point for the startup/shutdown registry. This macro has to be used in not more than one compilation unit of a component module.

HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS_DYNAMIC()

namespace **hpx**

namespace **components**

struct **component_startup_shutdown_base**

#include <component_startup_shutdown_base.hpp> The component_startup_shutdown_base has to be used as a base class for all component startup/shutdown registries.

Public Functions

virtual **~component_startup_shutdown_base**() = default

virtual bool **get_startup_function**(*startup_function_type* &startup, bool &pre_startup) = 0

Return any startup function for this component.

Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_startup** – [in, out] Will be set to true if the returned startup function is executed during the first round of calls.

Returns Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

virtual bool **get_shutdown_function**(*shutdown_function_type* &shutdown, bool &pre_shutdown) = 0

Return any startup function for this component.

Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_shutdown** – [in, out] Will be set to true if the returned shutdown function is executed during the first round of calls.

Returns Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

hpx/runtime_local/custom_exception_info.hpp

Defined in header hpx/runtime_local/custom_exception_info.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::string **diagnostic_information**(exception_info const &xi)

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function *hpx::diagnostic_information* can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

See also:

hpx::get_error_locality_id(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters **xi** – The parameter `e` will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if any of the required allocation operations fail)

Returns The formatted string holding all the available diagnostic information stored in the given exception instance.

std::uint32_t **get_error_locality_id**(*hpx*::exception_info const &xi) noexcept

Return the locality id where the exception was thrown.

The function *hpx::get_error_locality_id* can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `nothing` –

Returns The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return *hpx::naming::invalid_locality_id*.

std::string **`get_error_host_name`**(*hpx*::exception_info const &xi)

Return the hostname of the locality where the exception was thrown.

The function *hpx::get_error_host_name* can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

See also:

hpx::diagnostic_information() *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()* *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return and empty string.

std::int64_t **`get_error_process_id`**(*hpx*::exception_info const &xi) noexcept

Return the (operating system) process id of the locality where the exception was thrown.

The function *hpx::get_error_process_id* can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters xi – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws nothing –

Returns The process id of the OS-process which threw the exception If the exception instance does not hold this information, the function will return 0.

std::string **get_error_env**(*hpx*::exception_info const &xi)

Return the environment of the OS-process at the point the exception was thrown.

The function *hpx::get_error_env* can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters xi – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws std::bad_alloc – (if one of the required allocations fails)

Returns The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **get_error_backtrace**(*hpx*::exception_info const &xi)

Return the stack backtrace from the point the exception was thrown.

The function *hpx::get_error_backtrace* can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters xi – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws std::bad_alloc – (if one of the required allocations fails)

Returns The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::size_t **get_error_os_thread**(*hpx*::exception_info const &xi) noexcept

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function *hpx::get_error_os_thread* can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters **xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `nothing` –

Returns The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return std::size(-1).

std::size_t **get_error_thread_id**(*hpx*::exception_info const &xi) noexcept

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function *hpx::get_error_thread_id* can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()* *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters **xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `nothing` –

Returns The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return std::size_t(0).

std::string **`get_error_thread_description`**(*hpx*::exception_info const &xi)

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function *hpx::get_error_thread_description* can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error()*, *hpx::get_error_state()*, *hpx::get_error_what()*, *hpx::get_error_config()*

Parameters **`xi`** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **`get_error_config`**(*hpx*::exception_info const &xi)

Return the HPX configuration information point from which the exception was thrown.

The function *hpx::get_error_config* can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error()*, *hpx::get_error_state()* *hpx::get_error_what()*, *hpx::get_error_thread_description()*

Parameters **`xi`** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **`get_error_state`**(*hpx*::exception_info const &xi)

Return the HPX runtime state information at which the exception was thrown.

The function *hpx::get_error_state* can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error()*, *hpx::get_error_what()*, *hpx::get_error_thread_description()*

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

hpx::get_locality_id

Defined in header hpx/runtime.hpp[715].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::uint32_t **get_locality_id**(*error_code* &ec = *throws*)

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

Note: The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by get_num_localities()).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

[715] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

hpx::get_locality_name

Defined in header hpx/runtime.hpp[716].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::string **get_locality_name**()

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

See also:

future<std::string> get_locality_name(hpx::id_type const& id)

Returns This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

hpx::get_initial_num_localities, hpx::get_num_localities

Defined in header hpx/runtime.hpp[717].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::uint32_t **get_initial_num_localities**()

Return the number of localities which were registered at startup for the running application.

The function *get_initial_num_localities* returns the number of localities which were connected to the console at application startup.

See also:

hpx::find_all_localities, *hpx::get_num_localities*

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

[716] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp
[717] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

hpx::*future*<*std*::uint32_t> **get_num_localities**()

Asynchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

See also:

hpx::find_all_localities, *hpx::get_num_localities*

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

std::uint32_t **get_num_localities**(*launch*::sync_policy, *error_code* &ec = *throws*)

Return the number of localities which are currently registered for the running application.

The function *get_num_localities* returns the number of localities currently connected to the console.

See also:

hpx::find_all_localities, *hpx::get_num_localities*

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_local/get_os_thread_count.hpp

Defined in header hpx/runtime_local/get_os_thread_count.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::size_t **get_os_thread_count**()

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

std::size_t **get_os_thread_count**(*threads*::executor const &exec)

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

Parameters **exec** – [in] The executor to be used.

namespace **threads**

hpx::get_thread_name

Defined in header hpx/runtime.hpp[718].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::string **get_thread_name**()

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

hpx/runtime_local/get_worker_thread_num.hpp

Defined in header hpx/runtime_local/get_worker_thread_num.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_local/report_error.hpp

Defined in header hpx/runtime_local/report_error.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[718] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

Functions

void **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e)
The function report_error reports the given exception to the console.

void **report_error**(*std*::exception_ptr const &e)
The function report_error reports the given exception to the console.

hpx/runtime_local/runtime_local.hpp

Defined in header hpx/runtime_local/runtime_local.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

void **set_error_handlers**(*hpx*::*util*::runtime_configuration const &cfg)

class **runtime**

Public Types

using **notification_policy_type** = *threads*::*policies*::callback_notifier
Generate a new notification policy instance for the given thread name prefix

using **hpx_main_function_type** = int()
The *hpx_main_function_type* is the default function type usable as the main HPX thread function.

using **hpx_errorsink_function_type** = void(*std*::uint32_t, *std*::string const&)

Public Functions

virtual *notification_policy_type* **get_notification_policy**(char const *prefix, runtime_local::os_thread_type type)

state **get_state**() const

void **set_state**(state s)

explicit **runtime**(*hpx*::*util*::runtime_configuration rtcfg, bool initialize)
Construct a new HPX runtime instance.

virtual **~runtime**()
The destructor makes sure all HPX runtime services are properly shut down before exiting.

void **on_exit**(*hpx*::*function*<void()> const &f)
Manage list of functions to call on exit.

void **starting**()

Manage runtime 'stopped' state.

void **stopping**()

Call all registered on_exit functions.

bool **stopped**() const

This accessor returns whether the runtime instance has been stopped.

hpx::*util*::runtime_configuration &**get_config**()

access configuration information

hpx::*util*::runtime_configuration const &**get_config**() const

std::size_t **get_instance_number**() const

util::thread_mapper &**get_thread_mapper**() const

Return a reference to the internal PAPI thread manager.

threads::*topology* const &**get_topology**() const

virtual int **run**(*hpx*::*function*<*hpx_main_function_type*> const &func)

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

Note: The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters `func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

virtual int **run**()

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

Returns This function will always return 0 (zero).

virtual void **rethrow_exception**()

Rethrow any stored exception (to be called after *stop()*)

virtual int **start**(*hpx*::*function*<*hpx_main_function_type*> const &func, bool blocking = false)

Start the runtime system.

Parameters

- `func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*.
- `blocking` – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function runtime::start will call runtime::wait internally.

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise, it will return zero.

virtual int **start**(bool blocking = false)

Start the runtime system.

Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function runtime::start will call runtime::wait internally .

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise, it will return zero.

virtual int **wait**()

Wait for the shutdown action to be executed.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

virtual void **stop**(bool blocking = true)

Initiate termination of the runtime system.

Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

virtual int **suspend**()

Suspend the runtime system.

virtual int **resume**()

Resume the runtime system.

virtual int **finalize**(double)

virtual bool **is_networking_enabled**()

Return true if networking is enabled.

virtual *hpx*::*threads*::*threadmanager* &**get_thread_manager**()

Allow access to the thread manager instance used by the HPX runtime.

virtual *std*::string **here**() const

Returns a string of the locality endpoints (usable in debug output)

virtual bool **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

Parameters

- **num_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

virtual bool **report_error**(*std*::exception_ptr const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

Note: This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

Parameters

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.

- **terminate_all** – [in] signal whether all localities should be terminated

virtual void **add_pre_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with *add_startup_function*.

Note: The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters **f** – The function 'f' will be called from inside a HPX thread before hpx_main is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before hpx_main

Parameters **f** – The function 'f' will be called from inside a HPX thread before hpx_main is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

Note: The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters **f** – The function 'f' will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void **add_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during hpx::finalize

Parameters **f** – The function 'f' will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual *hpx*::*util*::*io_service_pool* ***get_thread_pool**(char const *name)

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are "main_pool", "io_pool", "parcel_pool", and "timer_pool". For any other argument value the function will return zero.

virtual bool **register_thread**(char const *name, *std*::size_t num = 0, bool service_thread = true, *error_code* &ec = *throws*)

Register an external OS-thread with HPX.

This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

'main', 'io', 'timer', 'parcel', 'worker'

Note: The function will compose a thread name of the form '<name>-thread#<num>' which is used to register the thread. It is the user's responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

Note: This function should be called for each thread exactly once. It will fail if it is called more than once.

Parameters

- **name** – [in] The name to use for thread registration.
- **num** – [in] The sequence number to use for thread registration. The default for this parameter is zero.
- **service_thread** – [in] The thread should be registered as a service thread. The default for this parameter is 'true'. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will return whether the requested operation succeeded or not.

virtual bool **unregister_thread**()

Unregister an external OS-thread with HPX.

This function will unregister any external OS-thread from HPX.

Note: This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see *register_thread*).

Returns This function will return whether the requested operation succeeded or not.

virtual runtime_local::os_thread_data **get_os_thread_data**(*std*::string const &label) const

Access data for a given OS thread that was previously registered by *register_thread*.

virtual bool **enumerate_os_threads**(*hpx*::*function*<bool(runtime_local::os_thread_data const&)> const &f) const

Enumerate all OS threads that have registered with the runtime.

notification_policy_type::on_startstop_type **on_start_func**() const

notification_policy_type::on_startstop_type **on_stop_func**() const

notification_policy_type::on_error_type **on_error_func**() const

Functions

char const ***get_stack_size_name**(*std*::ptrdiff_t size)

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters **size** – this represents the stack size

std::ptrdiff_t **get_default_stack_size**()

Returns the default stack size.

Get the default stack size in bytes.

std::ptrdiff_t **get_stack_size**(*thread_stacksize*)

Returns the stack size corresponding to the given stack size enumeration.

Get the stack size corresponding to the given stack size enumeration.

Parameters **size** – this represents the stack size

namespace **util**

Functions

bool **retrieve_commandline_arguments**(*hpx*::program_options::options_description const &app_options, *hpx*::program_options::variables_map &vm)

bool **retrieve_commandline_arguments**(*std*::string const &appname, *hpx*::program_options::variables_map &vm)

hpx::register_thread, hpx::unregister_thread, hpx::get_os_thread_data, hpx::enumerate_os_threads, hpx::get_runtime_instance_number, hpx::register_on_exit, hpx::is_starting, hpx::tolerate_node_faults, hpx::is_running, hpx::is_stopped, hpx::is_stopped_or_shutting_down, hpx::get_num_worker_threads, hpx::get_system_uptime

Defined in header hpx/runtime.hpp[719].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

bool **register_thread**(*runtime* *rt, char const *name, *error_code* &ec = *throws*)

Register the current kernel thread with HPX, this should be done once for each external OS-thread intended to invoke HPX functionality. Calling this function more than once will return false.

void **unregister_thread**(*runtime* *rt)

Unregister the thread from HPX, this should be done once in the end before the external thread exists.

runtime_local::os_thread_data **get_os_thread_data**(*std*::string const &label)

Access data for a given OS thread that was previously registered by *register_thread*. This function must be called from a thread that was previously registered with the runtime.

bool **enumerate_os_threads**(*hpx*::*function*<bool(os_thread_data const&)> const &f)

Enumerate all OS threads that have registered with the runtime.

std::size_t **get_runtime_instance_number**()

Return the runtime instance number associated with the runtime instance the current thread is running in.

bool **register_on_exit**(*hpx*::*function*<void()> const&)

Register a function to be called during system shutdown.

[719] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

bool **is_starting**()

Test whether the runtime system is currently being started.

This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is *hpx::state::startup*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

bool **tolerate_node_faults**()

Test if HPX runs in fault-tolerant mode.

This function returns whether the runtime system is running in fault-tolerant mode

bool **is_running**()

Test whether the runtime system is currently running.

This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is *hpx::state::running*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

bool **is_stopped**()

Test whether the runtime system is currently stopped.

This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is *hpx::state::stopped*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

bool **is_stopped_or_shutting_down**()

Test whether the runtime system is currently being shut down.

This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is *hpx::state::stopped* or *hpx::state::shutdown*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

std::size_t **get_num_worker_threads**()

Return the number of worker OS- threads used to execute HPX threads.

This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

std::uint64_t **get_system_uptime**()

Return the system uptime measure on the thread executing this call.

This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

namespace **threads**

hpx/runtime_local/service_executors.hpp

Defined in header hpx/runtime_local/service_executors.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **execution**

Enums

enum class **service_executor_type** : *std*::uint8_t

Values:

enumerator **io_thread_pool**

Selects creating a service executor using the I/O pool of threads

enumerator **parcel_thread_pool**

Selects creating a service executor using the parcel pool of threads

enumerator **timer_thread_pool**

Selects creating a service executor using the timer pool of threads

enumerator **main_thread**

Selects creating a service executor using the main thread

struct **io_pool_executor** : public *service_executor*

Public Functions

io_pool_executor()

struct **main_pool_executor** : public *service_executor*

Public Functions

main_pool_executor()

struct **timer_pool_executor** : public *service_executor*

Public Functions

timer_pool_executor()

hpx::shutdown_function_type, hpx::register_pre_shutdown_function, hpx::register_shutdown_function

Defined in header hpx/runtime.hpp[720].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **shutdown_function_type** = *hpx*::*move_only_function*<void()>

The type of the function which is registered to be executed as a shutdown or pre-shutdown function.

Functions

void **register_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during *hpx::finalize()* but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with *register_pre_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of *hpx::finalize()* before any of the registered shutdown functions are executed (see: hpx::register_shutdown_function()).

[720] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

See also:

hpx::register_shutdown_function()

Note: If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise an invalid_status exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

void **register_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during *hpx::finalize()* but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with *register_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of *hpx::finalize()* after any of the registered pre-shutdown functions are executed (see: hpx::register_pre_shutdown_function()).

See also:

hpx::register_pre_shutdown_function()

Note: If this function is called while the shutdown functions are being executed, or after that point, it will raise an invalid_status exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a shutdown function.

hpx::startup_function_type, hpx::register_pre_startup_function, hpx::register_startup_function

Defined in header hpx/runtime.hpp[721].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **startup_function_type** = *hpx*::*move_only_function*<void()>

The type of the function which is registered to be executed as a startup or pre-startup function.

[721] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

Functions

void **register_pre_startup_function**(*startup_function_type* f)

Add a function to be executed by a HPX thread before hpx_main but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with *register_pre_startup_function* are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see hpx::register_startup_function()).

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

hpx::register_startup_function()

Note: If this function is called while the pre-startup functions are being executed or after that point, it will raise aninvalid_status exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a pre-startup function.

void **register_startup_function**(*startup_function_type* f)

Add a function to be executed by a HPX thread before hpx_main but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with *register_startup_function* are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: hpx::register_pre_startup_function()), but before *hpx_main* is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

hpx::register_pre_startup_function()

Note: If this function is called while the startup functions are being executed or after that point, it will raise an invalid_status exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a startup function.

hpx/runtime_local/thread_hooks.hpp

Defined in header hpx/runtime_local/thread_hooks.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

threads::*policies*::callback_notifier::on_startstop_type **get_thread_on_start_func**()

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *register_thread_on_start_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::*policies*::callback_notifier::on_startstop_type **get_thread_on_stop_func**()

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *register_thread_on_stop_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::*policies*::callback_notifier::on_error_type **get_thread_on_error_func**()

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *register_thread_on_error_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::*policies*::callback_notifier::on_startstop_type **register_thread_on_start_func**(*threads*::*policies*::callback_notifier: &&f)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *get_thread_on_start_func*).

Note: This function can be called before the HPX runtime is initialized.

Parameters `f` – The function to install as the new start handler.

Returns The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::*policies*::callback_notifier::on_startstop_type **`register_thread_on_stop_func`**(*threads*::*policies*::callback_notifier::o &&f)

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *get_thread_on_stop_func*).

Note: This function can be called before the HPX runtime is initialized.

Parameters `f` – The function to install as the new stop handler.

Returns The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::*policies*::callback_notifier::on_error_type **`register_thread_on_error_func`**(*threads*::*policies*::callback_notifier::on &&f)

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *get_thread_on_error_func*).

Note: This function can be called before the HPX runtime is initialized.

Parameters `f` – The function to install as the new error handler.

Returns The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

hpx/runtime_local/thread_pool_helpers.hpp

Defined in header hpx/runtime_local/thread_pool_helpers.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resource**

Functions

std::size_t **get_num_thread_pools**()

Return the number of thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads**()

Return the number of threads in all thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std*::string const &pool_name)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std*::size_t pool_index)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_pool_index**(*std*::string const &pool_name)

Return the internal index of the pool given its name.

std::string const &**get_pool_name**(*std*::size_t pool_index)

Return the name of the pool given its internal index.

threads::*thread_pool_base* &**get_thread_pool**(*std*::string const &pool_name)

Return the name of the pool given its name.

threads::*thread_pool_base* &**get_thread_pool**(*std*::size_t pool_index)

Return the thread pool given its internal index.

bool **pool_exists**(*std*::string const &pool_name)

Return true if the pool with the given name exists.

bool **pool_exists**(*std*::size_t pool_index)

Return true if the pool with the given index exists.

namespace **threads**

Functions

std::int64_t **get_thread_count**(*thread_schedule_state* state = *thread_schedule_state*::*unknown*)

The function *get_thread_count* returns the number of currently known threads.

Note: If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters state – [in] This specifies the thread-state for which the number of threads should be retrieved.

std::int64_t **get_thread_count**(*thread_priority* priority, *thread_schedule_state* state = *thread_schedule_state*::*unknown*)

The function *get_thread_count* returns the number of currently known threads.

Note: If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

- **priority** – [in] This specifies the thread-priority for which the number of threads should be retrieved.
- **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

std::int64_t **get_idle_core_count**()

The function *get_idle_core_count* returns the number of currently idling threads (cores).

mask_type **get_idle_core_mask**()

The function *get_idle_core_mask* returns a bit-mask representing the currently idling threads (cores).

bool **enumerate_threads**(*hpx*::*function*<bool(thread_id_type)> const &f, *thread_schedule_state* state = *thread_schedule_state*::*unknown*)

The function *enumerate_threads* will invoke the given function *f* for each thread with a matching thread state.

Parameters

- **f** – [in] The function which should be called for each matching thread. Returning 'false' from this function will stop the enumeration process.
- **state** – [in] This specifies the thread-state for which the threads should be enumerated.

serialization

synchronization

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::barrier

Defined in header hpx/barrier.hpp[722].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

template<typename **OnCompletion** = detail::empty_oncompletion>

class **barrier**

#include <barrier.hpp> A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note] Each barrier phase consists of the following steps:

- The expected count is decremented by each call to arrive or arrive_and_drop.
- When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the CompletionFunction template parameter, the completion step is run as part of the call to arrive or arrive_and_drop that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
- When the completion step finishes, the expected count is reset to what was specified by the expected argument to the constructor, possibly adjusted by calls to arrive_and_drop, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling wait, and will remain blocked until the phase completion step is run. The phase completion step that is executed at the end of each phase has the following effects:

[722] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/barrier.hpp

- Invokes the completion function, equivalent to completion().
- Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the CompletionFunction template parameter, the behavior is undefined if any of the barrier object's member functions other than wait are called while the completion step is in progress.

Concurrent invocations of the member functions of barrier, other than its destructor, do not introduce data races. The member functions arrive and arrive_and_drop execute atomically.

CompletionFunction shall meet the Cpp17MoveConstructible (Table 28) and Cpp17Destructible (Table 32) requirements. std::is_nothrow_invocable_v<CompletionFunction&> shall be true.

The default value of the CompletionFunction template parameter is an unspecified type, such that, in addition to satisfying the requirements of CompletionFunction, it meets the Cpp17DefaultConstructible requirements (Table 27) and completion() has no effects.

barrier::arrival_token is an unspecified type, such that it meets the Cpp17MoveConstructible (Table 28), Cpp17MoveAssignable (Table 30), and Cpp17Destructible (Table 32) requirements.

Public Types

using **arrival_token** = bool

Public Functions

inline explicit constexpr **barrier**(*std*::ptrdiff_t expected, *OnCompletion* completion = *OnCompletion*())

Preconditions: expected >= 0 is true and expected <= max() is true.

Effects: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to expected. Initializes completion with std::move(f). Starts the first phase. [Note: If expected is 0 this object can only be destroyed.- end note]

Throws: Any exception thrown by CompletionFunction's move constructor.

~barrier() = default

inline *arrival_token* **arrive**(*std*::ptrdiff_t update = 1)

Preconditions: update > 0 is true, and update is less than or equal to the expected count for the current barrier phase.

Effects: Constructs an object of type arrival_token that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by update.

Synchronization: The call to arrive strongly happens before the start of the phase completion step for the current phase.

Error conditions: Any of the error conditions allowed for mutex types([thread.mutex.requirements.mutex]). [Note: This call can cause the completion step for the current phase to start.- end note]

Throws `system_error` – when an exception is required ([thread.req.exception]).

Returns : The constructed arrival_token object.

inline void **wait**(*arrival_token* &&old_phase) const

Preconditions: arrival is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

Effects: Blocks at the synchronization point associated with HPX_MOVE(arrival) until the phase completion step of the synchronization point's phase is run. [Note: If arrival is associated with the synchronization point for a previous phase, the call returns immediately. - end note]

Throws `system_error` – when an exception is required ([thread.req.exception]). Error conditions: Any of the error conditions allowed for mutex types ([thread.mutex.requirements.mutex]).

inline void **arrive_and_wait**()

Effects: Equivalent to: wait(arrive()).

inline void **arrive_and_drop**()

Preconditions: The expected count for the current barrier phase is greater than zero.

Effects: Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

Synchronization: The call to arrive_and_drop strongly happens before the start of the phase completion step for the current phase.

Throws `system_error` – when an exception is required ([thread.req.exception]).Error conditions: Any of the error conditions allowed for mutex types ([thread.mutex.requirements.mutex]). [Note: This call can cause the completion step for the current phase to start.- end note]

hpx::binary_semaphore

Defined in header hpx/semaphore.hpp[723].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **binary_semaphore**

#include <binary_semaphore.hpp> A binary semaphore is a semaphore object that has only two states. binary_semaphore is an alias for specialization of hpx::counting_semaphore with *LeastMaxValue* being 1. HPX's implementation of binary_semaphore is more efficient than the default implementation of a counting semaphore with a unit resource count (hpx::counting_semaphore).

Public Functions

binary_semaphore(*binary_semaphore* const&) = delete

binary_semaphore &**operator=**(*binary_semaphore* const&) = delete

binary_semaphore(*binary_semaphore*&&) = delete

binary_semaphore &**operator=**(*binary_semaphore*&&) = delete

explicit **binary_semaphore**(*std*::ptrdiff_t value = 1)

Constructs an object of type hpx::binary_semaphore with the internal counter initialized to *value*.

Parameters **value** – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

~binary_semaphore() = default

void **release**(*std*::ptrdiff_t update = 1)

Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of *try_acquire* that observe the result of the effects.

Throws `std::system_error` –

Parameters **update** – the amount to increment the internal counter by

Pre Both `update >= 0` and `update <= max() - counter` are *true*, where *counter* is the value of the internal counter.

bool **try_acquire**() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns *true* if it decremented the internal counter, otherwise *false*

[723] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/semaphore.hpp

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates try_acquire. If the result is true, returns.

Blocks on *this until counter is greater than zero.

Throws `std::system_error` –

Returns *void*.

bool **try_acquire_until**(*hpx*::*chrono*::steady_time_point const &abs_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters **abs_time** – the earliest time the function must wait until in order to fail

Throws `std::system_error` –

Returns *true* if it decremented the internal counter, otherwise *false*.

bool **try_acquire_for**(*hpx*::*chrono*::steady_duration const &rel_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws `std::system_error` –

Parameters **rel_time** – the minimum duration the function must wait for to fail

Returns *true* if it decremented the internal counter, otherwise false

Public Static Functions

static constexpr *std*::ptrdiff_t **max**() noexcept

Returns The maximum value of counter. This value is greater than or equal to *LeastMaxValue*.

Returns The internal counter's maximum possible value, as a *std::ptrdiff_t*.

hpx::condition_variable, hpx::condition_variable_any, hpx::cv_status

Defined in header hpx/condition_variable.hpp[724].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **cv_status**

The scoped enumeration *hpx::cv_status* describes whether a timed wait returned because of timeout or not. *hpx::cv_status* is used by the *wait_for* and *wait_until* member functions of hpx::condition_variable and hpx::condition_variable_any.

Values:

[724] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/condition_variable.hpp

enumerator **no_timeout**

The condition variable was awakened with *notify_all*, *notify_one*, or spuriously

enumerator **timeout**

the condition variable was awakened by timeout expiration

enumerator **error**

there was an error

class **condition_variable**

#include <condition_variable.hpp> The condition_variable class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the condition_variable.

The thread that intends to modify the shared variable has to

i. acquire a hpx::mutex (typically via *std::lock_guard*)

ii. perform the modification while the lock is held

iii. execute *notify_one* or *notify_all* on the *condition_variable* (the lock does not need to be held for notification)

Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on condition_variable has to

i. acquire a *std::unique_lock<hpx::mutex>*, on the same mutex as used to protect the shared variable

ii. either

   A. check the condition, in case it was already updated and notified

   B. execute *wait*, *await_for*, or *wait_until*. The wait operations atomically release the mutex and suspend the execution of the thread.

   C. When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake up was spurious. or

   A. use the predicated overload of *wait*, *wait_for*, and *wait_until*, which takes care of the three steps above.

hpx::condition_variable works only with *std::unique_lock<hpx::mutex>*. This restriction allows for maximal efficiency on some platforms. hpx::condition_variable_any provides a condition variable that works with any BasicLockable[725] object, such as *std::shared_lock*.

Condition variables permit concurrent invocation of the *wait*, *wait_for*, *wait_until*, *notify_one* and *notify_all* member functions.

The class hpx::condition_variable is a StandardLayoutType[726]. It is not CopyConstructible[727], MoveConstructible[728], CopyAssignable[729], or MoveAssignable[730].

Public Functions

inline **condition_variable**()

Construct an object of type hpx::condition_variable.

~condition_variable() = default

Destroys the object of type hpx::condition_variable.

IOW, ~condition_variable() can execute before a signaled thread returns from a wait. If this happens with condition_variable, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the condition_variable object and the member functions *wait* (*wait_for*, etc.).

Note: Preconditions: There is no thread blocked on *this. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait.This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction.The user should take care to ensure that no threads wait on *this once the destructor has been started, especially when the waiting threads are calling the *wait* functions in a loop or using the overloads of *wait*, *wait_for*, or *wait_until* that take a predicate. end note]

---

condition_variable(*condition_variable* const&) = delete

condition_variable(*condition_variable*&&) = delete

condition_variable &**operator=**(*condition_variable* const&) = delete

condition_variable &**operator=**(*condition_variable*&&) = delete

inline void **notify_one**(*error_code* &ec = *throws*) const

If any threads are waiting on **this*, calling *notify_one* unblocks one of the waiting threads.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns *notify_one* returns *void*.

inline void **notify_all**(*error_code* &ec = *throws*) const

Unblocks all threads currently waiting for **this*.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns *notify_all* returns *void*.

template<typename **Mutex**>
inline void **wait**(*std*::unique_lock<*Mutex*> &lock, *error_code* &ec = *throws*)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when notify_all() or notify_one() is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters **Mutex** – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns *wait* returns *void*.

template<typename **Mutex**, typename **Predicate**>
inline void **wait**(*std*::unique_lock<*Mutex*> &lock, *Predicate* pred, *error_code*& = *throws*)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

```
while (!pred()) {
    wait(lock);
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after *wait(lock)* exits, which means that lock can be used to guard access to *pred()*.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **pred** – Predicate which returns *false* if the waiting should be continued (bool(pred())==false). The signature of the predicate function should be equivalent to the following: `bool pred();`

Returns *wait* returns *void*.

template<typename **Mutex**>
inline *cv_status* **wait_until**(*std*::unique_lock<*Mutex*> &lock, *hpx*::*chrono*::steady_time_point const &abs_time, *error_code* &ec = *throws*)

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when notify_all() or notify_one() is executed, or when the absolute time point *abs_time* is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and *wait_until* exits.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters **Mutex** – Type of mutex to wait on.

Parameters
- **lock** – *unique_lock* that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns cv_status *wait_until* returns *hpx::cv_status::timeout* if the absolute timeout specified by *abs_time* was reached and *hpx::cv_status::no_timeout* otherwise.

template<typename **Mutex**, typename **Predicate**>
inline bool **wait_until**(*std*::unique_lock<*Mutex*> &lock, *hpx*::*chrono*::steady_time_point const &abs_time, *Predicate* pred, *error_code* &ec = *throws*)

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

```
while (!pred()) {
    if (wait_until(lock, abs_time) == hpx::cv_status::timeout) {
        return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters
- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters
- **lock** – *unique_lock* that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **pred** – Predicate which returns *false* if the waiting should be continued (bool(pred())==false). The signature of the predicate function should be equivalent to the following: `bool pred();`
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *wait_until* returns *false* if the predicate *pred* still evaluates to false after the *abs_time* timeout has expired, otherwise *true*. If the timeout had already expired, evaluates and returns the result of *pred*.

template<typename **Mutex**>
inline *cv_status* **wait_for**(*std*::unique_lock<*Mutex*> &lock, *hpx*::*chrono*::steady_duration const &rel_time, *error_code* &ec = *throws*)

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when notify_all() or notify_one() is executed, or when the relative timeout *rel_time* expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait_for() exits.

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

B. Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

Template Parameters **Mutex** – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns cv_status *hpx::cv_status::timeout* if the relative timeout specified by *rel_time* expired, *hpx::cv_status::no_timeout* otherwise.

template<typename **Mutex**, typename **Predicate**>
inline bool **wait_for**(*std*::unique_lock<*Mutex*> &lock, *hpx*::*chrono*::steady_duration const &rel_time, *Predicate* pred, *error_code* &ec = *throws*)

Equivalent to.

```
return wait_until(lock,
          hpx::chrono::steady_clock::now() + rel_time,
          hpx::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (bool(pred())==true).

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **pred** – Predicate which returns *false* if the waiting should be continued (bool(pred())==false). The signature of the predicate function should be equivalent to the following: `bool pred();`
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *wait_for* returns *false* if the predicate pred still evaluates to *false* after the *rel_time* timeout expired, otherwise *true*.

class **condition_variable_any**

#include <condition_variable.hpp> The condition_variable_any class is a generalization of hpx::condition_variable. Whereas hpx::condition_variable works only on *std::unique_lock<std::mutex>*, *a condition_variable_any* can operate on any lock that meets the BasicLockable[731] requirements.

See hpx::condition_variable for the description of the semantics of condition variables. It is not CopyConstructible[732], MoveConstructible[733], CopyAssignable[734], or MoveAssignable[735].

Public Functions

inline **condition_variable_any**()

Constructs an object of type hpx::condition_variable_any.

~condition_variable_any() = default

Destroys the object of type hpx::condition_variable_any.

It is only safe to invoke the destructor if all threads have been notified. It is not required that they have exited their respective wait functions: some threads may still be waiting to reacquire the associated lock, or may be waiting to be scheduled to run after reacquiring it.

The programmer must ensure that no threads attempt to wait on **this* once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or are using the overloads of the wait functions that take a predicate.

Preconditions: There is no thread blocked on *this. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait.This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on **this* once the destructor has been started, especially when the waiting threads are calling the *wait* functions in a loop or using the overloads of *wait*, *wait_for*, or *wait_until* that take a predicate. end note]

IOW, ~condition_variable_any() can execute before a signaled thread returns from a wait. If this happens with condition_variable_any, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the condition_variable_any object and the member functions wait (*wait_for*, etc.).

condition_variable_any(*condition_variable_any* const&) = delete

condition_variable_any(*condition_variable_any*&&) = delete

condition_variable_any &**operator=**(*condition_variable_any* const&) = delete

condition_variable_any &**operator=**(*condition_variable_any*&&) = delete

inline void **notify_one**(*error_code* &ec = *throws*) const

If any threads are waiting on **this*, calling *notify_one* unblocks one of the waiting threads.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock. However, some implementations (in particular many implementations of pthreads) recognize this situation and avoid this "hurry up and wait" scenario by transferring the waiting thread from the condition variable's queue directly to the queue of the mutex within the notify call, without waking it up.

Notifying while under the lock may nevertheless be necessary when precise scheduling of events is required, e.g. if the waiting thread would exit the program if the condition is satisfied, causing destruction of the notifying thread's condition variable. A spurious wakeup after mutex unlock but before notify would result in notify called on a destroyed object.

Note: The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns *notify_one* returns *void*.

inline void **notify_all**(*error_code* &ec = *throws*) const

Unblocks all threads currently waiting for **this*.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock.

Note: The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns *notify_all* returns *void*.

template<typename **Lock**>
inline void **wait**(*Lock* &lock, *error_code* &ec = *throws*)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when notify_all() or notify_one() is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

The effects of *notify_one()*/notify_all() and each of the three atomic parts of *wait()*/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Note: If these functions fail to meet the postconditions (lock is locked by the calling thread), std::terminate is called. For example, this could happen if re-locking the mutex throws an exception.

Template Parameters **Lock** – Type of *lock*.

Parameters
- **lock** – An object of type Lock that meets the BasicLockable[736] requirements, which must be locked by the current thread
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special'throw on error' *error_code*.

Returns *wait* returns *void*.

template<typename **Lock**, typename **Predicate**>
inline void **wait**(*Lock* &lock, *Predicate* pred, *error_code*& = *throws*)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

Equivalent to

```
while (!pred()) {
    wait(lock);
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after *wait(lock)* exits, which means that lock can be used to guard access to *pred()*.

The effects of *notify_one()*/notify_all() and each of the three atomic parts of *wait()*/wait_for()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Note: If these functions fail to meet the postconditions (lock is locked by the calling thread), std::terminate is called. For example, this could happen if re-locking the mutex throws an exception.

Template Parameters
- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters
- **lock** – an object of type Lock that meets the BasicLockable[737] requirements, which must be locked by the current thread

- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred()`.

Returns *wait* returns *void*.

template<typename **Lock**>
inline *cv_status* **wait_until**(*Lock* &lock, *hpx*::*chrono*::steady_time_point const &abs_time, *error_code* &ec = *throws*)

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when notify_all() or notify_one() is executed, or when the absolute time point *abs_time* is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and *wait_until* exits.

Note: The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters **Lock** – Type of *lock*.

Parameters

- **lock** – an object of type *Lock* that meets the requirements of BasicLockable[738], which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **ec** – used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns cv_status *hpx::cv_status::timeout* if the absolute timeout specified by *abs_time* was reached, *hpx::cv_status::no_timeout* otherwise.

template<typename **Lock**, typename **Predicate**>
inline bool **wait_until**(*Lock* &lock, *hpx*::*chrono*::steady_time_point const &abs_time, *Predicate* pred, *error_code* &ec = *throws*)

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Equivalent to

```
while (!pred()) {
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout) {
       return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

Note: The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters
- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters
- **lock** – an object of type *Lock* that meets the requirements of BasicLockable[739], which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **pred** – predicate which returns *false* if the waiting should be continued `(bool(pred()) == false)`. The signature of the predicate function should be equivalent to the following: `bool pred();`.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *false* if the predicate *pred* still evaluates to *false* after the *abs_time* timeout expired, otherwise true. If the timeout had already expired, evaluates and returns the result of *pred*.

template<typename **Lock**>
inline *cv_status* **wait_for**(*Lock* &lock, *hpx*::*chrono*::steady_duration const &rel_time, *error_code* &ec = *throws*)

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when notify_all() or notify_one() is executed, or when the relative timeout *rel_time* expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, *lock* is reacquired and wait_for() exits.

The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Note: Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

Template Parameters **Lock** – Type of *lock*.

Parameters
- **lock** – an object of type *Lock* that meets the BasicLockable[740] requirements, which must be locked by the current thread.
- **rel_time** – an object of type *hpx::chrono::duration* representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns cv_status *hpx::cv_status::timeout* if the relative timeout specified by *rel_time* expired, *hpx::cv_status::no_timeout* otherwise.

template<typename **Lock**, typename **Predicate**>
inline bool **wait_for**(*Lock* &lock, *hpx*::*chrono*::steady_duration const &rel_time, *Predicate* pred, *error_code* &ec = *throws*)

Equivalent to.

```
return wait_until(lock,
    hpx::chrono::steady_clock::now() + rel_time,
    std::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (`bool(pred()) == true`).

Note: The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters
- **`Lock`** – Type of *lock*.
- **`Predicate`** – Type of *pred*.

Parameters
- **`lock`** – an object of type *Lock* that meets the BasicLockable[741] requirements,which must be locked by the current thread.
- **`rel_time`** – an object of type *hpx::chrono::duration* representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **`pred`** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`.
- **`ec`** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *false* if the predicate *pred* still evaluates to *false* after the *rel_time* timeout expired, otherwise *true*.

template<typename **Lock**, typename **Predicate**>
inline bool **wait**(*Lock* &lock, *stop_token* stoken, *Predicate* pred, *error_code* &ec = *throws*)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (bool(pred())==true).

An interruptible wait: registers the condition_variable_any for the duration of wait(), to be notified if a stop request is made on the given stoken's associated stop-state; it is then equivalent to

```
while (!stoken.stop_requested()) {
    if (pred()) return true;
    wait(lock);
}
return pred();
```

Note that the returned value indicates whether *pred* evaluated to *true*, regardless of whether there was a stop requested or not.

Note: The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (`unlock+wait, wakeup, and lock`) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **`Lock`** – Type of *lock*.
- **`Predicate`** – Type of *pred*.

Parameters

- **`lock`** – an object of type Lock that meets the BasicLockable[742] requirements, which must be locked by the current thread
- **`stoken`** – a hpx::stop_token to register interruption for
- **`pred`** – predicate which returns `false` if the waiting should be continued `(bool(pred()) == false)`. The signature of the predicate function should be equivalent to the following: `bool pred()`.
- **`ec`** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool result of *pred()*.

template<typename **`Lock`**, typename **`Predicate`**>
inline bool **`wait_until`**(*Lock* &lock, *stop_token* stoken, *hpx*::*chrono*::steady_time_point const &abs_time, *Predicate* pred, *error_code* &ec = *throws*)

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied `(bool(pred()) == true)`.

An interruptible wait: registers the condition_variable_any for the duration of wait_until(), to be notified if a stop request is made on the given stoken's associated stop-state; it is then equivalent to

```
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout)
        return pred();
}
return pred();
```

Note: The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters

- **`Lock`** – Type of *lock*.
- **`Predicate`** – Type of *pred*.

Parameters

- **`lock`** – an object of type *Lock* that meets the requirements of BasicLockable[743], which must be locked by the current thread.
- **`stoken`** – a hpx::stop_token to register interruption for.
- **`abs_time`** – represents the time when waiting should be stopped.
- **`pred`** – predicate which returns *false* if the waiting should be continued `(bool(pred()) == false)`. The signature of the predicate function should be equivalent to the following: `bool pred();`.

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *pred()*, regardless of whether the timeout was met or stop was requested.

template<typename **Lock**, typename **Predicate**>
inline bool **wait_for**(*Lock* &lock, *stop_token* stoken, *hpx*::*chrono*::steady_duration const &rel_time, *Predicate* pred, *error_code* &ec = *throws*)

Equivalent to.

```
return wait_until(lock, std::move(stoken),
    hpx::chrono::steady_clock::now() + rel_time,
    std::move(pred));
```

Note: The effects of notify_one()/*notify_all*() and each of the three atomic parts of wait()/*wait_for*()/wait_until() (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for notify_one() to, for example, be delayed and unblock a thread that started waiting just after the call to notify_one() was made.

Template Parameters
- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters
- **lock** – an object of type *Lock* that meets the BasicLockable[744] requirements, which must be locked by the current thread.
- **stoken** – a hpx::stop_token to register interruption for.
- **rel_time** – an object of type *hpx::chrono::duration* representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **pred** – predicate which returns *false* if the waiting should be continued `(bool(pred()) == false)`. The signature of the predicate function should be equivalent to the following: `bool pred();`.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *pred()*, regardless of whether the timeout was met or stop was requested.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike hpx::mutex a counting_semaphore is not tied to threads of execution — acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on counting_semaphore can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template counting_semaphore maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of hpx::counting_semaphore are not DefaultConstructible[746], CopyConstructible[747], MoveConstructible[748], CopyAssignable[749], or MoveAssignable[750].

Note: counting_semaphore*'s* try_acquire() can spuriously fail.

Template Parameters **`LeastMaxValue`** – counting_semaphore allows more than one concurrent access to the same resource, for at least *LeastMaxValue* concurrent accessors. As its name indicates, the *LeastMaxValue* is the minimum max value, not the actual max value. Thus max() can yield a number larger than *LeastMaxValue*.

Public Functions

`counting_semaphore`(*counting_semaphore* const&) = delete

counting_semaphore &**`operator=`**(*counting_semaphore* const&) = delete

`counting_semaphore`(*counting_semaphore*&&) = delete

counting_semaphore &**`operator=`**(*counting_semaphore*&&) = delete

explicit **`counting_semaphore`**(*std*::ptrdiff_t value)

Constructs an object of type hpx::counting_semaphore with the internal counter initialized to *value*.

Parameters **`value`** – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

`~counting_semaphore`() = default

void **`release`**(*std*::ptrdiff_t update = 1)

Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of *try_acquire* that observe the result of the effects.

Throws *std*::system_error –

Parameters **update** – the amount to increment the internal counter by

Pre Both update >= 0 and update <= *max()* - counter are *true*, where *counter* is the value of the internal counter.

bool **try_acquire**() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns *true* if it decremented the internal counter, otherwise *false*

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates try_acquire. If the result is true, returns.
- Blocks on *this until counter is greater than zero.

Throws *std*::system_error –

Returns *void*.

bool **try_acquire_until**(*hpx*::*chrono*::steady_time_point const &abs_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters **abs_time** – the earliest time the function must wait until in order to fail

Throws *std*::system_error –

Returns *true* if it decremented the internal counter, otherwise *false*.

bool **try_acquire_for**(*hpx*::*chrono*::steady_duration const &rel_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws *std*::system_error –

Parameters **rel_time** – the minimum duration the function must wait for to fail

Returns *true* if it decremented the internal counter, otherwise false

Public Static Functions

static constexpr *std*::ptrdiff_t **max**() noexcept

Returns The maximum value of counter. This value is greater than or equal to *LeastMaxValue*.

Returns The internal counter's maximum possible value, as a *std::ptrdiff_t*.

template<typename **Mutex** = *hpx*::*spinlock*, int **N** = 0>

class **counting_semaphore_var**

#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike hpx::mutex a counting_semaphore_var is not tied to threads of execution — acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on counting_semaphore_var can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template counting_semaphore_var maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of hpx::counting_semaphore_var are not DefaultConstructible[751], CopyConstructible[752], MoveConstructible[753], CopyAssignable[754], or MoveAssignable[755].

Note: counting_semaphore_var*'s* try_acquire() can spuriously fail.

Template Parameters

- **`Mutex`** – Type of mutex
- **`N`** – The initial value of the internal semaphore lock count.

Public Functions

explicit **`counting_semaphore_var`**(*std*::ptrdiff_t value = *N*)

Constructs an object of type *hpx::counting_semaphore_value* with the internal counter initialized to *N*.

Parameters **`value`** – The initial value of the internal semaphore lock count. Normally this value should be zero, values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set. Defaults to *N* (which in turn defaults to zero).

`counting_semaphore_var`(*counting_semaphore_var* const&) = delete

counting_semaphore_var &**`operator=`**(*counting_semaphore_var* const&) = delete

void **`wait`**(*std*::ptrdiff_t count = 1)

Wait for the semaphore to be signaled.

Parameters **`count`** – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

bool **`try_wait`**(*std*::ptrdiff_t count = 1)

Try to wait for the semaphore to be signaled.

Parameters **`count`** – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

Returns *try_wait* returns true if the calling thread was able to acquire the requested amount of credits. *try_wait* returns false if not sufficient credits are available at this point in time.

void **signal**(*std*::ptrdiff_t count = 1)

Signal the semaphore.

Parameters **count** – The value by which the internal lock count will be incremented.

std::ptrdiff_t **signal_all**()

Unblock all acquirers.

Returns std::ptrdiff_t internal lock count after the operation.

void **release**(*std*::ptrdiff_t update = 1)

Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of *try_acquire* that observe the result of the effects.

Throws `std::system_error` –

Parameters **update** – the amount to increment the internal counter by

Pre Both `update >= 0` and `update <= max() - counter` are *true*, where *counter* is the value of the internal counter.

bool **try_acquire**() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns *true* if it decremented the internal counter, otherwise *false*

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates try_acquire. If the result is true, returns.

Blocks on *this until counter is greater than zero.

Throws `std::system_error` –

Returns *void*.

bool **try_acquire_until**(*hpx*::*chrono*::steady_time_point const &abs_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters **abs_time** – the earliest time the function must wait until in order to fail

Throws `std::system_error` –

Returns *true* if it decremented the internal counter, otherwise *false*.

bool **try_acquire_for**(*hpx*::*chrono*::steady_duration const &rel_time)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws `std::system_error` –

Parameters **rel_time** – the minimum duration the function must wait for to fail

Returns *true* if it decremented the internal counter, otherwise false

Public Static Functions

static constexpr *std*::ptrdiff_t **max()** noexcept

Returns The maximum value of counter. This value is greater than or equal to *LeastMaxValue*.

Returns The internal counter's maximum possible value, as a *std::ptrdiff_t*.

Private Types

using **mutex_type** = *Mutex*

hpx/synchronization/event.hpp

Defined in header hpx/synchronization/event.hpp.

hpx::latch

Defined in header hpx/latch.hpp[756].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **latch**

#include <latch.hpp> Latches are a thread coordination mechanism that allow one or more threads to block until an operation is completed. An individual latch is a single-use object; once the operation has been completed, the latch cannot be reused.

Subclassed by *hpx::lcos::local::latch*

[756] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/latch.hpp

Public Functions

latch(*latch* const&) = delete

latch(*latch*&&) = delete

latch &**operator=**(*latch* const&) = delete

latch &**operator=**(*latch*&&) = delete

inline explicit **latch**(*std*::ptrdiff_t count)

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

~latch() = default

Requires: No threads are blocked at the synchronization point.

Note: May be called even if some threads have not yet returned from *wait()* or count_down_and_wait(), provided that counter_ is 0.

Note: The destructor might not return until all threads have exited *wait()* or count_down_and_wait().

Note: It is the caller's responsibility to ensure that no other thread enters *wait()* after one thread has called the destructor. This may require additional coordination.

---

inline void **count_down**(*std*::ptrdiff_t update)

Decrements counter_ by n. Does not block.

Requires: counter_ >= n and n >= 0.

Synchronization: Synchronizes with all calls that block on this latch and with all try_wait calls on this latch that return true .

Throws `Nothing.` –

inline bool **try_wait**() const noexcept

Returns: With very low probability false. Otherwise counter == 0.

inline void **wait**() const

If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.

Throws `Nothing.` –

inline void **arrive_and_wait**(*std*::ptrdiff_t update = 1)

Effects: Equivalent to: count_down(update); *wait()*;

Public Static Functions

static inline constexpr std::ptrdiff_t() max () noexcept

Returns: The maximum value of counter that the implementation supports.

Protected Types

using **mutex_type** = *hpx*::*spinlock*

Protected Attributes

mutable *util*::cache_line_data<*mutex_type*> **mtx_**

mutable *util*::cache_line_data<*hpx*::*lcos*::*local*::detail::condition_variable> **cond_**

std::atomic<*std*::ptrdiff_t> **counter_**

bool **notified_**

namespace **lcos**

namespace **local**

class **latch** : public *hpx*::*latch*

#include <latch.hpp> A latch maintains an internal counter_ that is initialized when the latch is created. Threads may block at a synchronization point waiting for counter_ to be decremented to 0. When counter_ reaches 0, all such blocked threads are released.

Calls to countdown_and_wait() , *count_down()* , *wait()* , *is_ready()*, *count_up()* , and *reset()* behave as atomic operations.

Note: A hpx::latch is not an LCO in the sense that it has no global id and it can't be triggered using the action (parcel) mechanism. Use hpx::distributed::latch instead if this is required. It is just a low level synchronization primitive allowing to synchronize a given number of *threads*.

Public Functions

HPX_NON_COPYABLE(*latch*)

inline explicit **latch**(*std*::ptrdiff_t count)

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

~latch() = default

Requires: No threads are blocked at the synchronization point.

Note: May be called even if some threads have not yet returned from *wait()* or *count_down_and_wait()*, provided that counter_ is 0.

Note: The destructor might not return until all threads have exited *wait()* or *count_down_and_wait()*.

Note: It is the caller's responsibility to ensure that no other thread enters *wait()* after one thread has called the destructor. This may require additional coordination.

---

inline void **count_down_and_wait**()

Decrements counter_ by 1 . Blocks at the synchronization point until counter_ reaches 0.

Requires: counter_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all is_ready calls on this latch that return true.

Throws `Nothing.` –

inline bool **is_ready**() const noexcept

Returns: counter_ == 0. Does not block.

Throws `Nothing.` –

inline void **abort_all**() const

inline void **count_up**(*std*::ptrdiff_t n)

Increments counter_ by n. Does not block.

Requires: n >= 0.

Throws `Nothing.` –

inline void **reset**(*std*::ptrdiff_t n)

Reset counter_ to n. Does not block.

Requires: n >= 0.

Throws `Nothing.` –

inline bool **reset_if_needed_and_count_up**(*std*::ptrdiff_t n, *std*::ptrdiff_t count)

Effects: Equivalent to: if (*is_ready()*) reset(count); count_up(n); Returns: true if the latch was reset

hpx::mutex, hpx::timed_mutex

Defined in header hpx/mutex.hpp[757].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **mutex**

#include <mutex.hpp> mutex class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. *mutex* offers exclusive, non-recursive ownership semantics:

- A calling thread owns a mutex from the time that it successfully calls either *lock* or *try_lock* until it calls *unlock*.
- When a thread owns a *mutex*, all other threads will block (for calls to *lock*) or receive a *false* return value (for *try_lock*) if they attempt to claim ownership of the *mutex*.
- A calling thread must not own the *mutex* prior to calling *lock* or *try_lock*.

The behavior of a program is undefined if a *mutex* is destroyed while still owned by any threads, or a thread terminates while owning a *mutex*. The mutex class satisfies all requirements of Mutex[758] and StandardLayoutType[759].

hpx::mutex is neither copyable nor movable.

Subclassed by *hpx::timed_mutex*

Public Functions

HPX_NON_COPYABLE(*mutex*)

hpx::mutex is neither copyable nor movable

inline HPX_HOST_DEVICE_CONSTEXPR **mutex**(char const*const = "") noexcept

Constructs the *mutex*. The *mutex* is in unlocked state after the constructor completes.

Note: Because the default constructor is *constexpr*, static mutexes are initialized as part of static non-local initialization, before any dynamic non-local initialization begins. This makes it safe to lock a *mutex* in a constructor of any static object.

Parameters description – description of the *mutex*.

~mutex()

Destroys the *mutex*. The behavior is undefined if the *mutex* is owned by any thread or if any thread terminates while holding any ownership of the *mutex*.

void **lock**(char const *description, *error_code* &ec = *throws*)

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and

[757] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/mutex.hpp

throws a *std::system_error* with error condition *resource_deadlock_would_occur* instead of deadlocking. Prior unlock() operations on the same mutex synchronize- with (as defined in *std::memory_order*) this operation.

Note: lock() is usually not called directly: *std::unique_lock*, *std::scoped_lock*, and *std::lock_guard* are used to manage exclusive locking.

Parameters
- **`description`** – Description of the *mutex*
- **`ec`** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns void *lock* returns *void*.

inline void **`lock`**(*error_code* &ec = *throws*)

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and throws a *std::system_error* with error condition *resource_deadlock_would_occur* instead of deadlocking. Prior unlock() operations on the same mutex synchronize - with(as defined in *std::memory_order*) this operation.

Note: lock() is usually not called directly: *std::unique_lock*, *std::scoped_lock*, and *std::lock_guard* are used to manage exclusive locking. This overload essentially calls `void lock(char const* description, error_code& ec =throws);` with *description* as `mutex::lock`.

Parameters **`ec`** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns void *lock* returns *void*.

bool **`try_lock`**(char const *description, *error_code* &ec = *throws*)

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior lock() does not synchronize with this operation if it returns *false*.

Parameters
- **`description`** – Description of the *mutex*
- **`ec`** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock* returns *true* on successful lock acquisition, otherwise returns *false*.

inline bool **`try_lock`**(*error_code* &ec = *throws*)

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior lock() does not synchronize with this operation if it returns *false*.

Note: This overload essentially calls

```
void try_lock(char const* description,
              error_code& ec = throws);
```

with *description* as `mutex::try_lock`.

Parameters `ec` – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock* returns *true* on successful lock acquisition, otherwise returns *false*.

void **unlock**(*error_code* &ec = *throws*)

Unlocks the *mutex*. The *mutex* must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation *synchronizes-with* (as defined in *std::memory_order*) any subsequent *lock* operation that obtains ownership of the same *mutex*.

Parameters `ec` – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns *unlock* returns *void*.

class **timed_mutex** : private *hpx*::*mutex*

#include <mutex.hpp> The timed_mutex class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to *mutex*, timed_mutex offers exclusive, non-recursive ownership semantics. In addition, timed_mutex provides the ability to attempt to claim ownership of a timed_mutex with a timeout via the member functions try_lock_for() and try_lock_until(). The timed_mutex class satisfies all requirements of TimedMutex[760] and StandardLayoutType[761].

hpx::timed_mutex is neither copyable nor movable.

Public Functions

HPX_NON_COPYABLE(*timed_mutex*)

hpx::timed_mutex is neither copyable nor movable

timed_mutex(char const *const description = "")

Constructs a timed_mutex. The mutex is in unlocked state after the call.

Parameters `description` – Description of the timed_mutex.

~timed_mutex()

Destroys the timed_mutex. The behavior is undefined if the mutex is owned by any thread or if any thread terminates while holding any ownership of the mutex.

bool **try_lock_until**(*hpx*::*chrono*::steady_time_point const &abs_time, char const *description, *error_code* &ec = *throws*)

Tries to lock the mutex. Blocks until specified *abs_time* has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *abs_time* has already passed, this function behaves like try_lock(). As with try_lock(), this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point before *abs_time*. Prior unlock() operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_until* is called by a thread that already owns the mutex, the behavior is undefined.

Parameters

- `abs_time` – time point to block until
- `description` – Description of the timed_mutex

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock_until* returns *true* if the lock was acquired successfully, otherwise *false*.

inline bool **try_lock_until**(*hpx*::*chrono*::steady_time_point const &abs_time, *error_code* &ec = *throws*)

Tries to lock the mutex. Blocks until specified *abs_time* has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *abs_time* has already passed, this function behaves like try_lock(). As with try_lock(), this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point before *abs_time*. Prior unlock() operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_until* is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```
bool try_lock_until(
  hpx::chrono::steady_time_point const& abs_time,
  char const* description, error_code& ec = throws);
```

with *description* as `mutex::try_lock_until`.

Parameters

- **abs_time** – time point to block until
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock_until* returns *true* if the lock was acquired successfully, otherwise *false*.

inline bool **try_lock_for**(*hpx*::*chrono*::steady_duration const &rel_time, char const *description, *error_code* &ec = *throws*)

Tries to lock the mutex. Blocks until specified *rel_time* has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *rel_time* is less or equal *rel_time.zero()*, the function behaves like try_lock(). This function may block for longer than *rel_time* due to scheduling or resource contention delays. As with try_lock(), this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point during *rel_time*. Prior unlock() operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_for* is called by a thread that already owns the mutex, the behavior is undefined.

Parameters

- **rel_time** – minimum duration to block for
- **description** – Description of the timed_mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock_for* returns *true* if the lock was acquired successfully, otherwise *false*.

inline bool **try_lock_for**(*hpx*::*chrono*::steady_duration const &rel_time, *error_code* &ec = *throws*)

Tries to lock the mutex. Blocks until specified *rel_time* has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *rel_time* is less or equal *rel_time.zero()*, the function behaves like try_lock(). This function may block for longer than *rel_time* due to scheduling or resource contention delays. As with try_lock(), this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point during *rel_time*. Prior unlock() operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_for* is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```
bool try_lock_for(
    hpx::chrono::steady_duration const& rel_time,
    char const* description, error_code& ec = throws)
```

with *description* as `mutex::try_lock_for`.

Parameters
- **rel_time** – minimum duration to block for
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock_for* returns *true* if the lock was acquired successfully, otherwise *false*.

void **lock**(char const *description, *error_code* &ec = *throws*)

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and throws a *std::system_error* with error condition *resource_deadlock_would_occur* instead of deadlocking. Prior unlock() operations on the same mutex synchronize- with (as defined in *std::memory_order*) this operation.

Note: lock() is usually not called directly: *std::unique_lock*, *std::scoped_lock*, and *std::lock_guard* are used to manage exclusive locking.

Parameters
- **description** – Description of the *mutex*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns void *lock* returns *void*.

inline void **lock**(*error_code* &ec = *throws*)

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. hpx::mutex can detect the invalid usage and throws a *std::system_error* with error condition *resource_deadlock_would_occur* instead of deadlocking. Prior unlock() operations on the same mutex synchronize - with(as defined in *std::memory_order*) this operation.

Note: lock() is usually not called directly: *std::unique_lock*, *std::scoped_lock*, and *std::lock_guard* are used to manage exclusive locking. This overload essentially calls `void lock(char const* description, error_code& ec =throws);` with *description* as `mutex::lock`.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns void *lock* returns *void*.

bool **try_lock**(char const *description, *error_code* &ec = *throws*)

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior lock() does not synchronize with this operation if it returns *false*.

Parameters

- `description` – Description of the *mutex*
- `ec` – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock* returns *true* on successful lock acquisition, otherwise returns *false*.

inline bool **try_lock**(*error_code* &ec = *throws*)

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior unlock() operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior lock() does not synchronize with this operation if it returns *false*.

Note: This overload essentially calls

```
void try_lock(char const* description,
              error_code& ec = throws);
```

with *description* as `mutex::try_lock`.

Parameters `ec` – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns bool *try_lock* returns *true* on successful lock acquisition, otherwise returns *false*.

void **unlock**(*error_code* &ec = *throws*)

Unlocks the *mutex*. The *mutex* must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation *synchronizes-with* (as defined in *std::memory_order*) any subsequent *lock* operation that obtains ownership of the same *mutex*.

Parameters `ec` – Used to hold error code value originated during the operation. Defaults to *throws* — A special 'throw on error' *error_code*.

Returns *unlock* returns *void*.

namespace **lcos**

namespace **local**

namespace **threads**

Typedefs

using **thread_id_ref_type** = *thread_id_ref*

using **thread_self** = coroutines::detail::coroutine_self

Functions

thread_id **get_self_id**() noexcept

The function *get_self_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

thread_self ***get_self_ptr**() noexcept

The function *get_self_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

hpx::no_mutex

Defined in header hpx/mutex.hpp[762].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

struct **no_mutex**

#include <no_mutex.hpp> `no_mutex` class can be used in cases where the shared data between multiple threads can be accessed simultaneously without causing inconsistencies.

hpx::once_flag, hpx::call_once

Defined in header hpx/mutex.hpp[763].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_ONCE_INIT

namespace **hpx**

Functions

template<typename **F**, typename ...**Args**>
void **call_once**(*once_flag* &flag, *F* &&f, *Args*&&... args)

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time *call_once* is called, flag indicates that *f* was already called, *call_once* returns right away (such a call to *call_once* is known as passive).
- Otherwise, *call_once* invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to *call_once* is known as active).
  - If that invocation throws an exception, it is propagated to the caller of *call_once*, and the flag is not flipped so that another call will be attempted (such a call to *call_once* is known as exceptional).
  - If that invocation returns normally (such a call to *call_once* is known as returning), the flag is flipped, and all other calls to *call_once* with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to *call_once* are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note: If concurrent calls to *call_once* pass different functions *f*, it is unspecified which f will be called. The selected function runs in the same thread as the *call_once* invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is *pthread_once*.

Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke

[763] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/mutex.hpp

- **args** – arguments to pass to the function

Throws *std*::system_error – if any condition prevents calls to *call_once* from executing as specified or any exception thrown by *f*

struct **once_flag**

#include <*once.hpp*> The class *hpx::once_flag* is a helper structure for hpx::call_once. An object of type *hpx::once_flag* that is passed to multiple calls to hpx::call_once allows those calls to coordinate with each other such that only one of the calls will actually run to completion. *hpx::once_flag* is neither copyable nor movable.

Public Functions

HPX_NON_COPYABLE(*once_flag*)

inline **once_flag**() noexcept

Constructs an once_flag object. The internal state is set to indicate that no function has been called yet.

Private Members

std::atomic<long> **status_**

lcos::*local*::*event* **event_**

Friends

template<typename **F**, typename ...**Args**>
friend void **call_once**(*once_flag* &flag, *F* &&f, *Args*&&... args)

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time *call_once* is called, flag indicates that *f* was already called, *call_once* returns right away (such a call to *call_once* is known as passive).
- Otherwise, *call_once* invokes std::forward<Callable>(f) with the arguments std::forward<Args>(args)... (as if by hpx::invoke). Unlike the hpx::thread constructor or hpx::async, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to *call_once* is known as active).
  - If that invocation throws an exception, it is propagated to the caller of *call_once*, and the flag is not flipped so that another call will be attempted (such a call to *call_once* is known as exceptional).
  - If that invocation returns normally (such a call to *call_once* is known as returning), the flag is flipped, and all other calls to *call_once* with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to *call_once* are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note: If concurrent calls to *call_once* pass different functions *f*, it is unspecified which f will be called. The selected function runs in the same thread as the *call_once* invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is *pthread_once*.

Parameters
- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke
- **args** – arguments to pass to the function

Throws `std::system_error` – if any condition prevents calls to *call_once* from executing as specified or any exception thrown by *f*

namespace **lcos**

namespace **local**

Defined in header hpx/shared_mutex.hpp[765].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **shared_mutex** = detail::shared_mutex<>

The *shared_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a *shared_mutex* has two levels of access:

- *shared* - several threads can share ownership of the same mutex.
- *exclusive* - only one thread can own the mutex.

If one thread has acquired the exclusive lock (through *lock*, *try_lock*), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through *lock_shared*, *try_lock_shared*), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The *shared_mutex* class satisfies all requirements of *SharedMutex* and *StandardLayoutType*.

[765] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/shared_mutex.hpp

Typedefs

using **sliding_semaphore** = *sliding_semaphore_var*<>

template<typename **Mutex** = *hpx*::*spinlock*>

class **sliding_semaphore_var**

#include <sliding_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.

Public Functions

sliding_semaphore_var(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var &**operator=**(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var(*sliding_semaphore_var*&&) = delete

sliding_semaphore_var &**operator=**(*sliding_semaphore_var*&&) = delete

inline explicit **sliding_semaphore_var**(*std*::int64_t max_difference, *std*::int64_t lower_limit = 0) noexcept

Construct a new sliding semaphore.

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **set_max_difference**(*std*::int64_t max_difference, *std*::int64_t lower_limit = 0) noexcept

Set/Change the difference that will cause the semaphore to trigger

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **wait**(*std*::int64_t upper_limit)

Wait for the semaphore to be signaled.

Parameters **upper_limit** – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

inline bool **try_wait**(*std*::int64_t upper_limit = 1)

Try to wait for the semaphore to be signaled.

Parameters upper_limit – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

Returns The function returns true if the calling thread would not block if it was calling *wait()*.

inline void **signal**(*std*::int64_t lower_limit)

Signal the semaphore.

Parameters lower_limit – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the max_difference.

inline *std*::int64_t **signal_all**()

Functions

template<typename **Callback**>
stop_callback(*stop_token*, *Callback*) -> *stop_callback*<*Callback*>

The stop_callback class template provides an RAII object type that registers a callback function for an associated hpx::stop_token object, such that the callback function will be invoked when the hpx::stop_token*'s* associated hpx::stop_source is requested to stop. Callback functions registered via stop_callback*'s* constructor are invoked either in the same thread that successfully invokes *request_stop()* for a hpx::stop_source of the stop_callback*'s* associated hpx::stop_token; or if stop has already been requested prior to the constructor's registration, then the callback is invoked in the thread constructing the stop_callback. More than one stop_callback can be created for the same hpx::stop_token, from the same or different threads concurrently. No guarantee is provided for the order in which they will be executed, but they will be invoked synchronously; except for *stop_callback(s)* constructed after stop has already been requested for the hpx::stop_token, as described previously. If an invocation of a callback exits via an exception then hpx::terminate is called. hpx::stop_callback is not *CopyConstructible*, *CopyAssignable*, *MoveConstructible*, nor *MoveAssignable*. The template param Callback type must be both *invocable* and *destructible*. Any return value is ignored.

inline void **swap**(*stop_token* &lhs, *stop_token* &rhs) noexcept

inline void **swap**(*stop_source* &lhs, *stop_source* &rhs) noexcept

[767] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/stop_token.hpp

Variables

constexpr *nostopstate_t* **nostopstate** = {}

This is a constant object instance of *hpx::nostopstate_t* for use in constructing an empty *hpx::stop_source*, as a placeholder value in the non-default constructor.

struct **nostopstate_t**

#include <stop_token.hpp> Unit type intended for use as a placeholder in *hpx::stop_source* non-default constructor, that makes the constructed *hpx::stop_source* empty with no associated stop-state.

Public Functions

explicit **nostopstate_t**() = default

template<typename **Callback**>

class **stop_callback**

class **stop_source**

#include <stop_token.hpp> The stop_source class provides the means to issue a stop request, such as for *hpx::jthread* cancellation. A stop request made for one stop_source object is visible to all *stop_sources* and *hpx::stop_tokens* of the same associated stop-state; any hpx::stop_callback(s) registered for associated hpx::stop_token(s) will be invoked, and any *hpx::condition_variable_any* objects waiting on associated hpx::stop_token(s) will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

Note: For the purposes of *hpx::jthread* cancellation the stop_source object should be retrieved from the hpx::jthread object using *get_stop_source()*; or stop should be requested directly from the *hpx::jthread* object using request_stop(). This will then use the same associated stop-state as that passed into the *hpx::jthread's* invoked function argument (i.e., the function being executed on its thread). For other uses, however, a stop_source can be constructed separately using the default constructor, which creates new stop-state.

Public Functions

inline **stop_source**()

inline friend bool **operator!=**(*stop_source* const &lhs, *stop_source* const &rhs) noexcept

class **stop_token**

#include <stop_token.hpp> The stop_token class provides the means to check if a stop request has been made or can be made, for its associated hpx::stop_source object. It is essentially a thread-safe "view" of the associated stop-state. The *stop_token* can also be passed to the constructor of hpx::stop_callback, such that the callback will be invoked if the stop_token*'s* associated hpx::stop_source is requested to stop. And stop_token can be passed to the interruptible waiting functions of hpx::condition_variable_any, to interrupt the condition variable's wait if stop is requested.

Note: A stop_token object is not generally constructed independently, but rather retrieved from a *hpx::jthread* or hpx::stop_source. This makes it share the same associated stop-state as the *hpx::jthread* or hpx::stop_source.

namespace **hpx**

namespace **threads**

Functions

hpx::*future*<void> **resume_processing_unit**(*thread_pool_base* &pool, *std*::size_t virt_core)

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

Note: Can only be called from an HPX thread. Use resume_processing_unit_cb or to resume the processing unit from outside HPX. Requires that the pool has threads::policies::enable_elasticity set.

Parameters
- **pool** – [in] The thread pool to resume a processing unit on.
- **virt_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.

Returns A `future<void>` which is ready when the given processing unit has been resumed.

void **resume_processing_unit_cb**(*thread_pool_base* &pool, *hpx*::*function*<void()> callback, *std*::size_t virt_core, *error_code* &ec = *throws*)

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

Note: Requires that the pool has threads::policies::enable_elasticity set.

Parameters
- **pool** – [in] The thread pool to resume a processing unit on.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to resume.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx::*future*<void> **suspend_processing_unit**(*thread_pool_base* &pool, *std*::size_t virt_core)

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

Note: Can only be called from an HPX thread. Use suspend_processing_unit_cb or to suspend the processing unit from outside HPX. Requires that the pool has threads::policies::enable_elasticity set.

Parameters
- **pool** – [in] The thread pool to suspend a processing unit from.
- **virt_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A `future`<void> which is ready when the given processing unit has been suspended.

void **suspend_processing_unit_cb**(*hpx*::*function*<void()> callback, *thread_pool_base* &pool, *std*::size_t virt_core, *error_code* &ec = *throws*)

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

Note: Requires that the pool has threads::policies::enable_elasticity set.

Parameters
- **pool** – [in] The thread pool to suspend a processing unit from.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to suspend.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx::*future*<void> **resume_pool**(*thread_pool_base* &pool)

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

Note: Can only be called from an HPX thread. Use resume_cb or resume_direct to suspend the pool from outside HPX.

Parameters **pool** – [in] The thread pool to resume.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A `future`<void> which is ready when the thread pool has been resumed.

void **resume_pool_cb**(*thread_pool_base* &pool, *hpx*::*function*<void()> callback, *error_code* &ec = *throws*)

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

Parameters
- **pool** – [in] The thread pool to resume.
- **callback** – [in] called when the thread pool has been resumed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx::*future*<void> **suspend_pool**(*thread_pool_base* &pool)

Suspends the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

Note: Can only be called from an HPX thread. Use suspend_cb or suspend_direct to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters **pool** – [in] The thread pool to suspend.

Throws *hpx*::*exception* – if called from outside the HPX runtime.

Returns A future<void> which is ready when the thread pool has been suspended.

void **suspend_pool_cb**(*thread_pool_base* &pool, *hpx*::*function*<void()> callback, *error_code* &ec = *throws*)

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

Note: A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

- **pool** – [in] The thread pool to suspend.
- **callback** – [in] called when the thread pool has been suspended.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws *hpx*::*exception* – if called from an HPX thread which is running on the pool itself.

hpx::unlock_guard

Defined in header hpx/mutex.hpp[769].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

template<typename **Mutex**>

class **unlock_guard**

#include <unlock_guard.hpp> The class *unlock_guard* is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

unlock_guard performs the opposite functionality of lock_guard. When a lock_guard object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the lock_guard object was created, the lock_guard is destructed and the mutex is released. Accordingly, when an *unlock_guard* object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the *unlock_guard* object was created, the *unlock_guard* is destructed and the mutex is owned again. In this way, the mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

namespace **hpx**

Functions

inline void **swap**(*jthread* &lhs, *jthread* &rhs) noexcept

[770] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/thread.hpp

class **jthread**

#include <jthread.hpp> The class *jthread* represents a single thread of execution. It has the same general behavior as hpx::thread, except that *jthread* automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, *hpx::terminate* is called. The top-level function may communicate its return value or an exception to the caller via *hpx::promise* or by modifying shared variables (which may require synchronization, see *hpx::mutex* and *hpx::atomic*) Unlike hpx::thread, the jthread logically holds an internal private member of type *hpx::stop_source*, which maintains a shared stop-state. The *jthread* constructor accepts a function that takes a *hpx::stop_token* as its first argument, which will be passed in by the jthread from its internal *stop_source*. This allows the function to check if stop has been requested during its execution, and return if it has. hpx::jthread objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any *jthread* objects (after detach). No two hpx::jthread objects may represent the same thread of execution; hpx::jthread is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

namespace **this_thread**

Functions

thread::*id* **get_id**() noexcept

Returns the id of the current thread.

void **yield**() noexcept

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

> **Note:** The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler (SCHED_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

void **yield_to**(*thread*::*id*) noexcept

threads::*thread_priority* **get_priority**() noexcept

std::ptrdiff_t **get_stack_size**() noexcept

void **interruption_point**()

bool **interruption_enabled**()

bool **interruption_requested**()

void **interrupt**()

void **sleep_until**(*hpx*::*chrono*::steady_time_point const &abs_time)

Blocks the execution of the current thread until specified *abs_time* has been reached.

It is recommended to use the clock tied to *abs_time*, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than `abs_time-Clock::now()` at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after *abs_time* has been reached due to process scheduling or resource contention delays.

Parameters **abs_time** – absolute time to block until

inline void **sleep_for**(*hpx*::*chrono*::steady_duration const &rel_time)

Blocks the execution of the current thread for at least the specified *rel_time*. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.

Parameters **rel_time** – time duration to sleep

hpx::annotated_function

Defined in header hpx/functional.hpp[772].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[772] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/core/include_local/include/hpx/functional.hpp

Functions

template<typename **F**>
constexpr *F* &&**annotated_function**(*F* &&f, char const* = nullptr) noexcept

Returns a function annotated with the given annotation.

Annotating includes setting the thread description per thread id.

Parameters **function** –

template<typename **F**>
constexpr *F* &&**annotated_function**(*F* &&f, *std*::string const&) noexcept

namespace **util**

Functions

template<typename **F**>
constexpr decltype(auto) **annotated_function**(*F* &&f, char const *name = nullptr) noexcept

template<typename **F**>
constexpr decltype(auto) **annotated_function**(*F* &&f, *std*::string const &name) noexcept

hpx/threading_base/print.hpp

Defined in header hpx/threading_base/print.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/threading_base/register_thread.hpp

Defined in header hpx/threading_base/register_thread.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

template<typename **F**>
thread_function_type **make_thread_function**(*F* &&f)

template<typename **F**>
thread_function_type **make_thread_function_nullary**(*F* &&f)

void **register_thread**(*threads*::thread_init_data &data, *threads*::*thread_pool_base* *pool, *threads*::*thread_id_ref_type* &id, *error_code* &ec = *hpx*::*throws*)

Create a new *thread* using the given data.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws *invalid_status* – if the runtime system has not been started yet.

Returns This function will return the internal id of the newly created HPX-thread.

threads::*thread_id_ref_type* **register_thread**(*threads*::thread_init_data &data, *threads*::*thread_pool_base* *pool, *error_code* &ec = *hpx*::*throws*)

void **register_thread**(*threads*::thread_init_data &data, *threads*::*thread_id_ref_type* &id, *error_code* &ec = *throws*)

Create a new *thread* using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **data** – [in] The data to use for creating the thread.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws *invalid_status* – if the runtime system has not been started yet.

Returns This function will return the internal id of the newly created HPX-thread.

threads::*thread_id_ref_type* **register_thread**(*threads*::thread_init_data &data, *error_code* &ec = *throws*)

thread_id_ref_type **register_work**(*threads*::thread_init_data &data, *threads*::*thread_pool_base* *pool, *error_code* &ec = *hpx*::*throws*)

Create a new work item using the given data.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws `invalid_status` – if the runtime system has not been started yet.

thread_id_ref_type **register_work**(*threads*::thread_init_data &data, *error_code* &ec = *throws*)

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws `invalid_status` – if the runtime system has not been started yet.

hpx::scoped_annotation

Defined in header hpx/functional.hpp[773].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

struct **scoped_annotation**

#include <scoped_annotation.hpp> *scoped_annotation* associates a `name` with a section of code (scope). It can be used to visualize code execution in profiling tools like *Intel VTune*, *Apex Profiler*, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

hpx/threading_base/thread_data.hpp

Defined in header hpx/threading_base/thread_data.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

constexpr *thread_data* ***get_thread_id_data**(*thread_id_ref_type* const &tid) noexcept

constexpr *thread_data* ***get_thread_id_data**(thread_id_type const &tid) noexcept

class **thread_data** : public thread_data_reference_counting

#include <thread_data.hpp> A *thread* is the representation of a HPX thread. It's a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the *thread-manager*.

A *thread* encapsulates:
- A thread status word (see the functions *thread::get_state* and *thread::set_state*)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the thread-manager.

Public Types

using **spinlock_pool** = *util*::spinlock_pool<*thread_data*>

Public Functions

thread_data(*thread_data* const&) = delete

thread_data(*thread_data*&&) = delete

thread_data &**operator=**(*thread_data* const&) = delete

thread_data &**operator=**(*thread_data*&&) = delete inline thread_state **get_state**(*std*::memory_order const order = *std*::memory_order_acquire) const noexcept

The get_state function queries the state of this thread instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will be retrieved by using the function *threadmanager::get_state*.

Returns This function returns the current state of this thread. It will return one of the values as defined by the *thread_state* enumeration.

inline thread_state **set_state**(*thread_schedule_state* const state, *thread_restart_state* state_ex = *thread_restart_state*::*unknown*, *std*::memory_order const load_order = *std*::memory_order_acquire, *std*::memory_order const exchange_order = *std*::memory_order_acq_rel) const noexcept

The set_state function changes the state of this thread instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the thread-manager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status *threadmanager::set_state* should be used.

Parameters
- **state** – [in] The new state to be set for the thread.
- **state_ex** – [in]
- **load_order** – [in]
- **exchange_order** – [in]

inline bool **set_state_tagged**(*thread_schedule_state* const newstate, thread_state const &prev_state, thread_state &new_tagged_state, *std*::memory_order exchange_order = *std*::memory_order_acq_rel) const noexcept

inline bool **restore_state**(thread_state const new_state, thread_state const old_state, *std*::memory_order const load_order = *std*::memory_order_relaxed, *std*::memory_order const load_exchange = *std*::memory_order_acq_rel) const noexcept

The restore_state function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise it won't touch the thread state of this instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the threadmanager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status *threadmanager::set_state* should be used.

Parameters
- **new_state** – [in] The new state to be set for the thread.
- **old_state** – [in] The old state of the thread which still has to be the current state.
- **load_order** – [in]
- **load_exchange** – [in]

Returns This function returns *true* if the state has been changed successfully inline bool **restore_state**(*thread_schedule_state* new_state, *thread_restart_state* const state_ex, thread_state old_state, *std*::memory_order const load_exchange = *std*::memory_order_acq_rel) const noexcept

std::string **as_string**(*thread_description* const &desc)

threads::*thread_description* **get_thread_description**(thread_id_type const &id, *error_code* &ec = *throws*)

The function get_thread_description is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the description of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the string "<unknown>".

threads::*thread_description* **set_thread_description**(thread_id_type const &id, *threads*::*thread_description* const &desc = *threads*::*thread_description*(), *error_code* &ec = *throws*)

Functions

threads::*thread_restart_state* **suspend**(*threads*::*thread_schedule_state* state, *threads*::thread_id_type nextid, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *error_code* &ec = *throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

Throws `If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*threads*::*thread_schedule_state* state = *threads*::*thread_schedule_state*::*pending*, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *error_code* &ec = *throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

Throws `If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

threads::*thread_restart_state* **suspend**(*hpx*::*chrono*::steady_time_point const &abs_time, *threads*::thread_id_type id, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *error_code* &ec = *throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

Note: Must be called from within a HPX-thread.

Throws `If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. inline *threads*::*thread_restart_state* **suspend**(*hpx*::*chrono*::steady_duration const &rel_time, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *error_code* &ec = *throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.

Throws `If – &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*hpx*::*chrono*::steady_duration const &rel_time, *threads*::thread_id_type const &id, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *error_code* &ec = *throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.

Throws `If – &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*std*::uint64_t ms, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *error_code* &ec = *throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given time (specified in milliseconds).

Note: Must be called from within a HPX-thread.

Throws `If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

threads::*thread_pool_base* ***get_pool**(*error_code* &ec = *throws*)

Returns a pointer to the pool that was used to run the current thread

Throws `If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

thread_state **set_thread_state**(thread_id_type const &id, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*signaled*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *hpx*::*error_code* &ec = *throws*)

Set the thread state of the *thread* referenced by the thread_id *id*.

Note: If the thread referenced by the parameter *id* is in *thread_state::active* state this function schedules a new thread which will set the state of the thread as soon as its not active anymore. The function returns *thread_state::active* in this case.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.

- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the previous state of the thread referenced by the *id* parameter. It will return one of the values as defined by the *thread_state* enumeration. If the thread is not known to the thread-manager the return value will be *thread_state::unknown*.

thread_id_ref_type **set_thread_state**(thread_id_type const &id, *hpx*::*chrono*::steady_time_point const &abs_time, *std*::atomic<bool> *started, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*timeout*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *error_code* &ec = *throws*)

Set the thread state of the *thread* referenced by the thread_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (at the given time)

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **abs_time** – [in] Absolute point in time for the new thread to be run
- **started** – [in,out] A helper variable allowing to track the state of the timer helper thread
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

inline *thread_id_ref_type* **set_thread_state**(thread_id_type const &id, *hpx*::*chrono*::steady_time_point const &abs_time, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*timeout*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *error_code*& = *throws*)

inline *thread_id_ref_type* **set_thread_state**(thread_id_type const &id, *hpx*::*chrono*::steady_duration const &rel_time, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*timeout*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *error_code* &ec = *throws*)

Set the thread state of the *thread* referenced by the thread_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (after the given duration)

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread the state should be modified for.
- **rel_time** – [in] Time duration after which the new thread should be run
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

thread_state **get_thread_state**(thread_id_type const &id, *error_code* &ec = *throws*) noexcept

The function get_thread_backtrace is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception. The function get_thread_state is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.
- **id** – [in] The thread id of the thread the state should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the currently captured stack back trace of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the zero.

Returns This function returns the thread state of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *terminated*.

std::size_t **get_thread_phase**(thread_id_type const &id, *error_code* &ec = *throws*) noexcept

The function get_thread_phase is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread the phase should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the thread phase of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be ~0.

bool **get_thread_interruption_enabled**(thread_id_type const &id, *error_code* &ec = *throws*)

Returns whether the given thread can be interrupted at this point.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if the given thread can be interrupted at this point in time. It will return *false* otherwise.

bool **set_thread_interruption_enabled**(thread_id_type const &id, bool enable, *error_code* &ec = *throws*)

Set whether the given thread can be interrupted at this point.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread which should receive the new value.
- **enable** – [in] This value will determine the new interruption enabled status for the given thread.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the previous value of whether the given thread could have been interrupted.

bool **get_thread_interruption_requested**(thread_id_type const &id, *error_code* &ec = *throws*)

Returns whether the given thread has been flagged for interruption.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if the given thread was flagged for interruption. It will return *false* otherwise.

void **interrupt_thread**(thread_id_type const &id, bool flag, *error_code* &ec = *throws*)

Flag the given thread for interruption.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **flag** – [in] The flag encodes whether the thread should be interrupted (if it is *true*), or 'uninterrupted' (if it is *false*).
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline void **interrupt_thread**(thread_id_type const &id, *error_code* &ec = *throws*)

void **interruption_point**(thread_id_type const &id, *error_code* &ec = *throws*)

Interrupt the current thread at this point if it was canceled. This will throw a thread_interrupted exception, which will cancel the thread.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::*thread_priority* **get_thread_priority**(thread_id_type const &id, *error_code* &ec = *throws*) noexcept

Return priority of the given thread

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::ptrdiff_t **get_stack_size**(thread_id_type const &id, *error_code* &ec = *throws*) noexcept

Return stack size of the given thread

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::*thread_pool_base* ***get_pool**(thread_id_type const &id, *error_code* &ec = *throws*)

Returns a pointer to the pool that was used to run the current thread

Throws `If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

hpx::get_worker_thread_num, hpx::get_local_worker_thread_num, hpx::get_local_worker_thread_num, hpx::get_thread_pool_num, hpx::get_thread_pool_num

Defined in header hpx/runtime.hpp[774].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::size_t **get_worker_thread_num**()

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by *get_os_thread_count()*.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

std::size_t **get_worker_thread_num**(*error_code* &ec)

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by *get_os_thread_count()*. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters **ec** – [in,out] this represents the error status on exit.

std::size_t **get_local_worker_thread_num**()

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

[774] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

std::size_t **get_local_worker_thread_num**(*error_code* &ec)

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit.

std::size_t **get_thread_pool_num**()

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

std::size_t **get_thread_pool_num**(*error_code* &ec)

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit.

namespace **threads**

hpx/threading_base/thread_pool_base.hpp

Defined in header hpx/threading_base/thread_pool_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

std::ostream &**operator<<**(*std*::ostream &os, *thread_pool_base* const &thread_pool)

class **thread_pool_base**

#include <thread_pool_base.hpp> The base class used to manage a pool of OS threads.

Public Functions

virtual void **suspend_processing_unit_direct**(*std*::size_t virt_core, *error_code* &ec = *throws*) = 0

Suspends the given processing unit. Blocks until the processing unit has been suspended.

Parameters

- **virt_core** – [in] The processing unit on the the pool to be suspended. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume_processing_unit_direct**(*std*::size_t virt_core, *error_code* &ec = *throws*) = 0

Resumes the given processing unit. Blocks until the processing unit has been resumed.

Parameters

- **virt_core** – [in] The processing unit on the the pool to be resumed. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume_direct**(*error_code* &ec = *throws*) = 0

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **suspend_direct**(*error_code* &ec = *throws*) = 0

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

Note: A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws hpx::exception – if called from an HPX thread which is running on the pool itself.

struct **thread_pool_init_parameters**

Public Functions

namespace **hpx**

namespace **threads**

Functions

thread_data ***get_self_id_data**() noexcept

The function *get_self_id_data* returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

thread_self &**get_self**()

The function *get_self* returns a reference to the (OS thread specific) self reference to the current HPX thread.

thread_self ***get_self_ptr**() noexcept

The function *get_self_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_self_impl_type ***get_ctx_ptr**()

The function *get_ctx_ptr* returns a pointer to the internal data associated with each coroutine.

thread_self ***get_self_ptr_checked**(*error_code* &ec = *throws*)

The function *get_self_ptr_checked* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_id_type **get_self_id**() noexcept

The function *get_self_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

thread_id_type **get_outer_self_id**() noexcept

The function *get_outer_self_id* returns the HPX thread id of the current outer thread (or zero if the current thread is not a HPX thread). This usually returns the same as *get_self_id*, except for directly executed threads, in which case this returns the thread id of the outermost HPX thread.

thread_id_type **get_parent_id**() noexcept

The function *get_parent_id* returns the HPX thread id of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::size_t **get_parent_phase**() noexcept

The function *get_parent_phase* returns the HPX phase of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::ptrdiff_t **get_self_stacksize**() noexcept

The function *get_self_stacksize* returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

thread_stacksize **get_self_stacksize_enum**() noexcept

The function *get_self_stacksize_enum* returns the stack size of the /.

std::uint32_t **get_parent_locality_id**() noexcept

The function *get_parent_locality_id* returns the id of the locality of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::uint64_t **get_self_component_id**() noexcept

The function *get_self_component_id* returns the lva of the component the current thread is acting on

Note: This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_TARGET_ADDRESS being defined.

namespace **policies**

threadmanager

See *Public API* for a list of names and headers that are part of the public *HPX* API.

thread_id_ref_type **register_work**(thread_init_data &data, *error_code* &ec = *throws*) const

The function *register_work* adds a new work item to the thread manager. It doesn't immediately create a new *thread*, it just adds the task parameters (function, initial state and description) to the internal management data structures. The thread itself will be created when the number of existing threads drops below the number of threads specified by the constructors max_count parameter.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **ec** –

void **register_thread**(thread_init_data &data, *thread_id_ref_type* &id, *error_code* &ec = *throws*) const

The function *register_thread* adds a new work item to the thread manager. It creates a new *thread*, adds it to the internal management data structures, and schedules the new thread, if appropriate.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **id** – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- **ec** –

bool **run**() const

Run the thread manager's work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function *tfunc*.

Returns The function returns *true* if the thread manager has been started successfully, otherwise it returns *false*.

void **stop**(bool blocking = true) const

Forcefully stop the thread-manager.

Parameters **blocking** –

bool **is_busy**() const

bool **is_idle**() const

void **wait**() const

bool **wait_for**(*hpx*::*chrono*::steady_duration const &rel_time) const

void **suspend**() const

void **resume**() const

hpx::state **status**() const

Return whether the thread manager is still running This returns the "minimal state", i.e. the state of the least advanced thread pool

std::int64_t **get_thread_count**(*thread_schedule_state* state = *thread_schedule_state*::*unknown*, *thread_priority* priority = *thread_priority*::*default_*, *std*::size_t num_thread = static_cast<*std*::size_t>(-1), bool reset = false) const

return the number of HPX-threads with the given state

Note: This function locks the internal OS lock in the thread manager

std::int64_t **get_idle_core_count**() const

mask_type **get_idle_core_mask**() const

std::int64_t **get_background_thread_count**() const

bool **enumerate_threads**(*hpx*::*function*<bool(thread_id_type)> const &f, *thread_schedule_state* state = *thread_schedule_state*::*unknown*) const void **abort_all_suspended_threads**() const

bool **cleanup_terminated**(bool delete_all) const

std::size_t **get_os_thread_count**() const

Return the number of OS threads running in this thread-manager.

This function will return correct results only if the thread-manager is running.

std::thread &**get_os_thread_handle**(*std*::size_t num_thread) const

void **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e) const

API functions forwarding to notification policy.

This notifies the thread manager that the passed exception has been raised. The exception will be routed through the notifier and the scheduler (which will result in it being passed to the runtime object, which in turn will report it to the console, etc.).

mask_type **get_used_processing_units**() const

Returns the mask identifying all processing units used by this thread manager.

hwloc_bitmap_ptr **get_pool_numa_bitmap**(*std*::string const &pool_name) const

void **set_scheduler_mode**(*threads*::*policies*::scheduler_mode mode) const noexcept

void **add_scheduler_mode**(*threads*::*policies*::scheduler_mode mode) const noexcept

void **add_remove_scheduler_mode**(*threads*::*policies*::scheduler_mode to_add_mode, *threads*::*policies*::scheduler_mode to_remove_mode) const noexcept

void **remove_scheduler_mode**(*threads*::*policies*::scheduler_mode mode) const noexcept

void **reset_thread_distribution**() const noexcept

std::int64_t **get_queue_length**(bool reset) const

std::int64_t **get_cumulative_duration**(bool reset) const

std::int64_t **get_thread_count_unknown**(bool reset) const

std::int64_t **get_thread_count_active**(bool reset) const

std::int64_t **get_thread_count_pending**(bool reset) const

std::int64_t **get_thread_count_suspended**(bool reset) const

inline *std*::size_t **get_socket_number**(*std*::size_t num_thread, [[maybe_unused]] *error_code* &ec = *throws*) const noexcept

Return the Socket number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline *std*::size_t **get_numa_node_number**(*std*::size_t num_thread, [[maybe_unused]] *error_code* &ec = *throws*) const noexcept

Return the NUMA node number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_machine_affinity_mask**(*error_code* &ec = *throws*) const noexcept

Return a bit mask where each set bit corresponds to a processing unit available to the application.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_service_affinity_mask**(mask_cref_type used_processing_units, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

Parameters

- **used_processing_units** – [in] This is the mask of processing units which are not available for service threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_socket_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_numa_node_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

Parameters
- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_core_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

Parameters
- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_thread_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

Parameters
- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **set_thread_affinity_mask**(mask_cref_type mask, *error_code* &ec = *throws*) const

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

Note: Use this function on systems where the affinity must be set from inside the thread itself.

Parameters
- **mask** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_thread_affinity_mask_from_lva**(void const *lva, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

Parameters
- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **print_affinity_mask**(*std*::ostream &os, *std*::size_t num_thread, mask_cref_type m, *std*::string const &pool_name) const

Prints the given mask *m* to os in a human readable form.

bool **reduce_thread_priority**(*error_code* &ec = *throws*) const

Reduce thread priority of the current thread.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::size_t **get_number_of_sockets**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_numa_nodes**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_cores**() const

Return the number of available cores.

std::size_t **get_number_of_pus**() const noexcept

Return the number of available hardware processing units.

std::size_t **get_number_of_numa_node_cores**(*std*::size_t numa) const

Return number of cores in given numa domain.

std::size_t **get_number_of_numa_node_pus**(*std*::size_t numa) const

Return number of processing units in a given numa domain.

std::size_t **get_number_of_socket_pus**(*std*::size_t socket) const

Return number of processing units in a given socket.

std::size_t **get_number_of_core_pus**(*std*::size_t core) const

Return number of processing units in given core.

std::size_t **get_number_of_socket_cores**(*std*::size_t socket) const

Return number of cores units in given socket.

inline *std*::size_t **get_core_number**(*std*::size_t num_thread, *error_code*& = *throws*) const

std::size_t **get_pu_number**(*std*::size_t num_core, *std*::size_t num_pu, *error_code* &ec = *throws*) const

std::size_t **get_cache_size**(mask_cref_type mask, int level) const

Return the size of the cache associated with the given mask.

mask_type **get_cpubind_mask**(*error_code* &ec = *throws*) const

mask_type **get_cpubind_mask**(*std*::thread &handle, *error_code* &ec = *throws*) const

hwloc_bitmap_ptr **cpuset_to_nodeset**(mask_cref_type mask) const

convert a cpu mask into a numa node mask in hwloc bitmap form

void **write_to_log**() const

void ***allocate**(*std*::size_t len) const

This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

void ***allocate_membind**(*std*::size_t len, const *hwloc_bitmap_ptr* &bitmap, *hpx_hwloc_membind_policy* policy, int flags) const

allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc docs)

threads::mask_type **get_area_membind_nodeset**(void const *addr, *std*::size_t len) const

util

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/util/insert_checked.hpp

Defined in header hpx/util/insert_checked.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

template<typename **Iterator**>
constexpr bool **insert_checked**(*std*::pair<*Iterator*, bool> const &r) noexcept

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters **r** – [in] The return value of a std::map insert operation.

Returns This function returns **r.second**.

template<typename **Iterator**>
bool **insert_checked**(*std*::pair<*Iterator*, bool> const &r, *Iterator* &it)

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters

- **r** – [in] The return value of a std::map insert operation.
- **r** – [out] A reference to an Iterator, which is set to **r.first**.
- **it** – [out] on exit, will hold the iterator referring to the inserted element

Returns This function returns **r.second**.

hpx/util/sed_transform.hpp

Defined in header hpx/util/sed_transform.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

bool **parse_sed_expression**(*std*::string const &input, *std*::string &search, *std*::string &replace)

Parse a sed command.

Note: Currently, only supports search and replace syntax (s/search/replace/)

Parameters
- **input** – [in] The content to parse.
- **search** – [out] If the parsing is successful, this string is set to the search expression.
- **replace** – [out] If the parsing is successful, this string is set to the replace expression.

Returns *true* if the parsing was successful, false otherwise.

struct **sed_transform**

#include <sed_transform.hpp> An unary function object which applies a sed command to its subject and returns the resulting string.

Note: Currently, only supports search and replace syntax (s/search/replace/)

Public Functions

sed_transform(*std*::string const &search, *std*::string replace)

explicit **sed_transform**(*std*::string const &expression)

std::string **operator()**(*std*::string const &input) const

inline explicit **operator bool**() const noexcept

Defines

HPX_REGISTER_ACTION_DECLARATION(...)

Declare the necessary component action boilerplate code.

The macro *HPX_REGISTER_ACTION_DECLARATION* can be used to declare all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter *action* is the type of the action to declare the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as ‘<’, ‘>’, or ‘:’.

```
namespace app
{
    // Define a simple component exposing one action 'print_greeting'
    class HPX_COMPONENT_EXPORT server
      : public hpx::components::component_base<server>
    {
        void print_greeting ()
        {
            hpx::cout << "Hey, how are you?\n" << std::flush;
        }

        // Component actions need to be declared, this also defines the
        // type 'print_greeting_action' representing the action.
        HPX_DEFINE_COMPONENT_ACTION(server,
            print_greeting, print_greeting_action);
    };
}

// Declare boilerplate code required for each of the component actions.
HPX_REGISTER_ACTION_DECLARATION(app::server::print_greeting_action)
```

Example:

Note: This macro has to be used once for each of the component actions defined using one of the *HPX_DEFINE_COMPONENT_ACTION* macros. It has to be visible in all translation units using the action, thus it is recommended to place it into the header file defining the component.

`HPX_REGISTER_ACTION_DECLARATION_`(...)

`HPX_REGISTER_ACTION_DECLARATION_1`(action)

`HPX_REGISTER_ACTION`(...)

Define the necessary component action boilerplate code.

The macro *HPX_REGISTER_ACTION* can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter *action* is the type of the action to define the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as ‘<’, ‘>’, or ‘:’.

Note: This macro has to be used once for each of the component actions defined using one of the *HPX_DEFINE_COMPONENT_ACTION* or *HPX_DEFINE_PLAIN_ACTION* macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

Note: Only one of the forms of this macro *HPX_REGISTER_ACTION* or *HPX_REGISTER_ACTION_ID* should be used for a particular action, never both.

`HPX_REGISTER_ACTION_ID`(action, actionname, actionid)

Define the necessary component action boilerplate code and assign a predefined unique id to the action.

The macro *HPX_REGISTER_ACTION* can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter *action* is the type of the action to define the boilerplate for.

The parameter *actionname* specifies an unique name of the action to be used for serialization purposes. The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as ‘<’, ‘>’, or ‘:’.

The parameter *actionid* specifies an unique integer value which will be used to represent the action during serialization.

Note: This macro has to be used once for each of the component actions defined using one of the *HPX_DEFINE_COMPONENT_ACTION* or global actions *HPX_DEFINE_PLAIN_ACTION* macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

Note: Only one of the forms of this macro *HPX_REGISTER_ACTION* or *HPX_REGISTER_ACTION_ID* should be used for a particular action, never both.

namespace **hpx**

namespace **actions**

hpx/actions_base/basic_action_fwd.hpp

Defined in header hpx/actions_base/basic_action_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **actions**

template<typename **Component**, typename **Signature**, typename **Derived**>

struct **basic_action**

#include <basic_action_fwd.hpp>

Template Parameters

- **Component** – component type
- **Signature** – return type and arguments
- **Derived** – derived action class

hpx/actions_base/component_action.hpp

Defined in header hpx/actions_base/component_action.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_DEFINE_COMPONENT_ACTION(...)

Registers a member function of a component as an action type with HPX.

The macro *HPX_DEFINE_COMPONENT_ACTION* can be used to register a member function of a component as an action type named *action_type*.

The parameter *component* is the type of the component exposing the member function *func* which should be associated with the newly defined action type. The parameter `action_type` is the name of the action type to register with HPX.

```
namespace app
{
    // Define a simple component exposing one action 'print_greeting'
```

(continues on next page)

(continued from previous page)

```
    class HPX_COMPONENT_EXPORT server
      : public hpx::components::component_base<server>
    {
        void print_greeting() const
        {
            hpx::cout << "Hey, how are you?\n" << std::flush;
        }

        // Component actions need to be declared, this also defines the
        // type 'print_greeting_action' representing the action.
        HPX_DEFINE_COMPONENT_ACTION(server, print_greeting,
            print_greeting_action);
    };
}
```

Example:

The first argument must provide the type name of the component the action is defined for.

The second argument must provide the member function name the action should wrap.

The default value for the third argument (the typename of the defined action) is derived from the name of the function (as passed as the second argument) by appending '_action'. The third argument can be omitted only if the second argument with an appended suffix '_action' resolves to a valid, unqualified C++ type name.

Note: The macro *HPX_DEFINE_COMPONENT_ACTION* can be used with 2 or 3 arguments. The third argument is optional.

namespace **hpx**

namespace **actions**

hpx/actions_base/lambda_to_action.hpp

Defined in header hpx/actions_base/lambda_to_action.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/actions_base/plain_action.hpp

Defined in header hpx/actions_base/plain_action.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_DEFINE_PLAIN_ACTION(...)

Defines a plain action type.

```
namespace app
{
    void some_global_function(double d)
    {
        cout << d;
    }

    // This will define the action type 'app::some_global_action' which
    // represents the function 'app::some_global_function'.
    HPX_DEFINE_PLAIN_ACTION(some_global_function, some_global_action);
}
```

Example:

Note: Usually this macro will not be used in user code unless the intent is to avoid defining the action_type in global namespace. Normally, the use of the macro *HPX_PLAIN_ACTION* is recommended.

Note: The macro *HPX_DEFINE_PLAIN_ACTION* can be used with 1 or 2 arguments. The second argument is optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending '_action'. The second argument can be omitted only if the first argument with an appended suffix '_action' resolves to a valid, unqualified C++ type name.

HPX_DECLARE_PLAIN_ACTION(...)

Declares a plain action type.

HPX_PLAIN_ACTION(...)

Defines a plain action type based on the given function *func* and registers it with HPX.

The macro *HPX_PLAIN_ACTION* can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function *func*. It defines the action type *name* representing the given function. This macro additionally registers the newly define action type with HPX.

The parameter `func` is a global or free (non-member) function which should be encapsulated into a plain action. The parameter `name` is the name of the action type defined by this macro.

```
namespace app {
    void some_global_function(double d) {
        cout << d;
    }
}

// This will define the action type 'some_global_action' which
```

(continues on next page)

(continued from previous page)

```
// represents the function 'app::some_global_function'.
HPX_PLAIN_ACTION(app::some_global_function, some_global_action)
```

Example:

Note: The macro *HPX_PLAIN_ACTION* has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

Note: The macro *HPX_PLAIN_ACTION_ID* can be used with 1, 2, or 3 arguments. The second and third arguments are optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending '_action'. The second argument can be omitted only if the first argument with an appended suffix '_action' resolves to a valid, unqualified C++ type name. The default value for the third argument is *hpx::components::factory_state::check*.

Note: Only one of the forms of this macro *HPX_PLAIN_ACTION* or *HPX_PLAIN_ACTION_ID* should be used for a particular action, never both.

HPX_PLAIN_ACTION_ID(func, name, id)

Defines a plain action type based on the given function *func* and registers it with HPX.

The macro *HPX_PLAIN_ACTION_ID* can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function *func*. It defines the action type *actionname* representing the given function.

The parameter *actionid* specifies a unique integer value which will be used to represent the action during serialization.

The parameter `func` is a global or free (non-member) function which should be encapsulated into a plain action. The parameter `name` is the name of the action type defined by this macro.

The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

```
namespace app {
    void some_global_function(double d) {
        cout << d;
    }
}

// This will define the action type 'some_global_action' which
// represents the function 'app::some_global_function'.
HPX_PLAIN_ACTION_ID(app::some_global_function, some_global_action,
    some_unique_id);
```

Example:

Note: The macro *HPX_PLAIN_ACTION_ID* has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

Note: Only one of the forms of this macro *HPX_PLAIN_ACTION* or *HPX_PLAIN_ACTION_ID* should be used for a particular action, never both.

bool **register_locality**(*parcelset*::endpoints_type const &endpoints, *naming*::gid_type &prefix, *std*::uint32_t num_threads, *error_code* &ec = *throws*)

Add a locality to the runtime.

parcelset::endpoints_type const &**resolve_locality**(*naming*::gid_type const &gid, *error_code* &ec = *throws*)

Resolve a locality to its prefix.

Returns Returns an empty vector if the locality is not registered.

bool **has_resolved_locality**(*naming*::gid_type const &gid)

bool **unregister_locality**(*naming*::gid_type const &gid, *error_code* &ec = *throws*)

Remove a locality from the runtime.

void **remove_resolved_locality**(*naming*::gid_type const &gid)

remove given locality from locality cache

bool **get_console_locality**(*naming*::gid_type &locality, *error_code* &ec = *throws*)

Get locality locality_id of the console locality.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **locality** – [out] The locality_id value uniquely identifying the console locality. This is valid only, if the return value of this function is true.
- **try_cache** – [in] If this is set to true the console is first tried to be found in the local cache. Otherwise this function will always query AGAS, even if the console locality_id is already known locally.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if a console locality_id exists and returns *false* otherwise.

bool **get_localities**(*std*::vector<*naming*::gid_type> &locality_ids, *components*::component_type type, *error_code* &ec = *throws*) const

Query for the locality_ids of all known localities.

This function returns the locality_ids of all localities known to the AGAS server or all localities having a registered factory for a given component type.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **locality_ids** – [out] The vector will contain the prefixes of all localities registered with the AGAS server. The returned vector holds the prefixes representing the runtime_support components of these localities.
- **type** – [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is *components::component_enum_type::invalid*, which will return prefixes of all localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline bool **get_localities**(*std*::vector<*naming*::gid_type> &locality_ids, *error_code* &ec = *throws*) const

hpx::*future*<*std*::uint32_t> **get_num_localities_async**(*components*::component_type type = to_int(*hpx*::*components*::*component_enum_type*::*invalid*)) const

Query for the number of all known localities.

This function returns the number of localities known to the AGAS server or the number of localities having a registered factory for a given component type.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **type** – [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is *components::component_type::invalid*, which will return prefixes of all localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::uint32_t **get_num_localities**(*components*::component_type type, *error_code* &ec = *throws*) const

inline *std*::uint32_t **get_num_localities**(*error_code* &ec = *throws*) const

hpx::*future*<*std*::uint32_t> **get_num_overall_threads_async**() const

std::uint32_t **get_num_overall_threads**(*error_code* &ec = *throws*) const

hpx::*future*<*std*::vector<*std*::uint32_t>> **get_num_threads_async**() const

std::vector<*std*::uint32_t> **get_num_threads**(*error_code* &ec = *throws*) const

components::component_type **get_component_id**(*std*::string const &name, *error_code* &ec = *throws*) const

Return a unique id usable as a component type.

This function returns the component type id associated with the given component name. If this is the first request for this component name a new unique id will be created.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **name** – [in] The component name (string) to get the component type for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns the currently associated component type. Any error results in an exception thrown from this function.

void **iterate_types**(*iterate_types_function_type* const &f, *error_code* &ec = *throws*) const

std::string **get_component_type_name**(*components*::component_type id, *error_code* &ec = *throws*) const

inline *components*::component_type **register_factory**(*naming*::gid_type const &locality_id, *std*::string const &name, *error_code* &ec = *throws*) const

Register a factory for a specific component type.

This function allows to register a component factory for a given locality and component type.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **locality_id** – [in] The locality value uniquely identifying the given locality the factory needs to be registered for.
- **name** – [in] The component name (string) to register a factory for the given component type for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns the currently associated component type. Any error results in an exception thrown from this function. The returned component type is the same as if the function *get_component_id* was called using the same component name.

components::component_type **register_factory**(*std*::uint32_t locality_id, *std*::string const &name, *error_code* &ec = *throws*) const

bool **get_id_range**(*std*::uint64_t count, *naming*::gid_type &lower_bound, *naming*::gid_type &upper_bound, *error_code* &ec = *throws*)

Get unique range of freely assignable global ids.

Every locality needs to be able to assign global ids to different components without having to consult the AGAS server for every id to generate. This function can be called to preallocate a range of ids usable for this purpose.

Note: This function assigns a range of global ids usable by the given locality for newly created components. Any of the returned global ids still has to be bound to a local address, either by calling *bind* or *bind_range*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **l** – [in] The locality the locality id needs to be generated for. Repeating calls using the same locality results in identical locality_id values.

- **count** – [in] The number of global ids to be generated.
- **lower_bound** – [out] The lower bound of the assigned id range. The returned value can be used as the first id to assign. This is valid only, if the return value of this function is true.
- **upper_bound** – [out] The upper bound of the assigned id range. The returned value can be used as the last id to assign. This is valid only, if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if a new range has been generated (it has been called for the first time for the given locality) and returns *false* if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

inline bool **bind_local**(*naming*::gid_type const &id, *naming*::address const &addr, *error_code* &ec = *throws*)

Bind a global address to a local address.

Every element in the HPX namespace has a unique global address (global id). This global address has to be associated with a concrete local address to be able to address an instance of a component using its global address.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: Binding a gid to a local address sets its global reference count to one.

Parameters

- **id** – [in] The global address which has to be bound to the local address.
- **addr** – [in] The local address to be bound to the global address.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true*, if this global id got associated with an local address. It returns *false* otherwise.

inline *hpx*::*future*<bool> **bind_async**(*naming*::gid_type const &id, *naming*::address const &addr, *std*::uint32_t locality_id)

inline *hpx*::*future*<bool> **bind_async**(*naming*::gid_type const &id, *naming*::address const &addr, *naming*::gid_type const &locality)

bool **bind_range_local**(*naming*::gid_type const &lower_id, *std*::uint64_t count, *naming*::address const &baseaddr, *std*::uint64_t offset, *error_code* &ec = *throws*)

Bind unique range of global ids to given base address.

Every locality needs to be able to bind global ids to different components without having to consult the AGAS server for every id to bind. This function can be called to bind a range of consecutive global ids to a range of consecutive local addresses (separated by a given *offset*).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: Binding a gid to a local address sets its global reference count to one.

Parameters
- **lower_id** – [in] The lower bound of the assigned id range. The value can be used as the first id to assign.
- **count** – [in] The number of consecutive global ids to bind starting at *lower_id*.
- **baseaddr** – [in] The local address to bind to the global id given by *lower_id*. This is the base address for all additional local addresses to bind to the remaining global ids.
- **offset** – [in] The offset to use to calculate the local addresses to be bound to the range of global ids.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true*, if the given range was successfully bound. It returns *false* otherwise.

hpx::*future*<bool> **bind_range_async**(*naming*::gid_type const &lower_id, *std*::uint64_t count, *naming*::address const &baseaddr, *std*::uint64_t offset, *naming*::gid_type const &locality)

inline *hpx*::*future*<bool> **bind_range_async**(*naming*::gid_type const &lower_id, *std*::uint64_t count, *naming*::address const &baseaddr, *std*::uint64_t offset, *std*::uint32_t locality_id)

inline bool **unbind_local**(*naming*::gid_type const &id, *error_code* &ec = *throws*)

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

Note: You can unbind only global ids bound using the function *bind*. Do not use this function to unbind any of the global ids bound using *bind_range*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters
- **id** – [in] The global address (id) for which the association has to be removed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if the association has been removed, and it returns *false* if no association existed. Any error results in an exception thrown from this function.

inline bool **unbind_local**(*naming*::gid_type const &id, *naming*::address &addr, *error_code* &ec = *throws*)

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

Note: You can unbind only global ids bound using the function *bind*. Do not use this function to unbind any of the global ids bound using *bind_range*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **id** – [in] The global address (id) for which the association has to be removed.
- **addr** – [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if the association has been removed, and it returns *false* if no association existed. Any error results in an exception thrown from this function.

inline bool **unbind_range_local**(*naming*::gid_type const &lower_id, *std*::uint64_t count, *error_code* &ec = *throws*)

Unbind the given range of global ids.

Note: You can unbind only global ids bound using the function *bind_range*. Do not use this function to unbind any of the global ids bound using *bind*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **lower_id** – [in] The lower bound of the assigned id range. The value must the first id of the range as specified to the corresponding call to *bind_range*.
- **count** – [in] The number of consecutive global ids to unbind starting at *lower_id*. This number must be identical to the number of global ids bound by the corresponding call to *bind_range*
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if a new range has been generated (it has been called for the first time for the given locality) and returns *false* if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

bool **unbind_range_local**(*naming*::gid_type const &lower_id, *std*::uint64_t count, *naming*::address &addr, *error_code* &ec = *throws*)

Unbind the given range of global ids.

Note: You can unbind only global ids bound using the function *bind_range*. Do not use this function to unbind any of the global ids bound using *bind*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **lower_id** – [in] The lower bound of the assigned id range. The value must the first id of the range as specified to the corresponding call to *bind_range*.
- **count** – [in] The number of consecutive global ids to unbind starting at *lower_id*. This number must be identical to the number of global ids bound by the corresponding call to *bind_range*
- **addr** – [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if a new range has been generated (it has been called for the first time for the given locality) and returns *false* if this locality already got a range assigned in an earlier call.

hpx::*future*<*naming*::address> **unbind_range_async**(*naming*::gid_type const &lower_id, *std*::uint64_t count = 1)

inline bool **is_local_address_cached**(*naming*::gid_type const &id, *error_code* &ec = *throws*)

Test whether the given address refers to a local object.

This function will test whether the given address refers to an object living on the locality of the caller.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The address to test.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if the passed address refers to an object which lives on the locality of the caller.

bool **is_local_address_cached**(*naming*::gid_type const &id, *naming*::address &addr, *error_code* &ec = *throws*) bool **is_local_address_cached**(*naming*::gid_type const &id, *naming*::address &addr, *std*::pair<bool, *components*::pinned_ptr> &r, *hpx*::*move_only_function*<*std*::pair<bool, *components*::pinned_ptr>(*naming*::address const&)> &&f, *error_code* &ec = *throws*)

bool **is_local_lva_encoded_address**(*std*::uint64_t msb) const

inline bool **resolve_local**(*naming*::gid_type const &id, *naming*::address &addr, *error_code* &ec = *throws*)

Resolve a given global address (*id*) to its associated local address.

This function returns the local address which is currently associated with the given global address (*id*).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The global address (*id*) for which the associated local address should be returned.
- **addr** – [out] The local address which currently is associated with the given global address (id), this is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if the global address has been resolved successfully (there exists an association to a local address) and the associated local address has been returned. The function returns *false* if no association exists for the given global address. Any error results in an exception thrown from this function.

inline bool **resolve_local**(*hpx*::id_type const &id, *naming*::address &addr, *error_code* &ec = *throws*)

inline *naming*::address **resolve_local**(*naming*::gid_type const &id, *error_code* &ec = *throws*)

inline *naming*::address **resolve_local**(*hpx*::id_type const &id, *error_code* &ec = *throws*)

hpx::future_or_value<*naming*::address> **resolve_async**(*naming*::gid_type const &id)

inline bool **resolve_full_local**(*hpx*::id_type const &id, *naming*::address &addr, *error_code* &ec = *throws*)

inline *naming*::address **resolve_full_local**(*naming*::gid_type const &id, *error_code* &ec = *throws*)

inline *naming*::address **resolve_full_local**(*hpx*::id_type const &id, *error_code* &ec = *throws*)

hpx::future_or_value<*naming*::address> **resolve_full_async**(*naming*::gid_type const &id)

inline *hpx*::future_or_value<*naming*::address> **resolve_full_async**(*hpx*::id_type const &id)

bool **resolve_cached**(*naming*::gid_type const &id, *naming*::address &addr, *error_code* &ec = *throws*)

inline bool **resolve_cached**(*hpx*::id_type const &id, *naming*::address &addr, *error_code* &ec = *throws*)

inline bool **resolve_local**(*naming*::gid_type const *gids, *naming*::address *addrs, *std*::size_t size, *hpx*::detail::dynamic_bitset<> &locals, *error_code* &ec = *throws*)

bool **resolve_full_local**(*naming*::gid_type const *gids, *naming*::address *addrs, *std*::size_t size, *hpx*::detail::dynamic_bitset<> &locals, *error_code* &ec = *throws*)

bool **resolve_cached**(*naming*::gid_type const *gids, *naming*::address *addrs, *std*::size_t size, *hpx*::detail::dynamic_bitset<> &locals, *error_code* &ec = *throws*)

hpx::future_or_value<*std*::int64_t> **incref_async**(*naming*::gid_type const &gid, *std*::int64_t credits = 1, *hpx*::id_type const &keep_alive = *hpx*::invalid_id)

Increment the global reference count for the given id.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **gid** – [in] The global address (id) for which the global reference count has to be incremented.
- **credits** – [in] The number of reference counts to add for the given id.
- **keep_alive** – [in] Id to keep alive (if valid)
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns Whether the operation was successful.

inline *std*::int64_t **incref**(*naming*::gid_type const &gid, *std*::int64_t credits = 1, *error_code* &ec = *throws*)

void **decref**(*naming*::gid_type const &id, *std*::int64_t credits = 1, *error_code* &ec = *throws*)

Decrement the global reference count for the given id.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **id** – [in] The global address (id) for which the global reference count has to be decremented.
- **t** – [out] If this was the last outstanding global reference for the given gid (the return value of this function is zero), t will be set to the component type of the corresponding element. Otherwise t will not be modified.
- **credits** – [in] The number of reference counts to add for the given id.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global reference count after the decrement.

hpx::future<iterate_names_return_type> **iterate_ids**(std::string const &pattern) const

Invoke the supplied *hpx::function* for every registered global name.

This function iterates over all registered global ids and returns every found entry matching the given name pattern. Any error results in an exception thrown (or reported) from this function.

Parameters **pattern** – [in] pattern (possibly using wildcards) to match all existing entries against

bool **register_name**(std::string const &name, naming::gid_type const &id, error_code &ec = throws) const

Register a global name with a global address (id)

This function registers an association between a global name (string) and a global address (id) usable with one of the functions above (bind, unbind, and resolve).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **name** – [in] The global name (string) to be associated with the global address.
- **id** – [in] The global address (id) to be associated with the global address.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if the global name was registered. It returns false if the global name is not registered.

hpx::future<bool> **register_name_async**(std::string const &name, hpx::id_type const &id) const

bool **register_name**(std::string const &name, hpx::id_type const &id, error_code &ec = throws) const

hpx::future<hpx::id_type> **unregister_name_async**(std::string const &name) const

Unregister a global name (release any existing association)

This function releases any existing association of the given global name with a global address (id).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **name** – [in] The global name (string) for which any association with a global address (id) has to be released.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if an association of this global name has been released, and it returns *false*, if no association existed. Any error results in an exception thrown from this function.

hpx::id_type **unregister_name**(std::string const &name, error_code &ec = throws) const

hpx::future<hpx::id_type> **resolve_name_async**(std::string const &name) const

Query for the global address associated with a given global name.

This function returns the global address associated with the given global name.

This function returns true if it returned global address (id), which is currently associated with the given global name, and it returns false, if currently there is no association for this global name. Any error results in an exception thrown from this function.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **name** – [in] The global name (string) for which the currently associated global address has to be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns [out] The id currently associated with the given global name (valid only if the return value is true).

hpx::id_type **resolve_name**(*std*::string const &name, *error_code* &ec = *throws*) const

future<*hpx*::id_type> **on_symbol_namespace_event**(*std*::string const &name, bool call_for_past_events = false) const

Install a listener for a given symbol namespace event.

This function installs a listener for a given symbol namespace event. It returns a future which becomes ready as a result of the listener being triggered.

Note: The only event type which is currently supported is *symbol_ns_bind*, i.e. the listener is triggered whenever a global id is registered with the given name.

Parameters
- **name** – [in] The global name (string) for which the given event should be triggered.
- **evt** – [in] The event for which a listener should be installed.
- **call_for_past_events** – [in, optional] Trigger the listener even if the given event has already happened in the past. The default for this parameter is *false*.

Returns A future instance encapsulating the global id which is causing the registered listener to be triggered.

void **update_cache_entry**(*naming*::gid_type const &gid, *gva* const &gva, *error_code* &ec = *throws*)

> **Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

inline void **update_cache_entry**(*naming*::gid_type const &gid, *naming*::address const &addr, *std*::uint64_t count = 0, *std*::uint64_t offset = 0, *error_code* &ec = *throws*)

> **Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

bool **get_cache_entry**(*naming*::gid_type const &gid, *gva* &gva, *naming*::gid_type &idbase, *error_code* &ec = *throws*) const

> **Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

void **remove_cache_entry**(*naming*::gid_type const &id, *error_code* &ec = *throws*) const

> **Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

void **clear_cache**(*error_code* &ec = *throws*) const

> **Warning:** This function is for internal use only. It is dangerous and may break your code if you use it.

void **start_shutdown**(*error_code* &ec = *throws*)

hpx::*future*<*std*::pair<*hpx*::id_type, *naming*::address>> **begin_migration**(*hpx*::id_type const &id)

start/stop migration of an object

Returns Current locality and address of the object to migrate

bool **end_migration**(*hpx*::id_type const &id)

std::pair<bool, *components*::pinned_ptr> **was_object_migrated**(*naming*::gid_type const &gid, *hpx*::*move_only_function*<*components*::pinned_ptr(&&f)

Maintain list of migrated objects.

hpx::*future*<void> **mark_as_migrated**(*naming*::gid_type const &gid, *hpx*::*move_only_function*<*std*::pair<bool, *hpx*::*future*<void>>()> &&f, bool expect_to_be_marked_as_migrating)

Mark the given object as being migrated (if the object is unpinned). Delay migration until the object is unpinned otherwise.

void **unmark_as_migrated**(*naming*::gid_type const &gid_, *hpx*::*move_only_function*<void()> &&f)

Remove the given object from the table of migrated objects.

void **pre_cache_endpoints**(*std*::vector<*parcelset*::endpoints_type> const&)

namespace **agas**

Functions

naming::gid_type **bootstrap_primary_namespace_gid**()

hpx::id_type **bootstrap_primary_namespace_id**()

namespace **server**

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

```
|-----MSB------||------LSB-----|
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
|prefix||RC||----identifier----|

MSB        - Most significant bits (bit 64 to bit 127)
LSB        - Least significant bits (bit 0 to bit 63)
prefix     - Highest 32 bits (bit 96 to bit 127) of the MSB. Each
             locality is assigned a prefix. This creates a 96-bit
             address space for each locality.
RC         - Bit 88 to bit 92 of the MSB. This is the log2 of the number
             of reference counting credits on the GID.
             Bit 93 is used by the locking scheme for gid_types.
             Bit 94 is a flag which is set if the credit value is valid.
             Bit 95 is a flag that is set if a GID's credit count is
             ever split (e.g. if the GID is ever passed to another
             locality).
           - Bit 87 marks the gid such that it will not be stored in
             any of the AGAS caches. This is used mainly for ids
```

(continues on next page)

(continued from previous page)

```
                which represent 'one-shot' objects (like promises).
identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The
                content of these bits depends on the component type of
                the underlying object. For all user-defined components,
                these bits contain a unique 88-bit number which is
                assigned sequentially for each locality. For
                \a hpx#components#component_enum_type#runtime_support
                the high 24 bits are zeroed and the low 64 bits hold the
                LVA of the component.
```

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxxxx
    Historically unused address space reserved for future use.
xxxxxxxxxxxx0000xxxxxxxxxxxxxxxx
    Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxxxx
    Prefix of the bootstrap AGAS locality.
00000001000000010000000000000001
    Address of the primary_namespace component on the bootstrap AGAS
    locality.
00000001000000010000000000000002
    Address of the component_namespace component on the bootstrap AGAS
    locality.
00000001000000010000000000000003
    Address of the symbol_namespace component on the bootstrap AGAS
    locality.
00000001000000010000000000000004
    Address of the locality_namespace component on the bootstrap AGAS
    locality.
```

Note: The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

async_colocated

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::get_colocation_id

Defined in header hpx/runtime.hpp[777].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

hpx::id_type **get_colocation_id**(*launch*::sync_policy, *hpx*::id_type const &id, *error_code* &ec = *throws*)

Return the id of the locality where the object referenced by the given id is currently located on.

The function *hpx::get_colocation_id()* returns the id of the locality where the given object is currently located.

See also:

hpx::get_colocation_id()

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The id of the object to locate.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

[777] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

hpx::*future*<*hpx*::id_type> **get_colocation_id**(*hpx*::id_type const &id)

Asynchronously return the id of the locality where the object referenced by the given id is currently located on.

See also:

hpx::get_colocation_id(launch::sync_policy)

Parameters **id** – [in] The id of the object to locate.

async_distributed

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/async_distributed/base_lco.hpp

namespace **hpx**

namespace **components**

namespace **lcos**

template<typename **Result**, typename **RemoteResult**, typename **ComponentTag**>

class **base_lco_with_value** : public *hpx*::*lcos*::*base_lco*, public *ComponentTag*

#include <base_lco_with_value.hpp> The base_lco_with_value class is the common base class for all LCO's synchronizing on a value. The *RemoteResult* template argument should be set to the type of the argument expected for the set_value action.

Template Parameters

- **RemoteResult** – The type of the result value to be carried back to the LCO instance.
- **ComponentTag** – The tag type representing the type of the component (either component_tag or managed_component_tag).

Public Types

using **wrapping_type** = typename detail::base_lco_wrapping_type<*ComponentTag*, *base_lco_with_value*>::type

using **base_type_holder** = *base_lco_with_value*

Public Functions

inline void **set_value_nonvirt**(*RemoteResult* &&result)

The *function* set_value_nonvirt is called whenever a *set_value_action* is applied on this LCO instance. This function just forwards to the virtual function *set_value*, which is overloaded by the derived concrete LCO.

Parameters **result** – [in] The result value to be transferred from the remote operation back to this LCO instance.

inline *Result* **get_value_nonvirt**()

The *function* get_result_nonvirt is called whenever a *get_result_action* is applied on this LCO instance. This function just forwards to the virtual function *get_result*, which is overloaded by the derived concrete LCO.

HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco_with_value, set_value_nonvirt, set_value_action) HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco_with_value

The *set_value_action* may be used to trigger any LCO instances while carrying an additional parameter of any type.

RemoteResult is taken by rvalue ref. This allows for perfect forwarding. When the action thread function is created, the values are moved into the called function. If we took it by const lvalue reference, we would disable the possibility to further move the result to the designated destination.

Parameters **RemoteResult** – [in] The type of the result to be transferred back to this LCO instance. The *get_value_action* may be used to query the value this LCO instance exposes as its 'result' value.

namespace **traits**

hpx::distributed::promise

Defined in header hpx/future.hpp[778].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **distributed**

template<typename **Result**, typename **RemoteResult**>

class **promise**

#include <promise.hpp> A promise can be used by a single *thread* to invoke a (remote) action and wait for the result. The result is expected to be sent back to the promise using the LCO's set_event action

A promise is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type *Result*. The *promise* allows to synchronize exactly one *thread* (the one passed during construction time).

```
// Create the promise (the expected result is a id_type)
hpx::distributed::promise<hpx::id_type> p;

// Get the associated future
future<hpx::id_type> f = p.get_future();

// initiate the action supplying the promise as a
// continuation
apply<some_action>(new continuation(p.get_id()), ...);

// Wait for the result to be returned, yielding control
// in the meantime.
hpx::id_type result = f.get();
// ...
```

Note: The action executed by the promise must return a value of a type convertible to the type as specified by the template parameter *RemoteResult*

Template Parameters

- **Result** – The template parameter *Result* defines the type this promise is expected to return from *promise::get*.
- **RemoteResult** – The template parameter *RemoteResult* defines the type this promise is expected to receive from the remote action.

namespace **lcos**

[778] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/future.hpp

class **base_lco_with_value** : public *hpx*::*lcos*::*base_lco*, public *ComponentTag*

#include <base_lco_with_value.hpp>

template<typename **Action**, typename **Result** = typename *traits*::promise_local_result<typename *Action*::remote_result_type>::type, bool **DirectExecute** = *Action*::direct_execution::value>
class **packaged_action**

#include <packaged_action.hpp> A *packaged_action* can be used by a single *thread* to invoke a (remote) action and wait for the result. The result is expected to be sent back to the *packaged_action* using the LCO's set_event action

A *packaged_action* is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type *Result*.

Note: The action executed using the *packaged_action* as a continuation must return a value of a type convertible to the type as specified by the template parameter *Result*.

Template Parameters
- **Action** – The template parameter *Action* defines the action to be executed by this *packaged_action* instance. The arguments *arg0,… argN* are used as parameters for this action.
- **Result** – The template parameter *Result* defines the type this *packaged_action* is expected to return from its associated future *packaged_action::get_future*.
- **DirectExecute** – The template parameter *DirectExecute* is an optimization aid allowing to execute the action directly if the target is local (without spawning a new thread for this). This template does not have to be supplied explicitly as it is derived from the template parameter *Action*.

hpx/async_distributed/promise.hpp

Defined in header hpx/async_distributed/promise.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<>

class *hpx*::*distributed*::**promise**<void, *hpx*::*util*::unused_type> : public *lcos*::detail::promise_base<void, *hpx*::*util*::unused_type, *lcos*::detail::promise_data<void>>

Public Functions

promise() = default

constructs a promise object and a shared state.

template<typename **Allocator**>
inline **promise**(*std*::allocator_arg_t, *Allocator* const &a)

constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory for the shared state.

promise(*promise* &&other) noexcept = default

constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly-constructed object.

Post other has no shared state.

~promise() = default

Abandons any shared state.

promise &**operator=**(*promise* &&other) noexcept = default

Abandons any shared state (30.6.4) and then as if promise(HPX_MOVE(other)).swap(*this).

Returns *this.

inline void **swap**(*promise* &other) noexcept

Exchanges the shared state of *this and other.

Post *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

inline void **set_value**()

atomically stores the value r in the shared state and makes that state ready (30.6.4).

Throws future_error – if its shared state already has a stored value. if shared state has no stored value exception is raised. promise_already_satisfied if its shared state already has a stored value or exception. no_state if *this has no shared state.

Functions

void **trigger_lco_event**(*hpx*::id_type const &id, *naming*::address &&addr, bool move_credits = true)

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

inline void **trigger_lco_event**(*hpx*::id_type const &id, bool move_credits = true)

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

void **trigger_lco_event**(*hpx*::id_type const &id, *naming*::address &&addr, *hpx*::id_type const &cont, bool move_credits = true)

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

inline void **trigger_lco_event**(*hpx*::id_type const &id, *hpx*::id_type const &cont, bool move_credits = true)

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

template<typename **Result**>
void **set_lco_value**(*hpx*::id_type const &id, *naming*::address &&addr, *Result* &&t, bool move_credits = true)

Set the result value for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **t** – [in] This is the value which should be sent to the LCO.

- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

template<typename **Result**>
std::enable_if_t<!*std*::is_same_v<*std*::decay_t<*Result*>, *naming*::address>> **set_lco_value**(*hpx*::id_type const &id, *Result* &&t, bool move_credits = true)

Set the result value for the (managed) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

template<typename **Result**>
std::enable_if_t<!*std*::is_same_v<*std*::decay_t<*Result*>, *naming*::address>> **set_lco_value_unmanaged**(*hpx*::id_type const &id, *Result* &&t, bool move_credits = true)

Set the result value for the (unmanaged) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

template<typename **Result**>
void **set_lco_value**(*hpx*::id_type const &id, *naming*::address &&addr, *Result* &&t, *hpx*::id_type const &cont, bool move_credits = true)

Set the result value for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

template<typename **Result**>

std::enable_if_t<!std::is_same_v<std::decay_t<Result>, naming::address>> **set_lco_value**(hpx::id_type const &id, Result &&t, hpx::id_type const &cont, bool move_credits = true)

Set the result value for the (managed) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

template<typename **Result**>
std::enable_if_t<!std::is_same_v<std::decay_t<Result>, naming::address>> **set_lco_value_unmanaged**(hpx::id_type const &id, Result &&t, hpx::id_type const &cont, bool move_credits = true)

Set the result value for the (unmanaged) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

void **set_lco_error**(hpx::id_type const &id, naming::address &&addr, std::exception_ptr const &e, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

void **set_lco_error**(*hpx*::id_type const &id, *naming*::address &&addr, *std*::exception_ptr &&e, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

inline void **set_lco_error**(*hpx*::id_type const &id, *std*::exception_ptr const &e, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

inline void **set_lco_error**(*hpx*::id_type const &id, *std*::exception_ptr &&e, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

void **set_lco_error**(*hpx*::id_type const &id, *naming*::address &&addr, *std*::exception_ptr const &e, *hpx*::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

void **set_lco_error**(*hpx*::id_type const &id, *naming*::address &&addr, *std*::exception_ptr &&e, *hpx*::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.

- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

inline void **set_lco_error**(*hpx*::id_type const &id, *std*::exception_ptr const &e, *hpx*::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

inline void **set_lco_error**(*hpx*::id_type const &id, *std*::exception_ptr &&e, *hpx*::id_type const &cont, bool move_credits = true)

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

checkpoint

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/checkpoint/checkpoint.hpp

Defined in header hpx/checkpoint/checkpoint.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

This header defines the save_checkpoint and restore_checkpoint functions. These functions are designed to help HPX application developer's checkpoint their applications. Save_checkpoint serializes one or more objects and saves them as a byte stream. Restore_checkpoint converts the byte stream back into instances of the objects.

namespace **hpx**

namespace **util**

Functions

inline *std*::ostream &**operator<<**(*std*::ostream &ost, *checkpoint* const &ckp)

Operator<< Overload

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint's data. The operator>> overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

Parameters

- **ost** – Output stream to write to.
- **ckp** – Checkpoint to copy from.

Returns Operator<< returns the ostream object.

inline *std*::istream &**operator>>**(*std*::istream &ist, *checkpoint* &ckp)

Operator>> Overload

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint's data in the operator<< overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

Parameters

- **ist** – Input stream to write from.
- **ckp** – Checkpoint to write to.

Returns Operator>> returns the ostream object.

template<typename **T**, typename ...**Ts**, typename **U** = typename *std*::enable_if<!*hpx*::*traits*::is_launch_policy<*T*>::value && !*std*::is_same<typename *std*::decay<*T*>::type, *checkpoint*>::value>::type>
hpx::*future*<*checkpoint*> **save_checkpoint**(*T* &&t, *Ts*&&... ts)

Save_checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **U** – This parameter is used to make sure that T is not a launch policy or a checkpoint. This forces the compiler to choose the correct overload.

Parameters

- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

template<typename **T**, typename ...**Ts**>
hpx::*future*<*checkpoint*> **save_checkpoint**(*checkpoint* &&c, *T* &&t, *Ts*&&... ts)

Save_checkpoint - Take a pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

template<typename **T**, typename ...**Ts**, typename **U** = typename *std*::enable_if<!*std*::is_same<typename *std*::decay<*T*>::type, *checkpoint*>::value>::type>
hpx::*future*<*checkpoint*> **save_checkpoint**(*hpx*::*launch* p, *T* &&t, *Ts*&&... ts)

Save_checkpoint - Policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

template<typename **T**, typename ...**Ts**>
hpx::*future*<*checkpoint*> **save_checkpoint**(*hpx*::*launch* p, *checkpoint* &&c, *T* &&t, *Ts*&&... ts)

Save_checkpoint - Policy overload & pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

template<typename **T**, typename ...**Ts**, typename **U** = typename *std*::enable_if<!*std*::is_same<typename *std*::decay<*T*>::type, *checkpoint*>::value>::type>
checkpoint **save_checkpoint**(*hpx*::*launch*::sync_policy sync_p, *T* &&t, *Ts*&&... ts)

Save_checkpoint - Sync_policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **U** – This parameter is used to make sure that T is not a checkpoint. This forces the compiler to choose the correct overload.

Parameters

- **sync_p** – hpx::launch::sync_policy
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint which is passed hpx::launch::sync_policy will return a checkpoint which contains the serialized values checkpoint.

template<typename **T**, typename ...**Ts**>
checkpoint **save_checkpoint**(*hpx*::*launch*::sync_policy sync_p, *checkpoint* &&c, *T* &&t, *Ts*&&... ts)

Save_checkpoint - Sync_policy overload & pre-init. checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **sync_p** – hpx::launch::sync_policy
- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint which is passed hpx::launch::sync_policy will return a checkpoint which contains the serialized values checkpoint.

template<typename **T**, typename ...**Ts**, typename **U** = typename *std*::enable_if<!*hpx*::*traits*::is_launch_policy<*T*>::value && !*std*::is_same<typename *std*::decay<*T*>::type, *checkpoint*>::value>::type>
hpx::*future*<*checkpoint*> **prepare_checkpoint**(*T* const &t, *Ts* const&... ts)

prepare_checkpoint

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. prepare_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

template<typename **T**, typename ...**Ts**>
hpx::*future*<*checkpoint*> **prepare_checkpoint**(*checkpoint* &&c, *T* const &t, *Ts* const&... ts)

prepare_checkpoint

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. prepare_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **c** – Takes a pre-initialized checkpoint to prepare
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

template<typename **T**, typename ...**Ts**, typename **U** = typename *std*::enable_if<!*std*::is_same<*T*, *checkpoint*>::value>::type>
hpx::*future*<*checkpoint*> **prepare_checkpoint**(*hpx*::*launch* p, *T* const &t, *Ts* const&... ts)

prepare_checkpoint

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. prepare_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

template<typename **T**, typename ...**Ts**>
hpx::*future*<*checkpoint*> **prepare_checkpoint**(*hpx*::*launch* p, *checkpoint* &&c, *T* const &t, *Ts* const&... ts)

prepare_checkpoint

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. prepare_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **c** – Takes a pre-initialized checkpoint to prepare
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns prepare_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore_checkpoint operation.

template<typename **T**, typename ...**Ts**>
void **restore_checkpoint**(*checkpoint* const &c, *T* &t, *Ts*&... ts)

Restore_checkpoint

Restore_checkpoint takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in save_checkpoint). Restore_checkpoint can resurrect a stored component in two ways: by passing in a instance of a component's shared_ptr or by passing in an instance of the component's client.

Template Parameters

- **T** – A container to restore.

- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **c** – The checkpoint to restore.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Restore_checkpoint returns void.

class **checkpoint**

#include <checkpoint.hpp> Checkpoint Object

Checkpoint is the container object which is produced by save_checkpoint and is consumed by a restore_checkpoint. A checkpoint may be moved into the save_checkpoint object to write the byte stream to the pre-created checkpoint object.

Checkpoints are able to store all containers which are able to be serialized including components.

Friends

friend class hpx::serialization::access

friend *std*::ostream &**operator<<**(*std*::ostream &ost, *checkpoint* const &ckp)

Operator<< Overload

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint's data. The operator>> overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

Parameters

- **ost** – Output stream to write to.
- **ckp** – Checkpoint to copy from.

Returns Operator<< returns the ostream object.

friend *std*::istream &**operator>>**(*std*::istream &ist, *checkpoint* &ckp)

Operator>> Overload

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint's data in the operator<< overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

Parameters

- **ist** – Input stream to write from.
- **ckp** – Checkpoint to write to.

Returns Operator>> returns the ostream object.

template<typename **T**, typename ...**Ts**>
friend void **restore_checkpoint**(*checkpoint* const &c, *T* &t, *Ts*&... ts)

Restore_checkpoint

Restore_checkpoint takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in save_checkpoint). Restore_checkpoint can resurrect a stored component in two ways: by passing in a instance of a component's shared_ptr or by passing in an instance of the component's client.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters
- **c** – The checkpoint to restore.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Restore_checkpoint returns void.

Functions

template<typename **Container**, typename ...**Ts**>
void **save_checkpoint_data**(*Container* &data, *Ts*&&... ts)

save_checkpoint_data

Save_checkpoint_data takes any number of objects which a user may wish to store in the given container.

Template Parameters
- **Container** – Container used to store the check-pointed data.
- **Ts** – Types of variables to checkpoint

Parameters
- **data** – Container instance used to store the checkpoint data
- **ts** – Variable instances to be inserted into the checkpoint.

template<typename ...**Ts**>
std::size_t **prepare_checkpoint_data**(*Ts* const&... ts)

prepare_checkpoint_data

prepare_checkpoint_data takes any number of objects which a user may wish to store in a subsequent save_checkpoint_data operation. The function will return the number of bytes necessary to store the data that will be produced.

Template Parameters **Ts** – Types of variables to checkpoint

Parameters **ts** – Variable instances to be inserted into the checkpoint.

template<typename **Container**, typename ...**Ts**>
void **restore_checkpoint_data**(*Container* const &cont, *Ts*&... ts)

restore_checkpoint_data

restore_checkpoint_data takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to save_checkpoint_data that had used the given container instance.

Template Parameters

- **Container** – Container used to restore the check-pointed data.
- **Ts** – Types of variables to restore

Parameters

- **cont** – Container instance used to restore the checkpoint data
- **ts** – Variable instances to be restored from the container

struct **checkpointing_tag**

Functions

template<typename **T**>
hpx::*future*<*std*::vector<*std*::decay_t<*T*>>> **all_gather**(char const *basename, *T* &&result, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*(), *root_site_arg* root_site = *root_site_arg*())

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_gather operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. \params root_site The site that is responsible for creating the all_gather support object. This value is optional and defaults to '0' (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_gather operation has been completed.

template<typename **T**>
hpx::*future*<*std*::vector<*std*::decay_t<*T*>>> **all_gather**(*communicator* comm, *T* &&result, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Typedefs

using **num_sites_arg** = detail::argument_type<detail::num_sites_tag>

The number of participating sites (default: all localities)

using **this_site_arg** = detail::argument_type<detail::this_site_tag>

The local end of the communication channel.

using **that_site_arg** = detail::argument_type<detail::that_site_tag>

The opposite end of the communication channel.

using **generation_arg** = detail::argument_type<detail::generation_tag>

The generational counter identifying the sequence number of the operation performed on the given base name. It needs to be supplied only if the operation on the given base name has to be performed more than once. It must be a positive number greater than zero.

using **root_site_arg** = detail::argument_type<detail::root_site_tag, 0>

The site that is responsible for creating the support object of the operation. It defaults to '0' (zero).

using **tag_arg** = detail::argument_type<detail::tag_tag, 0>

The tag identifying the concrete operation.

using **arity_arg** = detail::argument_type<detail::arity_tag>

The number of children each of the communication nodes is connected to (default: picked based on num_sites).

hpx::distributed::barrier

Defined in header hpx/barrier.hpp[779].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **distributed**

Functions

explicit **barrier**(*std*::string const &base_name)

Creates a barrier, rank is locality id, size is number of localities

A barrier *base_name* is created. It expects that hpx::get_num_localities() participate and the local rank is hpx::get_locality_id().

Parameters **base_name** – The name of the barrier

barrier(*std*::string const &base_name, *std*::size_t num)

Creates a barrier with a given size, rank is locality id

A barrier *base_name* is created. It expects that *num* participate and the local rank is hpx::get_locality_id().

Parameters

- **base_name** – The name of the barrier
- **num** – The number of participating threads

barrier(*std*::string const &base_name, *std*::size_t num, *std*::size_t rank)

Creates a barrier with a given size and rank

A barrier *base_name* is created. It expects that *num* participate and the local rank is *rank*.

Parameters

- **base_name** – The name of the barrier
- **num** – The number of participating threads
- **rank** – The rank of the calling site for this invocation

barrier(*std*::string const &base_name, *std*::vector<*std*::size_t> const &ranks, *std*::size_t rank)

Creates a barrier with a vector of ranks

A barrier *base_name* is created. It expects that ranks.size() and the local rank is *rank* (must be contained in *ranks*).

Parameters

- **base_name** – The name of the barrier
- **ranks** – Gives a list of participating ranks (this could be derived from a list of locality ids

[779] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/barrier.hpp

- **rank** – The rank of the calling site for this invocation

void **wait**() const

Wait until each participant entered the barrier. Must be called by all participants

Returns This function returns once all participants have entered the barrier (have called *wait*).

hpx::*future*<void> **wait**(*hpx*::*launch*::async_policy) const

Wait until each participant entered the barrier. Must be called by all participants

Returns a future that becomes ready once all participants have entered the barrier (have called *wait*).

static void **synchronize**()

Perform a global synchronization using the default global barrier The barrier is created once at startup and can be reused throughout the lifetime of an HPX application.

Note: This function currently does not support dynamic connection and disconnection of localities.

hpx/collectives/broadcast.hpp

Defined in header hpx/collectives/broadcast.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

template<typename **T**>
hpx::*future*<void> **broadcast_to**(char const *basename, *T* &&local_result, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the broadcast operation
- **local_result** – A value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future that will become ready once the broadcast operation has been completed.

template<typename **T**>

hpx::*future*<void> **broadcast_to**(*communicator* comm, *T* &&local_result, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future that will become ready once the broadcast operation has been completed.

template<typename **T**>
hpx::*future*<void> **broadcast_to**(*communicator* comm, *generation_arg* generation, *T* &&local_result, *this_site_arg* this_site = *this_site_arg*())

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to transmit to all participating sites from this call site.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future that will become ready once the broadcast operation has been completed.

template<typename **T**>
hpx::*future*<*T*> **broadcast_from**(char const *basename, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the broadcast operation
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

template<typename **T**>
hpx::*future*<*T*> **broadcast_from**(*communicator* comm, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Parameters
- **comm** – A communicator object returned from *create_communicator*
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

hpx/collectives/broadcast_direct.hpp

Defined in header hpx/collectives/broadcast_direct.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

Functions

template<typename Action, typename ArgN, ...
> hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...
))> > broadcast (std::vector< hpx::id_type > const &ids, ArgN argN,...)

Perform a distributed broadcast operation.

The function hpx::lcos::broadcast performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

Note: If decltype(Action(…)) is void, then the result of this function is future<void>.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

template<typename Action, typename ArgN, ...
> void broadcast_post (std::vector< hpx::id_type > const &ids, ArgN argN,...)

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function hpx::lcos::broadcast_post performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

template<typename Action, typename ArgN, ...
> hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> > broadcast_with_index (std::vector< hpx::id_type > const &ids,
ArgN argN,...)

Perform a distributed broadcast operation.

The function hpx::lcos::broadcast_with_index performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Note: If decltype(Action(…)) is void, then the result of this function is future<void>.

Parameters
- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

```
template<typename Action, typename ArgN, ...
> void broadcast_post_with_index (std::vector< hpx::id_type > const &ids,
ArgN argN,...)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function hpx::lcos::broadcast_post_with_index performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Parameters
- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

hpx/collectives/channel_communicator.hpp

Defined in header hpx/collectives/channel_communicator.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

hpx::*future*<*channel_communicator*> **create_channel_communicator**(char const *basename, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*())

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future to a new communicator object usable with the collective operation.

channel_communicator **create_channel_communicator**(*hpx*::*launch*::sync_policy, char const *basename, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*())

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a new communicator object usable with the collective operation.

template<typename **T**>
hpx::*future*<void> **set**(*channel_communicator* comm, *that_site_arg* site, *T* &&value, *tag_arg* tag = *tag_arg*())

Send a value to the given site

This function sends a value to the given site based on the given communicator.

Parameters

- **comm** – The channel communicator object to use for the data transfer
- **site** – The destination site
- **value** – The value to send
- **tag** – The (optional) tag identifying the concrete operation

Returns This function returns a future<void> that becomes ready once the data transfer operation has finished.

template<typename **T**>
hpx::*future*<*T*> **get**(*channel_communicator* comm, *that_site_arg* site, *tag_arg* tag = *tag_arg*())

Send a value to the given site

This function receives a value from the given site based on the given communicator.

Parameters

- **comm** – The channel communicator object to use for the data transfer
- **site** – The source site

Returns This function returns a future<T> that becomes ready once the data transfer operation has finished. The future will hold the received value.

class **channel_communicator**

#include <channel_communicator.hpp> A handle identifying the communication channel to use for get/set operations

hpx/collectives/communication_set.hpp

Defined in header hpx/collectives/communication_set.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

communicator **create_communication_set**(char const *basename, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*(), *arity_arg* arity = *arity_arg*())

The function *create_communication_set* sets up a (distributed) tree-like communication structure that can be used with any of the collective APIs (such like *all_to_all* and similar).

Parameters

- **basename** – The base name identifying the all_to_all operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- **arity** – The number of children each of the communication nodes is connected to (default: picked based on num_sites).

Returns This function returns a new communicator object usable with the collective operation.

hpx/collectives/create_communicator.hpp

Defined in header hpx/collectives/create_communicator.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

communicator **create_communicator**(char const *basename, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*(), *root_site_arg* root_site = *root_site_arg*())

Create a new communicator object usable with any collective operation

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as *all_gather*, *all_reduce*, *all_to_all*, *broadcast*, etc.).

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- **root_site** – The site that is responsible for creating the collective support object. This value is optional and defaults to '0' (zero).

Returns This function returns a new communicator object usable with the collective operation.

communicator **create_local_communicator**(char const *basename, *num_sites_arg* num_sites, *this_site_arg* this_site, *generation_arg* generation = *generation_arg*(), *root_site_arg* root_site = *root_site_arg*())

Create a new communicator object usable with any local collective operation

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as *all_gather*, *all_reduce*, *all_to_all*, *broadcast*, etc.).

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites
- **this_site** – The sequence number of this invocation (usually the sequence number of the object participating in the collective operation). This value must be in the range [0, num_sites).

- **generation** – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- **root_site** – The site that is responsible for creating the collective support object. This value is optional and defaults to '0' (zero).

Returns This function returns a new communicator object usable for all local collective operations.

struct **communicator**

#include <create_communicator.hpp> A communicator instance represents the list of sites that participate in a particular collective operation.

Public Functions

void **set_info**(*num_sites_arg* num_sites, *this_site_arg* this_site) noexcept

Store the number of used sites and the index of the current site for this communicator instance.

Parameters

- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this site (usually the locality id).

std::pair<*num_sites_arg*, *this_site_arg*> **get_info**() const noexcept

Retrieve the number of used sites and the index of the current site for this communicator instance.

bool **is_root**() const

Return whether this communicator instance represents the root site of the communication operation.

hpx/collectives/exclusive_scan.hpp

Defined in header hpx/collectives/exclusive_scan.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

template<typename **T**, typename **F**>
hpx::*future*<*std*::decay_t<*T*>> **exclusive_scan**(char const *basename, *T* &&result, *F* &&op, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*(), *root_site_arg* root_site = *root_site_arg*())

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Parameters
- **basename** – The base name identifying the exclusive_scan operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. \params root_site The site that is responsible for creating the exclusive_scan support object. This value is optional and defaults to '0' (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

template<typename **T**, typename **F**>
hpx::*future*<*std*::decay_t<*T*>> **exclusive_scan**(*communicator* comm, *T* &&result, *F* &&op, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Parameters
- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed

more than once. The generation number (if given) must be a positive number greater than zero.

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

hpx/collectives/fold.hpp

Defined in header hpx/collectives/fold.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

Functions

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...
))> fold (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op, Init &&init,
ArgN argN,...)
```

Perform a distributed fold operation.

The function hpx::lcos::fold performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.

- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> fold_with_index (std::vector< hpx::id_type > const &ids,
FoldOp &&fold_op, Init &&init, ArgN argN,...)
```

Perform a distributed folding operation.

The function hpx::lcos::fold_with_index performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...
))> inverse_fold (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op,
Init &&init, ArgN argN,...)
```

Perform a distributed inverse folding operation.

The function hpx::lcos::inverse_fold performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.

- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> inverse_fold_with_index (std::vector< hpx::id_type > const &ids,
FoldOp &&fold_op, Init &&init, ArgN argN,...)
```

Perform a distributed inverse folding operation.

The function hpx::lcos::inverse_fold_with_index performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

hpx/collectives/gather.hpp

Defined in header hpx/collectives/gather.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(char const *basename, T &&result,
                                                  num_sites_arg num_sites = num_sites_arg(),
                                                  this_site_arg this_site = this_site_arg(),
                                                  generation_arg generation = generation_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the gather operation
- **result** – The value to transmit to the central gather point from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(communicator comm, T &&result, this_site_arg
                                                  this_site = this_site_arg(), generation_arg
                                                  generation = generation_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **result** – The value to transmit to the central gather point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **result** – The value to transmit to the central gather point from this call site.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied

only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

template<typename **T**>
hpx::*future*<*std*::vector<decay_t<*T*>>> **gather_there**(char const *basename, *T* &&result, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*(), *root_site_arg* root_site = *root_site_arg*())

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather_here* is executed)

Parameters
- **basename** – The base name identifying the gather operation
- **result** – The value to transmit to the central gather point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **root_site** – The sequence number of the central gather point (usually the locality id). This value is optional and defaults to 0.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

template<typename **T**>
hpx::*future*<*std*::vector<decay_t<*T*>>> **gather_there**(*communicator* comm, *T* &&result, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather_here* is executed)

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather_here* is executed)

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Parameters
- **comm** – A communicator object returned from *create_communicator*

- **result** – The value to transmit to the central gather point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **result** – The value to transmit to the central gather point from this call site.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

hpx/collectives/inclusive_scan.hpp

Defined in header hpx/collectives/inclusive_scan.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> inclusive_scan(char const *basename, T &&result, F &&op,
                                            num_sites_arg num_sites = num_sites_arg(),
                                            this_site_arg this_site = this_site_arg(),
                                            generation_arg generation = generation_arg(),
                                            root_site_arg root_site = root_site_arg())
```

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the inclusive_scan operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. \params root_site The site that is responsible for creating the inclusive_scan support object. This value is optional and defaults to '0' (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

template<typename **T**, typename **F**>
hpx::*future*<*std*::decay_t<*T*>> **inclusive_scan**(*communicator* comm, *T* &&result, *F* &&op, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

hpx::distributed::latch

Defined in header hpx/latch.hpp[780].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **distributed**

class **latch** : public *components*::client_base<*latch*, *hpx*::*lcos*::server::latch>

#include <latch.hpp> Latch is an implementation of a synchronization primitive that allows multiple threads to wait for a shared event to occur before proceeding. This latch can be invoked in a distributed application.

For a local only latch

See also:

hpx::latch.

Public Functions

latch() = default

explicit **latch**(*std*::ptrdiff_t count)

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

inline **latch**(*hpx*::id_type const &id)

Extension: Create a client side representation for the existing *server::latch* instance with the given global id *id*.

inline **latch**(*hpx*::*future*<*hpx*::id_type> &&f)

Extension: Create a client side representation for the existing *server::latch* instance with the given global id *id*.

inline **latch**(*hpx*::*shared_future*<*hpx*::id_type> const &id)

Extension: Create a client side representation for the existing *server::latch* instance with the given global id *id*.

inline **latch**(*hpx*::*shared_future*<*hpx*::id_type> &&id)

inline void **count_down_and_wait**()

Decrements counter_ by 1 . Blocks at the synchronization point until counter_ reaches 0.

Requires: counter_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all is_ready calls on this latch that return true.

Throws `Nothing.` –

[780] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/latch.hpp

inline void **arrive_and_wait**()

Decrements counter_ by update . Blocks at the synchronization point until counter_ reaches 0.

Requires: counter_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all is_ready calls on this latch that return true.

Throws `Nothing.` –

inline void **count_down**(*std*::ptrdiff_t n)

Decrements counter_ by n. Does not block.

Requires: counter_ >= n and n >= 0.

Synchronization: Synchronizes with all calls that block on this latch and with all is_ready calls on this latch that return true .

Throws `Nothing.` –

inline bool **is_ready**() const noexcept

Returns: counter_ == 0. Does not block.

Throws `Nothing.` –

inline bool **try_wait**() const noexcept

Returns: counter_ == 0. Does not block.

Throws `Nothing.` –

inline void **wait**() const

If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.

Throws `Nothing.` –

Private Types

typedef *components*::client_base<*latch*, *hpx*::*lcos*::server::latch> **base_type**

namespace **lcos**

hpx/collectives/reduce.hpp

Defined in header hpx/collectives/reduce.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

template<typename **T**, typename **F**>
hpx::*future*<*std*::decay_t<*T*>> **reduce_here**(char const *basename, *T* &&result, *F* &&op, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Reduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_reduce operation
- **local_result** – A value to reduce on the central reduction point from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

template<typename **T**, typename **F**>
hpx::*future*<decay_t<*T*>> **reduce_here**(*communicator* comm, *T* &&local_result, *F* &&op, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Reduce a set of values from different call sites

This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

Reduce a set of values from different call sites

This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to reduce on the root_site from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed

more than once. The generation number (if given) must be a positive number greater than zero.

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to reduce on the root_site from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

template<typename **T**, typename **F**>
hpx::*future*<void> **reduce_there**(char const *basename, *T* &&result, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*(), *root_site_arg* root_site = *root_site_arg*())

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce_here* is executed)

Parameters

- **basename** – The base name identifying the reduction operation
- **result** – A future referring to the value to transmit to the central reduction point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **root_site** – The sequence number of the central reduction point (usually the locality id). This value is optional and defaults to 0.

Returns This function returns a future<void>. It will become ready once the reduction operation has been completed.

template<typename **T**>
hpx::*future*<void> **reduce_there**(*communicator* comm, *T* &&local_result, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce_here* is executed)

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce_here* is executed)

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Parameters

- `comm` – A communicator object returned from *create_communicator*
- `local_result` – A value to reduce on the central reduction point from this call site.
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- `generation` – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- `comm` – A communicator object returned from *create_communicator*
- `local_result` – A value to reduce on the central reduction point from this call site.

This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- `this_site` – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

hpx/collectives/reduce_direct.hpp

Defined in header hpx/collectives/reduce_direct.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **`hpx`**

Top level HPX namespace.

namespace **`lcos`**

Functions

`template<typename Action, typename ReduceOp, typename ArgN, ...`
`> hpx::future< decltype(Action(hpx::id_type, ArgN,...`
`))> reduce (std::vector< hpx::id_type > const &ids, ReduceOp &&reduce_op,`
`ArgN argN,...)`

Perform a distributed reduction operation.

The function hpx::lcos::reduce performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

Parameters

- `ids` – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `reduce_op` – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- `argN` – [in] Any number of arbitrary arguments (passed by by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

`template<typename Action, typename ReduceOp, typename ArgN, ...`
`> hpx::future< decltype(Action(hpx::id_type, ArgN,...,`
`std::size_t))> reduce_with_index (std::vector< hpx::id_type > const &ids,`
`ReduceOp &&reduce_op, ArgN argN,...)`

Perform a distributed reduction operation.

The function hpx::lcos::reduce_with_index performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Parameters

- `ids` – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `reduce_op` – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- `argN` – [in] Any number of arbitrary arguments (passed by by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

hpx/collectives/scatter.hpp

Defined in header hpx/collectives/scatter.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

template<typename **T**>
hpx::*future*<*T*> **scatter_from**(char const *basename, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*(), *root_site_arg* root_site = *root_site_arg*())

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Parameters

- **basename** – The base name identifying the scatter operation
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **root_site** – The sequence number of the central scatter point (usually the locality id). This value is optional and defaults to 0.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

template<typename **T**>
hpx::*future*<*T*> **scatter_from**(*communicator* comm, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

template<typename **T**>
hpx::*future*<*T*> **scatter_to**(char const *basename, *std*::vector<*T*> &&result, *num_sites_arg* num_sites = *num_sites_arg*(), *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding *scatter_from* is executed)

Parameters

- **basename** – The base name identifying the scatter operation
- **result** – The value to transmit to the central scatter point from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

template<typename **T**>
hpx::*future*<*T*> **scatter_to**(*communicator* comm, *std*::vector<*T*> &&result, *this_site_arg* this_site = *this_site_arg*(), *generation_arg* generation = *generation_arg*())

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding *scatter_from* is executed)

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding *scatter_from* is executed)

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

components

hpx/components/basename_registration.hpp

Defined in header hpx/components/basename_registration.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename **Client**>
std::vector<*Client*> **find_all_from_basename**(*std*::string base_name, *std*::size_t num_ids)

Return all registered clients from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Return all registered ids from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Note: The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Note: The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Template Parameters `Client` – The client type to return

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **num_ids** – [in] The number of registered ids to expect.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **num_ids** – [in] The number of registered ids to expect.

Returns A list of futures representing the ids which were registered using the given base name.

Returns A list of futures representing the ids which were registered using the given base name.

template<typename **Client**>
std::vector<*Client*> **find_from_basename**(*std*::string base_name, *std*::vector<*std*::size_t> const &ids)

Return registered clients from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

Return registered ids from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

Note: The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Note: The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Template Parameters `Client` – The client type to return

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **ids** – [in] The sequence numbers of the registered ids.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **ids** – [in] The sequence numbers of the registered ids.

Returns A list of futures representing the ids which were registered using the given base name and sequence numbers.

Returns A list of futures representing the ids which were registered using the given base name and sequence numbers.

template<typename **Client**>
Client **find_from_basename**(*std*::string base_name, *std*::size_t sequence_nr)

Return registered id from the given base name and sequence number.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

Note: The future embedded in the returned client object will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Note: The future will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Template Parameters `Client` – The client type to return

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **sequence_nr** – [in] The sequence number of the registered id.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **sequence_nr** – [in] The sequence number of the registered id.

Returns A representing the id which was registered using the given base name and sequence numbers.

Returns A representing the id which was registered using the given base name and sequence numbers.

template<typename **Client**, typename **Stub**, typename **Data**>
hpx::*future*<bool> **register_with_basename**(*std*::string base_name, *components*::client_base<*Client*, *Stub*, *Data*> &client, *std*::size_t sequence_nr)

Register the id wrapped in the given client using the given base name.

The function registers the object the given client refers to using the provided base name.

Note: The operation will fail if the given sequence number is not unique.

Template Parameters `Client` – The client type to register

Parameters

- `base_name` – [in] The base name for which to retrieve the registered ids.
- `client` – [in] The client which should be registered using the given base name.
- `sequence_nr` – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system-wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

Returns A future representing the result of the registration operation itself.

template<typename **Client**>
Client **unregister_with_basename**(*std*::string base_name, *std*::size_t sequence_nr = ~static_cast<*std*::size_t>(0))

Unregister the given id using the given base name.

Unregister the given base name.

The function unregisters the given ids using the provided base name.

The function unregisters the given ids using the provided base name.

Template Parameters `Client` – The client type to return

Parameters

- `base_name` – [in] The base name for which to retrieve the registered ids.
- `sequence_nr` – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with *register_with_basename* before.
- `base_name` – [in] The base name for which to retrieve the registered ids.
- `sequence_nr` – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with *register_with_basename* before.

Returns A future representing the result of the un-registration operation itself.

Returns A future representing the result of the un-registration operation itself.

hpx/components/basename_registration_fwd.hpp

Defined in header hpx/components/basename_registration_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

hpx::*future*<bool> **register_with_basename**(*std*::string base_name, *hpx*::id_type const &id, *std*::size_t sequence_nr = ~static_cast<*std*::size_t>(0))

Register the given id using the given base name.

The function registers the given ids using the provided base name.

Note: The operation will fail if the given sequence number is not unique.

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **id** – [in] The id to register using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system-wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

Returns A future representing the result of the registration operation itself.

bool **register_with_basename**(*hpx*::*launch*::sync_policy, *std*::string base_name, *hpx*::id_type const &id, *std*::size_t sequence_nr = ~static_cast<*std*::size_t>(0), *error_code* &ec = *throws*)

hpx::*future*<bool> **register_with_basename**(*std*::string base_name, *hpx*::*future*<*hpx*::id_type> f, *std*::size_t sequence_nr = ~static_cast<*std*::size_t>(0))

Register the id wrapped in the given future using the given base name.

The function registers the object the given future refers to using the provided base name.

Note: The operation will fail if the given sequence number is not unique.

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **f** – [in] The future which should be registered using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system-wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

Returns A future representing the result of the registration operation itself.

hpx/components/get_ptr.hpp

Defined in header hpx/components/get_ptr.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename **Component**>
hpx::*future*<*std*::shared_ptr<*Component*>> **get_ptr**(*hpx*::id_type const &id)

Returns a future referring to the pointer to the underlying memory of a component.

The function hpx::get_ptr can be used to extract a future referring to the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise, the function will raise an error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

Parameters **id** – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.

Template Parameters **Component** – The type of the server side component.

Returns This function returns a future representing the pointer to the underlying memory for the component instance with the given *id*.

template<typename **Derived**, typename **Stub**, typename **Data**>
hpx::*future*<*std*::shared_ptr<typename *components*::client_base<*Derived*, *Stub*, *Data*>::server_component_type>> **get_ptr**(*com*
Stu
Dat
con
&c)

Returns a future referring to the pointer to the underlying memory of a component.

The function hpx::get_ptr can be used to extract a future referring to the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise, the function will raise an error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

Parameters **c** – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.

Returns This function returns a future representing the pointer to the underlying memory for the component instance with the given *id*.

template<typename **Component**>
std::shared_ptr<*Component*> **get_ptr**(*launch*::sync_policy p, *hpx*::id_type const &id, *error_code* &ec = *throws*)

Returns the pointer to the underlying memory of a component.

The function hpx::get_ptr_sync can be used to extract the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise, the function will raise and error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **p** – [in] The parameter *p* represents a placeholder type to turn make the call synchronous.
- **id** – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Template Parameters **Component** – The only template parameter has to be the type of the server side component.

Returns This function returns the pointer to the underlying memory for the component instance with the given *id*.

template<typename **Derived**, typename **Stub**, typename **Data**>

std::shared_ptr<typename *components*::client_base<*Derived*, *Stub*, *Data*>::server_component_type> **get_ptr**(*launch*::sync_pol p, *components*::client_base<*Derived*, *Stub*, *Data*> const &c, *error_code* &ec = *throws*)

Returns the pointer to the underlying memory of a component.

The function hpx::get_ptr_sync can be used to extract the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise, the function will raise and error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **p** – [in] The parameter *p* represents a placeholder type to turn make the call synchronous.
- **c** – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the pointer to the underlying memory for the component instance with the given *id*.

Public Functions

inline bool **get_startup_function**(*startup_function_type* &startup, bool &pre_startup) override

Return any startup function for this component.

Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_startup** –

Returns Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

inline bool **get_shutdown_function**(*shutdown_function_type* &shutdown, bool &pre_shutdown) override

Return any startup function for this component.

Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_shutdown** –

Returns Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

hpx/components_base/get_lva.hpp

Defined in header hpx/components_base/get_lva.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

template<typename **Component**, typename **Enable** = void>

struct **get_lva**

#include <get_lva.hpp> The get_lva template is a helper structure allowing to convert a local virtual address as stored in a local address (returned from the function *resolver_client::resolve*) to the address of the component implementing the action.

The default implementation uses the template argument *Component* to deduce the type wrapping the component implementing the action. This is used to get the needed address.

Template Parameters **Component** – This is the type of the component implementing the action to execute.

Public Static Functions

static inline constexpr *Component* ***call**(*naming*::address_type lva) noexcept

hpx/components_base/server/fixed_component_base.hpp

Defined in header hpx/components_base/server/fixed_component_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

template<typename **Component**, typename **Derived**>

class **managed_component**

#include <managed_component_base.hpp> The *managed_component* template is used as an indirection layer for components allowing to gracefully handle the access to non-existing components.

Additionally, it provides memory management capabilities for the wrapping instances, and it integrates the memory management with the AGAS service. Every instance of a *managed_component* gets assigned a global id. The provided memory management allocates the *managed_component* instances from a special heap, ensuring fast allocation and avoids a full network round trip to the AGAS service for each of the allocated instances.

Template Parameters

- **Component** – Component type
- **Derived** – Most derived component type

Public Types

namespace **hpx**

namespace **components**

Variables

constexpr char const *const **default_binpacking_counter_name** = "/runtime{locality/total}/count/component@"

static const *binpacking_distribution_policy* **binpacked** = {}

A predefined instance of the binpacking *distribution_policy*. It will represent the local locality and will place all items to create here.

struct **binpacking_distribution_policy**

#include <binpacking_distribution_policy.hpp> This class specifies the parameters for a binpacking distribution policy to use for creating a given number of items on a given set of localities. The binpacking policy will distribute the new objects in a way such that each of the localities will equalize the number of overall objects of this type based on a given criteria (by default this criteria is the overall number of objects of this type).

Public Functions

inline **binpacking_distribution_policy**()

Default-construct a new instance of a binpacking_distribution_policy. This policy will represent one locality (the local locality).

inline *binpacking_distribution_policy* **operator()**(*std*::vector<id_type> const &locs, char const *perf_counter_name = *default_binpacking_counter_name*) const

Create a new *default_distribution* policy representing the given set of localities.

Parameters
- **locs** – [in] The list of localities the new instance should represent
- **perf_counter_name** – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

inline *binpacking_distribution_policy* **operator()**(*std*::vector<id_type> &&locs, char const *perf_counter_name = *default_binpacking_counter_name*) const

Create a new *default_distribution* policy representing the given set of localities.

Parameters
- **locs** – [in] The list of localities the new instance should represent
- **perf_counter_name** – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

inline *binpacking_distribution_policy* **operator()**(id_type const &loc, char const *perf_counter_name = *default_binpacking_counter_name*) const

Create a new *default_distribution* policy representing the given locality

Parameters
- **loc** – [in] The locality the new instance should represent
- **perf_counter_name** – [in] The name of the performance counter that should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

template<typename **Component**, typename ...**Ts**>
inline *hpx*::*future*<*hpx*::id_type> **create**(*Ts*&&... vs) const

Create one object on one of the localities associated by this policy instance

Parameters **vs** – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

template<typename **Component**, typename ...**Ts**>
inline *hpx*::*future*<*std*::vector<bulk_locality_result>> **bulk_create**(*std*::size_t count, *Ts*&&... vs) const

Create multiple objects on the localities associated by this policy instance

Parameters
- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses which represent the newly created objects

inline *std*::string const &**get_counter_name**() const

Returns the name of the performance counter associated with this policy instance.

inline *std*::size_t **get_num_localities**() const

Returns the number of associated localities for this distribution policy

Note: This function is part of the creation policy implemented by this class

hpx/distribution_policies/colocating_distribution_policy.hpp

Defined in header hpx/distribution_policies/colocating_distribution_policy.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Variables

static const *colocating_distribution_policy* **colocated** = { }

A predefined instance of the co-locating *distribution_policy*. It will represent the local locality and will place all items to create here.

struct **colocating_distribution_policy**

#include <colocating_distribution_policy.hpp> This class specifies the parameters for a distribution policy to use for creating a given number of items on the locality where a given object is currently placed.

Public Functions

constexpr **colocating_distribution_policy**() = default

Default-construct a new instance of a colocating_distribution_policy. This policy will represent the local locality.

inline *colocating_distribution_policy* **operator()**(id_type const &id) const

Create a new colocating_distribution_policy representing the locality where the given object is current located

Parameters **id** – [in] The global address of the object with which the new instances should be colocated on

template<typename **Client**, typename **Stub**, typename **Data**>
inline *colocating_distribution_policy* **operator()**(client_base<*Client*, *Stub*, *Data*> const &client) const

Create a new colocating_distribution_policy representing the locality where the given object is current located

Parameters **client** – [in] The client side representation of the object with which the new instances should be colocated on

template<typename **Component**, typename ...**Ts**>

inline *hpx*::*future*<*hpx*::id_type> **create**(*Ts*&&... vs) const

Create one object on the locality of the object this distribution policy instance is associated with

Note: This function is part of the placement policy implemented by this class

Parameters **vs** – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

template<typename **Component**, typename ...**Ts**>
inline *hpx*::*future*<*std*::vector<bulk_locality_result>> **bulk_create**(*std*::size_t count, *Ts*&&... vs) const

Create multiple objects colocated with the object represented by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses which represent the newly created objects

template<typename **Action**, typename ...**Ts**>
inline *async_result*<*Action*>::type **async**(*launch* policy, *Ts*&&... vs) const

template<typename **Action**, typename **Callback**, typename ...**Ts**>
inline *async_result*<*Action*>::type **async_cb**(*launch* policy, *Callback* &&cb, *Ts*&&... vs) const

Note: This function is part of the invocation policy implemented by this class

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Variables

static const *default_distribution_policy* **default_layout** = {}

A predefined instance of the default *distribution_policy*. It will represent the local locality and will place all items to create here.

struct **default_distribution_policy**

#include <default_distribution_policy.hpp> This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

Public Functions

constexpr **default_distribution_policy**() = default

Default-construct a new instance of a default_distribution_policy. This policy will represent one locality (the local locality).

inline *default_distribution_policy* **operator()**(*std*::vector<id_type> const &locs) const

Create a new *default_distribution* policy representing the given set of localities.

Parameters **locs** – [in] The list of localities the new instance should represent

inline *default_distribution_policy* **operator()**(*std*::vector<id_type> &&locs) const

Create a new *default_distribution* policy representing the given set of localities.

Parameters **locs** – [in] The list of localities the new instance should represent

inline *default_distribution_policy* **operator()**(id_type const &loc) const

Create a new *default_distribution* policy representing the given locality

Parameters **loc** – [in] The locality the new instance should represent

template<typename **Component**, typename ...**Ts**>
inline *hpx*::*future*<*hpx*::id_type> **create**(*Ts*&&... vs) const

Create one object on one of the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters **vs** – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

template<typename **Component**, typename ...**Ts**>
inline *hpx*::*future*<*std*::vector<bulk_locality_result>> **bulk_create**(*std*::size_t count, *Ts*&&... vs) const

Create multiple objects on the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses that represent the newly created objects

template<typename **Action**, typename ...**Ts**>

Defined in header hpx/distribution_policies/target_distribution_policy.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Variables

static const *target_distribution_policy* **target** = { }

A predefined instance of the target_distribution_policy. It will represent the local locality and will place all items to create here.

struct **target_distribution_policy**

#include <target_distribution_policy.hpp> This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

Public Functions

target_distribution_policy() = default

Default-construct a new instance of a target_distribution_policy. This policy will represent one locality (the local locality).

inline *target_distribution_policy* **operator()**(id_type const &id) const

Create a new target_distribution_policy representing the given locality

Parameters **loc** – [in] The locality the new instance should represent

template<typename **Component**, typename ...**Ts**>
inline *hpx*::*future*<*hpx*::id_type> **create**(*Ts*&&... vs) const

Create one object on one of the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters **vs** – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

template<typename **Component**, typename ...**Ts**>
inline *hpx*::*future*<*std*::vector<bulk_locality_result>> **bulk_create**(*std*::size_t count, *Ts*&&... vs) const

Create multiple objects on the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters
- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses which represent the newly created objects

template<typename **Action**, typename ...**Ts**>
inline *async_result*<*Action*>::type **async**(*launch* policy, *Ts*&&... vs) const

template<typename **Action**, typename **Callback**, typename ...**Ts**>
inline *async_result*<*Action*>::type **async_cb**(*launch* policy, *Callback* &&cb, *Ts*&&... vs) const

Functions

template<typename **DistPolicy**>
distribution_policy_executor(*DistPolicy*&&) -> *distribution_policy_executor*<*std*::decay_t<*DistPolicy*>>

template<typename DistPolicy> HPX_DEPRECATED_V (1, 9, "hpx::parallel::execution::make_distribution_policy_executor is " "deprecated, use " "hpx::parallel::execution::distribution_policy_executor instead") distribution_policy

Create a new *distribution_policy_executor* from the given distribution_policy.

Parameters policy – The distribution_policy to create an executor from

template<typename **DistPolicy**>

class **distribution_policy_executor**

#include <distribution_policy_executor.hpp> A distribution_policy_executor creates groups of parallel execution agents that execute in threads implicitly created by the executor and placed on any of the associated localities.

Template Parameters DistPolicy – The distribution policy type for which an executor should be created. The expression *hpx::traits::is_distribution_policy_v<DistPolicy>* must evaluate to true.

init_runtime

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::finalize, hpx::disconnect

Defined in header hpx/init.hpp[781].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

int **finalize**(double shutdown_timeout, double localwait = -1.0, *error_code* &ec = *throws*)

Main function to gracefully terminate the HPX runtime system.

The function *hpx::finalize* is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on all localities.

The default value (`-1.0`) will try to find a globally set timeout value (can be set as the configuration parameter `hpx.shutdown_timeout`), and if that is not set or `-1.0` as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

The default value (`-1.0`) will try to find a globally set wait time value (can be set as the configuration parameter "hpx.finalize_wait_time"), and if this is not set or `-1.0` as well, it will disable any addition local wait time before proceeding.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to *hpx::disconnect*, these functions do not need to be called both.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **`shutdown_timeout`** – This parameter allows to specify a timeout (in microseconds), specifying how long any of the connected localities should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.

[781] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/init_runtime/include/hpx/init.hpp

- **localwait** – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

inline int **finalize**(*error_code* &ec = *throws*)

Main function to gracefully terminate the HPX runtime system.

The function *hpx::finalize* is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on all localities.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to *hpx::disconnect*, these functions do not need to be called both.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

void **terminate**()

Terminate any application non-gracefully.

The function *hpx::terminate* is the non-graceful way to exit any application immediately. It can be called from any locality and will terminate all localities currently used by the application.

Note: This function will cause HPX to call `std::terminate()` on all localities associated with this application. If the function is called not from an HPX thread it will fail and return an error using the argument *ec*.

---

int **disconnect**(double shutdown_timeout, double localwait = -1.0, *error_code* &ec = *throws*)

Disconnect this locality from the application.

The function *hpx::disconnect* can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on this locality.

The default value (`-1.0`) will try to find a globally set timeout value (can be set as the configuration parameter "hpx.shutdown_timeout"), and if that is not set or `-1.0` as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

The default value (`-1.0`) will try to find a globally set wait time value (can be set as the configuration parameter `hpx.finalize_wait_time`), and if this is not set or `-1.0` as well, it will disable any addition local wait time before proceeding.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **`shutdown_timeout`** – This parameter allows to specify a timeout (in microseconds), specifying how long this locality should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.
- **`localwait`** – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.
- **`ec`** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

inline int **`disconnect`**(*error_code* &ec = *throws*)

Disconnect this locality from the application.

The function *hpx::disconnect* can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on this locality.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters **`ec`** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

int **`stop`**(*error_code* &ec = *throws*)

Stop the runtime system.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called on every locality. This function should be used only if the runtime system was started using `hpx::start`.

Returns The function returns the value, which has been returned from the user supplied main HPX function (usually `hpx_main`).

hpx/hpx_init.hpp

Defined in header hpx/hpx_init.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

hpx::init

Defined in header hpx/init.hpp[782].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx_startup**

Variables

std::function<int(*hpx*::program_options::variables_map&)> const &**get_main_func**()

namespace **hpx**

Functions

inline int **init**(*std*::function<int(*hpx*::program_options::variables_map&)> f, int argc, char **argv, *init_params* const &params = *init_params*())

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread.

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc`/`argv`. Otherwise it will be executed as specified by the parameter`mode`.

Parameters

[782] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/init_runtime/include/hpx/init.hpp

- **f** – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- **argc** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **argv** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **params** – [in] The parameters to the *hpx::init* function (See documentation of hpx::init_params)

Returns The function returns the value, which has been returned from the user supplied `f`.

inline int **init**(*std*::function<int(int, char**)> f, int argc, char **argv, *init_params* const &params = *init_params*())

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

Functions

inline bool **start**(*std*::function<int(*hpx*::program_options::variables_map&)> f, int argc, char **argv, *init_params* const &params = *init_params*())

Main non-blocking entry point for launching the HPX runtime system.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution. This overload will not call `hpx_main`.

[784] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/init_runtime/include/hpx/init.hpp

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as an HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution.

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc`/`argv`. Otherwise it will be executed as specified by the parameter`mode`.

Parameters

- **`f`** – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- **`argc`** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **`argv`** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **`params`** – [in] The parameters to the *hpx::start* function (See documentation of hpx::init_params)

Returns The function returns *true* if command line processing succeeded and the runtime system was started successfully. It will return *false* otherwise.

inline bool **`start`**(*std*::function<int(int, char**)> f, int argc, char **argv, *init_params* const &params = *init_params*())

Main non-blocking entry point for launching the HPX runtime system.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution. This overload will not call `hpx_main`.

Parameters

- **`f`** – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.

- **argc** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **argv** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **params** – [in] The parameters to the *hpx::start* function (See documentation of hpx::init_params)

Returns The function returns *true* if command line processing succeeded and the runtime system was started successfully. It will return *false* otherwise.

inline bool **start**(int argc, char **argv, *init_params* const &params = *init_params*())

Main non-blocking entry point for launching the HPX runtime system.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution. This overload will not call `hpx_main`.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as an HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution.

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc`/`argv`. Otherwise it will be executed as specified by the parameter`mode`.

Parameters

- **argc** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **argv** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **params** – [in] The parameters to the *hpx::start* function (See documentation of hpx::init_params)

Returns The function returns *true* if command line processing succeeded and the runtime system was started successfully. It will return *false* otherwise.

inline bool **start**(*std*::nullptr_t f, int argc, char **argv, *init_params* const &params = *init_params*())

Main non-blocking entry point for launching the HPX runtime system.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution. This overload will not call `hpx_main`.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as an HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution.

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc`/`argv`. Otherwise it will be executed as specified by the parameter`mode`.

Parameters

- **`f`** – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- **`argc`** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **`argv`** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **`params`** – [in] The parameters to the *hpx::start* function (See documentation of hpx::init_params)

Returns The function returns *true* if command line processing succeeded and the runtime system was started successfully. It will return *false* otherwise.

inline bool **`start`**(*init_params* const &params = *init_params*())

Main non-blocking entry point for launching the HPX runtime system.

This is a simplified main, non-blocking entry point, which can be used to set up the runtime for an HPX application (the runtime system will be set up in console mode or worker mode depending on the command line settings). It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as an HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution.

Note: The created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc`/`argv`. If not command line arguments are passed, console mode is assumed.

Note: If no command line arguments are passed the HPX runtime system will not support any of the default command line options as described in the section 'HPX Command Line Options'.

Parameters **`params`** – [in] The parameters to the *hpx::start* function (See documentation of hpx::init_params)

Returns The function returns *true* if command line processing succeeded and the runtime system was started successfully. It will return *false* otherwise.

hpx::suspend, hpx::resume

Defined in header hpx/init.hpp[785].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

int **suspend**(*error_code* &ec = *throws*)

Suspend the runtime system.

The function *hpx::suspend* is used to suspend the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be empty. This function only be called when the runtime is running, or already suspended in which case this function will do nothing.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

int **resume**(*error_code* &ec = *throws*)

Resume the HPX runtime system.

The function *hpx::resume* is used to resume the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be resumed. This function only be called when the runtime suspended, or already running in which case this function will do nothing.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

[785] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/init_runtime/include/hpx/init.hpp

naming_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/naming_base/unmanaged.hpp

Defined in header hpx/naming_base/unmanaged.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

hpx::id_type **unmanaged**(*hpx*::id_type const &id)

The helper function *hpx::unmanaged* can be used to generate a global identifier which does not participate in the automatic garbage collection.

Note: This function allows to apply certain optimizations to the process of memory management in HPX. It however requires the user to take full responsibility for keeping the referenced objects alive long enough.

Parameters **id** – [in] The id to generated the unmanaged global id from This parameter can be itself a managed or a unmanaged global id.

Returns This function returns a new global id referencing the same object as the parameter *id*. The only difference is that the returned global identifier does not participate in the automatic garbage collection.

namespace **naming**

parcelset

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/parcelset/connection_cache.hpp

Defined in header hpx/parcelset/connection_cache.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/parcelset_base/parcelport.hpp

Defined in header hpx/parcelset_base/parcelport.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/parcelset_base/parcelset_base_fwd.hpp

Defined in header hpx/parcelset_base/parcelset_base_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PARCELPORT_BACKGROUND_MODE_ENUM_DEPRECATION_MSG

namespace **hpx**

namespace **parcelset**

Typedefs

using **parcel_write_handler_type** = *hpx*::*function*<void(*std*::error_code const&, *parcelset*::parcel const&)>

The type of the function that can be registered as a parcel write handler using the function *hpx::set_parcel_write_handler*.

Note: A parcel write handler is a function which is called by the parcel layer whenever a parcel has been sent by the underlying networking library and if no explicit parcel handler function was specified for the parcel.

Enums

enum class **parcelport_background_mode** : *std*::uint8_t

Type of background work to perform.

Values:

enumerator **flush_buffers**

perform buffer flush operations

enumerator **send**

perform send operations (includes buffer flush)

enumerator **receive**

perform receive operations

enumerator **all**

perform all operations

Functions

inline bool **operator&**(*parcelport_background_mode* lhs, *parcelport_background_mode* rhs)

char const ***get_parcelport_background_mode_name**(*parcelport_background_mode* mode)

Variables

parcel **empty_parcel**

constexpr *parcelport_background_mode* **parcelport_background_mode_flush_buffers** = *parcelport_background_mode*::*flush_buffers*

constexpr *parcelport_background_mode* **parcelport_background_mode_send** = *parcelport_background_mode*::*send* constexpr *parcelport_background_mode* **parcelport_background_mode_receive** = *parcelport_background_mode*::*receive*

constexpr *parcelport_background_mode* **parcelport_background_mode_all** = *parcelport_background_mode*::*all*

hpx/parcelset_base/set_parcel_write_handler.hpp

Defined in header hpx/parcelset_base/set_parcel_write_handler.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

performance_counters

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/performance_counters/counter_creators.hpp

Defined in header hpx/performance_counters/counter_creators.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **performance_counters**

Functions

bool **default_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

Default discovery function for performance counters; to be registered with the counter types. It will pass the counter_info and the *error_code* to the supplied function.

bool **locality_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality_id>/total)/<instancename>

bool **locality_pool_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality_id>/pool#<pool_name>/total)/<instancename>

bool **locality0_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

Default discoverer function for AGAS performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>{locality#0/total}/<instancename>

bool **locality_thread_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality_id>/worker-thread#<threadnum>)/<instancename>

bool **locality_pool_thread_counter_discoverer**(*counter_info* const &info, *discover_counter_func* const &f, *discover_counters_mode* mode, *error_code* &ec)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum>}/<instancename>

bool **locality_pool_thread_no_total_counter_discoverer**(*counter_info* const &info, *discover_counter_func* const &f, *discover_counters_mode* mode, *error_code* &ec)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum>}/<instancename>

This is essentially the same as above just that locality#*/total is not supported.

bool **locality_numa_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality_id>/numa-node#<threadnum>)/<instancename>

naming::gid_type **locality_raw_counter_creator**(*counter_info* const&, *hpx*::*function*<*std*::int64_t(bool)> const&, *error_code*&)

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

/<objectname>(locality#<locality_id>/total)/<instancename>

naming::gid_type **locality_raw_values_counter_creator**(*counter_info* const&, *hpx*::*function*<*std*::vector<*std*::int64_t>(bool)> const&, *error_code*&)

naming::gid_type **agas_raw_counter_creator**(*counter_info* const&, *error_code*&, char const*const)

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

/agas(<objectinstance>/total)/<instancename>

bool **agas_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/agas(<objectinstance>/total)/<instancename>

naming::gid_type **local_action_invocation_counter_creator**(*counter_info* const&, *error_code*&)

bool **local_action_invocation_counter_discoverer**(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)

hpx/performance_counters/counters.hpp

Defined in header hpx/performance_counters/counters.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **performance_counters**

Typedefs

typedef *hpx*::*function*<*naming*::gid_type(*counter_info* const&, *error_code*&)> **create_counter_func**

This declares the type of a function, which will be called by HPX whenever a new performance counter instance of a particular type needs to be created.

typedef *hpx*::*function*<bool(*counter_info* const&, *error_code*&)> **discover_counter_func**

This declares a type of a function, which will be passed to a *discover_counters_func* in order to be called for each discovered performance counter instance.

typedef *hpx*::*function*<bool(*counter_info* const&, *discover_counter_func* const&, *discover_counters_mode*, *error_code*&)> **discover_counters_func**

This declares the type of a function, which will be called by HPX whenever it needs to discover all performance counter instances of a particular type.

Enums

enum class **counter_type**

Values:

enumerator **text**

text shows a variable-length text string. It does not deliver calculated values.

Formula: None Average: None Type: Text

enumerator **raw**

raw shows the last observed value only. It does not deliver an average.

Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

enumerator **monotonically_increasing**

monotonically_increasing shows the cumulatively accumulated observed value. It does not deliver an average.

Formula: None. Shows cumulatively accumulated data as collected. Average: None Type: Instantaneous

enumerator **average_base**

average_base is used as the base data (denominator) in the computation of time or count averages for the *counter_type::average_count* and *counter_type::average_timer* counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in factional calculations without delivering an output. Average: SUM (N) / x Type: Instantaneous

enumerator **average_count**

average_count shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula: (N1 - N0) / (D1 - D0), where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average: (Nx - N0) / (Dx - D0) Type: Average

enumerator **aggregating**

aggregating applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula: F(Nx)

enumerator **average_timer**

average_timer measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: ((N1 - N0) / F) / (D1 - D0), where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval. Average: ((Nx - N0) / F) / (Dx - D0) Type: Average

enumerator **elapsed_time**

elapsed_time shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: (D0 - N0) / F, where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average: (Dx - N0) / F Type: Difference

enumerator **histogram**

histogram exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a counter_value. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

enumerator **raw_values**

raw_values exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a counter_value. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

enumerator **text**

enumerator **raw**

enumerator **monotonically_increasing**

enumerator **average_base**

enumerator **average_count**

enumerator **aggregating**

enumerator **average_timer**

enumerator **elapsed_time**

enumerator **histogram**

enumerator **raw_values**

raw_values counter exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a counter_value. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

enum class **counter_status**

Status and error codes used by the functions related to performance counters.

Values:

enumerator **valid_data**

No error occurred, data is valid.

enumerator **new_data**

Data is valid and different from last call.

enumerator **invalid_data**

Some error occurred, data is not value.

enumerator **already_defined**

The type or instance already has been defined.

enumerator **counter_unknown**

The counter instance is unknown.

enumerator **counter_type_unknown**

The counter type is unknown.

enumerator **generic_error**

A unknown error occurred.

enumerator **valid_data**

enumerator **new_data**

enumerator **invalid_data**

enumerator **already_defined**

enumerator **counter_unknown**

enumerator **counter_type_unknown**

enumerator **generic_error**

Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula: (N1 - N0) / (D1 - D0), where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average: (Nx - N0) / (Dx - D0) Type: Average

enumerator **`aggregating`**

aggregating applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula: F(Nx)

enumerator **`average_timer`**

average_timer measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: ((N1 - N0) / F) / (D1 - D0), where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval. Average: ((Nx - N0) / F) / (Dx - D0) Type: Average

enumerator **elapsed_time**

elapsed_time shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: (D0 - N0) / F, where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average: (Dx - N0) / F Type: Difference

enumerator **histogram**

histogram exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a counter_value. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

enumerator **raw_values**

raw_values exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a counter_value. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

enumerator **text**

enumerator **raw**

enumerator **monotonically_increasing**

enumerator **average_base**

enumerator **average_count**

enumerator **aggregating**

enumerator **average_timer**

enumerator **elapsed_time**

enumerator **histogram**

enumerator **raw_values**

raw_values counter exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a counter_value. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

enum class **counter_status**

Values:

enumerator **valid_data**

No error occurred, data is valid.

enumerator **new_data**

Data is valid and different from last call.

enumerator **invalid_data**

Some error occurred, data is not value.

enumerator **already_defined**

The type or instance already has been defined.

enumerator **counter_unknown**

The counter instance is unknown.

enumerator **counter_type_unknown**

The counter type is unknown.

enumerator **generic_error**

A unknown error occurred.

enumerator **valid_data**

enumerator **new_data**

enumerator **invalid_data**

enumerator **already_defined**

enumerator **counter_unknown**

enumerator **counter_type_unknown**

enumerator **generic_error**

enum class **discover_counters_mode**

Values:

enumerator **minimal**

enumerator **full**

Functions

inline constexpr bool **operator<**(*counter_type* lhs, *counter_type* rhs) noexcept

inline constexpr bool **operator>**(*counter_type* lhs, *counter_type* rhs) noexcept

std::ostream &**operator<<**(*std*::ostream &os, *counter_status* rhs)

counter_status **get_counter_type_name**(*counter_type_path_elements* const &path, *std*::string &result, *error_code* &ec = *throws*)

Create a full name of a counter type from the contents of the given counter_type_path_elements instance.The generated counter type name will not contain any parameters.

counter_status **get_full_counter_type_name**(*counter_type_path_elements* const &path, *std*::string &result, *error_code* &ec = *throws*)

Create a full name of a counter type from the contents of the given counter_type_path_elements instance. The generated counter type name will contain all parameters.

counter_status **get_counter_name**(*counter_path_elements* const &path, *std*::string &result, *error_code* &ec = *throws*)

Create a full name of a counter from the contents of the given counter_path_elements instance.

counter_status **get_counter_instance_name**(*counter_path_elements* const &path, *std*::string &result, *error_code* &ec = *throws*)

Create a name of a counter instance from the contents of the given counter_path_elements instance.

counter_status **get_counter_type_path_elements**(*std*::string const &name, *counter_type_path_elements* &path, *error_code* &ec = *throws*)

Fill the given counter_type_path_elements instance from the given full name of a counter type.

counter_status **get_counter_path_elements**(*std*::string const &name, *counter_path_elements* &path, *error_code* &ec = *throws*)

Fill the given counter_path_elements instance from the given full name of a counter.

counter_status **get_counter_name**(*std*::string const &name, *std*::string &countername, *error_code* &ec = *throws*)

Return the canonical counter instance name from a given full instance name.

counter_status **get_counter_type_name**(*std*::string const &name, *std*::string &type_name, *error_code* &ec = *throws*)

Return the canonical counter type name from a given (full) instance name.

HPX_DEPRECATED_V (1, 9, HPX_DISCOVER_COUNTERS_MODE_UNSCOPED_ENUM_DEPRECATION_MSG) inline const expr discover_counters_

counter_status **complement_counter_info**(*counter_info* &info, *counter_info* const &type_info, *error_code* &ec = *throws*)

Complement the counter info if parent instance name is missing.

counter_status **complement_counter_info**(*counter_info* &info, *error_code* &ec = *throws*)

counter_status **add_counter_type**(*counter_info* const &info, *create_counter_func* const &create_counter, *discover_counters_func* const &discover_counters, *error_code* &ec = *throws*)

counter_status **discover_counter_types**(*discover_counter_func* const &discover_counter, *discover_counters_mode* mode = *discover_counters_mode*::*minimal*, *error_code* &ec = *throws*)

Call the supplied function for each registered counter type.

counter_status **discover_counter_types**(*std*::vector<*counter_info*> &counters, *discover_counters_mode* mode = *discover_counters_mode*::*minimal*, *error_code* &ec = *throws*)

Return a list of all available counter descriptions.

counter_status **discover_counter_type**(*std*::string const &name, *discover_counter_func* const &discover_counter, *discover_counters_mode* mode = *discover_counters_mode*::*minimal*, *error_code* &ec = *throws*)

Call the supplied function for the given registered counter type.

counter_status **discover_counter_type**(*counter_info* const &info, *discover_counter_func* const &discover_counter, *discover_counters_mode* mode = *discover_counters_mode*::*minimal*, *error_code* &ec = *throws*)

counter_status **discover_counter_type**(*std*::string const &name, *std*::vector<*counter_info*> &counters, *discover_counters_mode* mode = *discover_counters_mode*::*minimal*, *error_code* &ec = *throws*)

Return a list of matching counter descriptions for the given registered counter type.

counter_status **discover_counter_type**(*counter_info* const &info, *std*::vector<*counter_info*> &counters, *discover_counters_mode* mode = *discover_counters_mode*::*minimal*, *error_code* &ec = *throws*)

bool **expand_counter_info**(*counter_info* const&, *discover_counter_func* const&, *error_code*&)

call the supplied function will all expanded versions of the supplied counter info.

This function expands all locality#* and worker-thread#* wild cards only.

counter_status **remove_counter_type**(*counter_info* const &info, *error_code* &ec = *throws*)

Remove an existing counter type from the (local) registry.

Note: This doesn't remove existing counters of this type, it just inhibits defining new counters using this type.

counter_status **get_counter_type**(*std*::string const &name, *counter_info* &info, *error_code* &ec = *throws*)

Retrieve the counter type for the given counter name from the (local) registry.

hpx::*future*<*hpx*::id_type> **get_counter_async**(*std*::string name, *error_code* &ec = *throws*)

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter name.

hpx::*future*<*hpx*::id_type> **get_counter_async**(*counter_info* const &info, *error_code* &ec = *throws*)

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter info.

void **get_counter_infos**(*counter_info* const &info, *counter_type* &type, *std*::string &helptext, *std*::uint32_t &version, *error_code* &ec = *throws*)

Retrieve the meta data specific for the given counter instance.

void **get_counter_infos**(*std*::string name, *counter_type* &type, *std*::string &helptext, *std*::uint32_t &version, *error_code* &ec = *throws*)

Retrieve the meta data specific for the given counter instance.

hpx/performance_counters/manage_counter_type.hpp

Defined in header hpx/performance_counters/manage_counter_type.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **performance_counters**

Functions

counter_status **install_counter_type**(*std*::string const &name, *hpx*::*function*<*std*::int64_t(bool)> const &counter_value, *std*::string const &helptext = "", *std*::string const &uom = "", *counter_type* type = *counter_type*::*raw*, *error_code* &ec = *throws*)

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new generic counter type based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this this counter type will cause the provided function to be called and the returned value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: `'/objectname{locality#<*>/total}/countername'` where '<*>' is a zero based integer identifying the locality the counter is created on.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.

- **counter_value** – [in] The function to call whenever the counter value is requested by a consumer.
- **helptext** – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **type** – [in] Type for the new performance counter type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an error_code from the enum *counter_status* (also, see note related to parameter *ec*).

counter_status **install_counter_type**(*std*::string const &name, *hpx*::*function*<*std*::vector<*std*::int64_t>(bool)> const &counter_value, *std*::string const &helptext = "", *std*::string const &uom = "", *error_code* &ec = *throws*)

Install a new generic performance counter type returning an array of values in a way, that will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new generic counter type that returns an array of values based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this this counter type will cause the provided function to be called and the returned array value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: `'/objectname{locality#<*>/total}/countername'` where '<*>' is a zero based integer identifying the locality the counter is created on.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **counter_value** – [in] The function to call whenever the counter value (array of values) is requested by a consumer.
- **helptext** – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an error_code from the enum *counter_status* (also, see note related to parameter *ec*).

void **install_counter_type**(*std*::string const &name, *counter_type* type, *error_code* &ec = *throws*)

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new counter type based on the provided *counter_type_info*. The counter type will be automatically unregistered during system shutdown.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an error_code from the enum *counter_status* (also, see note related to parameter *ec*).

counter_status **install_counter_type**(*std*::string const &name, *counter_type* type, *std*::string const &helptext, *std*::string const &uom = "", *std*::uint32_t version = HPX_PERFORMANCE_COUNTER_V1, *error_code* &ec = *throws*)

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new counter type based on the provided *counter_type_info*. The counter type will be automatically unregistered during system shutdown.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters
- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **helptext** – [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **version** – [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an error_code from the enum *counter_status* (also, see note related to parameter *ec*).

counter_status **install_counter_type**(*std*::string const &name, *counter_type* type, *std*::string const &helptext, *create_counter_func* const &create_counter, *discover_counters_func* const &discover_counters, *std*::uint32_t version = HPX_PERFORMANCE_COUNTER_V1, *std*::string const &uom = "", *error_code* &ec = *throws*)

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new generic counter type based on the provided *counter_type_info*. The counter type will be automatically unregistered during system shutdown.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **helptext** – [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **version** – [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- **create_counter** – [in] The function which will be called to create a new instance of this counter type.
- **discover_counters** – [in] The function will be called to discover counter instances which can be created.
- **uom** – [in] The unit of measure of the counter type (default: “”)
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an error_code from the enum *counter_status* (also, see note related to parameter *ec*).

hpx/performance_counters/registry.hpp

Defined in header hpx/performance_counters/registry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **performance_counters**

class **registry**

Public Functions

registry() = default

void **clear**()

Reset registry by deleting all stored counter types.

counter_status **add_counter_type**(*counter_info* const &info, *create_counter_func* const &create_counter, *discover_counters_func* const &discover_counters, *error_code* &ec = *throws*)

Add a new performance counter type to the (local) registry.

counter_status **discover_counter_types**(*discover_counter_func* discover_counter, *discover_counters_mode* mode, *error_code* &ec = *throws*)

Call the supplied function for all registered counter types.

counter_status **discover_counter_type**(*std*::string const &fullname, *discover_counter_func* discover_counter, *discover_counters_mode* mode, *error_code* &ec = *throws*)

Call the supplied function for the given registered counter type.

inline *counter_status* **discover_counter_type**(*counter_info* const &info, *discover_counter_func* const &f, *discover_counters_mode* mode, *error_code* &ec = *throws*)

counter_status **get_counter_create_function**(*counter_info* const &info, *create_counter_func* &create_counter, *error_code* &ec = *throws*) const

Retrieve the counter creation function which is associated with a given counter type.

counter_status **get_counter_discovery_function**(*counter_info* const &info, *discover_counters_func* &func, *error_code* &ec) const

Retrieve the counter discovery function which is associated with a given counter type.

counter_status **remove_counter_type**(*counter_info* const &info, *error_code* &ec = *throws*)

Remove an existing counter type from the (local) registry.

> **Note:** This doesn't remove existing counters of this type, it just inhibits defining new counters using this type.

counter_status **create_raw_counter_value**(*counter_info* const &info, *std*::int64_t *countervalue, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new performance counter instance of type raw_counter based on given counter value.

counter_status **create_raw_counter**(*counter_info* const &info, *hpx*::*function*<*std*::int64_t()> const &f, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

counter_status **create_raw_counter**(*counter_info* const &info, *hpx*::*function*<*std*::int64_t(bool)> const &f, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

counter_status **create_raw_counter**(*counter_info* const &info, *hpx*::*function*<*std*::vector<*std*::int64_t>()> const &f, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

counter_status **create_raw_counter**(*counter_info* const &info, *hpx*::*function*<*std*::vector<*std*::int64_t>(bool)> const &f, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

counter_status **create_counter**(*counter_info* const &info, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new performance counter instance based on given counter info.

counter_status **create_statistics_counter**(*counter_info* const &info, *std*::string const &base_counter_name, *std*::vector<*std*::size_t> const &parameters, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new statistics performance counter instance based on given base counter name and given base time interval (milliseconds).

counter_status **create_arithmetics_counter**(*counter_info* const &info, *std*::vector<*std*::string> const &base_counter_names, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new arithmetics performance counter instance based on given base counter names.

counter_status **create_arithmetics_counter_extended**(*counter_info* const &info, *std*::vector<*std*::string> const &base_counter_names, *naming*::gid_type &id, *error_code* &ec = *throws*)

Create a new extended arithmetics performance counter instance based on given base counter names.

counter_status **add_counter**(*hpx*::id_type const &id, *counter_info* const &info, *error_code* &ec = *throws*)

Add an existing performance counter instance to the registry.

counter_status **remove_counter**(*counter_info* const &info, *hpx*::id_type const &id, *error_code* &ec = *throws*)

remove the existing performance counter from the registry

counter_status **get_counter_type**(*std*::string const &name, *counter_info* &info, *error_code* &ec = *throws*)

Retrieve counter type information for given counter name.

plugin_factories

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/plugin_factories/binary_filter_factory.hpp

Defined in header hpx/plugin_factories/binary_filter_factory.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_BINARY_FILTER_FACTORY(BinaryFilter, pluginname)

This macro is used create and to register a minimal component factory with Hpx.Plugin.

namespace **hpx**

namespace **plugins**

template<typename **BinaryFilter**>

struct **binary_filter_factory** : public binary_filter_factory_base

#include <binary_filter_factory.hpp> The *message_handler_factory* provides a minimal implementation of a message handler's factory. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a message handler's factory instance.

Template Parameters **BinaryFilter** – The message handler type this factory should be responsible for.

Public Functions

inline **binary_filter_factory**(*util*::section const *global, *util*::section const *local, bool isenabled)

Construct a new factory instance.

Note: The contents of both sections has to be cloned in order to save the configuration setting for later use.

Parameters

- **global** – [in] The pointer to a *hpx::util::section* instance referencing the settings read from the [settings] section of the global configuration file (hpx.ini) This pointer may be nullptr if no such section has been found.
- **local** – [in] The pointer to a *hpx::util::section* instance referencing the settings read from the section describing this component type: [hpx.components.<name>], where <name> is the instance name of the component as given in the configuration files.
- **isenabled** –

~binary_filter_factory() override = default

inline *serialization*::binary_filter ***create**(bool compress, *serialization*::binary_filter *next_filter = nullptr) override

Create a new instance of a message handler

return Returns the newly created instance of the message handler supported by this factory

Protected Attributes

util::section **global_settings_**

util::section **local_settings_**

bool **isenabled_**

hpx/plugin_factories/message_handler_factory.hpp

Defined in header hpx/plugin_factories/message_handler_factory.hpp.

Defines

HPX_REGISTER_PLUGIN_REGISTRY(...)
This macro is used create and to register a minimal plugin registry with Hpx.Plugin.

HPX_REGISTER_PLUGIN_REGISTRY_(...)

HPX_REGISTER_PLUGIN_REGISTRY_2(PluginType, pluginname)

HPX_REGISTER_PLUGIN_REGISTRY_4(PluginType, pluginname, pluginsection, pluginsuffix)

HPX_REGISTER_PLUGIN_REGISTRY_5(PluginType, pluginname, pluginstring, pluginsection, pluginsuffix)

namespace **hpx**

namespace **plugins**

template<typename **Plugin**, char const *const **Name**, char const *const **Section**, char const *const **Suffix**>
struct **plugin_registry** : public *plugin_registry_base*

#include <plugin_registry.hpp> The plugin_registry provides a minimal implementation of a plugin's registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a plugin's registry instance.

Template Parameters Plugin – The plugin type this registry should be responsible for.

Public Functions

inline bool **get_plugin_info**(*std*::vector<*std*::string> &fillini) override

Return the ini-information for all contained components.

Parameters fillini – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

Returns Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

runtime_components

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_components/component_factory.hpp

Defined in header hpx/runtime_components/component_factory.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_COMPONENT(type, name, mode)

Define a component factory for a component type.

This macro is used create and to register a minimal component factory for a component type which allows it to be remotely created using the *hpx::new_<>* function.

This macro can be invoked with one, two or three arguments

Parameters

- **type** – The *type* parameter is a (fully decorated) type of the component type for which a factory should be defined.
- **name** – The *name* parameter specifies the name to use to register the factory. This should uniquely (system-wide) identify the component type. The *name* parameter must conform to the C++ identifier rules (without any namespace). If this parameter is not given, the first parameter is used.
- **mode** – The *mode* parameter has to be one of the defined enumeration values of the enumeration *hpx::components::factory_state*. The default for this parameter is *hpx::components::factory_state::enabled*.

hpx/runtime_components/component_registry.hpp

Defined in header hpx/runtime_components/component_registry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY(...)

This macro is used create and to register a minimal component registry with Hpx.Plugin.

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_(...)

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_2(ComponentType, componentname)

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_3(ComponentType, componentname, state)

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_DYNAMIC_(...)

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_DYNAMIC_2(ComponentType, componentname)

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_DYNAMIC_3(ComponentType, componentname, state)

namespace **hpx**

namespace **components**

template<typename **Component**, *factory_state* **state**>

struct **component_registry** : public *component_registry_base*

#include <component_registry.hpp> The component_registry provides a minimal implementation of a component's registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a component's registry instance.

Template Parameters **Component** – The component type this registry should be responsible for.

Public Functions

inline bool **get_component_info**(*std*::vector<*std*::string> &fillini, *std*::string const &filepath, bool is_static = false) override

Return the ini-information for all contained components.

Parameters

- **fillini** – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** –
- **is_static** –

Returns Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline void **register_component_type**() override

Return the unique identifier of the component type this factory is responsible for.

Parameters

- **locality** – [in] The id of the locality this factory is responsible for.
- **agas_client** – [in] The AGAS client to use for component id registration (if needed).

Returns Returns the unique identifier of the component type this factory instance is responsible for. This function throws on any error.

hpx/runtime_components/components_fwd.hpp

Defined in header hpx/runtime_components/components_fwd.hpp.

HPX_REGISTER_DERIVED_COMPONENT_FACTORY_DYNAMIC_4(ComponentType, componentname, basecomponentname, state)

hpx/runtime_components/new.hpp

Defined in header hpx/runtime_components/new.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename Component, typename... Ts> < unspecified > new_ (id_type const &locality, Ts &&... vs)

Create one or more new instances of the given Component type on the specified locality.

This function creates one or more new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
   hpx::new_<some_component>(hpx::find_here(), ...);
hpx::id_type id = f.get();
```

Parameters

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

template<typename Component, typename... Ts> < unspecified > local_new (Ts &&... vs)

Create one new instance of the given Component type on the current locality.

This function creates one new instance of the given Component type on the current locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
   hpx::local_new<some_component>(...);
hpx::id_type id = f.get();
```

Note: The difference of this function to *hpx::new_* is that it can be used in cases where the supplied arguments are non-copyable and non-movable. All operations are guaranteed to be local only.

Parameters **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which can be used to retrieve the global address of the newly created component. If the first argument is `hpx::launch::sync` the function will directly return an `hpx::id_type`.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

`template<typename Component, typename... Ts> < unspecified > new_ (id_type const &locality, std::size_t count, Ts &&... vs)`

Create multiple new instances of the given Component type on the specified locality.

This function creates multiple new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type> > f =
   hpx::new_<some_component[]>(hpx::find_here(), 10, ...);
hpx::id_type id = f.get();
```

Parameters

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **count** – [in] The number of component instances to create

- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. *Component*[], where `traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument *Component* represents an array of a client side object type (i.e. *Component*[], where `traits::is_client<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

template<typename Component, typename DistPolicy, typename... Ts> < unspecified > new_ (DistPolicy const &policy, Ts &&... vs)

Create one or more new instances of the given Component type based on the given distribution policy.

This function creates one or more new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for global address which can be used to reference the new component instance(s).

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
   hpx::new_<some_component>(hpx::default_layout, ...);
hpx::id_type id = f.get();
```

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

template<typename Component, typename DistPolicy, typename... Ts> < unspecified > new_ (DistPolicy const &policy, std::size_t count, Ts &&... vs)

Create multiple new instances of the given Component type on the localities as defined by the given distribution policy.

This function creates multiple new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type> > f =
   hpx::new_<some_component[]>(hpx::default_layout, 10, ...);
hpx::id_type id = f.get();
```

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. *Component*[], where `traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument *Component* represents an array of a client side object type (i.e. *Component*[], where `traits::is_client<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a std::vector<hpx::id_type>, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

runtime_distributed

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_distributed.hpp

Defined in header hpx/runtime_distributed.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **runtime_distributed** : public *runtime*

#include <runtime_distributed.hpp> The *runtime* class encapsulates the HPX runtime system in a simple to use way. It makes sure all required parts of the HPX runtime system are properly initialized.

Public Functions

explicit **runtime_distributed**(*util*::runtime_configuration &rtcfg, int (*pre_main)(*runtime_mode*) = nullptr, void (*post_main)() = nullptr)

Construct a new HPX runtime instance

Parameters **locality_mode** – [in] This is the mode the given runtime instance should be executed in.

~runtime_distributed()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

int **start**(*hpx*::*function*<hpx_main_function_type> const &func, bool blocking = false) override

Start the runtime system.

Parameters

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*.
- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally.

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise it will return zero.

int **start**(bool blocking = false) override

Start the runtime system.

Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally .

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise it will return zero.

int **wait**() override

Wait for the shutdown action to be executed.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

void **stop**(bool blocking = true) override

Initiate termination of the runtime system.

Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

int **finalize**(double shutdown_timeout) override

void **stop_helper**(bool blocking, *std*::condition_variable &cond, *std*::mutex &mtx)

Stop the runtime system, wait for termination.

Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

int **suspend**() override

Suspend the runtime system.

int **resume**() override

Resume the runtime system.

bool **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e, bool terminate_all = true) override

Report a non-recoverable error to the runtime system.

Parameters

- **num_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] Kill all localities attached to the currently running application (default: true)

bool **report_error**(*std*::exception_ptr const &e, bool terminate_all = true) override

Report a non-recoverable error to the runtime system.

Note: This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

Parameters

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] Kill all localities attached to the currently running application (default: true)

int **run**(*hpx*::*function*<hpx_main_function_type> const &func) override

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

Note: The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

int **run**() override

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

Returns This function will always return 0 (zero).

bool **is_networking_enabled**() override

template<typename **F**>
inline *components*::*server*::console_error_dispatcher::sink_type **set_error_sink**(*F* &&sink)

performance_counters::*registry* &**get_counter_registry**()

Allow access to the registry counter registry instance used by the HPX runtime.

performance_counters::*registry* const &**get_counter_registry**() const

Allow access to the registry counter registry instance used by the HPX runtime.

void **register_query_counters**(*std*::shared_ptr<*util*::query_counters> const &active_counters)

void **start_active_counters**(*error_code* &ec = *throws*) const

void **stop_active_counters**(*error_code* &ec = *throws*) const

void **reset_active_counters**(*error_code* &ec = *throws*) const

void **reinit_active_counters**(bool reset = true, *error_code* &ec = *throws*) const

void **evaluate_active_counters**(bool reset = false, char const *description = nullptr, *error_code* &ec = *throws*) const

void **stop_evaluating_counters**(bool terminate = false) const

naming::resolver_client &**get_agas_client**()

Allow access to the AGAS client instance used by the HPX runtime.

hpx::*threads*::*threadmanager* &**get_thread_manager**() override

Allow access to the thread manager instance used by the HPX runtime.

applier::*applier* &**get_applier**()

Allow access to the applier instance used by the HPX runtime.

std::string **here**() const override

Returns a string of the locality endpoints (usable in debug output)

naming::address_type **get_runtime_support_lva**() const

naming::gid_type **get_next_id**(*std*::size_t count = 1)

void **init_id_pool_range**()

util::unique_id_ranges &**get_id_pool**()

void **initialize_agas**()

Initialize AGAS operation.

void **add_pre_startup_function**(*startup_function_type* f) override

Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with *add_startup_function*.

Note: The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters f – The function 'f' will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void **add_startup_function**(*startup_function_type* f) override

Add a function to be executed inside a HPX thread before hpx_main

Parameters f – The function 'f' will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void **add_pre_shutdown_function**(*shutdown_function_type* f) override

Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

Note: The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters **f** – The function 'f' will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

void **add_shutdown_function**(*shutdown_function_type* f) override

Add a function to be executed inside a HPX thread during hpx::finalize

Parameters **f** – The function 'f' will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

hpx::*util*::*io_service_pool* ***get_thread_pool**(char const *name) override

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are "main_pool", "io_pool", "parcel_pool", and "timer_pool". For any other argument value the function will return zero.

bool **register_thread**(char const *name, *std*::size_t num = 0, bool service_thread = true, *error_code* &ec = *throws*) override

Register an external OS-thread with HPX.

notification_policy_type **get_notification_policy**(char const *prefix, runtime_local::os_thread_type type) override

Generate a new notification policy instance for the given thread name prefix

std::uint32_t **get_locality_id**(*error_code* &ec) const override

std::size_t **get_num_worker_threads**() const override

std::uint32_t **get_num_localities**(*hpx*::*launch*::sync_policy, *error_code* &ec) const override

std::uint32_t **get_initial_num_localities**() const override

hpx::*future*<*std*::uint32_t> **get_num_localities**() const override

std::string **get_locality_name**() const override

std::uint32_t **get_num_localities**(*hpx*::*launch*::sync_policy, *components*::component_type type, *error_code* &ec) const

hpx::*future*<*std*::uint32_t> **get_num_localities**(*components*::component_type type) const

std::uint32_t **assign_cores**(*std*::string const &locality_basename, *std*::uint32_t num_threads) override

std::uint32_t **assign_cores**() override

Public Static Functions

namespace **applier**

class **applier**

#include <applier.hpp> The *applier* class is used to decide whether a particular action has to be issued on a local or a remote resource. If the target component is local a new *thread* will be created, if the target is remote a parcel will be sent.

Public Functions

HPX_NON_COPYABLE(*applier*)

applier()

void **init**(*threads*::*threadmanager* &tm)

~applier() = default

void **initialize**(*std*::uint64_t rts)

threads::*threadmanager* &**get_thread_manager**()

Access the *thread-manager* instance associated with this *applier*.

This function returns a reference to the thread manager this applier instance has been created with.

naming::gid_type const &**get_raw_locality**(*error_code* &ec = *throws*) const

Allow access to the locality of the locality this applier instance is associated with.

This function returns a reference to the locality this applier instance is associated with.

std::uint32_t **get_locality_id**(*error_code* &ec = *throws*) const

Allow access to the id of the locality this applier instance is associated with.

This function returns a reference to the id of the locality this applier instance is associated with.

bool **get_raw_remote_localities**(*std*::vector<*naming*::gid_type> &locality_ids, *components*::component_type type = to_int(*hpx*::*components*::*component_enum_type*::*invalid*), *error_code* &ec = *throws*) const

Return list of localities of all remote localities registered with the AGAS service for a specific component type.

This function returns a list of all remote localities (all localities known to AGAS except the local one) supporting the given component type.

Parameters

- **locality_ids** – [out] The reference to a vector of id_types filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

Returns The function returns *true* if there is at least one remote locality known to the AGAS service (!prefixes.empty()).

bool **get_remote_localities**(*std*::vector<*hpx*::id_type> &locality_ids, *components*::component_type type = to_int(*hpx*::*components*::*component_enum_type*::*invalid*), *error_code* &ec = *throws*) const

bool **get_raw_localities**(*std*::vector<*naming*::gid_type> &locality_ids, *components*::component_type type = to_int(*hpx*::*components*::*component_enum_type*::*invalid*)) const

Return list of locality_ids of all localities registered with the AGAS service for a specific component type.

This function returns a list of all localities (all localities known to AGAS except the local one) supporting the given component type.

Parameters

- **locality_ids** – [out] The reference to a vector of id_types filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

Returns The function returns *true* if there is at least one remote locality known to the AGAS service (!prefixes.empty()).

bool **get_localities**(*std*::vector<*hpx*::id_type> &locality_ids, *error_code* &ec = *throws*) const

bool **get_localities**(*std*::vector<*hpx*::id_type> &locality_ids, *components*::component_type type, *error_code* &ec = *throws*) const

inline *naming*::gid_type const &**get_runtime_support_raw_gid**() const

By convention the runtime_support has a gid identical to the prefix of the locality the runtime_support is responsible for

inline *hpx*::id_type const &**get_runtime_support_gid**() const

By convention the runtime_support has a gid identical to the prefix of the locality the runtime_support is responsible for

Private Members

threads::*threadmanager* ***thread_manager_**

hpx::id_type **runtime_support_id_**

hpx/runtime_distributed/applier_fwd.hpp

Defined in header hpx/runtime_distributed/applier_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **applier**

Functions

applier &**get_applier()**

The function *get_applier* returns a reference to the (thread specific) applier instance.

applier ***get_applier_ptr()**

The function *get_applier* returns a pointer to the (thread specific) applier instance. The returned pointer is NULL if the current thread is not known to HPX or if the runtime system is not active.

namespace **applier**

The namespace *applier* contains all definitions needed for the class hpx::applier::applier and its related functionality. This namespace is part of the HPX core module.

hpx/runtime_distributed/copy_component.hpp

Defined in header hpx/runtime_distributed/copy_component.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Functions

template<typename **Component**>
future<*hpx*::id_type> **copy**(*hpx*::id_type const &to_copy)

Copy given component to the specified target locality.

The function *copy<Component>* will create a copy of the component referenced by *to_copy* on the locality specified with *target_locality*. It returns a future referring to the newly created component instance.

Note: The new component instance is created on the locality of the component instance which is to be copied.

Parameters **to_copy** – [in] The global id of the component to copy
Template Parameters **The** – only template argument specifies the component type to create.
Returns A future representing the global id of the newly (copied) component instance.

template<typename **Component**>
future<*hpx*::id_type> **copy**(*hpx*::id_type const &to_copy, *hpx*::id_type const &target_locality)

Copy given component to the specified target locality.

The function *copy<Component>* will create a copy of the component referenced by *to_copy* on the locality specified with *target_locality*. It returns a future referring to the newly created component instance.

Parameters
- **to_copy** – [in] The global id of the component to copy
- **target_locality** – [in] The locality where the copy should be created.

Template Parameters **The** – only template argument specifies the component type to create.
Returns A future representing the global id of the newly (copied) component instance.

template<typename **Derived**, typename **Stub**, typename **Data**>
Derived **copy**(client_base<*Derived*, *Stub*, *Data*> const &to_copy, *hpx*::id_type const &target_locality = *hpx*::invalid_id)

Copy given component to the specified target locality.

The function *copy* will create a copy of the component referenced by the client side object *to_copy* on the locality specified with *target_locality*. It returns a new client side object future referring to the newly created component instance.

Note: If the second argument is omitted (or is invalid_id) the new component instance is created on the locality of the component instance which is to be copied.

Parameters
- **to_copy** – [in] The client side object representing the component to copy
- **target_locality** – [in, optional] The locality where the copy should be created (default is same locality as source).

Template Parameters **The** – only template argument specifies the component type to create.
Returns A future representing the global id of the newly (copied) component instance.

hpx::find_root_locality, hpx::find_all_localities, hpx::find_remote_localities

Defined in header hpx/runtime.hpp[786].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

hpx::id_type **find_root_locality**(*error_code* &ec = *throws*)

Return the global id representing the root locality.

The function find_root_locality() can be used to retrieve the global id usable to refer to the root locality. The root locality is the locality where the main AGAS service is hosted.

See also:

hpx::find_all_localities(), hpx::find_locality()

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return *hpx::invalid_id* otherwise.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global id representing the root locality for this application.

std::vector<*hpx*::id_type> **find_all_localities**(*error_code* &ec = *throws*)

Return the list of global ids representing all localities available to this application.

The function find_all_localities() can be used to retrieve the global ids of all localities currently available to this application.

See also:

hpx::find_here(), hpx::find_locality()

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

[786] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

---

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global ids representing the localities currently available to this application.

std::vector<*hpx*::id_type> **find_remote_localities**(*error_code* &ec = *throws*)

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function find_remote_localities() can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one).

See also:

hpx::find_here(), hpx::find_locality()

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global ids representing the remote localities currently available to this application.

hpx/runtime_distributed/find_here.hpp

Defined in header hpx/runtime_distributed/find_here.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

hpx::id_type **find_here**(*error_code* &ec = *throws*)

Return the global id representing this locality.

The function find_here() can be used to retrieve the global id usable to refer to the current locality.

See also:

hpx::find_all_localities(), hpx::find_locality()

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return *hpx::invalid_id* otherwise.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global id representing the locality this function has been called on.

hpx::find_locality

Defined in header hpx/runtime.hpp[787].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::vector<*hpx*::id_type> **find_all_localities**(*components*::component_type type, *error_code* &ec = *throws*)

Return the list of global ids representing all localities available to this application which support the given component type.

The function find_all_localities() can be used to retrieve the global ids of all localities currently available to this application which support the creation of instances of the given component type.

See also:

hpx::find_here(), hpx::find_locality()

[787] http://github.com/STEllAR-GROUP/hpx/blob/4444c45f3668f6ff40f9561db17638415bce4838/libs/full/include/include/hpx/runtime.hpp

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return the available localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global ids representing the localities currently available to this application which support the creation of instances of the given component type. If no localities supporting the given component type are currently available, this function will return an empty vector.

std::vector<*hpx*::id_type> **find_remote_localities**(*components*::component_type type, *error_code* &ec = *throws*)

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function find_remote_localities() can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one) which support the creation of instances of the given component type.

See also:

hpx::find_here(), hpx::find_locality()

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return the available remote localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global ids representing the remote localities currently available to this application.

hpx::id_type **find_locality**(*components*::component_type type, *error_code* &ec = *throws*)

Return the global id representing an arbitrary locality which supports the given component type.

The function find_locality() can be used to retrieve the global id of an arbitrary locality currently available to this application which supports the creation of instances of the given component type.

See also:

hpx::find_here(), hpx::find_all_localities()

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Note: This function will return meaningful results only if called from an HPX-thread. It will return *hpx::invalid_id* otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return any available locality.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global id representing an arbitrary locality currently available to this application which supports the creation of instances of the given component type. If no locality supporting the given component type is currently available, this function will return *hpx::invalid_id*.

hpx/runtime_distributed/get_locality_name.hpp

Defined in header hpx/runtime_distributed/get_locality_name.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

future<*std*::string> **get_locality_name**(*hpx*::id_type const &id)

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

See also:

std::string get_locality_name()

Parameters id – [in] The global id of the locality for which the name should be retrieved

Returns This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

hpx/runtime_distributed/get_num_localities.hpp

Defined in header hpx/runtime_distributed/get_num_localities.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

hpx::*future*<*std*::uint32_t> **get_num_localities**(*components*::component_type t)

Asynchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also:

hpx::find_all_localities, *hpx::get_num_localities*

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters t – The component type for which the number of connected localities should be retrieved.

std::uint32_t **get_num_localities**(*launch*::sync_policy, *components*::component_type t, *error_code* &ec = *throws*)

Synchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also:

hpx::find_all_localities, *hpx::get_num_localities*

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters

- **t** – The component type for which the number of connected localities should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_distributed/migrate_component.hpp

Defined in header hpx/runtime_distributed/migrate_component.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Functions

template<typename **Component**, typename **DistPolicy**>
future<*hpx*::id_type> **migrate**(*hpx*::id_type const &to_migrate, [[maybe_unused]] *DistPolicy* const &policy)

Migrate the given component to the specified target locality

The function *migrate<Component>* will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The client side representation of the component to migrate.
- **policy** – [in] A distribution policy which will be used to determine the locality to migrate this object to.

Template Parameters

- **Component** – Specifies the component type of the component to migrate.
- **DistPolicy** – Specifies the distribution policy to use to determine the destination locality.

Returns A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

template<typename **Derived**, typename **Stub**, typename **Data**, typename **DistPolicy**>
Derived **migrate**(client_base<*Derived*, *Stub*, *Data*> const &to_migrate, *DistPolicy* const &policy)

Migrate the given component to the specified target locality

The function *migrate<Component>* will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The client side representation of the component to migrate.

- **policy** – [in] A distribution policy which will be used to determine the locality to migrate this object to.

Template Parameters
- **Derived** – Specifies the component type of the component to migrate.
- **DistPolicy** – Specifies the distribution policy to use to determine the destination locality.

Returns A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

template<typename **Component**>
future<*hpx*::id_type> **migrate**(*hpx*::id_type const &to_migrate, *hpx*::id_type const &target_locality)

Migrate the component with the given id to the specified target locality

The function *migrate<Component>* will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters
- **to_migrate** – [in] The global id of the component to migrate.
- **target_locality** – [in] The locality where the component should be migrated to.

Template Parameters **Component** – Specifies the component type of the component to migrate.

Returns A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

template<typename **Derived**, typename **Stub**, typename **Data**>
Derived **migrate**(client_base<*Derived*, *Stub*, *Data*> const &to_migrate, *hpx*::id_type const &target_locality)

Migrate the given component to the specified target locality

The function *migrate<Component>* will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters
- **to_migrate** – [in] The client side representation of the component to migrate.
- **target_locality** – [in] The id of the locality to migrate this object to.

Template Parameters **Derived** – Specifies the component type of the component to migrate.

Returns A client side representation of representing of the migrated component instance. This should be the same as *migrate_to*.

hpx/runtime_distributed/runtime_fwd.hpp

Defined in header hpx/runtime_distributed/runtime_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_distributed/runtime_support.hpp

Defined in header hpx/runtime_distributed/runtime_support.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Public Static Functions

static inline component_type **get_component_type**()

static inline void **set_component_type**(component_type t)

static inline constexpr void **finalize**()

finalize() will be called just before the instance gets destructed

Parameters

- **self** – [in] The HPX *thread* used to execute this function.
- **appl** – [in] The applier to be used for finalization of the component instance.

static inline bool **is_target_valid**(*hpx*::id_type const &id)

Protected Functions

int **load_components**(*util*::section &ini, *naming*::gid_type const &prefix, *naming*::resolver_client &agas_client, *hpx*::program_options::options_description &options, *std*::set<*std*::string> &startup_handled)

struct **runtime_support**

Subclassed by *hpx::components::runtime_support*

Public Static Functions

template<typename **Component**, typename ...**Ts**>
static inline *hpx*::*future*<*hpx*::id_type> **create_component_async**(*hpx*::id_type const &gid, *Ts*&&... vs)

Create a new component *type* using the *runtime_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

template<typename **Component**, typename ...**Ts**>
static inline *hpx*::id_type **create_component**(*hpx*::id_type const &gid, *Ts*&&... vs)

Create a new component *type* using the *runtime_support* with the given *targetgid*. Block for the creation to finish.

template<typename **Component**, typename ...**Ts**>
static inline *hpx*::*future*<*std*::vector<*hpx*::id_type>> **bulk_create_component_colocated_async**(*hpx*::id_type const &gid, *std*::size_t count, *Ts*&&... vs)

Create multiple new components *type* using the *runtime_support* colocated with the with the given *targetgid*. This is a non-blocking call.

template<typename **Component**, typename ...**Ts**>
static inline *std*::vector<*hpx*::id_type> **bulk_create_component_colocated**(*hpx*::id_type const &gid, *std*::size_t count, *Ts*&&... vs)

Create multiple new components *type* using the *runtime_support* colocated with the with the given *targetgid*. Block for the creation to finish.

template<typename **Component**, typename ...**Ts**>
static inline *hpx*::*future*<*std*::vector<*hpx*::id_type>> **bulk_create_component_async**(*hpx*::id_type const &gid, *std*::size_t count, *Ts*&&... vs)

Create multiple new components *type* using the *runtime_support* on the given locality. This is a non-blocking call.

template<typename **Component**, typename ...**Ts**>
static inline *std*::vector<*hpx*::id_type> **bulk_create_component**(*hpx*::id_type const &gid, *std*::size_t count, *Ts*&&... vs)

Create multiple new components *type* using the *runtime_support* on the given locality. Block for the creation to finish.

template<typename **Component**, typename ...**Ts**>
static inline *hpx*::*future*<*hpx*::id_type> **create_component_colocated_async**(*hpx*::id_type const &gid, *Ts*&&... vs)

Create a new component *type* using the *runtime_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

template<typename **Component**, typename ...**Ts**>

2.9 Contributing to *HPX*

HPX development happens on Github. The following sections are a collection of useful information related to *HPX* development.

2.9.1 Contributing to *HPX*

The main source of information to understand the process of how to contribute to HPX can be found in this document[788]. This is a living document that is constantly updated with relevant information.

2.9.2 *HPX* governance model

The *HPX* project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. This document[789] describes how that participation takes place and how to set about earning merit within the project community.

2.9.3 Release procedure for *HPX*

Below is a step by step procedure for making an *HPX* release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an *HPX* release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.
2. For minor and major releases: create and check out a new branch at an appropriate point on `master` with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.
3. Write release notes in `docs/sphinx/releases/whats_new_$VERSION.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.

[788] https://github.com/STEllAR-GROUP/hpx/blob/master/.github/CONTRIBUTING.md
[789] http://hpx.stellar-group.org/documents/governance/

4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:

   - `$HPX_SOURCE/README.rst`
     - Update grant information
   - `docs/sphinx/releases/whats_new_$VERSION.rst`
   - `docs/sphinx/about_hpx/people.rst`
     - Update collaborators
     - Update grant information

5. This step does not apply to patch releases. For APEX:

   - Change the release branch to be the most current release tag available in the APEX `git_external` section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the *HPX* release (APEX[790]).

6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.

7. Change version references in CITATION.cff. There are two occurrences. Change year in the copyright file under `/libs/core/version/src/version.cpp`.

8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main CMakeLists.txt and also deleting all related code and tests from the main source tree.

   The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:

   a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
   b. Second release cycle: turn this build option OFF by default.
   c. Third release cycle: completely remove the old code.

   The main CMakeLists.txt contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like Vc for example).

9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in `prerequisites.rst`.

10. Verify that the Jenkins setups for the release branch on Rostam and Piz Daint are running and do not display any errors.

11. Repeat the following steps until satisfied with the release.

    1. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to `-rcN`, where `N` is the current iteration of this step. Start with `-rc1`.
    2. Create a pre-release on GitHub using the script `tools/roll_release.sh`. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.
    3. This step is not necessary for patch releases. Notify `hpx-users@stellar-group.org` of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
    4. Allow at least a week for testing of the release candidate.

[790] http://github.com/UO-OACISS/xpress-apex

   - Use `git merge` when possible, and fall back to `git cherry-pick` when needed. For patch releases `git cherry-pick` is most likely your only choice if there have been significant unrelated changes on master since the previous release.
   - Go back to the first step when enough patches have been added.
   - If there are no more patches, continue to make the final release.

12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, `quickstart.rst` contains instructions to check out the latest stable tag. Make sure that refers to the new version.
13. Add a new entry to the RPM changelog (`cmake/packaging/rpm/Changelog.txt`) with the new version number and a link to the corresponding changelog.
14. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to an empty string.
15. Add the release date to the caption of the current "What's New" section in the docs, and change the value of `HPX_VERSION_DATE` in `CMakeLists.txt`.
16. Create a release on GitHub using the script `tools/roll_release.sh`. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.
17. Update the websites (hpx.stellar-group.org[791] and *stellar-group.org <https://stellar-group.org>*). You can login on wordpress through *this page <https://hpx.stellar-group.org/wp-login.php>*. You can update the pages with the following:
    - Update links on the downloads page. Link to the release on GitHub.
    - Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
    - A new blog post announcing the release, which links to downloads and the "What's New" section in the documentation (see previous releases for examples).
18. Merge release branch into master.
19. Post-release cleanup. Create a new pull request against master with the following changes:
    1. Modify the release procedure if necessary.
    2. Change `HPX_VERSION_TAG` in `CMakeLists.txt` back to `-trunk`.
    3. Increment `HPX_VERSION_MINOR` in `CMakeLists.txt`.
20. Update Vcpkg (`https://github.com/Microsoft/vcpkg`) to pull from latest release.
    - Update version number in CONTROL
    - Update tag and SHA512 to that of the new release
21. Update spack (`https://github.com/spack/spack`) with the latest HPX package.
    - Update version number in `hpx/package.py` and SHA256 to that of the new release
22. Announce the release on hpx-users@stellar-group.org, stellar@cct.lsu.edu, allcct@cct.lsu.edu, faculty@csc.lsu.edu, faculty@ece.lsu.edu, the *HPX* Slack channel, the IRC channel, our list of external collaborators, isocpp.org, reddit.com, HPC Wire, Inside HPC, Heise Online, and a CCT press release.
23. Beer and pizza.

[791] https://hpx.stellar-group.org

2.9.4 Testing *HPX*

To ensure correctness of *HPX*, we ship a large variety of unit and regression tests. The tests are driven by the CTest[792] tool and are executed automatically on each commit to the *HPX* Github[793] repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our *HPX* Issues[794] tracker with detailed information about the target system.

Running tests manually

Running the tests manually is as easy as typing `make tests && make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the CTest Documentation[795] for further details.

Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the *HPX* source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`.

Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `.jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our *HPX* Issues[796] page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the Support Website[797] page.

[795] https://www.cmake.org/cmake/help/latest/manual/ctest.1.html
[796] https://github.com/STEllAR-GROUP/hpx/issues
[797] https://stellar.cct.lsu.edu/support/

Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both CircleCI[798] and a combination of CDash[799] and pycicle[800]. You can see the dashboards here: CircleCI HPX dashboard[801] and CDash HPX dashboard[802] .

2.9.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, Docker[803] provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on CircleCI[804] uses a docker image to run all tests.

To get started you need to install Docker[805] using whatever means is most convenient on your system. Once you have Docker[806] installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on Docker Hub[807]. To start a container using the *HPX* build environment, run:

```
$ docker run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the Docker Documentation[808] for more information on using Docker[809].

> **Warning:** All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see Docker Documentation (Bind mounts)[810]).

2.9.6 Documentation

This documentation is built using Sphinx[811], and an automatically generated API reference using Doxygen[812] and Breathe[813].

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

798 https://circleci.com

804 https://circleci.com
805 https://www.docker.com
806 https://www.docker.com
807 https://hub.docker.com/r/stellargroup/build_env/
808 https://docs.docker.com/
809 https://www.docker.com
810 https://docs.docker.com/storage/bind-mounts/
811 http://www.sphinx-doc.org
812 https://www.doxygen.org
813 https://breathe.readthedocs.io/en/latest

Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- `python3`
- `sphinx 4.5.0` (Python package)
- `sphinx-book-theme` (Python package)
- `breathe 4.33.1` (Python package)
- `doxygen`
- `sphinxcontrib-bibtex`
- `sphinx-copybutton`

If the Python[814] dependencies are not available through your system package manager, you can install them using the Python package manager `pip`:

```
pip install --user "sphinx<5" sphinx-book-theme breathe sphinxcontrib-bibtex sphinx-
↪copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

`Doxygen_ROOT:PATH`
: Specifies where to look for the installation of the Doxygen[815] tool.

`Sphinx_ROOT:PATH`
: Specifies where to look for the installation of the Sphinx[816] tool.

`Breathe_APIDOC_ROOT:PATH`
: Specifies where to look for the installation of the Breathe[817] tool.

Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during CMake[818] configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

Note: If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

[814] https://www.python.org
[815] https://www.doxygen.org
[816] http://www.sphinx-doc.org
[817] https://breathe.readthedocs.io/en/latest
[818] https://www.cmake.org

Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with =.
- Sub-headings use only underlines with characters in decreasing level of importance: =, - and `.`.
- Use sentence case in headings.
- Refer to common terminology using `` :term:`Component` ``.
- Indent content of directives (`.. directive::`) by three spaces.
- For C++ code samples at the end of paragraphs, use `::` and indent the code sample by 4 spaces.
  - For other languages (or if you don't want a colon at the end of the paragraph), use `.. code-block:: language` and indent by three spaces as with other directives.
- Use `.. list-table::` to wrap tables with a lot of text in cells.

API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

2.9.7 Module structure

This section explains the structure of an *HPX* module.

The tool create_library_skeleton.py[819] can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- <lib_name>/
  - `README.rst`
  - `CMakeLists.txt`
  - `cmake`
  - `docs/`
    - `index.rst`
  - `examples/`
    - `CMakeLists.txt`
  - `include/`
    - `hpx/`

[819] https://github.com/STEllAR-GROUP/hpx/blob/master/libs/create_library_skeleton.py

            · <lib_name>

  – src/

    * CMakeLists.txt

  – tests/

    * CMakeLists.txt

    * unit/

      · CMakeLists.txt

    * regressions/

      · CMakeLists.txt

    * performance/

      · CMakeLists.txt

A `README.rst` should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main `CMakeLists.txt` is created in the root directory of the module. By default it contains a call to `add_hpx_module` which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

`add_hpx_module` requires a module name. Optional flags are:

Optional single-value arguments are:

- `INSTALL_BINARIES`: Install the resulting library.

Optional multi-value arguments-are:

- `SOURCES`: List of source files.
- `HEADERS`: List of header files.
- `COMPAT_HEADERS`: List of compatibility header files.
- `DEPENDENCIES`: Libraries that this module depends on, such as other modules.
- `CMAKE_SUBDIRS`: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional CMake[820] scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

[820] https://www.cmake.org

Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the cpp-dependencies[821] tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See *Using docker for development* for details on how to use the docker image.

To produce the graph produced by CI run the following command (`HPX_SOURCE` is assumed to hold the path to the *HPX* source directory):

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a `dot` file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

2.10 Releases

2.10.1 List of releases

HPX V1.10.0 (May 29, 2024)

General changes

- The HPX documentation has seen a major overhaul for this release. We finished documenting the public local HPX API, we have added migration guides from widely used parallelization platforms to HPX (OpenMP, TBB, and MPI).
- We have added facilities enabling optimizations for trivially-relocatable types (see P1144[822] for more details).
- We have added (and use) the `scope_xxx` helper facilities as specified by the C++ library fundamentals TS v3 (see: N4948[823]).

[821] https://github.com/tomtom-international/cpp-dependencies
[822] https://wg21.link/p1144
[823] http://wg21.link/n4948

- We have added configuration options that allow to build HPX without pre-installing any prerequisites. Use `HPX_WITH_FETCH_HWLOC=On` to have Portable Hardware Locality (HWLOC)[824] installed for you. Similarly, setting `HPX_WITH_FETCH_BOOST=On` during configuration time will install the necessary Boost[825] libraries (currently V1.84.0).
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- The collective operations APIs have seen an unification, we have fixed issues and performance problems for the collectives.
- The HPX executors have seen a streamlining and some consistency changes. We have applied many performance improvements to the executor implementations that directly positively impact the performance of our parallel algorithms.
- We have added a new parcelport allowing to use Gasnet as a communication platform.
- We have added optimizations to various parcelports improving overall communication performance. This includes - amongst other things - send immediate optimizations and receiver-side zero-copy optimizations.
- Futures will now execute the associated task eagerly and inline on any wait operation if the task has not started running yet. This feature can be enabled using the `HPX_COROUTINES_WITH_THREAD_SCHEDULE_HINT_RUNS_AS_CHILD=On` configuration setting (which is *Off* by default).
- We have enabled using json files to supply configuration information through the command line. This feature can be enabled with the configuration option `HPX_COMMAND_LINE_HANDLING_WITH_JSON_CONFIGURATION_FILES=On`. This functionality depends on the external JSon library[826], which can be built at configuration time by supplying `HPX_WITH_FETCH_JSON=On` to CMake[827].
- We have applied many fixes to our CUDA, ROCm, and SYCL build environments.

Breaking changes

- The CMake[828] configuration keys `SOMELIB_ROOT` (e.g., `BOOST_ROOT`) have been renamed to `Somelib_ROOT` (e.g., `Boost_ROOT`) to avoid warnings when using newer versions of CMake[829]. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the CMake[830] cache.

- PR #6472[880] - Troubleshoot CI hangs
- PR #6469[881] - improve(lci pp): more options to control the LCI parcelport
- PR #6467[882] - Bump jwlawson/actions-setup-cmake from 1.14 to 2.0
- PR #6464[883] - Update docs of "Writing distributed applications" page
- PR #6463[884] - Revert "Always return outermost thread id"
- PR #6458[885] - Reduce test workload to fix CI/CD time-out
- PR #6457[886] - replace boost::array with std::array and update file name
- PR #6456[887] - Move APEX CI to rostam
- PR #6455[888] - Fixing compilation if HPX_HAVE_THREAD_QUEUE_WAITTIME is defined
- PR #6454[889] - Update perftests reference measurements
- PR #6453[890] - Update supported platforms of Manual/Prerequisites page
- PR #6452[891] - Fix nvcc crashes in transform_stream.cu and synchronize.cu
- PR #6450[892] - Fix git tag name in Getting HPX page
- PR #6449[893] - LCI parcelport: add yield to potentially infinite retry loop
- PR #6447[894] - Use compressed ptr in schedulers when 128 atomics are not lockfree
- PR #6445[895] - Fix agas addressing cache
- PR #6444[896] - Update CTestConfig.cmake
- PR #6442[897] - Update CMakeLists.txt
- PR #6441[898] - Minor documentation fixes
- PR #6439[899] - Optimizing use of certain #includes
- PR #6438[900] - Bump jwlawson/actions-setup-cmake from 1.14 to 2.0
- PR #6436[901] - Update docs
- PR #6435[902] - Parcel layer tweaks

- PR #6434[903] - improve termination detection: removing lock from critical path
- PR #6433[904] - Use shared mutex for resolve_locality procedure
- PR #6432[905] - Module cleanup up to level 30
- PR #6429[906] - Making sure HPX_WITH_ASYNC_MPI is reported properly
- PR #6427[907] - Modifying CMakeLists to copy libhwloc-15.dll to the binary folder in Windows, independently
- PR #6425[908] - Fix macOS failing test
- PR #6424[909] - Adding option for downloading Boost using CMake FetchContent
- PR #6423[910] - Move adjacent_difference to numeric header file
- PR #6422[911] - Adding steal-half functionalities to work-requesting scheduler
- PR #6421[912] - Bump actions/checkout from 2 to 4
- PR #6418[913] - Working around nvcc problems to use CTAD
- PR #6416[914] - Change run_as_os_thread deprecation forwarding due to hipcc compilation issue
- PR #6415[915] - Attempting to avoid segfault in OctoTiger during initialization
- PR #6413[916] - Always return outermost thread id
- PR #6411[917] - Minor refactoring and fixes to the LCI parcelport and pingpong_performance2 benchmark
- PR #6410[918] - Adding scope_xxx from library fundamentals TS v3
- PR #6409[919] - Working around CUDA issue
- PR #6408[920] - Tightening up collective operation semantics
- PR #6406[921] - Working around ROCm compiler issue
- PR #6404[922] - Allow to disable use of [[no_unique_address]] attribute
- PR #6403[923] - Fixing copyright year
- PR #6402[924] - fix(lci pp): fix deadlocks with too many failed sends
- PR #6401[925] - fix(lci pp): fix the null_thread_id bug in the LCI parcelport

- PR #6400[926] - Fix the affinity setting bug when using LCI pp and multiple localities per node
- PR #6397[927] - Change API header titles and info
- PR #6396[928] - Making is_bitwise_serializable SFINAE-friendly
- PR #6395[929] - Adapt amount of collective testing
- PR #6394[930] - Adding option for installing Hwloc using CMake FetchContent
- PR #6393[931] - Optionally disable caching allocator
- PR #6391[932] - Cleaning up collective operations
- PR #6390[933] - Making function local constexpr variables non-static
- PR #6389[934] - Disable resolving hostnames if TCP is disabled
- PR #6387[935] - Need to break out of the loop when searching the suffixes.
- PR #6384[936] - Fixing allocation/deallocation mismatch in serialize_buffer
- PR #6383[937] - Enable fork_join_executor to handle return values from scheduled functions
- PR #6381[938] - Consistently treat conflicting parameters provided by executors and parameter objects
- PR #6380[939] - Fixing setting an annotation for an execution policy
- PR #6378[940] - Allowing to disable signal handlers
- PR #6377[941] - Fix gasnet-related test failures
- PR #6375[942] - Update LSU Jenkins with 2023-10 libraries
- PR #6374[943] - Investigate builder gasnet failure
- PR #6373[944] - Fixing communicator API, adding docs
- PR #6372[945] - Fix resource partitioner tests for small thread count
- PR #6371[946] - Fix jacobi omp examples.
- PR #6370[947] - improve one_size_heap_list: use rwlock to speedup the allocation/free
- PR #6369[948] - working issue with MPI_CC / CC conflict in automake

HPX V1.9.1 (August 4, 2023)

General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcelports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. *#include <thread>* now corresponds to *#include <hpx/thread.hpp>*. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcelport, but we have also cleaned up and improved the MPI parcelport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.

HPX V1.9.0 (May 2, 2023)

General changes

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.
- HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.
- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:
  - Coroutines were integrated with senders/receivers.

[1061] https://github.com/STEllAR-GROUP/hpx/pull/6283

get_completion_signatures now works with awaitable senders. - with_awaitable_senders allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. - when_all_vector was added.

- sync_wait and sync_wait_with_variant sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the main() function until the result is retrieved.
- The combinators for futures (a.k.a. async_combinators) when_*, wait_*, wait_*_nothrow were turned into CPOs allowing for end-user customization. For more information on the async_combinators refer to the documentation, https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators.
- The new datapar backend SVE allows simd and par_simd execution policies to exploit dataparalleism in the processors that have SVE vector registers like A64FX and Neoverse V1.
- The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.
- Copy button shortkey was added at the top-right of code-blocks.
- Pragma directive that reports warnings as errors on MSVC was fixed.
- Command line argument --hpx:loopback_network was added to facilitie debugging with networks.
- We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- tag_policy_tag et.al. were re-added after HPX V1.8.1 depracation.
- get_chunk_size and processing_units_count API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: *HPX V1.9.0 Namespace changes*.

- PR #6140[1135] - Fixing background scheduler to properly exit in the end
- PR #6139[1136] - [P2300] execution: Cleanup coroutines integration and improve ADL isolation
- PR #6137[1137] - Adding example of a simple master/slave distributed application
- PR #6136[1138] - Deprecate *execution::experimental::task_group* in favor of *experimental::task_group*
- PR #6135[1139] - Fixing warnings reported by MSVC analysis
- PR #6134[1140] - Adding notification function for parcelports to be called after early parcel handling
- PR #6132[1141] - Fixing to_non_par() for parallel simd policies
- PR #6131[1142] - modernize modules from level 25
- PR #6130[1143] - Remove the mutex lock in the critical path of get_partitioner.
- PR #6129[1144] - Modernize module from levels 22, 23
- PR #6127[1145] - Working around gccV9 problem that prevent us from storing enum classes in bit fields
- PR #6126[1146] - Deprecate hpx::parallel::task_block in favor of hpx::experimental::ta…
- PR #6125[1147] - Making sure sync_wait compiles when used with an lvalue sender involving bulk
- PR #6124[1148] - Fixing use of any_sender in combination with when_all
- PR #6123[1149] - Fixed issues found by PVS-Studio
- PR #6121[1150] - Modernize modules of level 21, 22
- PR #6120[1151] - Use index_queue for parallel executors bulk_async_execute
- PR #6119[1152] - Update CMakeLists.txt
- PR #6118[1153] - Modernize modules from level 17, 18, 19, and 20
- PR #6117[1154] - Initialize **buffer_allocate_time_** to 0
- PR #6116[1155] - Add new command line argument –hpx:loopback_network
- PR #6115[1156] - Modernize modules of levels 14, 15, and 16
- PR #6114[1157] - Enhance the formatting of the documentation

HPX V1.8.1 (Aug 5, 2022)

This is a bugfix release with a few minor additions and resolved problems.

General changes

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.
- More work was done towards full compatibility with the sender/receivers proposal P2300.
- Fixing sync_wait to decay the result types
- Fixed collective operations to properly avoid overalapping consecutive operations on the same communicator.

- Simplified the implementation of our execution policies and added mapping functions between those.
- Fixed performance issues with our implementation of *small_vector*.
- Serialization now works with buffers of unsigned characters.
- Fixing dangling reference in serialization of non-default constructible types
- Fixed static linking on Windows.
- Fixed support for M1/MacOS based architectures.
- Fixed support for gentoo/musl.
- Fixed *hpx::counting_semaphore_var*.
- Properly check start and end bounds for *hpx::for_loop*
- A lot of changes and fixes to the documentation (see https://hpx-docs.stellar-group.org).

Breaking changes

- No breaking changes have been introduced.

- PR #5879[1351] - New performance counters related to zero-copy chunks.

HPX V1.8.0 (May 18, 2022)

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 ("std::execution") and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

General changes

- The new documentation can now be found on our webpage: https://hpx-docs.stellar-group.org. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the "Quick start", "Manual" and "Examples" was improved, while the "Build system" page was adapted to include necessary information for newcommers.
- With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
  - `copy`, `copy_n`
  - `generate`
  - `adjacent_difference`, `adjacent_find`
  - `all_of`, `any_of`, `none_of`
  - `equal`, `mismatch`,
  - `inner_product`
  - `count`, `count_if`
  - `fill`, `fill_n`
  - `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
  - `for_each`, `for_each_n`
  - `generate`, `generate_n`.

[1345] https://github.com/STEllAR-GROUP/hpx/pull/5895

[1351] https://github.com/STEllAR-GROUP/hpx/pull/5879

- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.
- Several changes took place on the executors provided by HPX:
- The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the correspodning execution.
- The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, `hpx::async`, `hpx::dataflow`, etc.
- The performance of `fork_join_executor` was improved.
- The following algorithms have been added/adapted to be C++20 conformant:
  - `min_element`
  - `max_element`
  - `minmax_element`
  - `starts_with`
  - `ends_with`
  - `swap_ranges`
  - `unique`
  - `unique_copy`
  - `rotate`
  - `rotate_copy`
  - `sort`
  - `shift_left`
  - `shift_right`
  - `stable_sort`
  - `partition`
  - `partition_copy`
  - `stable_partition`
  - `adjacent_difference`
  - `nth_element`
  - `partial_sort`
  - `partial_sort_copy`.
- `HPX_FORWARD`/`HPX_MOVE` macros were introduced that replaced the `std::move` and `std::forward` facilities that in the library code.
- Hangs on distributed barrier were fixed.
- The performance of `scan_partitioner` was improved.
- Support was added for `thread_priority` to the `parallel_execution_policy`

- Regarding senders/receivers and the P2300 proposal various actions took place. stop_token was adapted to the recent proposal version (in_place_stop_token was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to when_all. Support for completion signatures was added. The following schedulers and algorithms were added:
  - get_completion_scheduler
  - any_sender and unique_any_sender
  - split sender
  - transform_mpi sender
  - transfer sender
  - let_error, let_stopped
  - get_env and related environment queries
  - schedule, set_value, set_error, set_done, start and connect are now proper customization points as defined in P2300.
- Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:
  - hpx::parallel::induction/reduction were movied into namespace hpx::experimental
  - for_loop and friends were moved into namespace hpx::experimental.
  - hpx::util::optional and friends were moved into namespace hpx.
  - hpx::lcos::barrier has been moved into the hpx::distributed namespace and hpx::lcos::local::cpp20_barrier has been renamed to barrier and moved into the hpx namespace.
  - hpx::lcos::latch has been moved into the hpx::distributed namespace and lcos::local::latch has been moved into the hpx namespace. The count_down_and_wait() functionality of latch has been renamed to arrive_and_wait().
  - hpx::util::unique_function_nonser has been renamed to hpx::move_only_function.
  - hpx::util::unique_function has been renamed to hpx::distributed::move_only_function.
  - hpx::util::function has been renamed to hpx::distributed::function.
  - hpx::util::function_nonser has been renamed to hpx::function.
  - hpx::util::function_ref have been moved to namespace hpx.
  - hpx::lcos::split_future changed namespace and is now used as hpx::split_future.
  - hpx::lcos::local::counting_semaphore has been deprecated and hpx::lcos::local::cpp20_counting_semaphore has been renamed to hpx::counting_semaphore.
  - hpx::lcos::local::cpp20_binary_semaphore has been renamed to hpx::binary_semaphore.
  - hpx::lcos::local::sliding_semaphore has been renamed to hpx::sliding_semaphore and
  - hpx::lcos::local::sliding_semaphore_var has been renamed to hpx::sliding_semaphore_var.
  - hpx::lcos::local::spinlock has been renamed to hpx::spinlock.
  - hpx::lcos::local::mutex has been renamed to hpx::mutex.
  - hpx::lcos::local::timed_mutex has been renamed to hpx::timed_mutex.

- hpx::lcos::local::no_mutex has been renamed to hpx::no_mutex.
- hpx::lcos::local::recursive_mutex has been renamed to hpx::recursive_mutex.
- hpx::lcos::local::shared_mutex has been renamed to hpx::shared_mutex.
- hpx::lcos::local::upgrade_lock has been renamed to hpx::upgrade_lock.
- hpx::lcos::local::upgrade_to_unique_lock has been renamed to hpx::upgrade_to_unique_lock.
- hpx::lcos::local::condition_variable has been renamed to hpx::condition_variable. hpx::lcos::local::condition_variable_var has been renamed to hpx::condition_variable_var.
- hpx::lcos::local::once_flag has been renamed to hpx::once_flag, and . hpx::lcos::local::call_once has been renamed to hpx::call_once.

- The new LCI (Lightweight Communication Interface) parcelport was added that supports irregular and asynchronous applications like graph analysis, sparce linear algebra, modern parallel architectures etc. Major features include:
  - Support for advanced communication primitives like two sided send/recv and one sided remote put.
  - Better multi-threaded performance.
  - Explicit user control of communication resource.
  - Flexible signaling mechanisms (synchronizer, completion queue, active message handler).
- The following CMake flags were added, mostly to support using HPX as a backend for SHAD (https://github.com/pnnl/SHAD). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you're doing:
  - HPX_SERIALIZATION_WITH_ALLOW_RAW_POINTER_SERIALIZATION
  - HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE
  - HPX_SERIALIZATION_WITH_ALLOW_CONST_TUPLE_MEMBERS

Breaking changes

- Minimum required C++ standard library is C++17.
- Support for GCC 7 and Clang 8.0.0 and below has been removed.
- CUDA version required updated to 11.4.
- CMake version required updated to 3.18.
- The default version of Asio used was updated to 1.20.0.
- The default version of APEX used was updated to 2.5.1.
- APEX version was updated to 2.5.1.
- tagged_pair and tagged_tuple were removed.
- tag_dispatch was renamed to tag_invoke.
- hpx.max_backgroud_threads was renamed to hpx.parcel.max_background_threads.
- The following CMake flags were removed after being deprecated for at least two releases:
  - HPX_SCHEDULER_MAX_TERMINATED_THREADS

    - HPX_WITH_GOOGLE_PERFTOOLS
    - HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY
    - HPX_HAVE_{COROUTINE,PLUGIN}_GCC_HIDDEN_VISIBILITY
    - HPX_TOP_LEVEL
    - HPX_WITH_COMPUTE_CUDA
    - HPX_WITH_ASYNC_CUDA

- `annotate_function` was renamed to `scoped_annotation`.
- `execution::transform` was renamed to `execution::then`.
- `execution::detach` was renamed to `execution::start_detached`.
- `execution::on_sender` was renamed to `execution::schedule_on`.
- `execution::just_on` was renamed to `execution::just_transfer`.
- `execution::set_done` was renamed to `execution::set_stopped`.

- Issue #5565[1371] - build failure: hpx::string_util::trim()
- Issue #5553[1372] - Github action to validate the cff file refs #5471
- Issue #5504[1373] - CMake does not work for HPX 1.7.0 on Piz Daint
- Issue #5503[1374] - Use contiguous index queue in bulk execution to reduce number of spawned tasks
- Issue #5502[1375] - C++20 std::coroutine cmake detection
- Issue #5478[1376] - hpx.dll built with vcpkg got functions pointing to the same location
- Issue #5472[1377] - Compilation error with cuda/11.3
- Issue #5469[1378] - Compiler warning about HPX_NODISCARD when building with APEX
- Issue #5463[1379] - Address minor comments of the C++17 PR bump
- Issue #5456[1380] - Use *std::ranges::iter_swap* where available
- Issue #5404[1381] - Build fails with error "Cannot open include file asio/io_context.hpp"
- Issue #5381[1382] - Add starts_with and ends_with algorithms
- Issue #5344[1383] - Further simplify tag_invoke helpers
- Issue #5269[1384] - Allow setting a label on executors/policies
- Issue #5219[1385] - (Re-)Implement executor API on top of sender/receiver infrastructure
- Issue #5216[1386] - Performance counter module not loading
- Issue #5162[1387] - Require C++17 support
- Issue #5156[1388] - Disentangle segmented algorithms

- PR #5853[1434] - Adding HPX dependency tool (adapted from Boostdep tool)
- PR #5852[1435] - Optimize LCI parcelport
- PR #5851[1436] - Forking dynamic_bitset from Boost
- PR #5850[1437] - Convert perf_counters::counter_type enum to enum class.
- PR #5849[1438] - Update LCI parcelport to LCI v1.7.1
- PR #5848[1439] - Fedora related fixes
- PR #5847[1440] - Fix API, troubleshooting & people
- PR #5844[1441] - Attempting to fix timeouts of segmented iterator tests
- PR #5842[1442] - change the default value of HPX_WITH_LCI_TAG to v1.7
- PR #5841[1443] - Move the split_future facilities into the namespace hpx
- PR #5840[1444] - wait_xxx_nothrow functions return whether one of the futures is exceptional
- PR #5839[1445] - Moving a list of synchronization primitives into namespace hpx
- PR #5837[1446] - Moving latch types to hpx and hpx::distributed namespaces
- PR #5835[1447] - Add missing compatibility layer for id_type::management_type values
- PR #5834[1448] - API docs changes
- PR #5831[1449] - Further improvement actions to rotate
- PR #5830[1450] - Exposing zero-copy serialization threshold through configuration option
- PR #5829[1451] - Attempting to fix failing barrier test
- PR #5827[1452] - Add back explicit template parameter to *ignore_while_checking* to compile with nvcc
- PR #5826[1453] - Reduce number of allocations while calling async_bulk_execute
- PR #5825[1454] - Steal from neighboring NUMA domain only
- PR #5823[1455] - Remove obsolete directories and adjust build system
- PR #5822[1456] - Clang-format remaining files

- PR #5729[1526] - Workaround for CMake/Ninja generator OOM problem
- PR #5727[1527] - Moving compression plugins to components directory
- PR #5726[1528] - Moving/consolidating parcel coalescing plugin sources
- PR #5725[1529] - Making sure headers for serialization filters are being installed
- PR #5723[1530] - Moving more tests to modules
- PR #5722[1531] - Removing superfluous semicolons
- PR #5720[1532] - Moving parcelports into modules
- PR #5719[1533] - Moving more files to parcelset module
- PR #5718[1534] - build: refactor sphinx config file
- PR #5717[1535] - Creating parcelset modules
- PR #5716[1536] - Avoid duplicate definition error
- PR #5715[1537] - The new LCI parcelport for HPX
- PR #5714[1538] - Refine propagation of **HPX_WITH_**… options
- PR #5713[1539] - Significantly reduce CI jobs run on Piz Daint
- PR #5712[1540] - Updating jenkins configuration for Rostam2.2
- PR #5711[1541] - Refactor manual sections
- PR #5710[1542] - Making task_group serializable
- PR #5709[1543] - Update the MPI cmake setup
- PR #5707[1544] - Better diagnose parcel bootstrap problems
- PR #5704[1545] - Test with hwloc 2.7.0 with GCC 11
- PR #5703[1546] - Fix *counting_iterator* container tests
- PR #5702[1547] - Attempting to fix CircleCI timeouts
- PR #5699[1548] - Update CI to use Boost 1.78.0

- PR #5697[1549] - Adding fork_join_executor to foreach_benchmark
- PR #5696[1550] - Modernize when_all and friends (when_any, when_some, when_each)
- PR #5693[1551] - Fix test errors with *_GLIBCXX_DEBUG* defined
- PR #5691[1552] - Rename *annotate_function* to *scoped_annotation*
- PR #5690[1553] - Replace tag_dispatch with tag_invoke in minmax segmented
- PR #5688[1554] - Remove more deprecated macros
- PR #5687[1555] - Add most important CMake options
- PR #5685[1556] - Fix future API
- PR #5684[1557] - Move lock registration to separate module and remove global lock registration
- PR #5683[1558] - Make hpx::wait_all etc. throw exceptions when waited futures hold exceptions and deprecate hpx::lcos::wait_all[_n] in favor of hpx::wait_all[_n]
- PR #5682[1559] - Fix macOS test exceptions
- PR #5681[1560] - docs: add links to hpx recepies
- PR #5680[1561] - Embed base execution policies to datapar execution policies
- PR #5679[1562] - Fix *fork_join_executor* with dynamic schedule
- PR #5678[1563] - Fix compilation of service executors with nvcc
- PR #5677[1564] - Remove compute_cuda module
- PR #5676[1565] - Don't require up-to-date approvals for bors
- PR #5675[1566] - Add default template type parameters for algorithms
- PR #5674[1567] - Allow using *any_sender* in global variables
- PR #5671[1568] - Making sure task_group can be reused
- PR #5670[1569] - Relax constraints on *execution::when_all*
- PR #5669[1570] - Use HPX_WITH_CXX_STANDARD for controlling C++ version
- PR #5667[1571] - Attempt to fix compilation issues with Boost V1.76

HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value `OFF` corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by *HPX* is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of *HPX* relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

Breaking changes

- The experimental `hpx::execution::simdpar` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

[1752] https://github.com/STEllAR-GROUP/hpx/pull/5440
[1753] https://github.com/STEllAR-GROUP/hpx/pull/5439
[1754] https://github.com/STEllAR-GROUP/hpx/pull/5436

General changes

- The following algorithms have been adapted to be C++20 conformant:
  - `remove`,
  - `remove_if`,
  - `remove_copy`,
  - `remove_copy_if`,
  - `replace`,
  - `replace_if`,
  - `reverse`, and
  - `lexicographical_compare`.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all *HPX* parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, *HPX* now experimentally supports GCC's SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpar` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
  - `detach`,
  - `ensure_started`,
  - `just`,
  - `just_on`,
  - `let_error`,
  - `let_value`,
  - `on`,
  - `transform`, and
  - `when_all`.

  Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.
- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nonser`. No changes should be required in user code to accommodate this change.

- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.
- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.
- The dependency on Boost.Asio has been replaced with the standalone Asio available at https://github.com/chriskohlhoff/asio. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake's fetchcontent by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.
- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.
- hipBLAS is now optional when compiling with `hipcc`. A warning instead of an error will be printed if hipBLAS is not found during configuration.
- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if HPX was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.
- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building *HPX*. This option should not be used on Windows.
- Numerous bug fixes.

Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations: - `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` - `HPX_WITH_ACTION_BASE_COMPATIBILITY` - `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY` - `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. - `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY` - `HPX_WITH_REGISTER_THREAD_COMPATIBILITY` - `HPX_WITH_REGISTER_THREAD_OVERLOADS_COMPATIBILITY` - `HPX_WITH_THREAD_AWARE_TIMER_COMPATIBILITY` - `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY` - `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`
- The `HPX_WITH_THREAD_SCHEDULERS` CMake option has been removed. All schedulers are now enabled when possible.
- `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY` has been turned off by default.

- PR #5413[1798] - Fixing sender/receiver code base to compile with MSVC
- PR #5407[1799] - Handle exceptions thrown during initialization of parcel handler
- PR #5406[1800] - Simplify dispatching to annotation handlers
- PR #5405[1801] - Fetch Asio automatically in perftests CI
- PR #5403[1802] - Create generic executor that adds annotations to any other executor
- PR #5402[1803] - Adapt `uninitialized_fill` and `uninitialized_fill_n` to C++ 20
- PR #5401[1804] - Modernize a variety of facilities related to parallel algorithms
- PR #5400[1805] - Fix sliding semaphore test
- PR #5399[1806] - Rename leftover `tag_fallback_invoke` to `tag_fallback_dispatch`
- PR #5398[1807] - Improve logging in AGAS symbol namespace
- PR #5396[1808] - Introduce compatibility layer for collective operations
- PR #5394[1809] - Enable OTF2 in APEX CI configuration
- PR #5393[1810] - Update APEX tag
- PR #5392[1811] - Fixing wrong usage of `std::forward`
- PR #5391[1812] - Fix forwarding in transform_receiver constructor
- PR #5390[1813] - Make sure shared priority scheduler steals tasks on the current NUMA domain when (core) stealing is enabled
- PR #5389[1814] - Adapt `uninitialized_move` and `uninitialized_move_n` to C++ 20
- PR #5388[1815] - Fixing `gather_there` for used with lvalue reference argument
- PR #5387[1816] - Extend thread state logging and change default stealing parameters
- PR #5386[1817] - Attempt to fix the startup hang with nodes > 32
- PR #5384[1818] - Remove HPX 1.5.0 deprecations
- PR #5382[1819] - Prefer installed Asio before considering FetchContent
- PR #5379[1820] - Allow using pre-downloaded (not installed) versions of Asio and/or Apex

- PR #5376[1821] - Remove unnecessary explicit listing of library modules.rst files in CMakeLists.txt
- PR #5375[1822] - Slight performance improvement for `hpx::copy` and `hpx::move` et.al.
- PR #5374[1823] - Remove unnecessary moves from future sender implementations
- PR #5373[1824] - More changes to clang-cuda Jenkins configuration
- PR #5372[1825] - Slight improvements to `min/max/minmax_element` algorithms
- PR #5371[1826] - Adapt `uninitialized_copy` and `uninitialized_copy_n` to C++ 20
- PR #5370[1827] - Decay types in `just_sender` `value_types` to match stored types
- PR #5367[1828] - Disable pkgconfig by default again on macOS
- PR #5365[1829] - Use ccache for Jenkins builds on Piz Daint
- PR #5363[1830] - Update cudatoolkit module name in clang-cuda Jenkins configuration
- PR #5362[1831] - Adding `channel_communicator`
- PR #5361[1832] - Fix compilation with MPI enabled
- PR #5360[1833] - Update APEX and asio tags
- PR #5359[1834] - Fix check for pu-step in single-core case
- PR #5357[1835] - Making sure collective operations can be reused by preallocating communicator
- PR #5356[1836] - Update API documentation
- PR #5355[1837] - Make the `sequenced_executor` `processing_units_count` member function const
- PR #5354[1838] - Making sure `default_stack_size` is defined whenever declared
- PR #5353[1839] - Add CUDA timestamp support to HPX Hardware Clock
- PR #5352[1840] - Adding missing includes
- PR #5351[1841] - Adding `enable_logging/disable_logging` API functions
- PR #5350[1842] - Adapt lexicographical_compare to C++20
- PR #5349[1843] - Update minimum boost version needed on the docs

- PR #5348[1844] - Rename `tag_invoke` and related facilities to `tag_dispatch`
- PR #5347[1845] - Remove `make_` prefix for executor properties
- PR #5346[1846] - Remove and disable compatibility options for 1.7.0
- PR #5343[1847] - Fix timed_executor static cast conversion
- PR #5342[1848] - Refactor CUDA event polling
- PR #5341[1849] - Adding `make_with_annotation` and `get_annotation` properties
- PR #5339[1850] - Making sure `hpx::util::hardware::timestamp()` is always defined
- PR #5338[1851] - Fixing `timed_executor` specializations of customization points
- PR #5335[1852] - Make `partial_algorithm` work with any number of arguments
- PR #5334[1853] - Follow up `iter_sent` include on #5225
- PR #5332[1854] - Simplify `tag_invoke` and friends
- PR #5331[1855] - More work on cleaning up executor CPOs
- PR #5330[1856] - Add option to disable pkgconfig generation
- PR #5328[1857] - Adapt data parallel support using std-simd
- PR #5327[1858] - Fix missing `ifdef HPX_SMT_PAUSE`
- PR #5326[1859] - Adding `resize()` to `serialize_buffer` allowing to shrink its size
- PR #5324[1860] - Add get member functions to `async_rw_mutex` proxy objects for explicitly getting the wrapped value
- PR #5323[1861] - Add `keep_future` algorithm
- PR #5322[1862] - Replace executor customization point implementations with `tag_invoke`
- PR #5321[1863] - Seperate segmented algorithms for reduce
- PR #5320[1864] - Fix `is_sender` trait and other small fixes to p0443 traits
- PR #5319[1865] - gcc 11.1 c++20 build fixes
- PR #5318[1866] - Make hipblas dependency optional as not always available

- PR #5282[1890] - Update Boost for daint 20.11 after update
- PR #5281[1891] - Fix Segmentation fault on `foreach_datapar_zipiter`
- PR #5280[1892] - Avoid modulo by zero in `counting_iterator` test
- PR #5279[1893] - Fix more GCC 10 deprecation warnings
- PR #5277[1894] - Small fixes and improvements to CUDA/MPI polling
- PR #5276[1895] - Fix typo in docs
- PR #5274[1896] - More P1897 algorithms
- PR #5273[1897] - Retry CDash submissions on failure
- PR #5272[1898] - Fix bogus deprecation warnings with GCC 10
- PR #5271[1899] - Correcting target ids for `symbol_namespace::iterate`
- PR #5268[1900] - Adding generic `require`, `require_concept`, and `query` properties
- PR #5267[1901] - Support annotations in `hpx::transform_reduce`
- PR #5266[1902] - Making late command line options available for local runtime
- PR #5265[1903] - Leverage `no_unique_address` for `member_pack`
- PR #5264[1904] - Adopt format in more places
- PR #5262[1905] - Install HPX in Rostam Jenkins jobs
- PR #5261[1906] - Limit Rostam Jenkins jobs to marvin partition temporarily
- PR #5260[1907] - Separate segmented algorithms for transform_reduce
- PR #5259[1908] - Making sure late command line options are recognized as configuration options
- PR #5258[1909] - Allow for HPX algorithms being invoked with std execution policies
- PR #5256[1910] - Separate segmented algorithms for transform
- PR #5255[1911] - Future/sender adapters
- PR #5254[1912] - Fixing datapar

HPX V1.6.0 (Feb 17, 2021)

General changes

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with hipcc and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.
- Experimental HIP support can be enabled by compiling *HPX* with `hipcc`. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.
- We have added `partial_sort` based on Francisco Tapia's implementation.
- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.
- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.
- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.
- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.
- We have added experimental support for properties as proposed in P2220[2001]. Currently the only supported property is the scheduling hint on `parallel_executor`.
- *`hpx::util::annotated_function`* can now be passed a dynamically generated `std::string`.
- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.
- We have removed all support for C and Fortran from our build system.
- We have further reduced the use of Boost types within *HPX* (`boost::system::error_code` and `boost::detail::spinlock`).
- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

Breaking changes

- hpxMP support has been completely removed.
- The `verbs` parcelport has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come

[2001] https://wg21.link/p2220

with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

Closed issues

- Issue #5148[2002] - `runtime_support.hpp` does not work with newer cling
- Issue #5147[2003] - Wrong results with parallel reduce
- Issue #5129[2004] - Missing specialization for `std::hash<hpx::thread::id>`
- Issue #5126[2005] - Use `std::string` for task annotations
- Issue #5115[2006] - Don't expect hwloc to always report Cores
- Issue #5113[2007] - Handle threadmanager exceptions during startup
- Issue #5112[2008] - libatomic problems causing unexpected fails
- Issue #5089[2009] - Remove non-BSL files
- Issue #5088[2010] - Unwrapping problem
- Issue #5087[2011] - Remove hpxMP support
- Issue #5077[2012] - PAPI counters are not accessible when HPX is installed
- Issue #5075[2013] - Make the structs in all `iter_sent.hpp` lower case
- Issue #5067[2014] - Bug `string_util/split.hpp`
- Issue #5049[2015] - Change back the hipcc jenkins config to the fury partition on rostam
- Issue #5038[2016] - Not all examples link in the latest HPX master
- Issue #5035[2017] - Build with `HPX_WITH_EXAMPLES` fails
- Issue #5019[2018] - Broken help string for hpx
- Issue #5016[2019] - `hpx::parallel::fill` fails compiling

- PR #5096[2065] - Remove fractals examples
- PR #5095[2066] - Use all AMD nodes again on rostam
- PR #5094[2067] - Attempt to remove macOS workaround for GH actions environment
- PR #5093[2068] - Remove verbs parcelport
- PR #5091[2069] - Avoid moving from lvalues
- PR #5090[2070] - Adopt C++20 `std::endian`
- PR #5085[2071] - Update daint CI to use Boost 1.75.0
- PR #5084[2072] - Disable compatibility options for 1.6.0 release
- PR #5083[2073] - Remove duplicated call to the `limiting_executor` in `future_overhead` test
- PR #5079[2074] - Add checks to make sure that MPI/CUDA polling is enabled/not disabled too early
- PR #5078[2075] - Add install lib directory to list of component search paths
- PR #5076[2076] - Fix a typo in the jenkins `clang-newest` cmake config
- PR #5074[2077] - Fixing warnings generated by MSVC
- PR #5073[2078] - Allow using noncopyable types with unwrapping
- PR #5072[2079] - Fix `is_convertible` args in `result_types`
- PR #5071[2080] - Fix unused parameters
- PR #5070[2081] - Fix unused variables warnings in hipcc
- PR #5069[2082] - Add support for sentinels to `adjacent_find`
- PR #5068[2083] - Fix string split function
- PR #5066[2084] - Adapt `search` to C++20 and Range TS
- PR #5065[2085] - Fix `hpx::range::adjacent_find` doxygen function signatures
- PR #5064[2086] - Refactor runtime configuration, command line handling, and resource partitioner
- PR #5063[2087] - Limit the device code guards to the distributed parts of the `future_overhead` bench

HPX V1.5.1 (Sep 30, 2020)

General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

Closed issues

- Issue #4971[2176] - Parallel sort fails to compile with C++20
- Issue #4950[2177] - Build with *HPX_WITH_PARCELPORT_ACTION_COUNTERS ON* fails
- Issue #4940[2178] - Codespell report for "HPX" (on fossies.org)
- Issue #4937[2179] - Allow suspension of runtime for multiple localities

Closed pull requests

- PR #4982[2180] - Add page about citing HPX to documentation
- PR #4981[2181] - Adding the missing include
- PR #4974[2182] - Remove leftover format export hack
- PR #4972[2183] - Removing use of get_temporary_buffer and return_temporary_buffer

HPX V1.5.0 (Sep 02, 2020)

General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of *HPX* in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in *HPX*. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of`/`any_of`/`none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the `experimental` namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below) . An significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (*Public API*). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in PR #4514[2190] for more details).
- The underlying executor of `block_executor` has been updated to a newer one.
- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.

[2190] https://github.com/STEllAR-GROUP/hpx/pull/4514

- All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.
- We have added performance counters type information (`aggregating`, `monotonically increasing`, `average count`, `average timer`, etc.).
- HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn't prevent the thread from being stolen, however.
- We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).
- `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).
- New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).
- We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.
- We fixed task annotations for actions.
- The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.
- We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.
- We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.
- We have changed the CMake targets exposed to the user, it now includes `HPX::hpx`, `HPX::wrap_main` (`int main` as the first *HPX* thread of the application, see *Starting the HPX runtime*), `HPX::plugin`, `HPX::component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX::hpx` CMake target.
- A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)
- A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)
- We now require for our CMake build system configuration files to be formatted using cmake-format.
- We have removed more dependencies on various Boost libraries.
- We have added an experimental option enabling unity builds of HPX using the `-DHPX_WITH_UNITY_BUILD=On` CMake option.
- Many bug fixes.

Breaking changes

- *HPX* now requires a C++14 capable compiler. We have set the *HPX* C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the `CMAKE_CXX_STANDARD` setting as mandated by CMake. The `HPX_WITH_CXX*` variables are now deprecated and will be removed in the future.
- Building and using HPX is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.
- We have added a `hpx::init_params` struct to pass parameters for *HPX* initialization e.g. the resource partitioner callback to initialize thread pools (*Using the resource partitioner*).
- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

- PR #4853[2340] - Adding test that derives component from two other components
- PR #4852[2341] - Fix mpi_ring test in distributed mode by ensuring all ranks run hpx_main
- PR #4851[2342] - Converting resiliency APIs to tag_invoke based CPOs
- PR #4849[2343] - Enable use of future_overhead test when DISTRIBUTED_RUNTIME is OFF
- PR #4847[2344] - Fixing 'error prone' constructs as reported by Codacy
- PR #4846[2345] - Disable Boost.Asio concepts support
- PR #4845[2346] - Fix PAPI counters
- PR #4843[2347] - Remove dependency on various Boost headers
- PR #4841[2348] - Rearrange public API headers
- PR #4840[2349] - Fixing TSS problems during thread termination
- PR #4839[2350] - Fix async_cuda build problems when distributed runtime is disabled
- PR #4837[2351] - Restore compatibility for old (now deprecated) copy algorithms
- PR #4836[2352] - Adding CPOs for hpx::reduce
- PR #4835[2353] - Remove *using util::result_of* from namespace hpx
- PR #4834[2354] - Fixing the calculation of the number of idle cores and the corresponding idle masks
- PR #4833[2355] - Allow thread function destructors to yield
- PR #4832[2356] - Fixing assertion in split_gids and memory leaks in 1d_stencil_7
- PR #4831[2357] - Making sure MPI_CXX_COMPILE_FLAGS is interpreted as a sequence of options
- PR #4830[2358] - Update documentation on using HPX::wrap_main
- PR #4827[2359] - Update clang-newest configuration to use clang 10
- PR #4826[2360] - Add Jenkins configuration for rostam
- PR #4825[2361] - Move all CUDA functionality to hpx::cuda::experimental namespace
- PR #4824[2362] - Add support for building master/release branches to Jenkins configuration

- PR #4614[2478] - Fix error message when HPX_IGNORE_CMAKE_BUILD_TYPE_COMPATIBILITY=OFF
- PR #4613[2479] - Make partitioner constructor private
- PR #4611[2480] - Making auto_chunk_size execute the given function using the given executor
- PR #4610[2481] - Making sure the thread-local lock registration data is moving to the core the suspended HPX thread is resumed on
- PR #4609[2482] - Adding an API function that exposes the number of idle cores
- PR #4608[2483] - Fixing moodycamel namespace
- PR #4607[2484] - Moving winsocket initialization to core library
- PR #4606[2485] - Local runtime module etc.
- PR #4604[2486] - Add config_registry module
- PR #4603[2487] - Deal with distributed modules in their respective CMakeLists.txt
- PR #4602[2488] - Small module fixes
- PR #4598[2489] - Making sure current_executor and service_executor functions are linked into the core library
- PR #4597[2490] - Adding broadcast_to/broadcast_from to collectives module
- PR #4596[2491] - Fix performance regression in block_executor
- PR #4595[2492] - Making sure main.cpp is built as a library if HPX_WITH_DYNAMIC_MAIN=OFF
- PR #4592[2493] - Futures module
- PR #4591[2494] - Adapting co_await support for C++20
- PR #4590[2495] - Adding missing exception test for for_loop()
- PR #4587[2496] - Move traits headers to hpx/modulename/traits directory
- PR #4586[2497] - Remove Travis CI config
- PR #4585[2498] - Update macOS test blacklist
- PR #4584[2499] - Attempting to fix missing symbols in stack trace
- PR #4583[2500] - Fixing bad static_cast

- PR #4582[2501] - Changing download url for Windows prerequisites to circumvent bandwidth limitations
- PR #4581[2502] - Adding missing using placeholder::_X
- PR #4579[2503] - Move get_stack_size_name and related functions
- PR #4575[2504] - Excluding unconditional definition of class backtrace from global header
- PR #4574[2505] - Changing return type of hardware_concurrency() to unsigned int
- PR #4570[2506] - Move tests to modules
- PR #4564[2507] - Reshuffle internal targets and add HPX::hpx_no_wrap_main target
- PR #4563[2508] - fix CMake option typo
- PR #4562[2509] - Unregister lock earlier to avoid holding it while suspending
- PR #4561[2510] - Adding test macros supporting custom output stream
- PR #4560[2511] - Making sure hash_any::operator()() is linked into core library
- PR #4559[2512] - Fixing compilation if HPX_WITH_THREAD_BACKTRACE_ON_SUSPENSION=On
- PR #4557[2513] - Improve spinlock implementation to perform better in high-contention situations
- PR #4553[2514] - Fix a runtime_ptr problem at shutdown when apex is enabled
- PR #4552[2515] - Add configuration option for making exceptions less noisy
- PR #4551[2516] - Clean up thread creation parameters
- PR #4549[2517] - Test FetchContent build on GitHub actions
- PR #4548[2518] - Fix stack size
- PR #4545[2519] - Fix header tests
- PR #4544[2520] - Fix a typo in sanitizer build
- PR #4541[2521] - Add API to check if a thread pool exists
- PR #4540[2522] - Making sure MPI support is enabled if MPI futures are used but networking is disabled
- PR #4538[2523] - Move channel documentation examples to examples directory

- PR #4462[2570] - Merge hpx_init and hpx_wrap into one static library
- PR #4461[2571] - Making thread_data test more realistic
- PR #4460[2572] - Suppress MPI warnings in version.cpp
- PR #4459[2573] - Make sure pkgconfig applications link with hpx_init
- PR #4458[2574] - Added example demonstrating how to create and use a wrapping executor
- PR #4457[2575] - Fixing execution of thread exit functions
- PR #4456[2576] - Move backtrace files to debugging module
- PR #4455[2577] - Move deadlock_detection and maintain_queue_wait_times source files into schedulers module
- PR #4450[2578] - Fixing compilation with std::filesystem enabled
- PR #4449[2579] - Fixing build system to actually build variant test
- PR #4447[2580] - This fixes an obsolete #include
- PR #4446[2581] - Resume tasks where they were suspended
- PR #4444[2582] - Minor CUDA fixes
- PR #4443[2583] - Add missing tests to CircleCI config
- PR #4442[2584] - Adding a tag to all auto-generated files allowing for tools to visually distinguish those
- PR #4441[2585] - Adding performance counter type information
- PR #4440[2586] - Fixing MSVC build
- PR #4439[2587] - Link HPX::plugin and component privately in hpx_setup_target
- PR #4437[2588] - Adding a test that verifies the problem can be solved using a trait specialization
- PR #4434[2589] - Clean up Boost dependencies and copy string algorithms to new module
- PR #4433[2590] - Fixing compilation issues (!) if MPI parcelport is enabled
- PR #4431[2591] - Ignore warnings about name mangling changing
- PR #4430[2592] - Add performance_counters module

- PR #4428[2593] - Don't add compatibility headers to module API reference
- PR #4426[2594] - Add currently failing tests on GitHub actions to blacklist
- PR #4425[2595] - Clean up and correct minimum required versions
- PR #4424[2596] - Making sure hpx.lock_detection=0 works as advertized
- PR #4421[2597] - Making sure interval time stops underlying timer thread on termination
- PR #4417[2598] - Adding serialization support for std::variant (if available) and std::tuple
- PR #4415[2599] - Partially reverting changes applied by PR 4373
- PR #4414[2600] - Added documentation for the compiler-wrapper script hpxcxx.in in creating_hpx_projects.rst
- PR #4413[2601] - Merging from V1.4.1 release
- PR #4412[2602] - Making sure to issue a warning if a file specified using –hpx:options-file is not found
- PR #4411[2603] - Make test specific to HPX_WITH_SHARED_PRIORITY_SCHEDULER
- PR #4407[2604] - Adding minimal MPI executor
- PR #4405[2605] - Fix cross pool injection test, use default scheduler as falback
- PR #4404[2606] - Fix a race condition and clean-up usage of scheduler mode
- PR #4399[2607] - Add more threading modules
- PR #4398[2608] - Add CODEOWNERS file
- PR #4395[2609] - Adding a parameter to auto_chunk_size allowing to control the amount of iterations to measure
- PR #4393[2610] - Use appropriate cache-line size defaults for different platforms
- PR #4391[2611] - Fixing use of allocator for C++20
- PR #4390[2612] - Making –hpx:help behavior consistent
- PR #4388[2613] - Change the resource partitioner initialization
- PR #4387[2614] - Fix roll_release.sh
- PR #4386[2615] - Add warning messages for using thread binding options on macOS

HPX V1.4.1 (Feb 12, 2020)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing `pdb` files on Windows
- Allow running tests using an installed version of *HPX*
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

Closed issues

- Issue #4320[2689] - HPX 1.4.0 does not compile with gcc 10
- Issue #4336[2690] - Building HPX 1.4.0 with IO Counters breaks (Windows)
- Issue #4334[2691] - HPX `Debug` and `RelWithDebinfo` builds on Windows not installing `.pdb` files
- Issue #4322[2692] - Undefine VT1 and VT2 after boost includes
- Issue #4314[2693] - Compile error on 1.4.0
- Issue #4307[2694] - `ld: error: duplicate symbol: freebsd_environ`

Closed pull requests

- PR #4376[2695] - Attempt to fix some test build errors on Windows
- PR #4357[2696] - Adding missing `#include`s to fix gcc V10 linker problems
- PR #4353[2697] - Skip `MPI_Finalize` if `MPI_Init` is not called from HPX
- PR #4343[2698] - Give a hard error if IO counters are enabled on non-Linux systems

- PR #4335[2700] - Adding capability to buildsystem to use an installed version of HPX
- PR #4315[2701] - Forcing exported symbols from composable_guard to be linked into core library
- PR #4310[2702] - Remove environment handling from `exception.cpp`

HPX V1.4.0 (January 15, 2020)

General changes

- We have added the collectives `all_to_all` and `all_reduce`.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the *documentation* for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size `thread_stacksize_nostack`.
- We have added an implementation of `unique_any`, which is a non-copyable version of `any`.
- The `shared_priority_queue_scheduler` has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option `--hpx:queuing=shared-priority`. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters `background-receive-duration` and `background-receive-overhead` for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when `HPX_WITH_NETWORKING=OFF`.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on Boost.Filesystem can explicitly be turned on with `HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON` (it is off by default if the standard library supports `std::filesystem`). Boost.ProgramOptions has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use Boost.ProgramOptions instead of the ProgramOptions provided by HPX. To remove the dependency `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` must be explicitly set to `OFF`. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.
- It is now possible to use the process affinity mask set by tools like `numactl` and various batch environments with the command line option `--hpx:use-process-mask`. Enabling this option implies `--hpx:ignore-batch-env`.
- It is now possible to create standalone thread pools without starting the runtime. See the `standalone_thread_pool_executor.cpp` test in the `execution` module for an example.

[2699] https://github.com/STEllAR-GROUP/hpx/pull/4337
[2700] https://github.com/STEllAR-GROUP/hpx/pull/4335
[2701] https://github.com/STEllAR-GROUP/hpx/pull/4315
[2702] https://github.com/STEllAR-GROUP/hpx/pull/4310

- Tasks annotated with *hpx::util::annotated_function* now have their correct name when using APEX to generate OTF2 files.
- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.
- The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.
- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.
- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.
- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.
- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.
- We now enforce formatting with `clang-format` on the majority of our source files.
- We have added SPDX license tags to all files.
- Many bugfixes.

Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_UNWRAPPED_COMPATIBLITY` option and the associated compatibility layer has been removed.

Closed issues

2756 https://github.com/STEllAR-GROUP/hpx/issues/3866

- Issue #3857[2757] - CMake all-keyword or all-plain for `target_link_libraries`
- Issue #3856[2758] - `hpx_setup_target` adds rogue flags
- Issue #3850[2759] - HPX fails to build on POWER8 with Clang7
- Issue #3848[2760] - Remove `lva` member from `thread_init_data`
- Issue #3838[2761] - `hpx::parallel::count/count_if` failing tests
- Issue #3651[2762] - `hpx::parallel::transform_reduce` with non const reference as lambda parameter
- Issue #3560[2763] - Apex integration with HPX not working properly
- Issue #3322[2764] - No warning when mixing debug/release builds

Closed pull requests

- PR #4300[2765] - Checks for `MPI_Init` being called twice
- PR #4299[2766] - Small CMake fixes
- PR #4298[2767] - Remove extra call to annotate function that messes up traces
- PR #4296[2768] - Fixing collectives locking problem
- PR #4295[2769] - Do not check `LICENSE_1_0.txt` for inspect violations
- PR #4293[2770] - Applying two small changes fixing carious MSVC/Windows problems
- PR #4285[2771] - Delete `apex.hpp`
- PR #4276[2772] - Disable doxygen generation for `hpx/debugging/print.hpp` file
- PR #4275[2773] - Make sure APEX is linked to even when not explicitly referenced
- PR #4272[2774] - Fix pushing of documentation
- PR #4271[2775] - Updating APEX tag, don't create new task_wrapper on `operator=` of hpx_thread object
- PR #4268[2776] - Testing for noexcept function specializations in C++11/14 mode
- PR #4267[2777] - Fixing MSVC warning
- PR #4266[2778] - Make sure macOS Travis CI fails if build step fails

- PR #4196[2825] - minor fixes for building on OSX Darwin
- PR #4195[2826] - Use full clone on CircleCI for pushing stable tag
- PR #4193[2827] - Add scheduling hints to hello_world_distributed
- PR #4192[2828] - Set up CUDA in HPXConfig.cmake
- PR #4191[2829] - Export allocators root variables
- PR #4190[2830] - Don't use `constexpr` in `thread_data` with GCC <= 6
- PR #4189[2831] - Only use `quick_exit` if available
- PR #4188[2832] - Google Season of Docs updates to documentation; writing single node hpx applications
- PR #4186[2833] - correct vc to cuda in cuda cmake
- PR #4184[2834] - Resetting some cached variables to make sure those are re-filled
- PR #4183[2835] - Fix `hpxcxx` configuration
- PR #4181[2836] - Rename base libraries var
- PR #4180[2837] - Move header left behind earlier to plugin module
- PR #4179[2838] - Moving `zip_iterator` and `transform_iterator` to iterator_support module
- PR #4178[2839] - Move checkpointing support to its own module
- PR #4177[2840] - Small const fix to `basic_execution` module
- PR #4176[2841] - Add back `HPX_LIBRARIES` and friends to `HPXConfig.cmake`
- PR #4175[2842] - Make Vc public and add it to `HPXConfig.cmake`
- PR #4173[2843] - Wait for runtime to be running before returning from hpx::start
- PR #4172[2844] - More protection against shutdown problems in error handling scenarios.
- PR #4171[2845] - Ignore lock in `condition_variable::wait`
- PR #4170[2846] - Adding APEX dependency to MPI parcelport
- PR #4168[2847] - Adding utility include

- PR #4167[2848] - Add a condition to setup the external libraries
- PR #4166[2849] - Add an `INTERNAL_FLAGS` option to link to `hpx_internal_flags`
- PR #4165[2850] - Forward `HPX_*` cmake cache variables to external projects
- PR #4164[2851] - Affinity and batch environment modules
- PR #4162[2852] - Handle `quick exit`
- PR #4160[2853] - Using `target_link_libraries` for cmake versions >= 3.12
- PR #4159[2854] - Make sure `HPX_WITH_NATIVE_TLS` is forwarded to dependent projects
- PR #4158[2855] - Adding allocator imported target as a dependency of allocator module
- PR #4157[2856] - Add `hpx_memory` as a dependency of parcelport plugins
- PR #4156[2857] - Stackless coroutines now can refer to themselves (through get_self() and friends)
- PR #4154[2858] - Added CMake policy CMP0060 for HPX applications.
- PR #4153[2859] - add header `iomanip` to tests and tool
- PR #4152[2860] - Casting MPI tag value
- PR #4149[2861] - Add back private `m_desc` member variable in program_options module
- PR #4147[2862] - Resource partitioner and threadmanager modules
- PR #4146[2863] - Google Season of Docs updates to documentation; creating hpx projects
- PR #4145[2864] - Adding basic support for stackless threads
- PR #4143[2865] - Exclude `test_client_1950` from all target
- PR #4142[2866] - Add a new `thread_pool_executor`
- PR #4140[2867] - Google Season of Docs updates to documentation; why hpx
- PR #4139[2868] - Remove runtime includes from coroutines module
- PR #4138[2869] - Forking `boost::intrusive_ptr` and adding it as `hpx::intrusive_ptr`
- PR #4137[2870] - Fixing TSS destruction

- PR #3875[3055] - Converted typedefs in actions submodule to using directives
- PR #3874[3056] - Allow one to suppress target keywords in `hpx_setup_target` for backwards compatibility
- PR #3873[3057] - Add scripts to create releases and generate lists of PRs and issues
- PR #3872[3058] - Fix latest HTML docs location
- PR #3870[3059] - Module cache
- PR #3869[3060] - Post 1.3.0 version bumps
- PR #3868[3061] - Replace the macro `HPX_ASSERT` by `HPX_TEST` in tests
- PR #3845[3062] - Assertion module
- PR #3839[3063] - Make tuple serialization non-intrusive
- PR #3832[3064] - Config module
- PR #3799[3065] - Remove compat namespace and its contents
- PR #3701[3066] - MoodyCamel lockfree
- PR #3496[3067] - Disabling MPI's (deprecated) C++ interface
- PR #3192[3068] - Move type info into `hpx::debug` namespace and add print helper functions
- PR #3159[3069] - Support Checkpointing Components

HPX V1.3.0 (May 23, 2019)

General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.
- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.
- Multiple issues reported by Clang sanitizers have been fixed.
- We have added (back) single-page HTML documentation and PDF documentation.
- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.
- We have added an implementation of `function_ref`.

[3067] https://github.com/STEllAR-GROUP/hpx/pull/3496
[3068] https://github.com/STEllAR-GROUP/hpx/pull/3192
[3069] https://github.com/STEllAR-GROUP/hpx/pull/3159

- The `barrier` and `latch` classes have gained a few additional member functions.

Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.
- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.
- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the CMake[3070] option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.
- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.
- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREPROCESSOR_WITH_DEPRECATION_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

Closed issues

- Issue #3863[3071] - shouldn't "-faligned-new" be a usage requirement?
- Issue #3841[3072] - Build error with msvc 19 caused by SFINAE and C++17
- Issue #3836[3073] - master branch does not build with idle rate counters enabled
- Issue #3819[3074] - Add debug suffix to modules built in debug mode
- Issue #3817[3075] - `HPX_INCLUDE_DIRS` contains non-existent directory
- Issue #3810[3076] - Source groups are not created for files in modules
- Issue #3805[3077] - HPX won't compile with `-DHPX_WITH_APEX=TRUE`

- PR #3835[3150] - make all latch members protected for consistency
- PR #3834[3151] - Disable transpose_block_numa example on CircleCI
- PR #3833[3152] - make latch **counter_** protected for deriving latch in hpxmp
- PR #3831[3153] - Fix CircleCI config for modules
- PR #3830[3154] - minor fix: option HPX_WITH_TEST was not working correctly
- PR #3828[3155] - Avoid for binaries that depend on HPX to directly link against internal modules
- PR #3827[3156] - Adding shortcut for `hpx::get_ptr<>(sync, id)` for a local, non-migratable objects
- PR #3826[3157] - Fix and update modules documentation
- PR #3825[3158] - Updating default APEX version to 2.1.3 with HPX
- PR #3823[3159] - Fix pkgconfig libs handling
- PR #3822[3160] - Change includes in hpx_wrap.cpp to more specific includes
- PR #3821[3161] - Disable barrier_3792 test when networking is disabled
- PR #3820[3162] - Assorted CMake fixes
- PR #3815[3163] - Removing left-over debug output
- PR #3814[3164] - Allow setting default scheduler mode via the configuration database
- PR #3813[3165] - Make the deprecation warnings issued by the old pp headers optional
- PR #3812[3166] - Windows requires to handle symlinks to directories differently from those linking files
- PR #3811[3167] - Clean up PP module and library skeleton
- PR #3806[3168] - Moving include path configuration to before APEX
- PR #3804[3169] - Fix latch
- PR #3803[3170] - Update hpxcxx to look at lib64 and use python3
- PR #3802[3171] - Numa binding allocator
- PR #3801[3172] - Remove duplicated includes

- PR #3771[3196] - Fix link to stackoverflow in documentation
- PR #3770[3197] - Replacing constexpr if in brace-serialization code
- PR #3769[3198] - Fix SIGSEGV handler
- PR #3768[3199] - Adding flags to scheduler allowing to control thread stealing and idle back-off
- PR #3767[3200] - Fix help formatting in hpxrun.py
- PR #3765[3201] - Fix a couple of bugs in the thread test
- PR #3764[3202] - Workaround for SFINAE regression in msvc14.2
- PR #3762[3203] - Prevent MSVC from prematurely instantiating things
- PR #3761[3204] - Update python scripts to work with python 3
- PR #3760[3205] - Fix callable vtable for GCC4.9
- PR #3759[3206] - Rename `PAGE_SIZE` to `PAGE_SIZE_` because AppleClang
- PR #3755[3207] - Making sure locks are not held during suspension
- PR #3754[3208] - Disable more code if networking is not available/not enabled
- PR #3752[3209] - Move `util::format` implementation to source file
- PR #3751[3210] - Fixing problems with `lcos::barrier` and iostreams
- PR #3750[3211] - Change error message to take into account `use_guard_page` setting
- PR #3749[3212] - Fix lifetime problem in `run_as_hpx_thread`
- PR #3748[3213] - Fixed unusable behavior of the clang code analyzer.
- PR #3747[3214] - Added `PMIX_RANK` to the defaults of `HPX_WITH_PARCELPORT_MPI_ENV`.
- PR #3745[3215] - Introduced `cache_aligned_data` and `cache_line_data` helper structure
- PR #3742[3216] - Remove more unused functionality from util/logging
- PR #3740[3217] - Fix includes in partitioned vector tests
- PR #3739[3218] - More fixes to make sure that `std::flush` really flushes all output

- PR #3737[3219] - Fix potential shutdown problems
- PR #3736[3220] - Fix `guided_pool_executor` after dataflow changes caused compilation fail
- PR #3734[3221] - Limiting executor
- PR #3732[3222] - More constrained bound constructors
- PR #3730[3223] - Attempt to fix deadlocks during component loading
- PR #3729[3224] - Add latch member function `count_up` and reset, requested by hpxMP
- PR #3728[3225] - Send even empty buffers on `hpx::endl` and `hpx::flush`
- PR #3727[3226] - Adding example demonstrating how to customize the memory management for a component
- PR #3726[3227] - Adding support for passing command line options through the `HPX_COMMANDLINE_OPTIONS` environment variable
- PR #3722[3228] - Document known broken OpenMPI builds
- PR #3716[3229] - Add barrier reset function, requested by hpxMP for reusing barrier
- PR #3715[3230] - More work on functions and vtables
- PR #3714[3231] - Generate single-page HTML, PDF, manpage from documentation
- PR #3713[3232] - Updating default APEX version to 2.1.2
- PR #3712[3233] - Update release procedure
- PR #3710[3234] - Fix the C++11 build, after #3704
- PR #3709[3235] - Move some component_registry functionality to source file
- PR #3708[3236] - Ignore all locks while handling assertions
- PR #3707[3237] - Remove obsolete hpx runtime executable
- PR #3705[3238] - Fix and simplify `make_ready_future` overload sets
- PR #3704[3239] - Reduce use of binders
- PR #3703[3240] - Ini
- PR #3702[3241] - Fixing CUDA compiler errors

- PR #3700[3242] - Added `barrier::increment` function to increase total number of thread
- PR #3697[3243] - One more attempt to fix migration…
- PR #3694[3244] - Fixing component migration
- PR #3693[3245] - Print thread state when getting disallowed value in set_thread_state
- PR #3692[3246] - Only disable `constexpr` with clang-cuda, not nvcc+gcc
- PR #3691[3247] - Link with libsupc++ if needed for thread_local
- PR #3690[3248] - Remove thousands separators in set_operations_3442 to comply with C++11
- PR #3688[3249] - Decouple serialization from function vtables
- PR #3687[3250] - Fix a couple of test failures
- PR #3686[3251] - Make sure tests.unit.build are run after install on CircleCI
- PR #3685[3252] - Revise quickstart CMakeLists.txt explanation
- PR #3684[3253] - Provide concept emulation for Ranges-TS concepts
- PR #3683[3254] - Ignore uninitialized chunks
- PR #3682[3255] - Ignore uninitialized chunks. Check proper indices.
- PR #3680[3256] - Ignore uninitialized chunks. Check proper range indices
- PR #3679[3257] - Simplify basic action implementations
- PR #3678[3258] - Making sure `HPX_HAVE_LIBATOMIC` is unset before checking
- PR #3677[3259] - Fix generated full version number to be usable in expressions
- PR #3674[3260] - Reduce functional utilities call depth
- PR #3672[3261] - Change new build system to use existing macros related to pseudo dependencies
- PR #3669[3262] - Remove indirection in `function_ref` when thread description is disabled
- PR #3668[3263] - Unbreaking `async_*cb*` tests
- PR #3667[3264] - Generate version.hpp

- PR #3665[3265] - Enabling MPI parcelport for gitlab runners
- PR #3664[3266] - making clang-tidy work properly again
- PR #3662[3267] - Attempt to fix exception handling
- PR #3661[3268] - Move `lcos::latch` to source file
- PR #3660[3269] - Fix accidentally explicit gid_type default constructor
- PR #3659[3270] - Parallel executor latch
- PR #3658[3271] - Fixing execution_parameters
- PR #3657[3272] - Avoid dangling references in wait_all
- PR #3656[3273] - Avoiding lifetime problems with sync_put_parcel
- PR #3655[3274] - Fixing nullptr dereference inside of function
- PR #3652[3275] - Attempt to fix `thread_map_type` definition with C++11
- PR #3650[3276] - Allowing for end iterator being different from begin iterator
- PR #3649[3277] - Added architecture identification to cmake to be able to detect timestamp support
- PR #3645[3278] - Enabling sanitizers on gitlab runner
- PR #3644[3279] - Attempt to tackle timeouts during startup
- PR #3642[3280] - Cleanup parallel partitioners
- PR #3640[3281] - Dataflow now works with functions that return a reference
- PR #3637[3282] - Merging the executor-enabled overloads of `shared_future<>::then`
- PR #3633[3283] - Replace deprecated boost endian macros
- PR #3632[3284] - Add instructions on getting HPX to documentation
- PR #3631[3285] - Simplify parcel creation
- PR #3630[3286] - Small additions and fixes to release procedure
- PR #3629[3287] - Modular pp

- PR #3627[3288] - Implement `util::function_ref`
- PR #3626[3289] - Fix cancelable_action_client example
- PR #3625[3290] - Added automatic serialization for simple structs (see #3034)
- PR #3624[3291] - Updating the default order of priority for `thread_description`
- PR #3621[3292] - Update copyright year and other small formatting fixes
- PR #3620[3293] - Adding support for gitlab runner
- PR #3619[3294] - Store debug logs and core dumps on CircleCI
- PR #3618[3295] - Various optimizations
- PR #3617[3296] - Fix link to the gpg key (#2)
- PR #3615[3297] - Fix unused variable warnings with networking off
- PR #3614[3298] - Restructuring counter data in scheduler to reduce false sharing
- PR #3613[3299] - Adding support for gitlab runners
- PR #3610[3300] - Don't wait for `stop_condition` in main thread
- PR #3608[3301] - Add inline keyword to `invalid_thread_id` definition for nvcc
- PR #3607[3302] - Adding configuration key that allows one to explicitly add a directory to the component search path
- PR #3606[3303] - Add nvcc to exclude constexpress since is it not supported by nvcc
- PR #3605[3304] - Add `inline` to definition of checkpoint stream operators to fix link error
- PR #3604[3305] - Use format for string formatting
- PR #3603[3306] - Improve the error message for using to less `MAX_CPU_COUNT`
- PR #3602[3307] - Improve the error message for to small values of `MAX_CPU_COUNT`
- PR #3600[3308] - Parallel executor aggregated
- PR #3599[3309] - Making sure networking is disabled for default one-locality-runs
- PR #3596[3310] - Store thread exit functions in `forward_list` instead of `deque` to avoid allocations

- PR #3590[3311] - Fix typo/mistake in thread queue `cleanup_terminated`
- PR #3588[3312] - Fix formatting errors in launching_and_configuring_hpx_applications.rst
- PR #3586[3313] - Make bind propagate value category
- PR #3585[3314] - Extend Cmake for building hpx as distribution packages (refs #3575)
- PR #3584[3315] - Untangle function storage from object pointer
- PR #3582[3316] - Towards Modularized HPX
- PR #3580[3317] - Remove extra `||` in merge.hpp
- PR #3577[3318] - Partially revert "Remove vtable empty flag"
- PR #3576[3319] - Make sure empty startup/shutdown functions are not being used
- PR #3574[3320] - Make sure `DATAPAR` settings are conveyed to depending projects
- PR #3573[3321] - Make sure HPX is usable with latest released version of Vc (V1.4.1)
- PR #3572[3322] - Adding test ensuring ticket 3565 is fixed
- PR #3571[3323] - Make empty `[unique_]function` vtable non-dependent
- PR #3566[3324] - Fix compilation with dynamic bitset for CPU masks
- PR #3563[3325] - Drop `util::[unique_]function` target_type
- PR #3562[3326] - Removing the target suffixes
- PR #3561[3327] - Replace executor traits return type deduction (keep non-SFINAE)
- PR #3557[3328] - Replace the last usages of boost::atomic
- PR #3556[3329] - Replace `boost::scoped_array` with `std::unique_ptr`
- PR #3552[3330] - (Re)move APEX readme
- PR #3548[3331] - Replace `boost::scoped_ptr` with `std::unique_ptr`
- PR #3547[3332] - Remove last use of Boost.Signals2
- PR #3544[3333] - Post 1.2.0 version bumps

HPX V1.2.1 (Feb 19, 2019)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the `future` implementation.
- Fix several problems in the CMake configuration which affects external projects.
- Add support for Boost 1.69.0.

Closed issues

- Issue #3638[3346] - Build HPX 1.2 with boost 1.69
- Issue #3635[3347] - Non-deterministic crashing on Stampede2
- Issue #3550[3348] - 1>e:000workhpxsrcthrow_exception.cpp(54): error C2440: '<function-style-cast>': cannot convert from 'boost::system::error_code' to 'hpx::exception'

HPX V1.2.0 (Nov 12, 2018)

General changes

Here are some of the main highlights and changes for this release:

- Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the CMake[3364] or pkg-config. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during CMake[3365] configuration. The implementation on Windows is unchanged.

3364 https://www.cmake.org
3365 https://www.cmake.org

- We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for *HPX* threads to be pinned to a particular worker thread.
- We have significantly improved the performance of our futures implementation by making the shared state atomic.
- We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.
- We have added a new option to the *--hpx:threads* command line option. It is now possible to use `cores` to tell *HPX* to only use one worker thread per core, unlike the existing option `all` which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of *--hpx:threads* has also been changed to `cores` as this leads to better performance in most cases.
- All command line options can now be passed alongside configuration options when initializing *HPX*. This means that some options that were previously only available on the command line can now be set as configuration options.
- HPXMP is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. HPXMP can be enabled within *HPX* by setting `DHPX_WITH_HPXMP=ON` during CMake[3366] configuration.
- Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during CMake[3367] configuration.
- The idling behaviour of *HPX* has been tweaked to allow for faster idling. This is useful in interactive applications where the *HPX* worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with `HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF` during CMake[3368] configuration.
- It is now possible to register callback functions for *HPX* worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

Breaking changes

- The implementation of `hpx_main.hpp` has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on *using Makefiles* for more details.
- The default value of *--hpx:threads* has changed from `all` to `cores`. The new option `cores` only starts one worker thread per core.
- We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.
- Our `boost::format`-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on `hpx::util::format` or `hpx::util::format_to`. The pull request for this change contains more information: PR #3266[3369].
- The following deprecated options have now been completely removed: `HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY`, `HPX_WITH_LOCAL_DATAFLOW`, `HPX_WITH_GENERIC_EXECUTION_POLICY`, `HPX_WITH_BOOST_CHRONO_COMPATIBILITY`, `HPX_WITH_EXECUTOR_COMPATIBILITY`, `HPX_WITH_EXECUTION_POLICY_COMPATIBILITY`, and `HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY`.

- PR #3439[3483] - Use correct MPI CXX libraries for MPI parcelport
- PR #3436[3484] - Add projection function to find_* (and fix very bad bug)
- PR #3435[3485] - Fixing 1205
- PR #3434[3486] - Fix threads cores
- PR #3433[3487] - Add Heise Online to release announcement list
- PR #3432[3488] - Don't track task dependencies for distributed runs
- PR #3431[3489] - Circle CI setting changes for hpxMP
- PR #3430[3490] - Fix unused params warning
- PR #3429[3491] - One thread per core
- PR #3428[3492] - This suppresses a deprecation warning that is being issued by MSVC 19.15.26726
- PR #3427[3493] - Fixes #3426
- PR #3425[3494] - Use source cache and workspace between job steps on CircleCI
- PR #3421[3495] - Add CDash timing output to future overhead test (for graphs)
- PR #3420[3496] - Add guided_pool_executor
- PR #3419[3497] - Fix typo in CircleCI config
- PR #3418[3498] - Add sphinx documentation
- PR #3415[3499] - Scheduler NUMA hint and shared priority scheduler
- PR #3414[3500] - Adding step to synchronize the APEX release
- PR #3413[3501] - Fixing multiple defines of APEX_HAVE_HPX
- PR #3412[3502] - Fixes linking with libhpx_wrap error with BSD and Windows based systems
- PR #3410[3503] - Fix typo in CMakeLists.txt
- PR #3409[3504] - Fix brackets and indentation in existing_performance_counters.qbk
- PR #3407[3505] - Fix unused param and extra ; warnings emitted by gcc 8.x

- PR #3406[3506] - Adding thread local allocator and use it for future shared states
- PR #3405[3507] - Adding DHPX_HAVE_THREAD_LOCAL_STORAGE=ON to builds
- PR #3404[3508] - fixing multiple definition of main() in linux
- PR #3402[3509] - Allow debug option to be enabled only for Linux systems with dynamic main on
- PR #3401[3510] - Fix cuda_future_helper.h when compiling with C++11
- PR #3400[3511] - Fix floating point exception scheduler_base idle backoff
- PR #3398[3512] - Atomic future state
- PR #3397[3513] - Fixing code for older gcc versions
- PR #3396[3514] - Allowing to register thread event functions (start/stop/error)
- PR #3394[3515] - Fix small mistake in primary_namespace_server.cpp
- PR #3393[3516] - Explicitly instantiate configured schedulers
- PR #3392[3517] - Add performance counters background overhead and background work duration
- PR #3391[3518] - Adapt integration of HPXMP to latest build system changes
- PR #3390[3519] - Make AGAS measurements optional
- PR #3389[3520] - Fix deadlock during shutdown
- PR #3388[3521] - Add several functionalities allowing to optimize synchronous action invocation
- PR #3387[3522] - Add cmake option to opt out of fail-compile tests
- PR #3386[3523] - Adding support for boost::container::small_vector to dataflow
- PR #3385[3524] - Adds Debug option for hpx initializing from main
- PR #3384[3525] - This hopefully fixes two tests that occasionally fail
- PR #3383[3526] - Making sure thread local storage is enable for hpxMP
- PR #3382[3527] - Fix usage of HPX_CAPTURE together with default value capture [=]
- PR #3381[3528] - Replace undefined instantiations of uniform_int_distribution

- PR #3232[3621] - Clean up suspension tests
- PR #3230[3622] - Add optional scheduler mode parameter to create_thread_pool function
- PR #3228[3623] - Allow suspension also on static schedulers
- PR #3163[3624] - libfabric parcelport w/o HPX_PARCELPORT_LIBFABRIC_ENDPOINT_RDM
- PR #3036[3625] - Switching to CircleCI 2.0

HPX V1.1.0 (Mar 24, 2018)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way *HPX* manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can be now be suspended/resumed independently. This functionality helps in running *HPX* concurrently to code that is directly relying on OpenMP[3626] and/or MPI[3627].
- We have continued to implement various parallel algorithms. *HPX* now almost completely implements all of the parallel algorithms as specified by the C++17 Standard[3628]. We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).
- Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The CMake[3629] configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.
- The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake[3630].
- The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to CMake.
- Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.
- Removed the (broken) component type `hpx::lcos::queue<T>`. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to CMake.

[3630] https://www.cmake.org

- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option `-DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On` on the CMake[3631] command line.
- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.
- User defined components don't have to be default-constructible anymore. Return types from actions don't have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.
- We have added a new launch policy `hpx::launch::lazy` that allows oneto defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of CMake[3632] is now V3.3.2.
- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.
- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.
- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.
- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.
- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the first place. In this case `hpx::async` now returns a `hpx::future<future<T>>` making its behavior conforming to its local counterpart.
- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.
- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.
- We have removed the experimental thread schedulers hierarchy_scheduler, periodic_priority_scheduler and throttling_scheduler in an effort to clean up and consolidate our thread schedulers.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #3250[3633] - Apex refactoring with guids
- PR #3249[3634] - Updating People.qbk
- PR #3246[3635] - Assorted fixes for CUDA
- PR #3245[3636] - Apex refactoring with guids
- PR #3242[3637] - Modify task counting in thread_queue.hpp
- PR #3240[3638] - Fixed typos
- PR #3238[3639] - Readding accidentally removed std::abort
- PR #3237[3640] - Adding Pipeline example
- PR #3236[3641] - Fixing memory_block
- PR #3233[3642] - Make schedule_thread take suspended threads into account
- Issue #3226[3643] - memory_block is breaking, signaling SIGSEGV on a thread on creation and freeing
- PR #3225[3644] - Applying quick fix for hwloc-2.0
- Issue #3224[3645] - HPX counters crashing the application
- PR #3223[3646] - Fix returns when setting config entries
- Issue #3222[3647] - Errors linking libhpx.so
- Issue #3221[3648] - HPX on Mac OS X with HWLoc 2.0.0 fails to run
- PR #3216[3649] - Reorder a variadic array to satisfy VS 2017 15.6
- PR #3214[3650] - Changed prerequisites.qbk to avoid confusion while building boost
- PR #3213[3651] - Relax locks for thread suspension to avoid holding locks when yielding
- PR #3212[3652] - Fix check in sequenced_executor test
- PR #3211[3653] - Use preinit_array to set argc/argv in init_globally example

- PR #3210[3654] - Adapted parallel::{search | search_n} for Ranges TS (see #1668)
- PR #3209[3655] - Fix locking problems during shutdown
- Issue #3208[3656] - init_globally throwing a run-time error
- PR #3206[3657] - Addition of new arithmetic performance counter "Count"
- PR #3205[3658] - Fixing return type calculation for bulk_then_execute
- PR #3204[3659] - Changing std::rand() to a better inbuilt PRNG generator
- PR #3203[3660] - Resolving problems during shutdown for VS2015
- PR #3202[3661] - Making sure resource partitioner is not accessed if its not valid
- PR #3201[3662] - Fixing optional::swap
- Issue #3200[3663] - hpx::util::optional fails
- PR #3199[3664] - Fix sliding_semaphore test
- PR #3198[3665] - Set pre_main status before launching run_helper
- PR #3197[3666] - Update README.rst
- PR #3194[3667] - parallel::{fill|fill_n} updated for Ranges TS
- PR #3193[3668] - Updating Runtime.cpp by adding correct description of Performance counters during register
- PR #3191[3669] - Fix sliding_semaphore_2338 test
- PR #3190[3670] - Topology improvements
- PR #3189[3671] - Deleting one include of median from BOOST library to arithmetics_counter file
- PR #3188[3672] - Optionally disable printing of diagnostics during terminate
- PR #3187[3673] - Suppressing cmake warning issued by cmake > V3.11
- PR #3185[3674] - Remove unused scoped_unlock, unlock_guard_try
- PR #3184[3675] - Fix nqueen example
- PR #3183[3676] - Add runtime start/stop, resume/suspend and OpenMP benchmarks

[3745] https://github.com/STEllAR-GROUP/hpx/pull/3107

- PR #3106[3746] - Add cmake test for std::decay_t to fix cuda build
- PR #3105[3747] - Fixing refcount for async traversal frame
- PR #3104[3748] - Local execution of direct actions is now actually performed directly
- PR #3103[3749] - Adding support for generic counter_raw_values performance counter type
- Issue #3102[3750] - Introduce generic performance counter type returning an array of values
- PR #3101[3751] - Revert "Adapting stack overhead limit for gcc 4.9"
- PR #3100[3752] - Fix #3068 (condition_variable deadlock)
- PR #3099[3753] - Fixing lock held during suspension in papi counter component
- PR #3098[3754] - Unbreak broadcast_wait_for_2822 test
- PR #3097[3755] - Adapting stack overhead limit for gcc 4.9
- PR #3096[3756] - fix detection of cxx11_std_atomic
- PR #3095[3757] - Add ciso646 header to get _LIBCPP_VERSION for testing inplace merge
- PR #3094[3758] - Relax atomic operations on performance counter values
- PR #3093[3759] - Short-circuit all_of/any_of/none_of instantiations
- PR #3092[3760] - Take advantage of C++14 lambda capture initialization syntax, where possible
- PR #3091[3761] - Remove more references to Boost from logging code
- PR #3090[3762] - Unify use of yield/yield_k
- PR #3089[3763] - Fix a strange thing in parallel::detail::handle_exception. (Fix #2834.)
- Issue #3088[3764] - A strange thing in parallel::sort.
- PR #3087[3765] - Fixing assertion in default_distribution_policy
- PR #3086[3766] - Implement parallel::remove and parallel::remove_if
- PR #3085[3767] - Addressing breaking changes in Boost V1.66
- PR #3084[3768] - Ignore build warnings round 2

- PR #3083[3769] - Fix typo HPX_WITH_MM_PREFECTH
- PR #3081[3770] - Pre-decay template arguments early
- PR #3080[3771] - Suspend thread pool
- PR #3079[3772] - Ignore build warnings
- PR #3078[3773] - Don't test inplace_merge with libc++
- PR #3076[3774] - Fixing 3075: Part 1
- PR #3074[3775] - Fix more build warnings
- PR #3073[3776] - Suspend thread cleanup
- PR #3072[3777] - Change existing symbol_namespace::iterate to return all data instead of invoking a callback
- PR #3071[3778] - Fixing pack_traversal_async test
- PR #3070[3779] - Fix dynamic_counters_loaded_1508 test by adding dependency to memory_component
- PR #3069[3780] - Fix scheduling loop exit
- Issue #3068[3781] - hpx::lcos::condition_variable could be suspect to deadlocks
- PR #3067[3782] - #ifdef out random_shuffle deprecated in later c++
- PR #3066[3783] - Make coalescing test depend on coalescing library to ensure it gets built
- PR #3065[3784] - Workaround for minimal_timed_async_executor_test compilation failures, attempts to copy a deferred call (in unevaluated context)
- PR #3064[3785] - Fixing wrong condition in wrapper_heap
- PR #3062[3786] - Fix exception handling for execution::seq
- PR #3061[3787] - Adapt MSVC C++ mode handling to VS15.5
- PR #3060[3788] - Fix compiler problem in MSVC release mode
- PR #3059[3789] - Fixing #2931
- Issue #3058[3790] - minimal_timed_async_executor_test_exe fails to compile on master (d6f505c)
- PR #3057[3791] - Fix stable_merge_2964 compilation problems

- PR #3056[3792] - Fix some build warnings caused by unused variables/unnecessary tests
- PR #3055[3793] - Update documentation for running tests
- Issue #3054[3794] - Assertion failure when using bulk hpx::**new_** in asynchronous mode
- PR #3052[3795] - Do not bind test running to cmake test build rule
- PR #3051[3796] - Fix HPX-Qt interaction in Qt example.
- Issue #3048[3797] - nqueen example fails occasionally
- PR #3047[3798] - Fixing #3044
- PR #3046[3799] - Add OS thread suspension
- PR #3042[3800] - PyCicle - first attempt at a build toold for checking PR's
- PR #3041[3801] - Fix a problem about asynchronous execution of parallel::merge and parallel::partition.
- PR #3040[3802] - Fix a mistake about exception handling in asynchronous execution of scan_partitioner.
- PR #3039[3803] - Consistently use executors to schedule work
- PR #3038[3804] - Fixing local direct function execution and lambda actions perfect forwarding
- PR #3035[3805] - Make parallel unit test names match build target/folder names
- PR #3033[3806] - Fix setting of default build type
- Issue #3032[3807] - Fix partitioner arg copy found in #2982
- Issue #3031[3808] - Errors linking libhpx.so due to missing references (master branch, commit 6679a8882)
- PR #3030[3809] - Revert "implement executor then interface with && forwarding reference"
- PR #3029[3810] - Run CI inspect checks before building
- PR #3028[3811] - Added range version of parallel::move
- Issue #3027[3812] - Implement all scheduling APIs in terms of executors
- PR #3026[3813] - implement executor then interface with && forwarding reference
- PR #3025[3814] - Fix typo unitialized to uninitialized

- PR #2821[3999] - Fix bugs and improve that about HPX_HAVE_CXX11_AUTO_RETURN_VALUE of CMake
- PR #2820[4000] - Support C++11 in benchmark codes of parallel::partition and parallel::partition_copy
- PR #2819[4001] - Fix compile errors in unit test of container version of parallel::partition
- Issue #2818[4002] - A strange thing in parallel::util::detail::handle_local_exceptions
- Issue #2815[4003] - HPX fails to compile with HPX_WITH_CUDA=ON and the new CUDA 9.0 RC
- Issue #2814[4004] - Using 'gmakeN' after 'cmake' produces error in src/CMakeFiles/hpx.dir/runtime/agas/addressing_service.cpp.o
- PR #2813[4005] - Properly support [[noreturn]] attribute if available
- Issue #2812[4006] - Compilation fails with gcc 7.1.1
- PR #2811[4007] - Adding hpx::launch::lazy and support for async, dataflow, and future::then
- PR #2810[4008] - Add option allowing to disable deprecation warning
- PR #2809[4009] - Disable throttling scheduler if HWLOC is not found/used
- PR #2808[4010] - Fix compile errors on some environments of parallel::partition
- Issue #2807[4011] - Difficulty building with `HPX_WITH_HWLOC=Off`
- PR #2806[4012] - Partitioned vector
- PR #2805[4013] - Serializing collections with non-default constructible data
- PR #2802[4014] - Fix FreeBSD 11
- Issue #2801[4015] - Rate limiting techniques in io_service
- Issue #2800[4016] - New Launch Policy: async_if
- PR #2799[4017] - Fix a unit test failure on GCC in tuple_cat
- PR #2798[4018] - bump minimum required cmake to 3.0 in test
- PR #2797[4019] - Making sure future::wait_for et.al. work properly for action results
- Issue #2796[4020] - wait_for does always in "deferred" state for calls on remote localities
- Issue #2795[4021] - Serialization of types without default constructor

- PR #2770[4045] - Adding test, fixing deadlock in config registry
- PR #2769[4046] - Remove some other warnings and errors detected by clang 5.0
- Issue #2768[4047] - Is there iterator tag for HPX?
- PR #2767[4048] - Improvements to continuation annotation
- PR #2765[4049] - gcc split stack support for HPX threads #620
- PR #2764[4050] - Fix some uses of begin/end, remove unnecessary includes
- PR #2763[4051] - Bump minimal Boost version to 1.55.0
- PR #2762[4052] - hpx::partitioned_vector serializer
- PR #2761[4053] - Adding configuration summary to cmake output and –hpx:info
- PR #2760[4054] - Removing 1d_hydro example as it is broken
- PR #2758[4055] - Remove various warnings detected by clang 5.0
- Issue #2757[4056] - In case of a "raw thread" is needed per core for implementing parallel algorithm, what is good practice in HPX?
- PR #2756[4057] - Allowing for LCOs to be simple components
- PR #2755[4058] - Removing make_index_pack_unrolled
- PR #2754[4059] - Implement parallel::unique_copy
- PR #2753[4060] - Fixing detection of [[fallthrough]] attribute
- PR #2752[4061] - New thread priority names
- PR #2751[4062] - Replace boost::exception with proposed exception_info
- PR #2750[4063] - Replace boost::iterator_range
- PR #2749[4064] - Fixing hdf5 examples
- Issue #2748[4065] - HPX fails to build with enabled hdf5 examples
- Issue #2747[4066] - Inherited task priorities break certain DAG optimizations
- Issue #2746[4067] - HPX segfaulting with valgrind

- PR #2721[4091] - Mind map
- PR #2720[4092] - reorder forward declarations to get rid of C++14-only auto return types
- PR #2719[4093] - Add documentation for partitioned_vector and add features in pack.hpp
- Issue #2718[4094] - Some forward declarations in execution_fwd.hpp aren't C++11-compatible
- PR #2717[4095] - Config support for fallthrough attribute
- PR #2716[4096] - Implement parallel::partition_copy
- PR #2715[4097] - initial import of icu string serializer
- PR #2714[4098] - initial import of valarray serializer
- PR #2713[4099] - Remove slashes before CMAKE_FILES_DIRECTORY variables
- PR #2712[4100] - Fixing wait for 1751
- PR #2711[4101] - Adjust code for minimal supported GCC having being bumped to 4.9
- PR #2710[4102] - Adding code of conduct
- PR #2709[4103] - Fixing UB in destroy tests
- PR #2708[4104] - Add inline to prevent multiple definition issue
- Issue #2707[4105] - Multiple defined symbols for task_block.hpp in VS2015
- PR #2706[4106] - Adding .clang-format file
- PR #2704[4107] - Add a synchronous mapping API
- Issue #2703[4108] - Request: Add the .clang-format file to the repository
- Issue #2702[4109] - STEllAR-GROUP/Vc slower than VCv1 possibly due to wrong instructions generated
- Issue #2701[4110] - Datapar with STEllAR-GROUP/Vc requires obscure flag
- Issue #2700[4111] - Naming inconsistency in parallel algorithms
- Issue #2699[4112] - Iterator requirements are different from standard in parallel copy_if.
- PR #2698[4113] - Properly releasing parcelport write handlers

- Issue #1056[4236] - Thread manager cleanup
- Issue #863[4237] - Futures should not require a default constructor
- Issue #856[4238] - Allow runtimemode_connect to be used with security enabled
- Issue #726[4239] - Valgrind
- Issue #701[4240] - Add RCR performance counter component
- Issue #528[4241] - Add support for known failures and warning count/comparisons to hpx_run_tests.py

HPX V1.0.0 (Apr 24, 2017)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling *HPX* with VS2012.
- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.
- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.
- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see PR #2289[4242] for more details).
- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.

[4242] https://github.com/STEllAR-GROUP/hpx/pull/2289

- We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or |boost_simd|_. Please see Issue #2333[4243] for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this blog-post[4244] for more information.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old inner_product names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).
- Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.
- All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The ols names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.
- The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also imroved the performance of creating `hpx::future` and of various facilities handling those.
- We have consolidated all of the code in HPX.Compute related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.
- Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.
- Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

Breaking changes

- We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.
- We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.

[4243] https://github.com/STEllAR-GROUP/hpx/issues/2333
[4244] http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/

- the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2596[4245] - Adding apex data
- PR #2595[4246] - Remove obsolete file
- Issue #2594[4247] - FindOpenCL.cmake mismatch with the official cmake module
- PR #2592[4248] - First attempt to introduce spmd_block in hpx
- Issue #2591[4249] - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
- PR #2588[4250] - Daint fixes
- PR #2587[4251] - Fixing transfer_(continuation)_action::schedule
- PR #2585[4252] - Work around MSVC having an ICE when compiling with -Ob2
- PR #2583[4253] - changing 7zip command to 7za in roll_release.sh
- PR #2582[4254] - First attempt to introduce spmd_block in hpx
- PR #2581[4255] - Enable annotated function for parallel algorithms
- PR #2580[4256] - First attempt to introduce spmd_block in hpx
- PR #2579[4257] - Make thread NICE level setting an option
- PR #2578[4258] - Implementing enqueue instead of busy wait when no sender is available
- PR #2577[4259] - Retrieve -std=c++11 consistent nvcc flag
- PR #2576[4260] - Add missing dependencies of cuda based tests
- PR #2575[4261] - Remove warnings due to some captured variables
- PR #2573[4262] - Attempt to resolve resolve_locality
- PR #2572[4263] - Adding APEX hooks to background thread

- Issue #2517[4310] - Race condition during Parcel Coalescing Handler creation
- Issue #2516[4311] - HPX locks up when using at least 256 localities
- Issue #2515[4312] - error: Install cannot find "/lib/hpx/libparcel_coalescing.so.0.9.99" but I can see that file
- PR #2514[4313] - Making sure that all continuations of a shared_future are invoked in order
- PR #2513[4314] - Fixing locks held during suspension
- PR #2512[4315] - MPI Parcelport improvements and fixes related to the background work changes
- PR #2511[4316] - Fixing bit-wise (zero-copy) serialization
- Issue #2509[4317] - Linking errors in hwloc_topology
- PR #2508[4318] - Added documentation for debugging with core files
- PR #2506[4319] - Fixing background work invocations
- PR #2505[4320] - Fix tuple serialization
- Issue #2504[4321] - Ensure continuations are called in the order they have been attached
- PR #2503[4322] - Adding serialization support for Vc v2 (datapar)
- PR #2502[4323] - Resolve various, minor compiler warnings
- PR #2501[4324] - Some other fixes around cuda examples
- Issue #2500[4325] - nvcc / cuda clang issue due to a missing -DHPX_WITH_CUDA flag
- PR #2499[4326] - Adding support for std::array to wait_all and friends
- PR #2498[4327] - Execute background work as HPX thread
- PR #2497[4328] - Fixing configuration options for spinlock-deadlock detection
- PR #2496[4329] - Accounting for different compilers in CrayKNL toolchain file
- PR #2494[4330] - Adding component base class which ties a component instance to a given executor
- PR #2493[4331] - Enable controlling amount of pending threads which must be available to allow thread stealing
- PR #2492[4332] - Adding new command line option –hpx:print-counter-reset

- PR #2491[4333] - Resolve ambiguities when compiling with APEX
- PR #2490[4334] - Resuming threads waiting on future with higher priority
- Issue #2489[4335] - nvcc issue because -std=c++11 appears twice
- PR #2488[4336] - Adding performance counters exposing the internal idle and busy-loop counters
- PR #2487[4337] - Allowing for plain suspend to reschedule thread right away
- PR #2486[4338] - Only flag HPX code for CUDA if HPX_WITH_CUDA is set
- PR #2485[4339] - Making thread-queue parameters runtime-configurable
- PR #2484[4340] - Added atomic counter for parcel-destinations
- PR #2483[4341] - Added priority-queue lifo scheduler
- PR #2482[4342] - Changing scheduler to steal only if more than a minimal number of tasks are available
- PR #2481[4343] - Extending command line option –hpx:print-counter-destination to support value 'none'
- PR #2479[4344] - Added option to disable signal handler
- PR #2478[4345] - Making sure the sine performance counter module gets loaded only for the corresponding example
- Issue #2477[4346] - Breaking at a throw statement
- PR #2476[4347] - Annotated function
- PR #2475[4348] - Ensure that using %osthread% during logging will not throw for non-hpx threads
- PR #2474[4349] - Remove now superficial non_direct actions from base_lco and friends
- PR #2473[4350] - Refining support for ITTNotify
- PR #2472[4351] - Some fixes around hpx compute
- Issue #2470[4352] - redefinition of boost::detail::spinlock
- Issue #2469[4353] - Dataflow performance issue
- PR #2468[4354] - Perf docs update
- PR #2466[4355] - Guarantee to execute remote direct actions on HPX-thread

- PR #2335[4471] - Making sure multiple components are properly initialized from arguments
- Issue #2334[4472] - Cannot construct component with large vector on a remote locality
- PR #2332[4473] - Fixing hpx::lcos::local::barrier
- PR #2331[4474] - Updating APEX support to include OTF2
- PR #2330[4475] - Support for data-parallelism for parallel algorithms
- Issue #2329[4476] - Coordinate settings in cmake
- PR #2328[4477] - fix LibGeoDecomp builds with HPX + GCC 5.3.0 + CUDA 8RC
- PR #2326[4478] - Making scan_partitioner work (for now)
- Issue #2323[4479] - Constructing a vector of components only correctly initializes the first component
- PR #2322[4480] - Fix problems that bubbled up after merging #2278
- PR #2321[4481] - Scalable barrier
- PR #2320[4482] - Std flag fixes
- Issue #2319[4483] - -std=c++14 and -std=c++1y with Intel can't build recent Boost builds due to insufficient C++14 support; don't enable these flags by default for Intel
- PR #2318[4484] - Improve handling of –hpx:bind=<bind-spec>
- PR #2317[4485] - Making sure command line warnings are printed once only
- PR #2316[4486] - Fixing command line handling for default bind mode
- PR #2315[4487] - Set id_retrieved if set_id is present
- Issue #2314[4488] - Warning for requested/allocated thread discrepancy is printed twice
- Issue #2313[4489] - –hpx:print-bind doesn't work with –hpx:pu-step
- Issue #2312[4490] - –hpx:bind range specifier restrictions are overly restrictive
- Issue #2311[4491] - hpx_0.9.99 out of project build fails
- PR #2310[4492] - Simplify function registration
- PR #2309[4493] - Spelling and grammar revisions in documentation (and some code)

HPX V0.9.99 (Jul 15, 2016)

General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming *HPX* V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of *HPX* and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big 'Thank you!' to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move *HPX* components to a different compute node). Additionally, this release of *HPX* cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

- We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.
- We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges (N4560[4568]) proposal. This also includes the addition of projections to the existing algorithms. Please see Issue #1668[4569] for a list of algorithms which have been adapted to N4560[4570].
- We have implemented index-based parallel for-loops based on a corresponding standardization proposal (P0075R1[4571]). Please see Issue #2016[4572] for a list of available algorithms.
- We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See Issue #1141[4573] for an overview of which algorithms are available by now.
- We have started to implement a new prototypical functionality with *HPX.Compute* which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.
- We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.

[4570] http://wg21.link/n4560
[4571] http://wg21.link/p0075r1
[4572] https://github.com/STEllAR-GROUP/hpx/issues/2016
[4573] https://github.com/STEllAR-GROUP/hpx/issues/1141

- Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type `T` into a future of any other type `R`, either based on default conversion rules of the embedded types or using a given explicit conversion function.
- We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without 'stopping the world' for the object to migrate. *HPX* will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See Issue #559[4574] and PR #1966[4575] for more details.
- The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see Issue #1265[4576] and PR #1912[4577] for more information.
- Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).
- We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of *HPX* itself and also of applications depending on it. We have further decreased the dependency of *HPX* on the Boost libraries by replacing part of those with facilities available from the standard libraries.
- Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.
- We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.
- We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.
- We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).
- We have extended the interfaces exposed from executors (as proposed by N4406[4578]) to accept an arbitrary number of arguments.

Breaking changes

- In order to move the dataflow facility to `namespace hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to CMake[4579] is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.
- The adaptation of the C++ Extensions for Ranges (N4560[4580]) proposal imposes some breaking changes related

4574 https://github.com/STEllAR-GROUP/hpx/issues/559
4575 https://github.com/STEllAR-GROUP/hpx/pull/1966
4576 https://github.com/STEllAR-GROUP/hpx/issues/1265
4577 https://github.com/STEllAR-GROUP/hpx/pull/1912
4578 http://wg21.link/n4406
4579 https://www.cmake.org
4580 http://wg21.link/n4560

to the return types of some of the parallel algorithms. Please see Issue #1668[4581] for a list of algorithms which have already been adapted.

- The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.
- We have removed support for Intel V13 and gcc 4.4.x.
- We have removed (default) support for the generic `hpx::parallel::execution_poliy` because it was removed from the Parallelism TS (__cpp11_n4104__) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to CMake.
- Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.
- Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.
- Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in *HPX* (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2250[4582] - change default chunker of parallel executor to static one
- PR #2247[4583] - HPX on ppc64le
- PR #2244[4584] - Fixing MSVC problems
- PR #2238[4585] - Fixing small typos
- PR #2237[4586] - Fixing small typos
- PR #2234[4587] - Fix broken add test macro when extra args are passed in
- PR #2231[4588] - Fixing possible race during future awaiting in serialization
- PR #2230[4589] - Fix stream nvcc
- PR #2229[4590] - Fixed run_as_hpx_thread
- PR #2228[4591] - On prefetching_test branch : adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- PR #2227[4592] - Support for HPXCL's opencl::event
- PR #2226[4593] - Preparing for release of V0.9.99

- PR #2225[4594] - fix issue when compiling components with hpxcxx
- PR #2224[4595] - Compute alloc fix
- PR #2223[4596] - Simplify promise
- PR #2222[4597] - Replace last uses of boost::function by util::function_nonser
- PR #2221[4598] - Fix config tests
- PR #2220[4599] - Fixing gcc 4.6 compilation issues
- PR #2219[4600] - nullptr support for `[unique_]function`
- PR #2218[4601] - Introducing clang tidy
- PR #2216[4602] - Replace NULL with nullptr
- Issue #2214[4603] - Let inspect flag use of NULL, suggest nullptr instead
- PR #2213[4604] - Require support for nullptr
- PR #2212[4605] - Properly find jemalloc through pkg-config
- PR #2211[4606] - Disable a couple of warnings reported by Intel on Windows
- PR #2210[4607] - Fixed host::block_allocator::bulk_construct
- PR #2209[4608] - Started to clean up new sort algorithms, made things compile for sort_by_key
- PR #2208[4609] - A couple of fixes that were exposed by a new sort algorithm
- PR #2207[4610] - Adding missing includes in /hpx/include/serialization.hpp
- PR #2206[4611] - Call package_action::get_future before package_action::apply
- PR #2205[4612] - The indirect_packaged_task::operator() needs to be run on a HPX thread
- PR #2204[4613] - Variadic executor parameters
- PR #2203[4614] - Delay-initialize members of partitioned iterator
- PR #2202[4615] - Added segmented fill for hpx::vector
- Issue #2201[4616] - Null Thread id encountered on partitioned_vector

- PR #2200[4617] - Fix hangs
- PR #2199[4618] - Deprecating hpx/traits.hpp
- PR #2198[4619] - Making explicit inclusion of external libraries into build
- PR #2197[4620] - Fix typo in QT CMakeLists
- PR #2196[4621] - Fixing a gcc warning about attributes being ignored
- PR #2194[4622] - Fixing partitioned_vector_spmd_foreach example
- Issue #2193[4623] - partitioned_vector_spmd_foreach seg faults
- PR #2192[4624] - Support Boost.Thread v4
- PR #2191[4625] - HPX.Compute prototype
- PR #2190[4626] - Spawning operation on new thread if remaining stack space becomes too small
- PR #2189[4627] - Adding callback taking index and future to when_each
- PR #2188[4628] - Adding new example demonstrating receive_buffer
- PR #2187[4629] - Mask 128-bit ints if CUDA is being used
- PR #2186[4630] - Make startup & shutdown functions unique_function
- PR #2185[4631] - Fixing logging output not to cause hang on shutdown
- PR #2184[4632] - Allowing component clients as action return types
- Issue #2183[4633] - Enabling logging output causes hang on shutdown
- Issue #2182[4634] - 1d_stencil seg fault
- Issue #2181[4635] - Setting small stack size does not change default
- PR #2180[4636] - Changing default bind mode to balanced
- PR #2179[4637] - adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- PR #2177[4638] - Fixing 2176
- Issue #2176[4639] - Launch process test fails on OSX

- PR #2054[4755] - Add a forwarding coroutine header
- PR #2053[4756] - Replace uses of boost::unordered_map with std::unordered_map
- PR #2052[4757] - Rewrite tuple unwrap
- PR #2050[4758] - Replace uses of BOOST_SCOPED_ENUM with C++11 scoped enums
- PR #2049[4759] - Attempt to narrow down split_credit problem
- PR #2048[4760] - Fixing gcc startup hangs
- PR #2047[4761] - Fixing when_xxx and wait_xxx for MSVC12
- PR #2046[4762] - adding persistent_auto_chunk_size and related tests for for_each
- PR #2045[4763] - Fixing HPX_HAVE_THREAD_BACKTRACE_DEPTH build time configuration
- PR #2044[4764] - Adding missing service executor types
- PR #2043[4765] - Removing ambiguous definitions for is_future_range and future_range_traits
- PR #2042[4766] - Clarify that HPX builds can use (much) more than 2GB per process
- PR #2041[4767] - Changing future_iterator_traits to support pointers
- Issue #2040[4768] - Improve documentation memory usage warning?
- PR #2039[4769] - Coroutine cleanup
- PR #2038[4770] - Fix cmake policy CMP0042 warning MACOSX_RPATH
- PR #2037[4771] - Avoid redundant specialization of [**unique_**]function_nonser
- PR #2036[4772] - nvcc dies with an internal error upon pushing/popping warnings inside templates
- Issue #2035[4773] - Use a less restrictive iterator definition in hpx::lcos::detail::future_iterator_traits
- PR #2034[4774] - Fixing compilation error with thread queue wait time performance counter
- Issue #2033[4775] - Compilation error when compiling with thread queue waittime performance counter
- Issue #2032[4776] - Ambiguous template instantiation for is_future_range and future_range_traits.
- PR #2031[4777] - Don't restart timer on every incoming parcel

HPX V0.9.11 (Nov 11, 2015)

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an `executor`, which can be used to customize the `where` and `when` of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choce of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (`master`) are prohibited. Any change has to go through a peer review before it will be merged to `master`. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the master branch since the last release.

General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.
- Added integration with the CircleCI[4976] hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.
- The compiler configuration subsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.
- The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_` only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.
- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
  - *hpx::components::default_distribution_policy* which tries to place multiple component instances as evenly as possible.
  - *hpx::components::colocating_distribution_policy* which will refer to the locality where a given component instance is currently placed.
  - *hpx::components::binpacking_distribution_policy* which will place multiple component instances as evenly as possible based on any performance counter.
  - *hpx::components::target_distribution_policy* which allows one to represent a given locality in the context of a distrwibution policy.
- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)` which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.
- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.
- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal N4411[4977].
- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a task_block with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.
- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see N4399[4978]).
- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).
- Added performance counters allowing to track the number of action invocations (local and remote invocations).
- Added new command line options –hpx:print-counter-at and –hpx:reset-counters.

4976 https://circleci.com/gh/STEllAR-GROUP/hpx
4977 http://wg21.link/n4411
4978 http://wg21.link/n4399

- The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.
- Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.
- Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).
- HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see https://github.com/UO-OACISS/xpress-apex. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.
- We have implemented many more of the *Using parallel algorithms*. Please see Issue #1141[4979] for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a `hpx::components::component_base` instead of `hpx::components::managed_component_base`.
- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.
- The CMake project name has changed from 'hpx' to 'HPX' for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into <prefix>/lib/cmake/HPX and not <prefix>/lib/cmake/hpx.
- The macro `HPX_REGISTER_MINIMAL_COMPONENT_FACTORY` has been deprecated. Please use `HPX_REGISTER_COMPONENT`. instead. The old macro will be removed in the next release.
- The obsolete distributing_factory and binpacking_factory components have been removed. The corresponding functionality is now provided by the `hpx::new_` API function in conjunction with the `hpx::default_layout` and `hpx::binpacking` distribution policies (`hpx::components::default_distribution_policy` and `hpx::components::binpacking_distribution_policy`)
- The API function `hpx::new_colocated` has been deprecated. Please use the consolidated API `hpx::new_` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The API function `hpx::async_colocated` has been deprecated. Please use the consolidated API `hpx::async` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The obsolete remote_object component has been removed.

[4979] https://github.com/STEllAR-GROUP/hpx/issues/1141

- Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding announcement[4980] on the hpx-users@stellar.cct.lsu.edu mailing list.
- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with `HPX_WITH_...`, while the preprocessor constant which is used at build time starts with `HPX_HAVE_...`. For instance, the former cmake command line `-DHPX_MALLOC=...` now has to be specified a `-DHPX_WITH_MALLOC=...` and will cause the preprocessor constant `HPX_HAVE_MALLOC` to be defined. The actual name of the constant (i.e. `MALLOC`) has not changed. Please see the corresponding documentation for more details (*CMake options*).
- The `get_gid()` functions exposed by the component base classes `hpx::components::server::simple_component_base`, `hpx::components::server::managed_component_base`, and `hpx::components::server::fixed_component_base` have been replaced by two new functions: `get_unmanaged_id()` and `get_id()`. To enable the old function name for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.
- All functions which were named `get_gid()` but were returning `hpx::id_type` have been renamed to `get_id()`. To enable the old function names for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #1855[4981] - Completely removing external/endian
- PR #1854[4982] - Don't pollute CMAKE_CXX_FLAGS through find_package()
- PR #1853[4983] - Updating CMake configuration to get correct version of TAU library
- PR #1852[4984] - Fixing Performance Problems with MPI Parcelport

- PR #1814[5016] - Fix async to dispatch to the correct locality in all cases
- Issue #1813[5017] - async(launch::. . . , action(), . . .) always invokes locally
- PR #1812[5018] - fixed syntax error in CMakeLists.txt
- PR #1811[5019] - Agas optimizations
- PR #1810[5020] - drop superfluous typedefs
- PR #1809[5021] - Allow HPX to be used as an optional package in 3rd party code
- PR #1808[5022] - Fixing #1723
- PR #1807[5023] - Making sure resolve_localities does not hang during normal operation
- Issue #1806[5024] - Spinlock no longer movable and deletes operator '=', breaks MiniGhost
- Issue #1804[5025] - register_with_basename causes hangs
- PR #1801[5026] - Enhanced the inspect tool to take user directly to the problem with hyperlinks
- Issue #1800[5027] - Problems compiling application on smic
- PR #1799[5028] - Fixing cv exceptions
- PR #1798[5029] - Documentation refactoring & updating
- PR #1797[5030] - Updating the activeharmony CMake module
- PR #1795[5031] - Fixing cv
- PR #1794[5032] - Fix connect with hpx::runtime_mode_connect
- PR #1793[5033] - fix a wrong use of HPX_MAX_CPU_COUNT instead of HPX_HAVE_MAX_CPU_COUNT
- PR #1792[5034] - Allow for default constructed parcel instances to be moved
- PR #1791[5035] - Fix connect with hpx::runtime_mode_connect
- Issue #1790[5036] - assertion `action_.get()` failed: HPX(assertion_failure) when running Octotiger with pull request 1786
- PR #1789[5037] - Fixing discover_counter_types API function
- Issue #1788[5038] - connect with hpx::runtime_mode_connect

- Issue #1787[5039] - discover_counter_types not working
- PR #1786[5040] - Changing addressing_service to use std::unordered_map instead of std::map
- PR #1785[5041] - Fix is_iterator for container algorithms
- PR #1784[5042] - Adding new command line options:
- PR #1783[5043] - Minor changes for APEX support
- PR #1782[5044] - Drop legacy forwarding action traits
- PR #1781[5045] - Attempt to resolve the race between cv::wait_xxx and cv::notify_all
- PR #1780[5046] - Removing serialize_sequence
- PR #1779[5047] - Fixed #1501: hwloc configuration options are wrong for MIC
- PR #1778[5048] - Removing ability to enable/disable parcel handling
- PR #1777[5049] - Completely removing stackless threads
- PR #1776[5050] - Cleaning up util/plugin
- PR #1775[5051] - Agas fixes
- PR #1774[5052] - Action invocation count
- PR #1773[5053] - replaced MSVC variable with WIN32
- PR #1772[5054] - Fixing Problems in MPI parcelport and future serialization.
- PR #1771[5055] - Fixing intel 13 compiler errors related to variadic template template parameters for `lcos::when_` tests
- PR #1770[5056] - Forwarding decay to `std::`
- PR #1769[5057] - Add more characters with special regex meaning to the existing patch
- PR #1768[5058] - Adding test for receive_buffer
- PR #1767[5059] - Making sure that uptime counter throws exception on any attempt to be reset
- PR #1766[5060] - Cleaning up code related to throttling scheduler
- PR #1765[5061] - Restricting thread_data to creating only with intrusive_pointers

- PR #1665[5154] - Fixes an error with the whitespace check that showed the incorrect location of the error
- Issue #1664[5155] - Inspect tool found incorrect endline whitespace
- PR #1663[5156] - Improve use of locks
- Issue #1662[5157] - Possible exception source in coalescing_message_handler
- PR #1661[5158] - Added support for 128bit number serialization
- PR #1660[5159] - Serialization 128bits
- PR #1659[5160] - Implemented inner_product and adjacent_diff algos
- PR #1658[5161] - Add serialization for std::set (as there is for std::vector and std::map)
- PR #1657[5162] - Use of shared_ptr in io_service_pool changed to unique_ptr
- Issue #1656[5163] - 1d_stencil codes all have wrong factor
- PR #1654[5164] - When using runtime_mode_connect, find the correct localhost public ip address
- PR #1653[5165] - Fixing 1617
- PR #1652[5166] - Remove traits::action_may_require_id_splitting
- PR #1651[5167] - Fixed performance counters related to AGAS cache timings
- PR #1650[5168] - Remove leftovers of traits::type_size
- PR #1649[5169] - Shorten target names on Windows to shorten used path names
- PR #1648[5170] - Fixing problems introduced by merging #1623 for older compilers
- PR #1647[5171] - Simplify running automatic builds on Windows
- Issue #1646[5172] - Cache insert and update performance counters are broken
- Issue #1644[5173] - Remove leftovers of traits::type_size
- Issue #1643[5174] - Remove traits::action_may_require_id_splitting
- PR #1642[5175] - Adds spell checker to the inspect tool for qbk and doxygen comments
- PR #1640[5176] - First step towards fixing 688

- PR #1639[5177] - Re-apply remaining changes from limit_dataflow_recursion branch
- PR #1638[5178] - This fixes possible deadlock in the test ignore_while_locked_1485
- PR #1637[5179] - Fixing hpx::wait_all() invoked with two vector<future<T>>
- PR #1636[5180] - Partially re-apply changes from limit_dataflow_recursion branch
- PR #1635[5181] - Adding missing test for #1572
- PR #1634[5182] - Revert "Limit recursion-depth in dataflow to a configurable constant"
- PR #1633[5183] - Add command line option to ignore batch environment
- PR #1631[5184] - hpx::lcos::queue exhibits strange behavior
- PR #1630[5185] - Fixed endline_whitespace_check.cpp to detect lines with only whitespace
- Issue #1629[5186] - Inspect trailing whitespace checker problem
- PR #1628[5187] - Removed meaningless const qualifiers. Minor icpc fix.
- PR #1627[5188] - Fixing the queue LCO and add example demonstrating its use
- PR #1626[5189] - Deprecating get_gid(), add get_id() and get_unmanaged_id()
- PR #1625[5190] - Allowing to specify whether to send credits along with message
- Issue #1624[5191] - Lifetime issue
- Issue #1623[5192] - hpx::wait_all() invoked with two vector<future<T>> fails
- PR #1622[5193] - Executor partitioners
- PR #1621[5194] - Clean up coroutines implementation
- Issue #1620[5195] - Revert #1535
- PR #1619[5196] - Fix result type calculation for hpx::make_continuation
- PR #1618[5197] - Fixing RDTSC on Xeon/Phi
- Issue #1617[5198] - hpx cmake not working when run as a subproject
- Issue #1616[5199] - cmake problem resulting in RDTSC not working correctly for Xeon Phi creates very strange results for duration counters

- Issue #1615[5200] - hpx::make_continuation requires input and output to be the same
- PR #1614[5201] - Fixed remove copy test
- Issue #1613[5202] - Dataflow causes stack overflow
- PR #1612[5203] - Modified foreach partitioner to use bulk execute
- PR #1611[5204] - Limit recursion-depth in dataflow to a configurable constant
- PR #1610[5205] - Increase timeout for CircleCI
- PR #1609[5206] - Refactoring thread manager, mainly extracting thread pool
- PR #1608[5207] - Fixed running multiple localities without localities parameter
- PR #1607[5208] - More algorithm fixes to adjacentfind
- Issue #1606[5209] - Running without localities parameter binds to bogus port range
- Issue #1605[5210] - Too many serializations
- PR #1604[5211] - Changes the HPX image into a hyperlink
- PR #1601[5212] - Fixing problems with remove_copy algorithm tests
- PR #1600[5213] - Actions with ids cleanup
- PR #1599[5214] - Duplicate binding of global ids should fail
- PR #1598[5215] - Fixing array access
- PR #1597[5216] - Improved the reliability of connecting/disconnecting localities
- Issue #1596[5217] - Duplicate id binding should fail
- PR #1595[5218] - Fixing more cmake config constants
- PR #1594[5219] - Fixing preprocessor constant used to enable C++11 chrono
- PR #1593[5220] - Adding operator|() for hpx::launch
- Issue #1592[5221] - Error (typo) in the docs
- Issue #1590[5222] - CMake fails when CMAKE_BINARY_DIR contains '+'.

- Issue #524[5384] - Extend scheduler to support threads which can't be stolen

HPX V0.9.10 (Mar 24, 2015)

General changes

This is the 12th official release of *HPX*. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run *HPX* applications on up to ~24k cores. We have also shown that HPX can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of *HPX*. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel- ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies and to improve the available networking bandwidth. Please note that in this release we disabled the ibverbs and ipc parcel ports as those have not been ported to the new plugin system yet (see Issue #839[5385]).

Another corner stone of this release is our work towards a complete implementation of __cpp11_n4104__ (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [link hpx.manual.parallel.parallel_algorithms Parallel Algorithms] for more details). We also implemented some extensions to __cpp11_n4104__ allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of `hpx::vector` which is a distributed data structure closely aligned to the functionality of `std::vector`. The difference is that `hpx::vector` stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with `hpx::vector`. At this point we have implemented only a few of the parallel algorithms to support distributed data structures (like `hpx::vector`) for testing purposes (see Issue #1338[5386] for a documentation of our progress).

Breaking changes

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- Move to Variadics- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (`hpx::async_continue`, `hpx::apply_continue`, `hpx::when_each`, `hpx::wait_each`, synchronous invocation of actions).
- Changes to Macros- We also removed the macros `HPX_STD_FUNCTION` and `HPX_STD_TUPLE`. This shouldn't affect any user code as we replaced `HPX_STD_FUNCTION` with `hpx::util::function_nonser` which was the default expansion used for this macro. All *HPX* API functions which expect a `hpx::util::function_nonser` (or a `hpx::util::unique_function_nonser`) can now be transparently called with a compatible `std::function` instead. Similarly, `HPX_STD_TUPLE` was replaced by its default expansion as well: `hpx::util::tuple`.

5384 https://github.com/STEllAR-GROUP/hpx/issues/524
5385 https://github.com/STEllAR-GROUP/hpx/issues/839
5386 https://github.com/STEllAR-GROUP/hpx/issues/1338

* Changes to `hpx::unique_future`- `hpx::unique_future`, which was deprecated in the previous release for `hpx::future` is now completely removed from *HPX*. This completes the transition to a completely standards conforming implementation of `hpx::future`.
* Changes to Supported Compilers. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our *Prerequisites* page for more details.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

* Issue #1402[5387] - Internal shared_future serialization copies
* Issue #1399[5388] - Build takes unusually long time…
* Issue #1398[5389] - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
* Issue #1397[5390] - Completely remove hpx::unique_future
* Issue #1396[5391] - Parallel scan algorithms with different initial values
* Issue #1395[5392] - Race Condition - 1d_stencil_8 - SuperMIC
* Issue #1394[5393] - "suspending thread while at least one lock is being held" - 1d_stencil_8 - SuperMIC
* Issue #1393[5394] - SEGFAULT in 1d_stencil_8 on SuperMIC
* Issue #1392[5395] - Fixing #1168
* Issue #1391[5396] - Parallel Algorithms for scan partitioner for small number of elements
* Issue #1387[5397] - Failure with more than 4 localities
* Issue #1386[5398] - Dispatching unhandled exceptions to outer user code
* Issue #1385[5399] - Adding Copy algorithms, fixing `parallel::copy_if`
* Issue #1384[5400] - Fixing 1325
* Issue #1383[5401] - Fixed #504: Refactor Dataflow LCO to work with futures, this removes the dataflow component as it is obsolete
* Issue #1382[5402] - `is_sorted`, `is_sorted_until` and `is_partitioned` algorithms
* Issue #1381[5403] - fix for CMake versions prior to 3.1
* Issue #1380[5404] - resolved warning in CMake 3.1 and newer

- Issue #1332[5451] - Variadic templates support for actions
- Issue #1331[5452] - Some ambiguous calls of map::erase have been prevented by adding additional check in locality constructor.
- Issue #1330[5453] - Defining Plain Actions does not work as described in the documentation
- Issue #1329[5454] - Distributed vector cleanup
- Issue #1328[5455] - Sync docs and comments with code in hello_world example
- Issue #1327[5456] - Typos in docs
- Issue #1326[5457] - Documentation and code diverged in Fibonacci tutorial
- Issue #1325[5458] - Exceptions thrown during parcel handling are not handled correctly
- Issue #1324[5459] - fixed bandwidth calculation
- Issue #1323[5460] - mmap() failed to allocate thread stack due to insufficient resources
- Issue #1322[5461] - HPX fails to build aa182cf
- Issue #1321[5462] - Limiting size of outgoing messages while coalescing parcels
- Issue #1320[5463] - passing a future with launch::deferred in remote function call causes hang
- Issue #1319[5464] - An exception when tries to specify number high priority threads with abp-priority
- Issue #1318[5465] - Unable to run program with abp-priority and numa-sensitivity enabled
- Issue #1317[5466] - N4071 Search/Search_n finished, minor changes
- Issue #1316[5467] - Add config option to make -Ihpx.run_hpx_main!=1 the default
- Issue #1314[5468] - Variadic support for async and apply
- Issue #1313[5469] - Adjust when_any/some to the latest proposed interfaces
- Issue #1312[5470] - Fixing #857: hpx::naming::locality leaks parcelport specific information into the public interface
- Issue #1311[5471] - Distributed get'er/set'er_values for distributed vector
- Issue #1310[5472] - Crashing in hpx::parcelset::policies::mpi::connection_handler::handle_messages() on SuperMIC

- Issue #1308[5473] - Unable to execute an application with –hpx:threads
- Issue #1307[5474] - merge_graph linking issue
- Issue #1306[5475] - First batch of variadic templates support
- Issue #1305[5476] - Create a compiler wrapper
- Issue #1304[5477] - Provide a compiler wrapper for hpx
- Issue #1303[5478] - Drop support for GCC44
- Issue #1302[5479] - Fixing #1297
- Issue #1301[5480] - Compilation error when tried to use boost range iterators with wait_all
- Issue #1298[5481] - Distributed vector
- Issue #1297[5482] - Unable to invoke component actions recursively
- Issue #1294[5483] - HDF5 build error
- Issue #1275[5484] - The parcelport implementation is non-optimal
- Issue #1267[5485] - Added classes and unit tests for local_file, orangefs_file and pxfs_file
- Issue #1264[5486] - Error "assertion '!m_fun' failed" randomly occurs when using TCP
- Issue #1254[5487] - thread binding seems to not work properly
- Issue #1220[5488] - parallel::copy_if is broken
- Issue #1217[5489] - Find a better way of fixing the issue patched by #1216
- Issue #1168[5490] - Starting HPX on Cray machines using aprun isn't working correctly
- Issue #1085[5491] - Replace startup and shutdown barriers with broadcasts
- Issue #981[5492] - With SLURM, –hpx:threads=8 should not be necessary
- Issue #857[5493] - hpx::naming::locality leaks parcelport specific information into the public interface
- Issue #850[5494] - "flush" not documented
- Issue #763[5495] - Create buildbot instance that uses std::bind as HPX_STD_BIND

- Issue #680[5496] - Convert parcel ports into a plugin system
- Issue #582[5497] - Make exception thrown from HPX threads available from `hpx::init`
- Issue #504[5498] - Refactor Dataflow LCO to work with futures
- Issue #196[5499] - Don't store copies of the locality network metadata in the gva table

HPX V0.9.9 (Oct 31, 2014, codename Spooky)

General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the *HPX* releases so far. We are especially happy about the large number of people who contributed for the first time to *HPX*.

- We completed the transition from the older (non-conforming) implementation of `hpx::future` to the new and fully conforming version by removing the old code and by renaming the type `hpx::unique_future` to `hpx::future`. In order to maintain backwards compatibility with existing code which uses the type `hpx::unique_future` we support the configuration variable `HPX_UNIQUE_FUTURE_ALIAS`. If this variable is set to `ON` while running cmake it will additionally define a template alias for this type.
- We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: *Building HPX*. Please revisit your build scripts to adapt to the changes. The most notable changes are:
  - `HPX_NO_INSTALL` is no longer necessary.
  - For external builds, you need to set `HPX_DIR` instead of `HPX_ROOT` as described here: *Using HPX with CMake-based projects*.
  - IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
  - Building HPX statically (without dynamic libraries) is now supported (`-DHPX_STATIC_LINKING=On`).
  - Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section *CMake options* for more information).
  - This also fixes a long list of issues, for more information see Issue #1204[5500].
- We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably N4409[5501] (Working Draft, Technical Specification for C++ Extensions for Parallelism), N4411[5502] (Task Region Rev. 3), and N4313[5503] (Working Draft, Technical Specification for C++ Extensions for Concurrency).
- We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at *HPX* Buildbot Website[5504].

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1296[5505] - Rename make_error_future to make_exceptional_future, adjust to N4123
- Issue #1295[5506] - building issue
- Issue #1293[5507] - Transpose example
- Issue #1292[5508] - Wrong abs() function used in example
- Issue #1291[5509] - non-synchronized shift operators have been removed
- Issue #1290[5510] - RDTSCP is defined as true for Xeon Phi build
- Issue #1289[5511] - Fixing 1288
- Issue #1288[5512] - Add new performance counters
- Issue #1287[5513] - Hierarchy scheduler broken performance counters
- Issue #1286[5514] - Algorithm cleanup
- Issue #1285[5515] - Broken Links in Documentation
- Issue #1284[5516] - Uninitialized copy
- Issue #1283[5517] - missing boost::scoped_ptr includes
- Issue #1282[5518] - Update documentation of build options for schedulers
- Issue #1281[5519] - reset idle rate counter
- Issue #1280[5520] - Bug when executing on Intel MIC
- Issue #1279[5521] - Add improved when_all/wait_all
- Issue #1278[5522] - Implement improved when_all/wait_all
- Issue #1277[5523] - feature request: get access to argc argv and variables_map
- Issue #1276[5524] - Remove merging map
- Issue #1274[5525] - Weird (wrong) string code in papi.cpp

5524 https://github.com/STEllAR-GROUP/hpx/issues/1276
5525 https://github.com/STEllAR-GROUP/hpx/issues/1274

- Issue #1273[5526] - Sequential task execution policy
- Issue #1272[5527] - Avoid CMake name clash for Boost.Thread library
- Issue #1271[5528] - Updates on HPX Test Units
- Issue #1270[5529] - hpx/util/safe_lexical_cast.hpp is added
- Issue #1269[5530] - Added default value for "LIB" cmake variable
- Issue #1268[5531] - Memory Counters not working
- Issue #1266[5532] - FindHPX.cmake is not installed
- Issue #1263[5533] - apply_remote test takes too long
- Issue #1262[5534] - Chrono cleanup
- Issue #1261[5535] - Need make install for papi counters and this builds all the examples
- Issue #1260[5536] - Documentation of Stencil example claims
- Issue #1259[5537] - Avoid double-linking Boost on Windows
- Issue #1257[5538] - Adding additional parameter to create_thread
- Issue #1256[5539] - added buildbot changes to release notes
- Issue #1255[5540] - Cannot build MiniGhost
- Issue #1253[5541] - hpx::thread defects
- Issue #1252[5542] - HPX_PREFIX is too fragile
- Issue #1250[5543] - switch_to_fiber_emulation does not work properly
- Issue #1249[5544] - Documentation is generated under Release folder
- Issue #1248[5545] - Fix usage of hpx_generic_coroutine_context and get tests passing on powerpc
- Issue #1247[5546] - Dynamic linking error
- Issue #1246[5547] - Make cpuid.cpp C++11 compliant
- Issue #1245[5548] - HPX fails on startup (setting thread affinity mask)

- Issue #1244[5549] - HPX_WITH_RDTSC configure test fails, but should succeed
- Issue #1243[5550] - CTest dashboard info for CSCS CDash drop location
- Issue #1242[5551] - Mac fixes
- Issue #1241[5552] - Failure in Distributed with Boost 1.56
- Issue #1240[5553] - fix a race condition in examples.diskperf
- Issue #1239[5554] - fix wait_each in examples.diskperf
- Issue #1238[5555] - Fixed #1237: hpx::util::portable_binary_iarchive failed
- Issue #1237[5556] - hpx::util::portable_binary_iarchive faileds
- Issue #1235[5557] - Fixing clang warnings and errors
- Issue #1234[5558] - TCP runs fail: Transport endpoint is not connected
- Issue #1233[5559] - Making sure the correct number of threads is registered with AGAS
- Issue #1232[5560] - Fixing race in wait_xxx
- Issue #1231[5561] - Parallel minmax
- Issue #1230[5562] - Distributed run of 1d_stencil_8 uses less threads than spec. & sometimes gives errors
- Issue #1229[5563] - Unstable number of threads
- Issue #1228[5564] - HPX link error (cmake / MPI)
- Issue #1226[5565] - Warning about struct/class thread_counters
- Issue #1225[5566] - Adding parallel::replace etc
- Issue #1224[5567] - Extending dataflow to pass through non-future arguments
- Issue #1223[5568] - Remaining find algorithms implemented, N4071
- Issue #1222[5569] - Merging all the changes
- Issue #1221[5570] - No error output when using mpirun with hpx
- Issue #1219[5571] - Adding new AGAS cache performance counters

- Issue #1216[5572] - Fixing using futures (clients) as arguments to actions
- Issue #1215[5573] - Error compiling simple component
- Issue #1214[5574] - Stencil docs
- Issue #1213[5575] - Using more than a few dozen MPI processes on SuperMike results in a seg fault before getting to hpx_main
- Issue #1212[5576] - Parallel rotate
- Issue #1211[5577] - Direct actions cause the future's shared_state to be leaked
- Issue #1210[5578] - Refactored local::promise to be standard conformant
- Issue #1209[5579] - Improve command line handling
- Issue #1208[5580] - Adding parallel::reverse and parallel::reverse_copy
- Issue #1207[5581] - Add copy_backward and move_backward
- Issue #1206[5582] - N4071 additional algorithms implemented
- Issue #1204[5583] - Cmake simplification and various other minor changes
- Issue #1203[5584] - Implementing new launch policy for (local) async: `hpx::launch::fork`.
- Issue #1202[5585] - Failed assertion in connection_cache.hpp
- Issue #1201[5586] - pkg-config doesn't add mpi link directories
- Issue #1200[5587] - Error when querying time performance counters
- Issue #1199[5588] - library path is now configurable (again)
- Issue #1198[5589] - Error when querying performance counters
- Issue #1197[5590] - tests fail with intel compiler
- Issue #1196[5591] - Silence several warnings
- Issue #1195[5592] - Rephrase initializers to work with VC++ 2012
- Issue #1194[5593] - Simplify parallel algorithms
- Issue #1193[5594] - Adding `parallel::equal`

- Issue #1192[5595] - HPX(out_of_memory) on including <hpx/hpx.hpp>
- Issue #1191[5596] - Fixing #1189
- Issue #1190[5597] - Chrono cleanup
- Issue #1189[5598] - Deadlock .. somewhere? (probably serialization)
- Issue #1188[5599] - Removed `future::get_status()`
- Issue #1186[5600] - Fixed FindOpenCL to find current AMD APP SDK
- Issue #1184[5601] - Tweaking future unwrapping
- Issue #1183[5602] - Extended `parallel::reduce`
- Issue #1182[5603] - `future::unwrap` hangs for `launch::deferred`
- Issue #1181[5604] - Adding `all_of`, `any_of`, and `none_of` and corresponding documentation
- Issue #1180[5605] - `hpx::cout` defect
- Issue #1179[5606] - `hpx::async` does not work for member function pointers when called on types with self-defined unary `operator*`
- Issue #1178[5607] - Implemented variadic `hpx::util::zip_iterator`
- Issue #1177[5608] - MPI parcelport defect
- Issue #1176[5609] - `HPX_DEFINE_COMPONENT_CONST_ACTION_TPL` does not have a 2-argument version
- Issue #1175[5610] - Create util::zip_iterator working with util::tuple<>
- Issue #1174[5611] - Error Building HPX on linux, root_certificate_authority.cpp
- Issue #1173[5612] - hpx::cout output lost
- Issue #1172[5613] - HPX build error with Clang 3.4.2
- Issue #1171[5614] - `CMAKE_INSTALL_PREFIX` ignored
- Issue #1170[5615] - Close hpx_benchmarks repository on Github
- Issue #1169[5616] - Buildbot emails have syntax error in url
- Issue #1167[5617] - Merge partial implementation of standards proposal N3960

- Issue #1166[5618] - Fixed several compiler warnings
- Issue #1165[5619] - cmake warns: "tests.regressions.actions" does not exist
- Issue #1164[5620] - Want my own serialization of hpx::future
- Issue #1162[5621] - Segfault in hello_world example
- Issue #1161[5622] - Use `HPX_ASSERT` to aid the compiler
- Issue #1160[5623] - Do not put -DNDEBUG into hpx_application.pc
- Issue #1159[5624] - Support Clang 3.4.2
- Issue #1158[5625] - Fixed #1157: Rename when_n/wait_n, add when_xxx_n/wait_xxx_n
- Issue #1157[5626] - Rename when_n/wait_n, add when_xxx_n/wait_xxx_n
- Issue #1156[5627] - Force inlining fails
- Issue #1155[5628] - changed header of printout to be compatible with python csv module
- Issue #1154[5629] - Fixing iostreams
- Issue #1153[5630] - Standard manipulators (like std::endl) do not work with hpx::ostream
- Issue #1152[5631] - Functions revamp
- Issue #1151[5632] - Suppressing cmake 3.0 policy warning for CMP0026
- Issue #1150[5633] - Client Serialization error
- Issue #1149[5634] - Segfault on Stampede
- Issue #1148[5635] - Refactoring mini-ghost
- Issue #1147[5636] - N3960 copy_if and copy_n implemented and tested
- Issue #1146[5637] - Stencil print
- Issue #1145[5638] - N3960 hpx::parallel::copy implemented and tested
- Issue #1144[5639] - OpenMP examples 1d_stencil do not build
- Issue #1143[5640] - 1d_stencil OpenMP examples do not build

- Issue #1142[5641] - Cannot build HPX with gcc 4.6 on OS X
- Issue #1140[5642] - Fix OpenMP lookup, enable usage of config tests in external CMake projects.
- Issue #1139[5643] - hpx/hpx/config/compiler_specific.hpp
- Issue #1138[5644] - clean up pkg-config files
- Issue #1137[5645] - Improvements to create binary packages
- Issue #1136[5646] - HPX_GCC_VERSION not defined on all compilers
- Issue #1135[5647] - Avoiding collision between winsock2.h and windows.h
- Issue #1134[5648] - Making sure, that hpx::finalize can be called from any locality
- Issue #1133[5649] - 1d stencil examples
- Issue #1131[5650] - Refactor unique_function implementation
- Issue #1130[5651] - Unique function
- Issue #1129[5652] - Some fixes to the Build system on OS X
- Issue #1128[5653] - Action future args
- Issue #1127[5654] - Executor causes segmentation fault
- Issue #1124[5655] - Adding new API functions: `register_id_with_basename`, `unregister_id_with_basename`, `find_ids_from_basename`; adding test
- Issue #1123[5656] - Reduce nesting of try-catch construct in `encode_parcels`?
- Issue #1122[5657] - Client base fixes
- Issue #1121[5658] - Update `hpxrun.py.in`
- Issue #1120[5659] - HTTS2 tests compile errors on v110 (VS2012)
- Issue #1119[5660] - Remove references to boost::atomic in accumulator example
- Issue #1118[5661] - Only build test thread_pool_executor_1114_test if `HPX_SCHEDULER` is set
- Issue #1117[5662] - local_queue_executor linker error on vc110
- Issue #1116[5663] - Disabled performance counter should give runtime errors, not invalid data

- Issue #1115[5664] - Compile error with Intel C++ 13.1
- Issue #1114[5665] - Default constructed executor is not usable
- Issue #1113[5666] - Fast compilation of logging causes ABI incompatibilities between different `NDEBUG` values
- Issue #1112[5667] - Using thread_pool_executors causes segfault
- Issue #1111[5668] - `hpx::threads::get_thread_data` always returns zero
- Issue #1110[5669] - Remove unnecessary null pointer checks
- Issue #1109[5670] - More tests adjustments
- Issue #1108[5671] - Clarify build rules for "libboost_atomic-mt.so"?
- Issue #1107[5672] - Remove unnecessary null pointer checks
- Issue #1106[5673] - network_storage benchmark improvements, adding legends to plots and tidying layout
- Issue #1105[5674] - Add more plot outputs and improve instructions doc
- Issue #1104[5675] - Complete quoting for parameters of some CMake commands
- Issue #1103[5676] - Work on test/scripts
- Issue #1102[5677] - Changed minimum requirement of window install to 2012
- Issue #1101[5678] - Changed minimum requirement of window install to 2012
- Issue #1100[5679] - Changed readme to no longer specify using MSVC 2010 compiler
- Issue #1099[5680] - Error returning futures from component actions
- Issue #1098[5681] - Improve storage test
- Issue #1097[5682] - data_actions quickstart example calls missing function decorate_action of data_get_action
- Issue #1096[5683] - MPI parcelport broken with new zero copy optimization

5686 https://github.com/STEllAR-GROUP/hpx/issues/1093

- Issue #1092[5687] - Rename unique_future<> back to future<>
- Issue #1091[5688] - Inconsistent error message
- Issue #1090[5689] - On windows 8.1 the examples crashed if using more than one os thread
- Issue #1089[5690] - Components should be allowed to have their own executor
- Issue #1088[5691] - Add possibility to select a network interface for the ibverbs parcelport
- Issue #1087[5692] - ibverbs and ipc parcelport uses zero copy optimization
- Issue #1083[5693] - Make shell examples copyable in docs
- Issue #1082[5694] - Implement proper termination detection during shutdown
- Issue #1081[5695] - Implement thread_specific_ptr for hpx::threads
- Issue #1072[5696] - make install not working properly
- Issue #1070[5697] - Complete quoting for parameters of some CMake commands
- Issue #1059[5698] - Fix more unused variable warnings
- Issue #1051[5699] - Implement when_each
- Issue #973[5700] - Would like option to report hwloc bindings
- Issue #970[5701] - Bad flags for Fortran compiler
- Issue #941[5702] - Create a proper user level context switching class for BG/Q
- Issue #935[5703] - Build error with gcc 4.6 and Boost 1.54.0 on hpx trunk and 0.9.6
- Issue #934[5704] - Want to build HPX without dynamic libraries
- Issue #927[5705] - Make hpx/lcos/reduce.hpp accept futures of id_type
- Issue #926[5706] - All unit tests that are run with more than one thread with CTest/hpx_run_test should configure hpx.os_threads
- Issue #925[5707] - regression_dataflow_791 needs to be brought in line with HPX standards
- Issue #899[5708] - Fix race conditions in regression tests
- Issue #879[5709] - Hung test leads to cascading test failure; make tests should support the MPI parcelport

HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.).

With the changes below, *HPX* is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, *HPX* insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using *HPX*:

- *HPX* is solidly rooted in a sophisticated theoretical execution model – ParalleX
- *HPX* exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of *HPX*.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today's mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

General changes

- A major API breaking change for this release was introduced by implementing `hpx::future` and `hpx::shared_future` fully in conformance with the C++11 Standard[5729]. While `hpx::shared_future` is new and will not create any compatibility problems, we revised the interface and implementation of the existing `hpx::future`. For more details please see the mailing list archive[5730]. To avoid any incompatibilities for existing code we named the type which implements the `std::future` interface as `hpx::unique_future`. For the next release this will be renamed to `hpx::future`, making it full conforming to C++11 Standard[5731].
- A large part of the code base of *HPX* has been refactored and partially re-implemented. The main changes were related to
  - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
  - The parcel subsystem: these changes improve the performance of the *HPX* networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
  - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
  - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.

[5729] http://www.open-std.org/jtc1/sc22/wg21
[5730] http://mail.cct.lsu.edu/pipermail/hpx-users/2014-January/000141.html
[5731] http://www.open-std.org/jtc1/sc22/wg21

- We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.
- We removed the use of C++11 move emulation (using Boost.Move), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.
- We improved the reference counting scheme used by *HPX* which helps managing distributed objects and memory. This improves the overall stability of *HPX* and further simplifies writing real world applications.
- The minimal Boost version required to use *HPX* is now V1.49.0.
- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the XPI specification[5732].

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1086[5733] - Expose internal boost::shared_array to allow user management of array lifetime
- Issue #1083[5734] - Make shell examples copyable in docs
- Issue #1080[5735] - /threads{locality#*/total}/count/cumulative broken
- Issue #1079[5736] - Build problems on OS X
- Issue #1078[5737] - Improve robustness of component loading
- Issue #1077[5738] - Fix a missing enum definition for 'take' mode
- Issue #1076[5739] - Merge Jb master
- Issue #1075[5740] - Unknown CMake command "add_hpx_pseudo_target"
- Issue #1074[5741] - Implement `apply_continue_callback` and `apply_colocated_callback`
- Issue #1073[5742] - The new `apply_colocated` and `async_colocated` functions lead to automatic registered functions
- Issue #1071[5743] - Remove deferred_packaged_task
- Issue #1069[5744] - serialize_buffer with allocator fails at destruction
- Issue #1068[5745] - Coroutine include and forward declarations missing
- Issue #1067[5746] - Add allocator support to util::serialize_buffer

- Issue #1066[5747] - Allow for MPI_Init being called before HPX launches
- Issue #1065[5748] - AGAS cache isn't used/populated on worker localities
- Issue #1064[5749] - Reorder includes to ensure ws2 includes early
- Issue #1063[5750] - Add `hpx::runtime::suspend` and `hpx::runtime::resume`
- Issue #1062[5751] - Fix `async_continue` to properly handle return types
- Issue #1061[5752] - Implement `async_colocated` and `apply_colocated`
- Issue #1060[5753] - Implement minimal component migration
- Issue #1058[5754] - Remove `HPX_UTIL_TUPLE` from code base
- Issue #1057[5755] - Add performance counters for threading subsystem
- Issue #1055[5756] - Thread allocation uses two memory pools
- Issue #1053[5757] - Work stealing flawed
- Issue #1052[5758] - Fix a number of warnings
- Issue #1049[5759] - Fixes for TLS on OSX and more reliable test running
- Issue #1048[5760] - Fixing after 588 hang
- Issue #1047[5761] - Use port '0' for networking when using one locality
- Issue #1046[5762] - `composable_guard` test is broken when having more than one thread
- Issue #1045[5763] - Security missing headers
- Issue #1044[5764] - Native TLS on FreeBSD via __thread
- Issue #1043[5765] - `async` et.al. compute the wrong result type
- Issue #1042[5766] - `async` et.al. implicitly unwrap reference_wrappers
- Issue #1041[5767] - Remove redundant costly Kleene stars from regex searches
- Issue #1040[5768] - CMake script regex match patterns has unnecessary kleenes
- Issue #1039[5769] - Remove use of Boost.Move and replace with std::move and real rvalue refs

- Issue #1038[5770] - Bump minimal required Boost to 1.49.0
- Issue #1037[5771] - Implicit unwrapping of futures in async broken
- Issue #1036[5772] - Scheduler hangs when user code attempts to "block" OS-threads
- Issue #1035[5773] - Idle-rate counter always reports 100% idle rate
- Issue #1034[5774] - Symbolic name registration causes application hangs
- Issue #1033[5775] - Application options read in from an options file generate an error message
- Issue #1032[5776] - `hpx::id_type` local reference counting is wrong
- Issue #1031[5777] - Negative entry in reference count table
- Issue #1030[5778] - Implement condition_variable
- Issue #1029[5779] - Deadlock in thread scheduling subsystem
- Issue #1028[5780] - HPX-thread cumulative count performance counters report incorrect value
- Issue #1027[5781] - Expose `hpx::thread_interrupted` error code as a separate exception type
- Issue #1026[5782] - Exceptions thrown in asynchronous calls can be lost if the value of the future is never queried
- Issue #1025[5783] - `future::wait_for/wait_until` do not remove callback
- Issue #1024[5784] - Remove dependence to boost assert and create hpx assert
- Issue #1023[5785] - Segfaults with tcmalloc
- Issue #1022[5786] - prerequisites link in readme is broken
- Issue #1020[5787] - HPX Deadlock on external synchronization
- Issue #1019[5788] - Convert using `BOOST_ASSERT` to `HPX_ASSERT`
- Issue #1018[5789] - compiling bug with gcc 4.8.1
- Issue #1017[5790] - Possible crash in io_pool executor
- Issue #1016[5791] - Crash at startup
- Issue #1014[5792] - Implement Increment/Decrement Merging

- Issue #1003[5800] - Performance counter naming issue
- Issue #982[5801] - Race condition during startup
- Issue #912[5802] - OS X: component type not found in map
- Issue #663[5803] - Create a buildbot slave based on Clang 3.2/OSX
- Issue #636[5804] - Expose `this_locality::apply<act>(p1, p2);` for local execution
- Issue #197[5805] - Add `--console=address` option for PBS runs
- Issue #175[5806] - Asynchronous AGAS API

HPX V0.9.7 (Nov 13, 2013)

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

General changes

- Ported HPX to BlueGene/Q
- Improved HPX support for Xeon/Phi accelerators
- Reimplemented `hpx::bind`, `hpx::tuple`, and `hpx::function` for better performance and better compliance with the C++11 Standard. Added `hpx::mem_fn`.
- Reworked `hpx::when_all` and `hpx::when_any` for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added `hpx::when_any_swapped`.
- Added `hpx::copy` as a precursor for a migrate functionality
- Added `hpx::get_ptr` allowing to directly access the memory underlying a given component
- Added the `hpx::lcos::broadcast`, `hpx::lcos::reduce`, and `hpx::lcos::fold` collective operations

[5805] https://github.com/STEllAR-GROUP/hpx/issues/197
[5806] https://github.com/STEllAR-GROUP/hpx/issues/175

- Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
- Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind` (`balanced`, `scattered`, `compact`), improved default settings when running multiple localities on the same node.
- Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
- Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
- General performance improvements of the code related to threads and futures.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1005[5807] - Allow one to disable array optimizations and zero copy optimizations for each parcelport
- Issue #1004[5808] - Generate new HPX logo image for the docs
- Issue #1002[5809] - If MPI parcelport is not available, running HPX under mpirun should fail
- Issue #1001[5810] - Zero copy serialization raises assert
- Issue #1000[5811] - Can't connect to a HPX application running with the MPI parcelport from a non MPI parcelport locality
- Issue #999[5812] - Optimize `hpx::when_n`
- Issue #998[5813] - Fixed const-correctness
- Issue #997[5814] - Making serialize_buffer::data() type save
- Issue #996[5815] - Memory leak in hpx::lcos::promise
- Issue #995[5816] - Race while registering pre-shutdown functions
- Issue #994[5817] - thread_rescheduling regression test does not compile
- Issue #992[5818] - Correct comments and messages
- Issue #991[5819] - setcap cap_sys_rawio=ep for power profiling causes an HPX application to abort
- Issue #989[5820] - Jacobi hangs during execution
- Issue #988[5821] - multiple_init test is failing

5844 https://github.com/STEllAR-GROUP/hpx/issues/957

- Issue #956[5845] - Segfault with a3382fb
- Issue #955[5846] - `--hpx:nodes` and `--hpx:nodefiles` do not work with foreign nodes
- Issue #954[5847] - Make order of arguments for hpx::async and hpx::broadcast consistent
- Issue #953[5848] - Cannot use MKL with HPX
- Issue #952[5849] - `register_[pre_]shutdown_function` never throw
- Issue #951[5850] - Assert when number of threads is greater than hardware concurrency
- Issue #948[5851] - `HPX_HAVE_GENERIC_CONTEXT_COROUTINES` conflicts with `HPX_HAVE_FIBER_BASED_COROUTINES`
- Issue #947[5852] - Need MPI_THREAD_MULTIPLE for backward compatibility
- Issue #946[5853] - HPX does not call `MPI_Finalize`
- Issue #945[5854] - Segfault with `hpx::lcos::broadcast`
- Issue #944[5855] - OS X: assertion `pu_offset_ < hardware_concurrency` failed
- Issue #943[5856] - #include <hpx/hpx_main.hpp> does not work
- Issue #942[5857] - Make the BG/Q work with -O3
- Issue #940[5858] - Use separator when concatenating locality name
- Issue #939[5859] - Refactor MPI parcelport to use `MPI_Wait` instead of multiple `MPI_Test` calls
- Issue #938[5860] - Want to officially access `client_base::gid_`
- Issue #937[5861] - `client_base::gid_` should be private``
- Issue #936[5862] - Want doxygen-like source code index
- Issue #935[5863] - Build error with gcc 4.6 and Boost 1.54.0 on hpx trunk and 0.9.6
- Issue #933[5864] - Cannot build HPX with Boost 1.54.0
- Issue #932[5865] - Components are destructed too early
- Issue #931[5866] - Make HPX work on BG/Q
- Issue #930[5867] - make git-docs is broken

- Issue #929[5868] - Generating index in docs broken
- Issue #928[5869] - Optimize `hpx::util::static_` for C++11 compilers supporting magic statics
- Issue #924[5870] - Make kill_process_tree (in process.py) more robust on Mac OSX
- Issue #923[5871] - Correct BLAS and RNPL cmake tests
- Issue #922[5872] - Cannot link against BLAS
- Issue #921[5873] - Implement `hpx::mem_fn`
- Issue #920[5874] - Output locality with `--hpx:print-bind`
- Issue #919[5875] - Correct grammar; simplify boolean expressions
- Issue #918[5876] - Link to hello_world.cpp is broken
- Issue #917[5877] - adapt cmake file to new boostbook version
- Issue #916[5878] - fix problem building documentation with xsltproc >= 1.1.27
- Issue #915[5879] - Add another TBBMalloc library search path
- Issue #914[5880] - Build problem with Intel compiler on Stampede (TACC)
- Issue #913[5881] - fix error messages in fibonacci examples
- Issue #911[5882] - Update OS X build instructions
- Issue #910[5883] - Want like to specify MPI_ROOT instead of compiler wrapper script
- Issue #909[5884] - Warning about void* arithmetic
- Issue #908[5885] - Buildbot for MIC is broken
- Issue #906[5886] - Can't use `--hpx:bind=balanced` with multiple MPI processes
- Issue #905[5887] - `--hpx:bind` documentation should describe full grammar
- Issue #904[5888] - Add hpx::lcos::fold and hpx::lcos::inverse_fold collective operation
- Issue #903[5889] - Add `hpx::when_any_swapped()`
- Issue #902[5890] - Add `hpx::lcos::reduce` collective operation

- Issue #901[5891] - Web documentation is not searchable
- Issue #900[5892] - Web documentation for trunk has no index
- Issue #898[5893] - Some tests fail with GCC 4.8.1 and MPI parcel port
- Issue #897[5894] - HWLOC causes failures on Mac
- Issue #896[5895] - pu-offset leads to startup error
- Issue #895[5896] - `hpx::get_locality_name` not defined
- Issue #894[5897] - Race condition at shutdown
- Issue #893[5898] - `--hpx:print-bind` switches std::cout to hexadecimal mode
- Issue #892[5899] - `hwloc_topology_load` can be expensive – don't call multiple times
- Issue #891[5900] - The documentation for `get_locality_name` is wrong
- Issue #890[5901] - `--hpx:print-bind` should not exit
- Issue #889[5902] - `--hpx:debug-hpx-log=FILE` does not work
- Issue #888[5903] - MPI parcelport does not exit cleanly for –hpx:print-bind
- Issue #887[5904] - Choose thread affinities more cleverly
- Issue #886[5905] - Logging documentation is confusing
- Issue #885[5906] - Two threads are slower than one
- Issue #884[5907] - is_callable failing with member pointers in C++11
- Issue #883[5908] - Need help with is_callable_test
- Issue #882[5909] - tests.regressions.lcos.future_hang_on_get does not terminate
- Issue #881[5910] - tests/regressions/block_matrix/matrix.hh won't compile with GCC 4.8.1
- Issue #880[5911] - HPX does not work on OS X
- Issue #878[5912] - `future::unwrap` triggers assertion
- Issue #877[5913] - "make tests" has build errors on Ubuntu 12.10

- Issue #845[5937] - Issues with having both debug and release modules in the same directory
- Issue #844[5938] - Create configuration header
- Issue #843[5939] - Tests should use CTest
- Issue #842[5940] - Remove buffer_pool from MPI parcelport
- Issue #841[5941] - Add possibility to broadcast an index with hpx::lcos::broadcast
- Issue #838[5942] - Simplify `util::tuple`
- Issue #837[5943] - Adopt boost::tuple tests for `util::tuple`
- Issue #836[5944] - Adopt boost::function tests for `util::function`
- Issue #835[5945] - Tuple interface missing pieces
- Issue #833[5946] - Partially preprocessing files not working
- Issue #832[5947] - Native papi counters do not work with wild cards
- Issue #831[5948] - Arithmetics counter fails if only one parameter is given
- Issue #830[5949] - Convert hpx::util::function to use new scheme for serializing its base pointer
- Issue #829[5950] - Consistently use `decay<T>` instead of `remove_const< remove_reference<T>>`
- Issue #828[5951] - Update future implementation to N3721 and N3722
- Issue #827[5952] - Enable MPI parcelport for bootstrapping whenever application was started using mpirun
- Issue #826[5953] - Support command line option `--hpx:print-bind` even if `--hpx::bind` was not used
- Issue #825[5954] - Memory counters give segfault when attempting to use thread wild cards or numbers only total works
- Issue #824[5955] - Enable lambda functions to be used with hpx::async/hpx::apply
- Issue #823[5956] - Using a hashing filter
- Issue #822[5957] - Silence unused variable warning
- Issue #821[5958] - Detect if a function object is callable with given arguments
- Issue #820[5959] - Allow wildcards to be used for performance counter names

- Issue #819[5960] - Make the AGAS symbolic name registry distributed
- Issue #818[5961] - Add future::then() overload taking an executor
- Issue #817[5962] - Fixed typo
- Issue #815[5963] - Create an lco that is performing an efficient broadcast of actions
- Issue #814[5964] - Papi counters cannot specify thread#* to get the counts for all threads
- Issue #813[5965] - Scoped unlock
- Issue #811[5966] - simple_central_tuplespace_client run error
- Issue #810[5967] - ostream error when << any objects
- Issue #809[5968] - Optimize parcel serialization
- Issue #808[5969] - HPX applications throw exception when executed from the build directory
- Issue #807[5970] - Create performance counters exposing overall AGAS statistics
- Issue #795[5971] - Create timed make_ready_future
- Issue #794[5972] - Create heterogeneous `when_all`/`when_any`/etc.
- Issue #721[5973] - Make HPX usable for Xeon Phi
- Issue #694[5974] - CMake should complain if you attempt to build an example without its dependencies
- Issue #692[5975] - SLURM support broken
- Issue #683[5976] - python/hpx/process.py imports epoll on all platforms
- Issue #619[5977] - Automate the doc building process
- Issue #600[5978] - GTC performance broken
- Issue #577[5979] - Allow for zero copy serialization/networking
- Issue #551[5980] - Change executable names to have debug postfix in Debug builds
- Issue #544[5981] - Write a custom .lib file on Windows pulling in hpx_init and hpx.dll, phase out hpx_init
- Issue #534[5982] - `hpx::init` should take functions by `std::function` and should accept all forms of hpx_main

- Issue #508[5983] - FindPackage fails to set FOO_LIBRARY_DIR
- Issue #506[5984] - Add cmake support to generate ini files for external applications
- Issue #470[5985] - Changing build-type after configure does not update boost library names
- Issue #453[5986] - Document `hpx_run_tests.py`
- Issue #445[5987] - Significant performance mismatch between MPI and HPX in SMP for allgather example
- Issue #443[5988] - Make docs viewable from build directory
- Issue #421[5989] - Support multiple HPX instances per node in a batch environment like PBS or SLURM
- Issue #316[5990] - Add message size limitation
- Issue #249[5991] - Clean up locking code in big boot barrier
- Issue #136[5992] - Persistent CMake variables need to be marked as cache variables

HPX V0.9.6 (Jul 30, 2013)

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

General changes

The major new features in this release are:

- We further consolidated the API exposed by *HPX*. We aligned our APIs as much as possible with the existing C++11 Standard[5993] and related proposals to the C++ standardization committee (such as N3632[5994] and N3857[5995]).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported *HPX* to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.
- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).

[5995] http://wg21.link/n3857

- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal N3562[5996]. This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance The Linda Coordination Language[5997]).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- Issue #806[5998] - make (all) in examples folder does nothing
- Issue #805[5999] - Adding the introduction and fixing DOCBOOK dependencies for Windows use
- Issue #804[6000] - Add stackless (non-suspendable) thread type
- Issue #803[6001] - Create proper serialization support functions for util::tuple
- Issue #800[6002] - Add possibility to disable array optimizations during serialization
- Issue #798[6003] - HPX_LIMIT does not work for local dataflow
- Issue #797[6004] - Create a parcelport which uses MPI
- Issue #796[6005] - Problem with Large Numbers of Threads
- Issue #793[6006] - Changing dataflow test case to hang consistently
- Issue #792[6007] - CMake Error
- Issue #791[6008] - Problems with local::dataflow
- Issue #790[6009] - wait_for() doesn't compile
- Issue #789[6010] - HPX with Intel compiler segfaults
- Issue #788[6011] - Intel compiler support

- Issue #787[6012] - Fixed SFINAEd specializations
- Issue #786[6013] - Memory issues during benchmarking.
- Issue #785[6014] - Create an API allowing to register external threads with HPX
- Issue #784[6015] - util::plugin is throwing an error when a symbol is not found
- Issue #783[6016] - How does hpx:bind work?
- Issue #782[6017] - Added quotes around STRING REPLACE potentially empty arguments
- Issue #781[6018] - Make sure no exceptions propagate into the thread manager
- Issue #780[6019] - Allow arithmetics performance counters to expand its parameters
- Issue #779[6020] - Test case for 778
- Issue #778[6021] - Swapping futures segfaults
- Issue #777[6022] - hpx::lcos::details::when_xxx don't restore completion handlers
- Issue #776[6023] - Compiler chokes on dataflow overload with launch policy
- Issue #775[6024] - Runtime error with local dataflow (copying futures?)
- Issue #774[6025] - Using local dataflow without explicit namespace
- Issue #773[6026] - Local dataflow with unwrap: functor operators need to be const
- Issue #772[6027] - Allow (remote) actions to return a future
- Issue #771[6028] - Setting HPX_LIMIT gives huge boost MPL errors
- Issue #770[6029] - Add launch policy to (local) dataflow
- Issue #769[6030] - Make compile time configuration information available
- Issue #768[6031] - Const correctness problem in local dataflow
- Issue #767[6032] - Add launch policies to async
- Issue #766[6033] - Mark data structures for optimized (array based) serialization
- Issue #765[6034] - Align hpx::any with N3508: Any Library Proposal (Revision 2)

- Issue #764[6035] - Align hpx::future with newest N3558: A Standardized Representation of Asynchronous Operations
- Issue #762[6036] - added a human readable output for the ping pong example
- Issue #761[6037] - Ambiguous typename when constructing derived component
- Issue #760[6038] - Simple components can not be derived
- Issue #759[6039] - make install doesn't give a complete install
- Issue #758[6040] - Stack overflow when using locking_hook<>
- Issue #757[6041] - copy paste error; unsupported function overloading
- Issue #756[6042] - GTCX runtime issue in Gordon
- Issue #755[6043] - Papi counters don't work with reset and evaluate API's
- Issue #753[6044] - cmake bugfix and improved component action docs
- Issue #752[6045] - hpx simple component docs
- Issue #750[6046] - Add hpx::util::any
- Issue #749[6047] - Thread phase counter is not reset
- Issue #748[6048] - Memory performance counter are not registered
- Issue #747[6049] - Create performance counters exposing arithmetic operations
- Issue #745[6050] - apply_callback needs to invoke callback when applied locally
- Issue #744[6051] - CMake fixes
- Issue #743[6052] - Problem Building github version of HPX
- Issue #742[6053] - Remove HPX_STD_BIND
- Issue #741[6054] - assertion 'px != 0' failed: HPX(assertion_failure) for low numbers of OS threads
- Issue #739[6055] - Performance counters do not count to the end of the program or evaluation
- Issue #738[6056] - Dedicated AGAS server runs don't work; console ignores -a option.
- Issue #737[6057] - Missing bind overloads

- Issue #736[6058] - Performance counter wildcards do not always work
- Issue #735[6059] - Create native ibverbs parcelport based on rdma operations
- Issue #734[6060] - Threads stolen performance counter total is incorrect
- Issue #733[6061] - Test benchmarks need to be checked and fixed
- Issue #732[6062] - Build fails with Mac, using mac ports clang-3.3 on latest git branch
- Issue #731[6063] - Add global start/stop API for performance counters
- Issue #730[6064] - Performance counter values are apparently incorrect
- Issue #729[6065] - Unhandled switch
- Issue #728[6066] - Serialization of hpx::util::function between two localities causes seg faults
- Issue #727[6067] - Memory counters on Mac OS X
- Issue #725[6068] - Restore original thread priority on resume
- Issue #724[6069] - Performance benchmarks do not depend on main HPX libraries
- Issue #723[6070] - [teletype]–hpx:nodes=``cat $PBS_NODEFILE`` works; –hpx:nodefile=$PBS_NODEFILE does not.[c++]
- Issue #722[6071] - Fix binding const member functions as actions
- Issue #719[6072] - Create performance counter exposing compression ratio
- Issue #718[6073] - Add possibility to compress parcel data
- Issue #717[6074] - strip_credit_from_gid has misleading semantics
- Issue #716[6075] - Non-option arguments to programs run using `pbsdsh` must be before `--hpx:nodes`, contrary to directions
- Issue #715[6076] - Re-thrown exceptions should retain the original call site
- Issue #714[6077] - failed assertion in debug mode
- Issue #713[6078] - Add performance counters monitoring connection caches
- Issue #712[6079] - Adjust parcel related performance counters to be connection type specific

- Issue #601[6126] - Intel support
- Issue #557[6127] - Remove action codes
- Issue #531[6128] - AGAS request and response classes should use switch statements
- Issue #529[6129] - Investigate the state of hwloc support
- Issue #526[6130] - Make HPX aware of hyper-threading
- Issue #518[6131] - Create facilities allowing to use plain arrays as action arguments
- Issue #473[6132] - hwloc thread binding is broken on CPUs with hyperthreading
- Issue #383[6133] - Change result type detection for hpx::util::bind to use result_of protocol
- Issue #341[6134] - Consolidate route code
- Issue #219[6135] - Only copy arguments into actions once
- Issue #177[6136] - Implement distributed AGAS
- Issue #43[6137] - Support for Darwin (Xcode + Clang)

HPX V0.9.5 (Jan 16, 2013)

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

General changes

This release is continuing along the lines of code and API consolidation, and overall usability inprovements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported *HPX* to the Android platform. *HPX* applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported *HPX* to Mac OSX (using the Clang compiler). Thanks to Pyry Jahkola for contributing the corresponding patches. Please see the section macos_installation for more details.

We made a special effort to make HPX usable in highly concurrent use cases. Many of the HPX API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. HPX actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like `hpx::bind`.

[6126] https://github.com/STEllAR-GROUP/hpx/issues/601
[6127] https://github.com/STEllAR-GROUP/hpx/issues/557
[6128] https://github.com/STEllAR-GROUP/hpx/issues/531
[6129] https://github.com/STEllAR-GROUP/hpx/issues/529
[6130] https://github.com/STEllAR-GROUP/hpx/issues/526
[6131] https://github.com/STEllAR-GROUP/hpx/issues/518
[6132] https://github.com/STEllAR-GROUP/hpx/issues/473
[6133] https://github.com/STEllAR-GROUP/hpx/issues/383
[6134] https://github.com/STEllAR-GROUP/hpx/issues/341
[6135] https://github.com/STEllAR-GROUP/hpx/issues/219
[6136] https://github.com/STEllAR-GROUP/hpx/issues/177
[6137] https://github.com/STEllAR-GROUP/hpx/issues/43

All of the API has been aligned as much as possible with established paradigms. HPX now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of HPX we perform after the move to Github[6138] This step has enabled a wider participation from the community and further encourages us in our decision to release HPX as a true open source library (HPX is licensed under the very liberal Boost Software License[6139]).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX' releases so far.

- Issue #666[6140] - Segfault on calling hpx::finalize twice
- Issue #665[6141] - Adding declaration num_of_cores
- Issue #662[6142] - pkgconfig is building wrong
- Issue #660[6143] - Need uninterrupt function
- Issue #659[6144] - Move our logging library into a different namespace
- Issue #658[6145] - Dynamic performance counter types are broken
- Issue #657[6146] - HPX v0.9.5 (RC1) hello_world example segfaulting
- Issue #656[6147] - Define the affinity of parcel-pool, io-pool, and timer-pool threads
- Issue #654[6148] - Integrate the Boost auto_index tool with documentation
- Issue #653[6149] - Make HPX build on OS X + Clang + libc++
- Issue #651[6150] - Add fine-grained control for thread pinning
- Issue #650[6151] - Command line no error message when using -hpx:(anything)
- Issue #645[6152] - Command line aliases don't work in [teletype]``@file``[c++]
- Issue #644[6153] - Terminated threads are not always properly cleaned up
- Issue #640[6154] - `future_data<T>::set_on_completed_` used without locks
- Issue #638[6155] - hpx build with intel compilers fails on linux

6155 https://github.com/STEllAR-GROUP/hpx/issues/638

- Issue #637[6156] - –copy-dt-needed-entries breaks with gold
- Issue #635[6157] - Boost V1.53 will add Boost.Lockfree and Boost.Atomic
- Issue #633[6158] - Re-add examples to final 0.9.5 release
- Issue #632[6159] - Example `thread_aware_timer` is broken
- Issue #631[6160] - FFT application throws error in parcellayer
- Issue #630[6161] - Event synchronization example is broken
- Issue #629[6162] - Waiting on futures hangs
- Issue #628[6163] - Add an `HPX_ALWAYS_ASSERT` macro
- Issue #625[6164] - Port coroutines context switch benchmark
- Issue #621[6165] - New INI section for stack sizes
- Issue #618[6166] - pkg_config support does not work with a HPX debug build
- Issue #617[6167] - hpx/external/logging/boost/logging/detail/cache_before_init.hpp:139:67: error: 'get_thread_id' was not declared in this scope
- Issue #616[6168] - Change wait_xxx not to use locking
- Issue #615[6169] - Revert visibility 'fix' (fb0b6b8245dad1127b0c25ebafd9386b3945cca9)
- Issue #614[6170] - Fix Dataflow linker error
- Issue #613[6171] - find_here should throw an exception on failure
- Issue #612[6172] - Thread phase doesn't show up in debug mode
- Issue #611[6173] - Make stack guard pages configurable at runtime (initialization time)
- Issue #610[6174] - Co-Locate Components
- Issue #609[6175] - future_overhead
- Issue #608[6176] - `--hpx:list-counter-infos` problem
- Issue #607[6177] - Update Boost.Context based backend for coroutines
- Issue #606[6178] - 1d_wave_equation is not working

- Issue #605[6179] - Any C++ function that has serializable arguments and a serializable return type should be remotable
- Issue #604[6180] - Connecting localities isn't working anymore
- Issue #603[6181] - Do not verify any ini entries read from a file
- Issue #602[6182] - Rename argument_size to type_size/ added implementation to get parcel size
- Issue #599[6183] - Enable locality specific command line options
- Issue #598[6184] - Need an API that accesses the performance counter reporting the system uptime
- Issue #597[6185] - compiling on ranger
- Issue #595[6186] - I need a place to store data in a thread self pointer
- Issue #594[6187] - 32/64 interoperability
- Issue #593[6188] - Warn if logging is disabled at compile time but requested at runtime
- Issue #592[6189] - Add optional argument value to `--hpx:list-counters` and `--hpx:list-counter-infos`
- Issue #591[6190] - Allow for wildcards in performance counter names specified with `--hpx:print-counter`
- Issue #590[6191] - Local promise semantic differences
- Issue #589[6192] - Create API to query performance counter names
- Issue #587[6193] - Add get_num_localities and get_num_threads to AGAS API
- Issue #586[6194] - Adjust local AGAS cache size based on number of localities
- Issue #585[6195] - Error while using counters in HPX
- Issue #584[6196] - counting argument size of actions, initial pass.
- Issue #581[6197] - Remove `RemoteResult` template parameter for `future`<>
- Issue #580[6198] - Add possibility to hook into actions
- Issue #578[6199] - Use angle brackets in HPX error dumps
- Issue #576[6200] - Exception incorrectly thrown when `--help` is used
- Issue #575[6201] - HPX(bad_component_type) with gcc 4.7.2 and boost 1.51

6201 https://github.com/STEllAR-GROUP/hpx/issues/575

- Issue #574[6202] - `--hpx:connect` command line parameter not working correctly
- Issue #571[6203] - `hpx::wait()` (callback version) should pass the future to the callback function
- Issue #570[6204] - `hpx::wait` should operate on `boost::arrays` and `std::lists`
- Issue #569[6205] - Add a logging sink for Android
- Issue #568[6206] - 2-argument version of `HPX_DEFINE_COMPONENT_ACTION`
- Issue #567[6207] - Connecting to a running HPX application works only once
- Issue #565[6208] - HPX doesn't shutdown properly
- Issue #564[6209] - Partial preprocessing of new component creation interface
- Issue #563[6210] - Add `hpx::start/hpx::stop` to avoid blocking main thread
- Issue #562[6211] - All command line arguments swallowed by hpx
- Issue #561[6212] - Boost.Tuple is not move aware
- Issue #558[6213] - `boost::shared_ptr`<> style semantics/syntax for client classes
- Issue #556[6214] - Creation of partially preprocessed headers should be enabled for Boost newer than V1.50
- Issue #555[6215] - `BOOST_FORCEINLINE` does not name a type
- Issue #554[6216] - Possible race condition in thread `get_id()`
- Issue #552[6217] - Move enable client_base
- Issue #550[6218] - Add stack size category 'huge'
- Issue #549[6219] - ShenEOS run seg-faults on single or distributed runs
- Issue #545[6220] - `AUTOGLOB` broken for add_hpx_component
- Issue #542[6221] - FindHPX_HDF5 still searches multiple times
- Issue #541[6222] - Quotes around application name in hpx::init
- Issue #539[6223] - Race conditition occurring with new lightweight threads
- Issue #535[6224] - hpx_run_tests.py exits with no error code when tests are missing

6224 https://github.com/STEllAR-GROUP/hpx/issues/535

- Issue #530[6225] - Thread description(<unknown>) in logs
- Issue #523[6226] - Make thread objects more lightweight
- Issue #521[6227] - `hpx::error_code` is not usable for lightweight error handling
- Issue #520[6228] - Add full user environment to HPX logs
- Issue #519[6229] - Build succeeds, running fails
- Issue #517[6230] - Add a guard page to linux coroutine stacks
- Issue #516[6231] - hpx::thread::detach suspends while holding locks, leads to hang in debug
- Issue #514[6232] - Preprocessed headers for <hpx/apply.hpp> don't compile
- Issue #513[6233] - Buildbot configuration problem
- Issue #512[6234] - Implement action based stack size customization
- Issue #511[6235] - Move action priority into a separate type trait
- Issue #510[6236] - trunk broken
- Issue #507[6237] - no matching function for call to `boost::scoped_ptr<hpx::threads::topology>::scoped_ptr(hpx::thre`
- Issue #505[6238] - undefined_symbol regression test currently failing
- Issue #502[6239] - Adding OpenCL and OCLM support to HPX for Windows and Linux
- Issue #501[6240] - find_package(HPX) sets cmake output variables
- Issue #500[6241] - wait_any/wait_all are badly named
- Issue #499[6242] - Add support for disabling pbs support in pbs runs
- Issue #498[6243] - Error during no-cache runs
- Issue #496[6244] - Add partial preprocessing support to cmake
- Issue #495[6245] - Support HPX modules exporting startup/shutdown functions only
- Issue #494[6246] - Allow modules to specify when to run startup/shutdown functions
- Issue #493[6247] - Avoid constructing a string in make_success_code

- Issue #492[6248] - Performance counter creation is no longer synchronized at startup
- Issue #491[6249] - Performance counter creation is no longer synchronized at startup
- Issue #490[6250] - Sheneos on_completed_bulk seg fault in distributed
- Issue #489[6251] - compiling issue with g++44
- Issue #488[6252] - Adding OpenCL and OCLM support to HPX for the MSVC platform
- Issue #487[6253] - FindHPX.cmake problems
- Issue #485[6254] - Change distributing_factory and binpacking_factory to use bulk creation
- Issue #484[6255] - Change `HPX_DONT_USE_PREPROCESSED_FILES` to `HPX_USE_PREPROCESSED_FILES`
- Issue #483[6256] - Memory counter for Windows
- Issue #479[6257] - strange errors appear when requesting performance counters on multiple nodes
- Issue #477[6258] - Create (global) timer for multi-threaded measurements
- Issue #472[6259] - Add partial preprocessing using Wave
- Issue #471[6260] - Segfault stack traces don't show up in release
- Issue #468[6261] - External projects need to link with internal components
- Issue #462[6262] - Startup/shutdown functions are called more than once
- Issue #458[6263] - Consolidate hpx::util::high_resolution_timer and `hpx::util::high_resolution_clock`
- Issue #457[6264] - index out of bounds in `allgather_and_gate` on 4 cores or more
- Issue #448[6265] - Make HPX compile with clang
- Issue #447[6266] - 'make tests' should execute tests on local installation
- Issue #446[6267] - Remove SVN-related code from the codebase
- Issue #444[6268] - race condition in smp
- Issue #441[6269] - Patched Boost.Serialization headers should only be installed if needed
- Issue #439[6270] - Components using `HPX_REGISTER_STARTUP_MODULE` fail to compile with MSVC

HPX V0.9.0 (Jul 5, 2012)

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

General changes

- Significant improvements made to the usability of *HPX* in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a packaged_task as defined by the C++11 Standard[6296].
- *HPX* now exposes `hpx::thread` which is compliant to the C++11 std::thread type except that it (purely locally) represents an *HPX* thread. This new type does not expose any of the remote capabilities of the underlying *HPX*-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 std::future<> type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will 'return' to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 `std::promise<>` and `std::packaged_task<>` types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- `hpx::thread` and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.
- *HPX* now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- *HPX* now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- *HPX* continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write is own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal *HPX* program now looks like this:

[6294] https://github.com/STEllAR-GROUP/hpx/issues/48
[6295] https://github.com/STEllAR-GROUP/hpx/issues/21
[6296] http://www.open-std.org/jtc1/sc22/wg21

```
#include <hpx/hpx_init.hpp>

int hpx_main()
{
    return hpx::finalize();
}

int main()
{
    return hpx::init();
}
```

This removes the immediate dependency on the Boost.Program_options[6297] library.

Note: This minimal version of an *HPX* program does not support any of the default command line arguments (such as –help, or command line options related to PBS). It is suggested to always pass `argc` and `argv` to *HPX* as shown in the example below.

- In order to support those, but still not to depend on Boost.Program_options[6298], the minimal program can be written as:

```
#include <hpx/hpx_init.hpp>

// The arguments for hpx_main can be left off, which very similar to the
// behavior of ``main()`` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: `hpx::components::binpacking_factory` which is equivalent to the existing `hpx::components::distributing_factory` component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to create, and one based on an arbitrary performance counter which will be queried for all relevant localities.
- Added API functions allowing to access elements of the diagnostic information embedded in the given exception: *`hpx::get_locality_id`*, `hpx::get_host_name`, `hpx::get_process_id`, `hpx::get_function_name`, `hpx::get_file_name`, `hpx::get_line_number`, `hpx::get_os_thread`, `hpx::get_thread_id`, and `hpx::get_thread_description`.

6298 https://www.boost.org/doc/html/program_options.html

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #71[6299] - GIDs that are not serialized via `handle_gid<>` should raise an exception
- Issue #105[6300] - Allow for `hpx::util::function`s to be registered in the AGAS symbolic namespace
- Issue #107[6301] - Nasty threadmanger race condition (reproducible in sheneos_test)
- Issue #108[6302] - Add millisecond resolution to *HPX* logs on Linux
- Issue #110[6303] - Shutdown hang in distributed with release build
- Issue #116[6304] - Don't use TSS for the applier and runtime pointers
- Issue #162[6305] - Move local synchronous execution shortcut from hpx::function to the applier
- Issue #172[6306] - Cache sources in CMake and check if they change manually
- Issue #178[6307] - Add an INI option to turn off ranged-based AGAS caching
- Issue #187[6308] - Support for disabling performance counter deployment
- Issue #202[6309] - Support for sending performance counter data to a specific file
- Issue #218[6310] - boost.coroutines allows different stack sizes, but stack pool is unaware of this
- Issue #231[6311] - Implement movable `boost::bind`
- Issue #232[6312] - Implement movable `boost::function`
- Issue #236[6313] - Allow binding `hpx::util::function` to actions
- Issue #239[6314] - Replace `hpx::function` with `hpx::util::function`
- Issue #240[6315] - Can't specify RemoteResult with lcos::async
- Issue #242[6316] - REGISTER_TEMPLATE support for plain actions
- Issue #243[6317] - `handle_gid<>` support for `hpx::util::function`
- Issue #245[6318] - `*_c_cache code` throws an exception if the queried GID is not in the local cache
- Issue #246[6319] - Undefined references in dataflow/adaptive1d example

6358 https://github.com/STEllAR-GROUP/hpx/issues/415
6359 https://github.com/STEllAR-GROUP/hpx/issues/425
6360 https://github.com/STEllAR-GROUP/hpx/issues/426

General changes

- *HPX* does not need to be installed anymore to be functional.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- Issue #295[6361] - Don't require install path to be known at compile time.
- Issue #371[6362] - Add hpx iostreams to standard build.
- Issue #384[6363] - Fix compilation with GCC 4.7.
- Issue #390[6364] - Remove keep_factory_alive startup call from ShenEOS; add shutdown call to H5close.
- Issue #393[6365] - Thread affinity control is broken.

Bug fixes (commits)

Here is a list of the important commits included in this point release:

- r7642 - External: Fix backtrace memory violation.
- **r7775 - Components: Fix symbol visibility bug with component startup** providers. This prevents one components providers from overriding another components.
- r7778 - Components: Fix startup/shutdown provider shadowing issues.

HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added 'local' futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.

[6361] https://github.com/STEllAR-GROUP/hpx/issues/295
[6362] https://github.com/STEllAR-GROUP/hpx/issues/371
[6363] https://github.com/STEllAR-GROUP/hpx/issues/384
[6364] https://github.com/STEllAR-GROUP/hpx/issues/390
[6365] https://github.com/STEllAR-GROUP/hpx/issues/393

- Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.
- Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.
- Added more automated tests to verify proper functioning of *HPX*.
- Started to create documentation for *HPX* and its API.
- Added documentation toolchain to the build system.
- Added dataflow LCO.
- Changed default *HPX* command line options to have `hpx:` prefix. For instance, the former option `--threads` is now `--hpx:threads`. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section *HPX Command Line Options* for a full list of available options.
- Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section *HPX Command Line Options* for a detailed description of command line option aliasing.
- Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.
- Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).
- Improved support for Windows builds with CMake.
- Added support for components to register their own command line options.
- Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an *HPX* thread.
- Added two new experimental thread schedulers: hierarchy_scheduler and periodic_priority_scheduler. These can be activated by using the command line options `--hpx:queuing=hierarchy` or `--hpx:queuing=periodic`.

Example applications

- Graph500 performance benchmark[6366] (thanks to Matthew Anderson for contributing this application).
- GTC (Gyrokinetic Toroidal Code)[6367]: a skeleton for particle in cell type codes.
- Random Memory Access: an example demonstrating random memory accesses in a large array
- ShenEOS example[6368], demonstrating partitioning of large read-only data structures and exposing an interpolation API.
- Sine performance counter demo.
- Accumulator examples demonstrating how to write and use *HPX* components.
- Quickstart examples (like hello_world, fibonacci, quicksort, factorial, etc.) demonstrating simple *HPX* concepts which introduce some of the concepts in *HPX*.
- Load balancing and work stealing demos.

[6366] http://www.graph500.org/
[6367] http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/
[6368] http://stellarcollapse.org/equationofstate

API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding *hpx::find_remote_localities*, and *hpx::get_num_localities*.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

```
/object{parentname#parentindex/instance#index}/counter#parameters
```

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.
- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #31[6369] - Specialize handle_gid<> for examples and tests
- Issue #72[6370] - Fix AGAS reference counting
- Issue #104[6371] - heartbeat throws an exception when decrefing the performance counter it's watching
- Issue #111[6372] - throttle causes an exception on the target application
- Issue #142[6373] - One failed component loading causes an unrelated component to fail
- Issue #165[6374] - Remote exception propagation bug in AGAS reference counting test
- Issue #186[6375] - Test credit exhaustion/splitting (e.g. prepare_gid and symbol NS)
- Issue #188[6376] - Implement remaining AGAS reference counting test cases
- Issue #258[6377] - No type checking of GIDs in stubs classes
- Issue #271[6378] - Seg fault/shared pointer assertion in distributed code

- Issue #281[6379] - CMake options need descriptive text
- Issue #283[6380] - AGAS caching broken (gva_cache needs to be rewritten with ICL)
- Issue #285[6381] - HPX_INSTALL root directory not the same as CMAKE_INSTALL_PREFIX
- Issue #286[6382] - New segfault in dataflow applications
- Issue #289[6383] - Exceptions should only be logged if not handled
- Issue #290[6384] - c++11 tests failure
- Issue #293[6385] - Build target for component libraries
- Issue #296[6386] - Compilation error with Boost V1.49rc1
- Issue #298[6387] - Illegal instructions on termination
- Issue #299[6388] - gravity aborts with multiple threads
- Issue #301[6389] - Build error with Boost trunk
- Issue #303[6390] - Logging assertion failure in distributed runs
- Issue #304[6391] - Exception 'what' strings are lost when exceptions from decode_parcel are reported
- Issue #306[6392] - Performance counter user interface issues
- Issue #307[6393] - Logging exception in distributed runs
- Issue #308[6394] - Logging deadlocks in distributed
- Issue #309[6395] - Reference counting test failures and exceptions
- Issue #311[6396] - Merge AGAS remote_interface with the runtime_support object
- Issue #314[6397] - Object tracking for id_types
- Issue #315[6398] - Remove handle_gid and handle credit splitting in id_type serialization
- Issue #320[6399] - applier::get_locality_id() should return an error value (or throw an exception)
- Issue #321[6400] - Optimization for id_types which are never split should be restored
- Issue #322[6401] - Command line processing ignored with Boost 1.47.0

[6400] https://github.com/STEllAR-GROUP/hpx/issues/321
[6401] https://github.com/STEllAR-GROUP/hpx/issues/322

- Issue #323[6402] - Credit exhaustion causes object to stay alive
- Issue #324[6403] - Duplicate exception messages
- Issue #326[6404] - Integrate Quickbook with CMake
- Issue #329[6405] - –help and –version should still work
- Issue #330[6406] - Create pkg-config files
- Issue #337[6407] - Improve usability of performance counter timestamps
- Issue #338[6408] - Non-std exceptions deriving from std::exceptions in tfunc may be sliced
- Issue #339[6409] - Decrease the number of send_pending_parcels threads
- Issue #343[6410] - Dynamically setting the stack size doesn't work
- Issue #351[6411] - 'make install' does not update documents
- Issue #353[6412] - Disable FIXMEs in the docs by default; add a doc developer CMake option to enable FIXMEs
- Issue #355[6413] - 'make' doesn't do anything after correct configuration
- Issue #356[6414] - Don't use `hpx::util::static_` in topology code
- Issue #359[6415] - Infinite recursion in hpx::tuple serialization
- Issue #361[6416] - Add compile time option to disable logging completely
- Issue #364[6417] - Installation seriously broken in r7443

HPX V0.7.0 (Dec 12, 2011)

We have had roughly 1000 commits since the last release and we have closed approximately 120 tickets (bugs, feature requests, etc.).

6416 https://github.com/STEllAR-GROUP/hpx/issues/361
6417 https://github.com/STEllAR-GROUP/hpx/issues/364

General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see 'API changes' below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal *HPX* parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running *HPX* applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os_thread_num, balancing/px_thread_phase, examples demonstrating load balancing and work stealing.

API changes

- Added `hpx::find_all_localities`.
- Added `hpx::terminate` for non-graceful termination of applications.
- Added `hpx::lcos::async` functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (`hpx::agas::*`).
- Renamed `hpx::components::wait` to `hpx::lcos::wait`.
- Renamed `hpx::lcos::future_value` to `hpx::lcos::promise`.
- Renamed `hpx::lcos::recursive_mutex` to `hpx::lcos::local_recursive_mutex`, `hpx::lcos::mutex` to `hpx::lcos::local_mutex`
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.

- Removed `hpx::process` (this will be replaced by a real process implementation in the future).
- Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
- Removed deprecated `hpx::naming::full_address`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #28[6418] - Integrate Windows/Linux CMake code for *HPX* core
- Issue #32[6419] - hpx::cout() should be hpx::cout
- Issue #33[6420] - AGAS V2 legacy client does not properly handle error_code
- Issue #60[6421] - AGAS: allow for registerid to optionally take ownership of the gid
- Issue #62[6422] - adaptive1d compilation failure in Fusion
- Issue #64[6423] - Parcel subsystem doesn't resolve domain names
- Issue #83[6424] - No error handling if no console is available
- Issue #84[6425] - No error handling if a hosted locality is treated as the bootstrap server
- Issue #90[6426] - Add general commandline option -N
- Issue #91[6427] - Add possibility to read command line arguments from file
- Issue #92[6428] - Always log exceptions/errors to the log file
- Issue #93[6429] - Log the command line/program name
- Issue #95[6430] - Support for distributed launches
- Issue #97[6431] - Attempt to create a bad component type in AMR examples
- Issue #100[6432] - factorial and factorial_get examples trigger AGAS component type assertions
- Issue #101[6433] - Segfault when hpx::process::here() is called in fibonacci2
- Issue #102[6434] - unknown_component_address in int_object_semaphore_client
- Issue #114[6435] - marduk raises assertion with default parameters

- Issue #115[6436] - Logging messages for SMP runs (on the console) shouldn't be buffered
- Issue #119[6437] - marduk linking strategy breaks other applications
- Issue #121[6438] - pbsdsh problem
- Issue #123[6439] - marduk, dataflow and adaptive1d fail to build
- Issue #124[6440] - Lower default preprocessing arity
- Issue #125[6441] - Move hpx::detail::diagnostic_information out of the detail namespace
- Issue #126[6442] - Test definitions for AGAS reference counting
- Issue #128[6443] - Add averaging performance counter
- Issue #129[6444] - Error with endian.hpp while building adaptive1d
- Issue #130[6445] - Bad initialization of performance counters
- Issue #131[6446] - Add global startup/shutdown functions to component modules
- Issue #132[6447] - Avoid using auto_ptr
- Issue #133[6448] - On Windows hpx.dll doesn't get installed
- Issue #134[6449] - HPX_LIBRARY does not reflect real library name (on Windows)
- Issue #135[6450] - Add detection of unique_ptr to build system
- Issue #137[6451] - Add command line option allowing to repeatedly evaluate performance counters
- Issue #139[6452] - Logging is broken
- Issue #140[6453] - CMake problem on windows
- Issue #141[6454] - Move all non-component libraries into $PREFIX/lib/hpx
- Issue #143[6455] - adaptive1d throws an exception with the default command line options
- Issue #146[6456] - Early exception handling is broken
- Issue #147[6457] - Sheneos doesn't link on Linux
- Issue #149[6458] - sheneos_test hangs

6458 https://github.com/STEllAR-GROUP/hpx/issues/149

- Issue #154[6459] - Compilation fails for r5661
- Issue #155[6460] - Sine performance counters example chokes on chrono headers
- Issue #156[6461] - Add build type to –version
- Issue #157[6462] - Extend AGAS caching to store gid ranges
- Issue #158[6463] - r5691 doesn't compile
- Issue #160[6464] - Re-add AGAS function for resolving a locality to its prefix
- Issue #168[6465] - Managed components should be able to access their own GID
- Issue #169[6466] - Rewrite AGAS future pool
- Issue #179[6467] - Complete switch to request class for AGAS server interface
- Issue #182[6468] - Sine performance counter is loaded by other examples
- Issue #185[6469] - Write tests for symbol namespace reference counting
- Issue #191[6470] - Assignment of read-only variable in point_geometry
- Issue #200[6471] - Seg faults when querying performance counters
- Issue #204[6472] - –ifnames and suffix stripping needs to be more generic
- Issue #205[6473] - –list-* and –print-counter-* options do not work together and produce no warning
- Issue #207[6474] - Implement decrement entry merging
- Issue #208[6475] - Replace the spinlocks in AGAS with hpx::lcos::local_mutexes
- Issue #210[6476] - Add an –ifprefix option
- Issue #214[6477] - Performance test for PX-thread creation
- Issue #216[6478] - VS2010 compilation
- Issue #222[6479] - r6045 context_linux_x86.hpp
- Issue #223[6480] - fibonacci hangs when changing the state of an active thread
- Issue #225[6481] - Active threads end up in the FEB wait queue

- Issue #229[6484] - Invalid initialization of reference in thread_init_data
- Issue #235[6485] - Invalid GID in iostreams
- Issue #238[6486] - Demangle type names for the default implementation of get_action_name
- Issue #241[6487] - C++11 support breaks GCC 4.5
- Issue #247[6488] - Reference to temporary with GCC 4.4
- Issue #248[6489] - Seg fault at shutdown with GCC 4.4
- Issue #253[6490] - Default component action registration kills compiler
- Issue #272[6491] - G++ unrecognized command line option
- Issue #273[6492] - quicksort example doesn't compile
- Issue #277[6493] - Invalid CMake logic for Windows

2.10.2 Namespace changes

HPX V1.9.0 Namespace changes

The latest release includes amongst others changes in the namespaces so that *HPX* facilities correspond to the C++ Standard Library. The old namespaces are deprecated. Below is a comprehensive list of the namespace changes.

Table 2.183: Namespace changes in V1.9.0

Old namespace	New namespace
`hpx::util::mem_fn`	*hpx::mem_fn*
`hpx::util::invoke`	*hpx::invoke*
`hpx::util::invoke_r`	*hpx::invoke_r*
`hpx::util::invoke_fused`	*hpx::invoke_fused*
`hpx::util::invoke_fused_r`	*hpx::invoke_fused_r*
`hpx::util::unlock_guard`	*hpx::unlock_guard*
`hpx::parallel::v1::reduce_by_key`	*hpx::experimental::reduce_by_key*
`hpx::parallel::v1::sort_by_key`	*hpx::experimental::sort_by_key*
`hpx::parallel::task_canceled_exception`	*hpx::experimental::task_canceled_exception*
`hpx::parallel::task_block`	*hpx::experimental::task_block*
`hpx::parallel::define_task_block`	*hpx::experimental::define_task_block* |
`hpx::parallel::define_task_block_restore_thread`	*hpx::experimental::define_task_block_restore_thread*
`hpx::execution::experimental::task_group`	*hpx::experimental::task_group*

A list of institutions and projects using *HPX* can be found on the *HPX* Users[6497] page.

2.13 About *HPX*

2.13.1 History

The development of High Performance ParalleX (*HPX*) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the Center for Computation and Technology (CCT)[6498], a multi-disciplinary research institute at Louisiana State University (LSU)[6499]. The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of *HPX*. In 2011 we decided to formalize our collective research efforts by creating the STE||AR[6500] group (**S**ystems **T**echnology, **E**mergent Para**ll**elism, and **A**lgorithm **R**esearch). Over time, the team grew to include researchers around the country and the world. In 2014, the STE||AR[6501] Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the *HPX* project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by *HPX* is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the Boost[6502] collection of C++ libraries. We steer the development of *HPX* with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about STE||AR[6503] and ParalleX, see *People* and *Why HPX?*.

2.13.2 People

The STE||AR[6504] Group (pronounced as stellar) stands for "**S**ystems **T**echnology, **E**mergent Para**ll**elism, and **A**lgorithm **R**esearch". We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the STE||AR[6505] Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. *HPX*, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use *HPX* for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

HPX is based on *ParalleX* which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- *Starvation*: due to lack of usable application parallelism and means of managing it,
- *Overhead*: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- *Latency*: from remote access across system or to local memories,
- *Contention*: due to multicore chip I/O pins, memory banks, and system interconnects.

The ParalleX model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on *HPX* is centered around implementing the concepts as defined by the ParalleX model. *HPX* is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of *HPX* (and ParalleX) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Panos Syskakis for benchmarking and optimizing our parallel algorithms.
- Shreyas Atre, for contributing fixes to our implementation of senders/receivers and extending our coroutines integration with senders/receivers.
- Alexander Neumann, for contributing fixes to the cmake build system.
- Dimitra Karatza, for her work on refactoring the documentation and providing a new user-friendly environment during and after Google Season of Docs 2021.

- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of hwloc in *HPX*.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell (Swiss National Supercomputing Centre[6535]), for her tireless work on refactoring our CMake setup and modularizing *HPX*.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing *HPX* builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the *HPX* runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.
- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an *HPX* backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg (Swiss National Supercomputing Centre[6536]), for his tireless help cleaning up and maintaining *HPX*.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylanx.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in *HPX* and the fixes he provided. Chris also contributed support for RISC-V architectures.
- Shoshana Jakobovits, for her work on the resource partitioner.
- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.

[6536] https://www.cscs.ch

- Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.
- Zach Byerly (Louisiana State University (LSU)[6537]), who in his work developing applications on top of *HPX* opened tickets and contributed to the *HPX* examples.
- Daniel Estermann, for his work porting *HPX* to the Raspberry Pi.
- Alireza Kheirkhahan (Louisiana State University (LSU)[6538]), who built and administered our local cluster as well as his work in distributed IO.
- Abhimanyu Rawat, who worked on stack overflow detection.
- David Pfander, who improved signal handling in *HPX*, provided his optimization expertise, and worked on incorporating the Vc vectorization into *HPX*.
- Denis Demidov, who contributed his insights with VexCL.
- Khalid Hasanov, who contributed changes which allowed to run *HPX* on 64Bit power-pc architectures.
- Zahra Khatami (Louisiana State University (LSU)[6539]), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.
- Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for *HPX.Compute*.
- Minh-Khanh Do, who contributed the implementation of several segmented algorithms.
- Bibek Wagle (Louisiana State University (LSU)[6540]), who worked on fixing and analyzing the performance of the *parcel* coalescing plugin in *HPX*.
- Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.
- Andreas Schaefer, who worked on integrating his library (LibGeoDecomp[6541]) with *HPX*. He reported various problems and submitted several patches to fix issues allowing for a better integration with LibGeoDecomp[6542].
- Satyaki Upadhyay, who contributed several examples to *HPX*.
- Brandon Cordes, who contributed several improvements to the inspect tool.
- Harris Brakmic, who contributed an extensive build system description for building *HPX* with Visual Studio.
- Parsa Amini (Louisiana State University (LSU)[6543]), who refactored and simplified the implementation of *AGAS* in *HPX* and who works on its implementation and optimization.
- Luis Martinez de Bartolome who implemented a build system extension for *HPX* integrating it with the Conan[6544] C/C++ package manager.
- Vinay C Amatya (Louisiana State University (LSU)[6545]), who contributed to the documentation and provided some of the *HPX* examples.
- Kevin Huck and Nick Chaimov (University of Oregon[6546]), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with *HPX*.
- Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for *HPX*.

- Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs (HPXCL[6547]).
- Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.
- Nidhi Makhijani who helped cleaning up some enum consistencies in *HPX* and contributed to the resource manager used in the thread scheduling subsystem. She also worked on *HPX* in the context of the Google Summer of Code 2015.
- Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on *HPX* in the context of the Google Summer of Code program 2015.
- Daniel Bourgeois (Center for Computation and Technology (CCT)[6548]) who contributed to *HPX* the implementation of several parallel algorithms (as proposed by N4313[6549]).
- Anuj Sharma and Christopher Bross (Department of Computer Science 3 - Computer Architecture[6550]), who worked on *HPX* in the context of the Google Summer of Code[6551] program 2014.
- Martin Stumpf (Department of Computer Science 3 - Computer Architecture[6552]), who rebuilt our contiguous testing infrastructure (see the *HPX* Buildbot Website[6553]). Martin is also working on HPXCL[6554] (mainly all work related to OpenCL[6555]) and implementing an *HPX* backend for POCL[6556], a portable computing language solution based on OpenCL[6557].
- Grant Mercer (University of Nevada, Las Vegas[6558]), who helped creating many of the parallel algorithms (as proposed by N4313[6559]).
- Damond Howard (Louisiana State University (LSU)[6560]), who works on HPXCL[6561] (mainly all work related to CUDA[6562]).
- Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.
- Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating *HPX* as a backend for NT2[6563]. He also contributed an implementation of an API similar to Fortran co-arrays on top of *HPX*.
- John Biddiscombe (Swiss National Supercomputing Centre[6564]), who helped with the BlueGene/Q port of *HPX*, implemented the parallel sort algorithm, and made several other contributions.
- Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make *HPX* more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.
- Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling *HPX*.
- Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.

- Patricia Grubel (New Mexico State University[6565]), who contributed the description of the different *HPX* thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.
- Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.
- Agustin Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.
- Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the iostreams module. He also contributed a complete rewrite of the serialization infrastructure replacing Boost.Serialization inside *HPX*.
- Pyry Jahkola, who contributed the Mac OS build system and build documentation on how to build *HPX* using Clang and libc++.
- Mario Mulansky, who created an *HPX* backend for his Boost.Odeint library, and who submitted several test cases allowing us to reproduce and fix problems in *HPX*.
- Rekha Raj, who contributed changes to the description of the Windows build instructions.
- Jeremy Kemp how worked on an *HPX* OpenMP backend and added regression tests.
- Alex Nagelberg for his work on implementing a C wrapper API for *HPX*.
- Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in *HPX*.
- Joseph Kleinhenz, Markus Elfring, Kirill Kropivyansky, Alexander Neundorf, Bryant Lam, and Alex Hirsch who improved our CMake.
- Tapasweni Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, lslada, Alex Myczko, and Avyav Kumar who improved the documentation.
- Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikel Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penuchot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Daiß who contributed to the general improvement of *HPX*.

HPX Funding Acknowledgements[6566] lists current and past funding sources for *HPX*. Special thanks to Google Summer of Code[6567] and Google Season of Docs[6568] for the continuous support they provide which helps us enhance both our code and our documentation.
